RICARDO, David. David Ricardo, one of the most celebrated English economists of this century, was born in London in 1772, and died at Gatcom Park, in the county of Gloucester, Sept. 11, 1823. His family is said to have come originally from Lisbon; it is certain that his father, a Dutch Jew, came to England, where he acquired an honorable position by his ability and integrity, at the same time that he made a fortune in financial business and business on 'Change. David Ricardo received a commercial education at a school in Holland, where he remained two years, and, at the age of fourteen, he was placed in his father's office in London. He soon showed, in this struggle with the chances of financial life, a cool and sound judgment, penetrating sagacity, and great skill in calculating mentally the advantages of an operation, in disentangling difficult transactions, and in reaching an exact solution in spite of the most complicated details. — Business did not wholly absorb him, however, and his mind was preoccupied, on the one hand, with the social and economical questions raised by the situation of Europe in general and his own country in particular, and also by religious questions on the other. His reflections on these last decided him to change his religion, and to join the church of England, in spite of the formal disapprobation of his family and his father, toward whom, however, he never forgot his duty as a respectful son. This event rendered a separation inevitable, and young David Ricardo was obliged to consider how to make his fortune alone. But as he had already given proof of a remarkable aptitude for business, support, means and encouragement were not lacking, and he was able to take a share in very lucrative operations. — At the age of twenty-five he was rich, and had married Miss Wilkinson. His lot decided, and being no longer absorbed by the cares of fortune, he, like Lavoisier, divided his time into two parts: one for business, the other for scientific studies, toward which an inborn inclination had long drawn him. He resumed the study of mathematics and of the natural sciences, devoting himself especially to chemical research. He was one of the first to introduce gas burners into one of his residences. At the same time he took great pleasure in reading the *chefs-d'œuvre* of literature, and Fonteyrand heard it related in his family that he plunged with infinite delight into the reading of Shakespeare. — But he was still

more strongly attracted toward political economy, after he had read, as he himself relates, the immortal work of Adam Smith, with which he had first become acquainted in 1799, at Bath, to which place he had accompanied Mrs. Ricardo, whose health had become impaired. Thus it was that, by the nature of his business and the bent of his mind, he was preparing himself theoretically and practically for the financial and economical struggles in which he played so great a part during the last years of his life. — Ricardo made his first appearance as a writer and economist in 1810, at the age of thirty-eight years, by the publication of his pamphlet, entitled, "The high price of Bullion a proof of the depreciation of Bank Notes." This pamphlet made a great sensation, because it revealed the true cause of the decline of the English exchange and of the depreciation of bank notes. Ricardo demonstrated that the increase in prices which merchandise of all kinds had undergone was not, as was generally supposed, attributable to the wars, but rather to the depreciation of paper money. The ministry did not want to believe in this depreciation. A bullion committee was appointed by parliament, and Mr. Horner, who made the report, admitted that Ricardo's demonstration was unanswerable, and he proved by the Hamburg exchange that the value of paper was only 25 per cent. that of specie. This was the opinion of Huskisson, Canning and Henry Thornton; but the house of commons made, nevertheless, on the motion of Mr. Vansittart, chancellor of the exchequer, the singular declaration that paper had not undergone any depreciation! At the head of the opponents of the ideas and measures contained in the treatise of Ricardo, and the report of the committee of the house of commons, was Mr. Bosanquet, who maintained his opinion in a pamphlet which provoked a reply from Ricardo, in the course of this same year (1810). — The next publication of Ricardo was in 1815, at the time when the famous bill relative to the exportation of foreign grain, so often afterward modified and finally withdrawn, on the motion of Sir Robert Peel and by the efforts of the free trade league, was being discussed. In it Ricardo maintained the principles of commercial liberty, and foreshadowed the theory of rent, with which his name is identified. The year following, he published another tract on monetary circulation, and proposed, that, in order to keep paper on the same level as gold and to render it inconvertible, bank notes should be exchanged for ingots or pieces of bullion of the standard weight and measure. — Ricardo retired from business shortly after the peace of 1815, and applied himself to study with renewed ardor. In 1816 he arranged his ideas on economy and finance in their proper relation to each other in his "Principles of Political Economy and Taxation." It is to be remarked, that, in his preface to this book, he is far from claiming as his own the theory of rent. He declares, "that the true doctrine of rent was published simultaneously by Malthus, in a pamphlet, entitled, 'An

Enquiry into the Nature and Progress of Rent,' and by a member of the university of Oxford (Dr. West), in an 'Essay upon the Application of Capital to Land'; that without a profound knowledge of this doctrine it is impossible to conceive of the effect of taxation upon the different classes of society, especially when the things taxed are the direct products of the soil; that Adam Smith and other distinguished writers, not having considered the principle of rent correctly, they had neglected many important truths, the knowledge of which can be acquired only after having thoroughly fathomed the nature of rent." Mr. M'Culloch ("Principles of Political Economy," London, 1843), afterward saw that the first idea of this theory was to be met with in a pamphlet published forty years previous, in 1777, by an Englishman, Dr. James Anderson ("An Enquiry into the Corn Laws"), which seems to have escaped the notice of Adam Smith, and which was undoubtedly unknown to Malthus, West and Ricardo. Be that as it may, we are inclined, together with M'Culloch, Senior, Rossi, and others, to accord to Ricardo the honor of the complete demonstration of this theory, imperfectly seen by Adam Smith, treated of in part by James Anderson in 1777, treated anew and more fully in 1815, in the two simultaneous pamphlets of Malthus and West, and finally expounded with wonderful clearness by Rossi in his *Cours d'Economie politique*. (See RENT.)* — Thanks to these remarkable publications, to his skill in business, and to a large fortune, which was stated to be twelve millions; thanks also to the independence of his mind and character, Ricardo occupied an important position in his country. In 1818 he was returned to parliament by the electors of Portarlington. Two of his letters testify to his extreme distrust of his own strength. "You have seen," he wrote, April 7, 1814, to one of his friends, "that I have a seat in the house of commons. I fear that I shall not be of much use there. I have twice attempted to speak, but in the most embarrassed manner, and have scarcely any hope of being able to overcome the fright which takes possession of me when I hear my own voice." "I thank you," said he, in another letter, dated June 22, 1814, "for the efforts which you have made to inspire me with a little courage. The indulgence of the house has lessened for me the difficulty of speaking, but I still see so many and such terrible obstacles, that I fear much that it would be wiser to confine myself to silent votes." Everything shows that he was too harsh toward himself in this judgment. This is how Lord Brougham

expressed himself with regard to it. "Ricardo's language had a remarkable stamp of distinction; his style was clear, simple, correct, and its woof was enriched with facts and valuable documents. He practiced abstinence in questions which had not been the object of his long meditation, and, when he spoke on events and laws concerning the church or of politics in general, he seemed to be acting in obedience to the inveterate frankness of his nature and the indomitable freedom of his spirit. Hence it was that few men ever exercised such real effect on parliament; few men have commanded such lively attention, and as he had neither captivating inspirations nor graceful speech, with which to charm his auditors, this influence may be regarded as the triumph of reason, of integrity, of ability. Besides, he commanded the respect of all parties, even the ministerial, against which he was constantly fighting; but he would not submit to the yoke of any coterie, voting with the opposition, the radicals, or the cabinet, from judgment and not from tactics or ambition. Although he owed part of his fortune to the negotiation of government loans, he more than once combated from the tribune that ruinous practice of governments in general and of the then existing English government in particular." — Such was the man as a politician. As a scholar he was no less calm, no less independent. During twenty years he debated with Malthus, with Mill, and with J. B. Say, without the antagonism of ideas impairing the friendship which existed between his illustrious opponents and himself. In private life, Ricardo's character was at once firm, mild, simple and amiable; he was an indulgent father, a kind husband, a devoted friend. He particularly liked to collect about him men of talent, and to converse freely on all subjects, but principally on those which were connected with his favorite science. A most pleasant memory of him is preserved by the club of political economy of London, one of the founders of which he was, and at Paris, in the circle which J. B. Say and his amiable consort gathered together once a week. It is also said that his generosity kept pace with his ability: nearly all the charitable institutions of London counted him in the number of their patrons, and he maintained at his own expense an alms-house and two schools in the neighborhood of his residence in the county of Gloucester. James Stuart Mill has said of him: "His history offers a most encouraging example; he had everything to do, and he performed well his task. Let the young mind which longs to spring beyond the sphere in which it has been placed not despair, in view of his great career, of attaining to the highest place in science or in politics. Ricardo had to make his fortune, to form his mind and even to begin his education, without any guide but his penetrating sagacity, without any encouragement but his energetic will, and it is thus that, while making an immense fortune, he broadened his judgment and endowed his mind with a strength which has never been surpassed." — Without being robust, Ricardo

* Ricardo has been the subject of many different judgments. Some (Rossi and J. S. Mill being of this number) regarded him as the first of economists, after Adam Smith; others place him in the second rank; the truth probably lying between the two extremes. As a thinker, Ricardo appears to us superior, original and profound; as a writer, he sometimes obscures his thought by abstract formulas, the strictness of which is only apparent, though we do not wish to say that he is in error when he is obscure. He employs short sentences when enunciating propositions introduced by hypotheses and followed by explanations.

was gifted with a constitution which seemed to promise him a longer career. But he had for several years a pain in his ear to which he did not pay much attention, and which assumed a very alarming character, in September, 1823, after his return to Gatcom Park at the close of the session. The rupture of an abscess at first afforded him some relief, but inflammation set in again, the brain was attacked, and he died on the 11th of September,* after two days of great suffering. He was but fifty-one years old.

JOSEPH GARNIER.

RIDERS (IN U. S. HISTORY). In the federal government, and in the state governments also, with some exceptions (see VETO), a limited veto power is given to the executive, the president or the governor. Where a legislative majority is sufficient to pass a bill, but not to overcome the veto, a measure which has good reason to fear a veto is sometimes attached to some very necessary bill, such as an appropriation bill, and the two are passed as a single bill, so as to force the executive either to accept the doubtful measure or to incur the odium of a veto of the more essential bill. Such an addition is commonly called a "rider." It is evidently an invasion of the executive province. In most of the states it is now forbidden, 1, by requiring every bill to relate to but a single subject, and that to be expressed in its title, not in order to lay a ground for adjudication by the courts, but to give the executive a fair excuse for the veto; or 2, far more effectively, by giving the executive the power to veto single clauses in an appropriation bill, while approving the rest. The constitution of the confederate states (see that title) adopted both these remedies; and the second has been suggested as a very proper amendment to the constitution of the United States.—I. *In the States.* Riders were not familiar in our early history. The only original state constitution which refers to them is that of Maryland, 1776. "That the senate may be at full and perfect liberty to exercise their judgment in passing laws, and that they may not be compelled by the house of delegates either to reject a money bill which the emergency of affairs may require, or to assent to some other act of legislation in their conscience and judgment injurious to the public welfare, the house of delegates shall not on any occasion, or under any pretense, annex to or blend with a money bill any matter, clause or thing not immediately relating to, and necessary for, the imposing, assessing, levying or applying the taxes or supplies to be raised for the support of government, or the current expenses of the state." In Delaware, 1792, provision was made that no "matter or clause not immediately relating to and necessary for raising revenue, be in any manner blended with or annexed to a bill for raising revenue"; and this has been continued in force ever since. Kentucky,

* The date given by M'Culloch and Fonteyrand. The "Universal Biography" says the 11th of August of the same year, but M'Culloch and Fonteyrand must have known best.

1799, provided that the senate "shall not introduce any new matter, under color of an amendment, which does not relate to raising a revenue," and renewed it in 1850. The language of this latter provision was followed by Louisiana in 1819 and in all subsequent constitutions, and by Maine in 1820. In other states the evil is either still untouched, or has been attempted to be remedied in one of the two modes above specified. The first method, by requiring single subjects for bills, introduced by New Jersey in 1844, has been imbedded in the state constitutions since the following years: Alabama, 1865; Arkansas, 1868; California, 1849; Colorado, 1876; Florida, 1868; Georgia, 1865; Illinois, (private bills and salaries) 1848, (all bills) 1870; Indiana, 1851, Iowa, 1846; Kansas, (Topeka constitution) 1855, (Lecompton) 1857, (Wyandotte) 1859; Kentucky, 1850; Minnesota, 1857; Missouri, 1865; Nebraska, 1866; Nevada, 1864; New Jersey, 1844; New York (private or local bills), 1846; Ohio, 1851; Oregon, 1857; Pennsylvania, 1864, (by amendment), 1873; South Carolina, 1865; Tennessee, 1870; Texas, 1845; Virginia, 1850; West Virginia, 1861; Wisconsin (private and local bills), 1848. In all these it is still in existence. The second method, the extension of the veto power to single clauses, is in force in the following states, having been introduced by the constitutions of the years named: Alabama, 1875; Arkansas, 1874; California, 1879; Colorado, 1876; Florida (amendment in), 1875; Georgia, 1865; Louisiana, 1879; Missouri, 1875; Nebraska, 1875; New Jersey (amendment in), 1875; New York (amendment in), 1874; Pennsylvania, 1873; Texas, 1866; West Virginia, 1872.—II. *In the Union.* The power of attaching riders to bills has never been taken away from the national legislature, though it has gradually, by increasing and unnecessary use, come to be looked upon as an illegitimate and possibly dangerous exercise of power. It would not be possible here to specify all the instances in which provisions in the nature of riders have been added; it is only intended to specify the cases in which the rider has attracted general attention as a possible precedent, or has provoked important opposition.—The first of these was the joining, by the senate in 1820, of the bill for the admission of Maine to the Missouri bill permitting slavery, so as to compel the house to take both or neither. In this case the two bills were finally separated. (See COMPROMISES, IV.)—In 1849 the territory acquired from Mexico was still unorganized, the house being determined to prohibit slavery therein, against the wish of the senate. (See ANNEXATIONS, IV.; WILMOT PROVISIO; COMPROMISES, V.) In the senate, Feb. 20, while the civil and diplomatic appropriation bill, which the house had already passed, was under consideration, Walker, of Wisconsin, offered as an amendment a provision that the constitution and revenue laws be extended to the still unorganized territory, and that the president be authorized to enforce them; and this was adopted Feb. 26. Its object was to secure the introduction of slaves to the territory, under cover

of the constitution, though Webster showed conclusively that the constitution could not thus be made a territorial law. But he resisted the rider mainly on the score of prudence, acknowledging that it was parliamentary, and that he "could not say that, if you had a bill under consideration for abolishing flogging in the navy, you might not introduce an amendment declaring war with Great Britain." The house very ingeniously threw the onus back upon the senate, March 2. It did not reject the rider, but "concurred with the amendment" that the existing (Mexican) laws be continued in the territory until July 4, 1850, unless sooner superseded by organization. As the Mexican law forbade slavery, this would have fixed the status of the territory. After midnight of March 3, the adjournment day, the senate receded from its amendment, thus getting rid of the house amendment with it, and passed the appropriation bill without any rider. — The dispersion of the Kansas legislature in July, 1856, by federal troops, under the president's order (see KANSAS), was at once brought up in congress, where the new republican party controlled the house (see REPUBLICAN PARTY, I.), while the senate was democratic. When the army appropriation bill came up, the house added to it a rider forbidding the employment of federal troops for the enforcement of the territorial laws of Kansas, and directing the president to protect persons and property, to keep the peace, to disarm the territorial militia, to prevent them from attempting to enforce the territorial laws, and to recall United States arms distributed in the territory. The senate rejected the amendments; both houses adhered to their position; and the time fixed for adjournment, Aug. 18, came, leaving the army bill still unpassed. The president, by proclamation, at once called a special session for Aug. 21. The house again added its rider, and the senate again rejected it. Finally the house yielded, and passed the bill without the rider by the close vote of 101 to 98; and it became law Aug. 30. — The great volume of legislation required by the rebellion made this period prolific in riders. Thus, the validation of the president's acts and proclamations of 1861 (see HABEAS CORPUS), after failing as a separate bill, was added as a rider to an act to increase the pay of privates in the regular army, Aug. 6; and generally the words "and for other purposes" in the titles of bills become indicative of some hidden or open rider. None of these provoked special opposition, and they may be passed over. From the first appearance of the conflict of opinion between President Johnson and the majority in congress (see RECONSTRUCTION), it was evident that riders would play an important part. In the senate, May 2, 1866, a rider was attached to the postoffice appropriation bill, forbidding the payment of salaries to officers until their confirmation by the senate (see TENURE OF OFFICE); but this was subsequently reconsidered and rejected. During the next session the conflict became open, and in February, 1867, the army appropriation bill was passed

with two important riders. The second section of the bill enacted that the orders of the president and secretary of war to the army should only be given through the general of the army (Gen. Grant); that the latter should not be relieved, removed or transferred from Washington without the previous approval of the senate; and that any officer who should transmit or obey orders, except through the general of the army, should be punishable by imprisonment for from two to twenty years. The sixth section ordered the immediate disbanding of the militia forces of the unreconstructed states. March 2, 1867, the president signed the bill, but protested against the riders, as attempts to deprive him of his functions as commander-in-chief, and ten states of their right to control their own militia, both of which were given by the constitution, not by congress. These sections were preliminary steps to the impeachment of Johnson. (See IMPEACHMENTS, VI.) — Jan. 13, 1868, while a bill to make five, instead of six, of the supreme court judges a quorum, a most important rider was added, providing that no decision against the constitutionality of a federal law should be valid without the concurrence of two-thirds of the judges therein. The senate did not consider it. — There was no further important party contest in congress on riders (but see AMNESTY) until 1872. June 7, three days before final adjournment, Senator Kellogg, of Louisiana, suddenly moved to add to the civil appropriation bill a general election law, authorizing the oversight and control of elections by federal supervisors, which the senate had already passed, but which the democratic minority in the house was opposing with a probability of success. There are no rules in the senate to limit debate, but in the case of appropriation bills, and "such amendments as directly relate to the appropriations," the senate minority had agreed to limit each senator to five minutes' debate. The democratic senators alleged that the introduction of this amendment was a breach of faith; but the republican majority decided it to be germane. Sumner, under this ruling, endeavored also to get in his supplementary civil rights bill (see that title), but the senate rejected it, and passed the amendment. Much the same objection was made in the house, but after several conferences the amendment was adopted. It amended an act of Feb. 28, 1871, by allowing the appointment of federal supervisors of election in any county or congressional district where ten citizens should request it from the federal circuit judge, with the proviso that the supervisors appointed under it should "have no power or authority to make arrests," only to witness the election, the counting of the votes, and the making of the returns. The bill was thus passed, under a suspension of the rules, by a vote of 102 to 79, and in the senate by a vote of 39 to 17. — Feb. 24, 1873, an amendment was moved to the legislative appropriation bill, increasing the salary of the president to \$50,000; those of the vice-president, supreme court justices, secretaries

and speaker of the house to \$10,000; and of the senators and representatives to \$7,500 and traveling expenses. It passed both houses, and became law, March 3. The increase of salary to congressmen included the members of the congress which had voted it; and hence the increase, popularly known as "the salary grab," proved to be highly unpopular. (See SALARY GRAB.)—Feb. 25, 1865, an act, introduced by a democratic senator from Kentucky, became law. Originally it forbade, under penalties, the bringing of any troops to an election place in any state "unless it be necessary to repel the armed enemies of the United States," but the republican majority added thereto the words "or to keep the peace at the polls." In this form it became, in 1874, §§ 2002 and 5528 of the Revised Statutes. The general election law of May 30, 1870, amended Feb. 28, 1871, authorized the appointment, by federal circuit judges, of two supervisors of elections for congressmen, to personally count every ballot, but not, as above amended in 1872, to make arrests. Both of these provisions were disliked by the democrats, and they also complained of unfairness shown by clerks of federal courts in making up grand jury lists. During the session of 1876-7 the democratic majority in the house had passed the army appropriation bill with a rider forbidding the employment of the army in sustaining the reconstructed southern state governments. The senate refused to concur, and congress adjourned in March without passing the appropriation bill. The army was unpaid until, at the special session of Oct. 15, an army appropriation bill was passed without the rider. One section of the general election law allowed the marshal or his deputies, in case of resistance to arrest, to call in the *posse comitatus* to assist them; and in 1876 the attorney general decided that the federal troops might be summoned as a *posse*. In 1878 a rider was added to the army appropriation bill, forbidding the use of federal troops as a *posse*, except in cases where it was "expressly authorized by the constitution or by act of congress," and the bill was approved June 18, 1878. This initial success encouraged the democrats to attack the whole body of legislation above specified, in which was contained most of the legislation under which troops could still be employed. Their determination to do so was stimulated by the elections of 1878, which made it certain that the succeeding congress would be democratic in both branches. If the still republican senate should obstinately resist the riders, and force a special session after March, a concurrent house and senate would then be arrayed against the president alone, who had not hitherto had any effective support from his own party. (See HAYES, R. B.) The struggle began early in February, 1879. The house re-enacted §§ 2002 and 5528, without the words "to keep the peace at the polls," and the legislative, executive and judicial appropriation bill, with riders repealing the essence of the gen-

eral election law, forbidding the payment of any money to supervisors, etc., and changing the grand jury law so as to have the list arranged by members of both political parties. The senate struck out all the riders; the two houses disagreed; the bills failed to pass; and both parties "appealed to the country" on the final adjournment. March 4, President Hayes called a special session of the new congress for March 18. Its meeting was the signal for a political tournament of about two months, in which the democrats declared their purpose to wipe out the remnants of war legislation, and the republicans charged their opponents with a design to "starve the government to death," since they had failed to "shoot it to death." The principal results of the session were the partial success of the democrats, the renewed support of the president by his party, and the recognition of Garfield as an unusually able party leader. The army bill was first passed with its rider, and was vetoed, April 30, on the grounds that there was plenty of time to pass both political bills and appropriation bills, and that the junction of the two was an attempt to coerce the president, and possibly, in the future, the senate also, and to enable the house to dictate permanently whatever legislation it might see fit to attach to appropriation bills. The democratic majority was but eight in the senate, and seven in the house; so that the bill was not passed over the veto. Another army appropriation bill, omitting the original rider, and substituting another forbidding the use of any money for the transportation or subsistence of troops for service at the polls in any state, was passed toward the end of the session, and approved June 23. The original rider had first been passed as a separate bill, and vetoed May 12. The executive, legislative and judicial appropriation bill, with its riders, was then passed, and was vetoed May 29. June 10-14, two appropriation bills were passed: the first, for the executive and legislative expenses, without any riders, was approved June 21; the second, for the courts alone, with the riders which had caused the veto of the whole bill, was vetoed June 23, on the grounds that there were but two proper methods of overthrowing existing legislation, by repeal, or through the courts, and that the riders simply forbade the executive to execute laws yet unrepealed. July 1, congress adjourned, leaving the courts unprovided for. It was suggested that the president should continue calling special sessions until congress was willing to pass an appropriation bill for the courts; but this extreme, though legitimate, measure was not put in force. The courts and court officers went unpaid until the following session, when the struggle was renewed in a milder form. The democrats passed a judiciary bill, with a proviso that special deputy marshals should be selected from the different political parties, and should be of good moral character. This was also vetoed May 4, 1880, as a bad precedent of an indirect repeal of a law. The bill was then passed without an appropriation for special deputies.

The army appropriation bill of May 4, renewed the rider forbidding payment for transportation or subsistence of troops for service at the polls in any state.—See (I.) Poore's *Federal and State Constitutions*; 2 Hough's *American Constitutions*, 637, a summary of provisions as to veto power in the states, as they stood in 1872; the variations in this article are subsequent changes; (II.) see *Congressional Globe* and *Congressional Record*, under the several dates; 16 Benton's *Debates of Congress*, 306, 1 Greeley's *American Conflict*, 195, 2 Wilson's *Rise and Fall of the Slave Power*, 29, 505; and *Statutes at Large and Revised Statutes*, under the dates and sections named.

RIGHT OF PETITION. (See PETITION, RIGHT OF.)

RIU KIU. The demands of practical politics in Asia are compelling the issue of a problem that has, especially since the opening of this century, been awaiting solution. The extension of European interests in the far east has had the tendency, not only to force China to define her relations with the nations of the west, but also with those on or near her borders. For many centuries the centre of culture to more than half of the largest, the most populous and the most varied continent of earth, China, has divided the world into two portions: the middle (China), and the foreign (all other nations). The outlying people were "barbarians," and all holding relations with her were reckoned as tributaries or vassals. The investiture bestowed upon each, and the actual reception, by the Chinese "Son of Heaven," of gifts which were considered as marks of homage from almost every country, from the Caspian sea to Japan, and from the Malay archipelago to the frozen tundras of Siberia, are recorded in the Chinese court annals. Even the embassies from Rome, India, Venice, and the modern kingdoms of Europe, were registered as "tribute bearers." China's form of the doctrine of the "Divine Right" to rule all nations, is expressed in the title of her emperors, Whang-Ti, Heavenly Dynasty, or Theocratic emperor. Western governments in Christendom have compelled a change in diplomatic language as regards themselves, but the tone of oriental mock-courtesy or real loyalty to the Chinese emperor is still very abject, however independent such countries as Annam or Corea may in actuality be. Almost alone of China's neighbors, Japan has asserted and maintained absolute political independence, though Siam is rapidly following her example. China, now pressed on all sides by European enterprise and ambition, finds that she must maintain her old claims, or suffer the presence of frontagers who, instead of manifesting the demeanor of childlike suppliants, bear the attitude of jealous defiance. Since she

lost, by the diplomacy of Ignatieff in 1860, the Amoor region and maritime provinces touching the Pacific and Corea—a territory as large as France—she has firmly resisted all further encroachments. Wrestling Ili from Russia, she further manifested her policy by warning off the Japanese from Formosa in 1876, by demanding Riu Kiu from Japan, by garrisoning Seoul with her soldiery after the Corean uprising in July, 1880, by military defense of her frontier against suspected Russian aggression, and by informing France of her determination to defend her vassal Tonquin against invasion, annexation or protectorate. The problem is further complicated, not only in the case of Riu Kiu, but in that of others, as in the Indo-Chinese peninsula, by the fact that these petty kingdoms have for centuries rendered homage and paid tribute to two countries: to the nearest and less powerful, and to supreme China—to the distant "Son of Heaven" and "Lord of Ten Thousand Chariots" in Peking. So long as the ordinary conditions of Asiatic statecraft were unvexed with modern and western ideas, this state of things could go on undisturbed. The entrance of Russians, French and British on the scene as neighbors, and extra-territorial residents, has complicated the problem. — Of Riu Kiu (Sleepy Dragon), a group of thirty-seven sugar and rice producing islands stretching like a long rope (okina-wa) from Satsuma to Formosa, with a population of over 166,000 souls, we may say that it needs a Solomon to pronounce upon its parentage. Like a babe between two maternal claimants, it is in danger of the sword and of division. The Riu Kiu people are, in origin, language and dynasty, true Japanese, but being powerless between the two great rival empires, Japan and China, they have endeavored to keep the friendship of both by tribute and acknowledgment of submission to either. Thirty-six Chinese families from Fu-kien settled in the islands in A. D. 1372, and encouraged trade, friendship and relations of culture and submission to the Chinese court, which were not interrupted by the Japanese. Before this time and afterward, however, Riu Kiu was a feudal dependency of Satsuma, and was so dealt with by the Japanese shōguns, and the junk-load of gifts sent annually to China was permitted as merely "an exchange of neighborly courtesies." On account of their evident reluctance to fill their quota of war material, ordered by Hidēyoshi when about to invade Corea in 1592, the prince of Satsuma, in 1609, after the Corean war and civil trouble in Japan were over, made an expedition to Riu Kiu, and completely subdued the principality, sent the king Shonei as prisoner to Yedo, and after a thorough reformation of administration in the islands, the daimiōs of Satsuma were confirmed in their possession of Riu Kiu, keeping Shonei as hostage for three years, while the laws and customs of his dominions were being assimilated to those of Japan. Upon his accession to office, each prince of Riu Kiu took an oath of allegiance to the daimiō of Satsuma, and Japan treated Riu

Kiu as an integral portion of the empire. In time of famine, food was sent to relieve the starving, and indemnity was exacted from the Formosan pirates for depredations upon Riu Kiu sailors. Commodore M. C. Perry, in 1853, acted upon the principle that Riu Kiu was a dependency of Japan, and though modifying his view after a stay of some months in China, he finally made an agreement with the regent of Riu Kiu, which, however, contained no statement of the political status of the island kingdom. In 1872, after the abolition of feudalism in Japan, Riu Kiu was made a province (*han*), and the chief, Sho-tai, a governor (*han-wo*). In 1874, Riu Kiu was brought directly under control of the home department, and the custom of sending presents or tribute to China was forbidden. In the diplomatic correspondence between Peking and Tōkiō, relative to the Formosan affair in 1874, China distinctly recognized the Riu Kiuans (who had been killed by the Formosan savages) as Japanese subjects. The Chinese envoys to Japan in 1878 protested against the Japanese occupation of Riu Kiu and their interdict on tribute to China, demanding that the old *status quo* of the islands should be restored. Terashima, the mikado's minister (and now envoy at Washington), objecting to their offensive language, cut off further negotiation. On April 4, 1879, the Riu Kiu *han* (province) was abolished, and the okinawa *ken* (prefecture) established, while Sho-tai, the chief, was ordered to reside, like the former daimiōs, or feudal chiefs now retired, in Tōkiō. The discussion was now opened at Peking, but with little progress, until, in 1879, Prince Kung referred the matter to Gen. U. S. Grant, then visiting China and about to go to Japan. After his arrival in Tōkiō, and consideration of the evidence on both sides, Gen. Grant advised the withdrawal of previous dispatches and the appointment of plenipotentiary commissioners to settle the difficulty. The commission began its sittings in Peking, Aug. 15, 1880, and the negotiations continued during three months. On Oct. 21 the drafts of the treaty which was expected to end the controversy were ready for signature. It provided that the boundary line between the two empires should be drawn at about the twenty-fifth parallel of north latitude; that Yayé-yama and Miako islands should belong to China, but all northward should belong to Japan. The treaty, as agreed upon by the high commissioners, was to be signed within ten days; but after sixteen days had elapsed, the Tsung-li Yamen notified Mr. Shishido, the mikado's envoy, that by imperial order the treaty was to be submitted to the northern and southern superintendents of trade, and others, for consideration and further report. This amazing violation, by the Peking government, of the principles of international law and common courtesy, in remanding the solemn decisions of a plenipotentiary commission—to which, on the recommendation of an eminent American citizen, Japan had, in good faith and covenant with China, submitted her case—to

other parties, is thus adjudged by the Hon. J. B. Angell, minister of the United States to China: "Even if they [the Chinese] have justice on their side, in opposing the seizure of the islands by Japan, they could not well contrive a better way to alienate the sympathy of all civilized nations from them in the assertion of their rights than by the course which, if we accept the statement of Mr. Shishido, they have now seen fit to take in their negotiations with Japan." On Jan. 20, 1881, nearly five months after the commission had finished its labors, and after repeated remonstrances, Mr. Shishido, the mikado's commissioner, left Peking, since which time the Japanese government have steadily refused to reopen the question with China. Whether by war, by diplomacy, or by arbitration, the solution of the long-standing problem of China's claim to sovereignty over pupil or neighbor nations seems probable, and may take place before the end of this century. Neither Japan, with her new sense of nationality, nor European nations in this age of liberty, are inclined to respect a claim that seems more antiquated and anachronistic as such a figment as the holy Roman empire and such a doctrine as the divine right of kings to reign settle below the world's horizon. — LITERATURE. ROMAN CATHOLIC CHURCH. The object of the present article is, in the first place, to present a condensed exposition of all those provisions of the constitution of the Catholic church which are of any importance for the political understanding of ecclesiastical questions, and then of those principles of that same constitution which have to do with the relation of the Catholic church to the state and to other confessions, etc.: the whole from the point of view, and according to the teaching, of the Catholic church itself.*—I. *Nature and Mission of the Church.* The Catholic church, according to its own dogmatic teaching, is the body or community of all those who are

* This article is intended neither as an argument for, nor as an attack upon, the Catholic church. It is a simple statement of its own doctrines, written by a deep thinker profoundly versed in its doctrines and laws. See note at the close of the article.—Ed.

united in the faith in Jesus Christ, a community founded by Jesus Christ, the Son of God, to the end that, within its fold, the individual may work out his eternal salvation. To effect this his purpose, Christ—for the continuation of the functions which he performed during his earthly life, and for the application of the spiritual means of the sacraments bequeathed by him to this community—at the same time established his apostolate, charged with the task and endowed with the power of appointing successors who should, unto the end of time, labor toward the restoration willed by Christ, and purchased for them by his incarnation and death, viz., the restoration of all nations to the true faith, and effecting through that faith, their entrance into the kingdom of God. To preserve the true faith unaltered forever, God promised and sent the Holy Ghost, the divine Spirit, to the church, to remain with it throughout all time. The Catholic Church, founded by Christ, is the only true (*unica, una*) one; it is of direct divine institution, built on the apostles chosen by Christ himself, and on their successors, descended from them, in an uninterrupted series, by spiritual generation or ordination (*ecclesia apostolica*); it has been called to be universal (*catholica*) both in time and space, and to receive into its bosom all those who fulfill the conditions which Christ attached to entrance into his community; unto it is granted, through its instruments of grace, the power to make man the child of God, to help him to fulfill his religious destiny and to sanctify him (*ecclesia sancta*). But, to do this, the church must be everywhere recognizable, external and visible (*ecclesia externa, visibilis*). To this end it has received, in the fundamental features of it, a definite constitution, with the church's central point in the bishop of Rome, the successor to the priority conferred by Christ on Peter, that is to say, to the primacy among the apostles, and therefore, in the bishop of Rome as the visible vicar of Christ. Hence the church is an *ecclesia, catholica, apostolica Romana*. In order that the church may not err in matters pertaining to the faith, that is, in general, in its teaching, concerning all those doctrines on the acceptance of which membership in the Christian community depends (the dogmas of the church), or in those precepts the observance of which is a condition to the salvation of the individual (the fundamental doctrines of morals), it is, by the constant dwelling within it of the Holy Ghost, endowed with infallibility for all time (*ecclesia infallibilis*). Thus, the Catholic church represents itself, not merely as a *subjective* community of Christian believers, but also as an *objective* community, as the *only external visible* institution founded by Christ for the *realization of his kingdom*. Its foundation is the doctrine of faith and morals proclaimed by Christ himself, and preserved, first, in the recognized sacred books of the New Testament (Bible), which, according to the universal belief of the church, were written under divine inspiration, and secondly, in the oral tradition of the church. The church is, accord-

ingly, the fulfillment of the promise made by God after the fall, the institution for which he prepared the way under the old dispensation; so that Christianity is not the abolition but the fulfillment of Judaism; and therefore the sacred books of the latter (the Old Testament) in as far as they do not exclusively relate to national, ceremonial and like affairs, preserve their authority in Christianity. — Hence the aim and object of the church is not the establishment of an earthly kingdom; it is not a kingdom of this world; its interests are not secular, but religious and spiritual; its mission is to restore harmony between the cravings of the sensitive faculty and the commands of God, to bring it to pass that the individual, through faith, and through the grace accorded by God to all, may *will* his own salvation, and with freedom, by works conformable to the faith, labor for his salvation. According to the teaching of the Catholic church, it is not mere faith in Christ that insures salvation, but faith in Christ, and works corresponding to that faith; a life in, and conformable to, the faith. Although, according to its dogmas, entrance into its communion is a condition to salvation (*extra ecclesiam nulla salus*), the attaching of the consequences which follow the non-fulfillment of that condition presupposes knowledge, and an act of the will refusing to enter it. Hence the church does not condemn those of a faith other than its own. — In this world, the church fulfills its task through the mediation of a visible institution, and through means, connected with visible symbols and forms; visible, because intended for men who, as visible, external beings, are bound to and can not escape such forms. Those of the church who have ended their earthly career, immediately enter into a state of perfection, of beatitude in the contemplation of God (church triumphant), or remain in a middle state of purification (purgatory), (the church suffering). These, together with the faithful in this world still working out their salvation in the earthly struggle (church militant), constitute the communion of saints (*communio sanctorum*); through this communion the merits of the saints may be applied to those on earth, and the prayers of the living avail those undergoing the purification of purgatory. Only the church on earth (the church militant) has anything to do with human law. It enters into the domain of law because of the action which it desires to and must exercise on men, even on all men, because of the external means it employs, and finally because of its compact, visible organization. But its mission, nevertheless, is not an earthly and human one; hence, by its very nature, it is not dependent on any power whatever, nor conditioned by any such power; the church *must* fulfill its mission, wherever and as soon as it has the means to fulfill it; because with the possibility to fulfill it comes its duty to fulfill it. As regards the individual Catholic, the external fulfillment of his duty consists in the life in the church, and according to the teachings of the church. And this supposes: participation in external divine worship (*cultus*);

participation in the means of grace, in each according to the circumstances of life (the sacraments); the fulfilment of the commands which the church teaches as directly divine, or which it proclaims itself by virtue of the power granted it (profession of the dogmas of the church, and observance of the precepts of morals). When the acts of individuals are external, they become subject to human law (*forum externum*); but when these acts are entirely internal, they belong to the domain of conscience (*forum internum*). — II. *Constitution and Administration of the Church.*

1. *Persons.* The constitution of the church, or of the society which constitutes the church, is that of a *societas inæqualis*, as it was called even in the middle ages. That society is divided into two different and separate classes: first, the clergy, the body which embraces all persons chosen to guide the church, to administer the means of grace left it, and to act as mediators of salvation to individuals; and secondly, the laymen, the people, the collective body of the faithful, subject to the guidance of the clergy. Sometimes the former are called the teaching, ruling or governing church, and the latter the learning or obeying church. The mark that distinguishes these classes each from the other, is ordination, bestowed on the clergy by a bishop, which is, as it were, an act of spiritual generation, and of itself confers the faculty (*facultas spiritualis*) of administering or dispensing the spiritual means of grace bequeathed to the church. There is a gradation in holy orders, according as this administration of the sacraments, or means of grace, by the very nature of that administration, supposes a power which does not reside in man as such, and which, therefore, can not be acquired or conferred without the indwelling capacity to confer it, in the person who confers it; or according as it may be exercised by purely human faculties. The priests (*presbyteri, sacerdotes*), through the sacrament of holy orders (the external sign consisting in the imposition of hands by the bishop, the invocation of the Holy Ghost, and anointment), receive the grace and especially the power of changing the bread and wine into the body and blood of Christ, and hence of performing the sacred function which is the central point of divine worship in the Catholic church. They are intrusted with the guidance of the life of the church in detail. Above the priests stand the bishops, as successors of the apostles, endowed with the plenitude of the priesthood, a plenitude which manifests itself in the spiritual power to grant admission into the ranks of the clergy, and especially into the priesthood and episcopate. The bishops become such by virtue of a special act called consecration, and are looked upon as the holders, necessarily and unconditionally called for the government of the church, of the fullness of power deposited in the church. From the bishops the other members of the clergy derive their powers, as well as the external right (called *jurisdictio* in the language of the church) of exercising the spiritual faculties

which have been granted them. The episcopate is, therefore, the exclusive guide and ruler of the church, and this by virtue of its position in the church; its power is the ordinary *κατ' ἐξοχήν*, and hence is also called, by way of eminence, *jurisdictio ordinaria*; if any one else is invested with an analogous authority, it is only by way of fiction. The priestly and episcopal dignity is indelibly stamped on the individual; or, in theological language, it impresses on the soul a *character indelebilis*, so that the priest or the bishop may, in deed, be deprived of his right as such, but never of his purely spiritual power. Hence there always exists between them and laymen a profound spiritual ineffaceable difference. Below the priests, there are six other grades of the clergy (deacons, subdeacons, acolytes, exorcists, lectors, ostiaries), the members of which have no similar specific functions to perform, and to whom, on that account, the indelible character of the priesthood is not imputed. Their duties, in our day, in the church, are practically nothing; but in themselves these duties consist in taking care of the poor, attending the sick, and in discharging the humbler services in the church. Among the clergy are reckoned, moreover, all who have received the tonsure, and who are thus externally distinguished from laymen. The clergy are further divided into the *secular* clergy, and the *regular* clergy, belonging to the religious orders. The former embrace all who are subject only to the law applicable to the clergy, and, speaking relatively, to the law applicable to all the faithful in general; the latter include all those who live in accordance with a particular rule (*regula*, hence *clerus regularis*) obligatory upon them only by virtue of their own voluntary act. A person belonging to a religious or monastic body need not have received any of the degrees of holy orders, so that here the difference is not a practical one. — The seven degrees of holy orders are divided into the higher orders (priests, deacons and subdeacons) and minor orders. All of them confer certain rights and impose duties which it is not necessary to enumerate here. — At the summit of the episcopate, as head of the church, is the pope. The pope and the bishops are the necessary, independent rulers of the church. They represent the teaching, governing church. Their representation of the church takes place in a general council; such council can not, in the very nature of things, be always nor even frequently assembled. Hence, from the beginning, the guidance of the church by the episcopate was practically this: each bishop obtained (and obtains) a portion of the domain of the church, as his exclusive field of activity, within which he executes the mission of the church as teacher, priest and administrator of its laws. To the episcopal office, the only and fundamental one in the government of the church, there have in time been associated other authorities or bodies, the existence of which, not resting on any necessity, is a result of historical development, and consequently remains subject to that development in the future. — Hence

the constitutional and administrative organism of the church is the following: The territorial domain of the church is divided into dioceses. The occupant and ruler of each diocese or see is a bishop (*episcopus diœcesanus, ordinarius*). Several dioceses constitute an ecclesiastical province (*provincia ecclesiastica*) under a metropolitan, who, however, is only a judge of second resort, who is empowered to visit the dioceses of his suffragans, governed by clearly defined provisions, who has besides a few other powers, but whose office has by no means a complete intermediate degree of authority. In the early days of the church, several provinces constituted a patriarchate (Italy, the Roman; one at Constantinople, and one at Jerusalem, Antiochia and Alexandria respectively). The modern patriarchates, those just mentioned, those of Venice and Lisbon, and that of the Armenians and Maronites, are merely nominal, and without any juridical importance. — The union of the bishops with the pope is effected by the constant intercourse that naturally results from the ever-recurring need of papal acts and decisions for the several dioceses, and also by the duty of the ordinaries of presenting themselves from time to time before the pope, to give an account of the condition of their dioceses in everything that pertains to the church; by the sending out of papal legates; but, above all, by the oath of fidelity or oath of obedience, which every bishop takes to the pope at his consecration. Finally, the intercourse of the pope with the faithful (both ecclesiastics and laymen) affords him a means of obtaining information concerning the condition of the several churches, since every one is free, subject, of course, to rational rules, to communicate with the pope. — In the guidance and government of the dioceses the bishops are assisted, *so far as the entire diocese is concerned*: 1. By chapters (metropolitan chapters, cathedral chapters, etc.). These sprung by degrees from the clergy of the bishop's city, and particularly from the clergy of the bishop's church; from the sixth to the ninth century, they led a life in common (*rita communis*), after the pattern of monks, subject to a rule; later they assumed, more and more, the character of independent corporations, a character which they still retain. The bishop is required to obtain their consent to certain acts, and to seek their advice as to others; leaving these cases out of consideration, cases which are distinctly defined in the law of the church, the bishop is not bound by the chapters nor obliged to choose his assistants in the administration of his diocese from among them, although practically he does so everywhere. 2. The vicars general (*vicarii generales*), who were originally, particularly in Germany, appointed as a counterpoise to the excessive jurisdiction of the archdeacons, and who by degrees maintained their position as permanent assistants by reason of the great extent of the dioceses and the frequent absence of the bishops. 3. Suffragan bishops (*vicarii in pontificaliibus*). These are real bishops, consecrated with a title to dioceses which formerly existed, but which are now in the hands

of the infidels (in Asia and Africa). These bishops are appointed by the pope at the request of the bishop, and, as mandataries of the bishop, perform episcopal spiritual functions. They are given only to cardinal bishoprics, to great dioceses, and to those in which such suffragan bishops are traditional. 4. Officials, with the same historical development and position as the vicars general, but limited to the exercise of juridical authority. — In our days a formal tribunal for this purpose is usually appointed (with a president and at least four counselors), a tribunal which the bishop constitutes as he wishes. In like manner, there is generally appointed an official body for the administration of the diocese, under the presidency of the ordinary or of his vicar general. — *For the separate districts.* The dioceses are divided into archdeaneries, deaneries, and district vicariates, at the head of which, named by the bishop (also by the clergy of the diocese, and confirmed by the bishop), there is an arch-priest, dean and district vicar, to whom belongs the supervision of the clergy in their office, of their moral conduct, the administration of the property of the church, and, as a rule, the schools for the children of the people. The dean, etc., is required to visit his district every year, and conscientiously to report its condition and the state of its accounts, and to examine the parish books; he is the medium of communication of the bishop with the clergy, and of the addresses or petitions of the latter to the episcopal authorities. He has no jurisdiction, but only the right to make expostulations, remonstrances, etc. A district of this kind embraces an indefinite number of parishes (*parochiæ*), each governed by a parish priest (*parochus*). The parish priest, accordingly, is the most important helpmate of the bishop. The parish priest has, as assistants, vicars, chaplains, curates, etc., who are appointed and removed by the bishop. — 2. *Objects of the Church's Action.* It clearly follows, from what has been said, that the life of the individual, in its totality, is the proper object of the action of the church, inasmuch as the mission of the church consists in this: to remove all contradiction, in man, between his will and the commands of God, that is, to bring perfect harmony into all his actions. Its efforts, therefore, by no means aim at doing away with natural (national, political) relations or conditions, but only at bringing them into harmony with Christian conditions, that is, at raising the principles, ideas and maxims that move individuals and nations in their doings, to the height of Christian principles, ideas and maxims. Hence it strives not to remove or destroy the external, special, peculiar stamp given to individuals and nations by their character, land and climate; but only to concentrate them, in their final end, on the goal to which religion tends, that is, on the world beyond. This sufficiently explains why the church has endeavored to leave its impress, and actually has left it, on all nations, on their different classes and on their condition, changing and transforming them; why it has endeavored to banish, and, by

its influence, for the most part, has banished, from civil, penal, public and international law, every principle which was based on heathen views, or was in conflict with its own principles, or which stood as an external obstacle in the way of the full development of its doctrine. It is intelligible, that the church endeavored to exert, and actually exerted, a direct influence here, because it considered that in this manner it could most fittingly secure the actual operation and enforcement of Christian principles. Thus, during the middle ages, we see an infinity of objects drawn into its domain, with which, at a first glance, it would seem to have nothing to do. Men, in our day, are accustomed to look upon all this as a transcending of power, as evidence of the usurpation of the clergy, and the ambition of popes; they forget, that in looking at it through the spectacles of the nineteenth century they are judging not historically, but only critically. Denied it can not be, that all civilized nations have been educated by the Catholic church; that through it a Christian foundation was given to the state, and a new civilization introduced into all the departments of social life and of the life of the law. How deeply the necessity of the position the church assumed here, was rooted in the circumstances of the time and in the mission of the church and the state, in those ages, is sufficiently evinced by the fact, that this action of the church met with almost no opposition. All resistance before the sixteenth century was directed only against certain matters of detail. But, although the practical action of the church still may extend, or historically has extended, into every sphere, it can not be ignored that its *direct* action, so far as its end and mission are concerned, has not so broad an aim now, and that consequently no place in things non-essential belongs to it, that none such is necessary or can appear necessary to it, and that it has no right to such a place. Rather can the direct, immediate and ever-legitimate aim of the church be this and this only: man in his moral and religious relations. If the church here attains its object, harmony will of itself follow. Nothing, therefore, would be more foolish than for the clergy of the Catholic church to long for the recovery of worldly rights, honors and titles, as did the Jews for the flesh pots of Egypt. If the clergy be truly spiritual, and not worldly, if they keep in view, not only in the pulpit, but in their own body, alone and in connection with others, the honor of God, the salvation of their neighbor, and, finally, their own supreme end and esteem; if they only do all this, honor, and, what is of paramount importance, their own greatest efficiency for the elevation of society, will be better secured than if human laws prescribed that any homage should be paid them. — Hence, what immediately and necessarily comes within the province of the church is, in the first place, the preaching of the divine word, that is, instruction in the Christian religion. Its founder has imposed on it the imperative duty to preach the word, and, therefore, given it the right to do so.

It may, indeed, for a time be prevented, by circumstances beyond its control, from exercising that right, but it can never, in principle, abandon it, nor require any external recognition of it. This task of the church is called the *potestas magisterii*. To it belongs the religious instruction of its members, whether imparted in higher institutions of learning or in public schools, since it would be inconsistent to want the church, and at the same time to question its exclusive right of instruction in the faith. If there be no doubt in this matter, there is a doubt as to how far the influence of the church in the public schools should extend. No one will assert that the public schools have simply the duty to equip the child with knowledge. They are also called upon to educate and to train it, in the proper sense of the word; but education without religious principles is a radically vicious one. It is likewise manifest, that, since the majority of young people, on leaving the schools, cease accumulating fresh stores of knowledge, what they have acquired at school remains with most men the basis of their actions through life. But from this it clearly follows that the church, in respect of the public schools, can not confine itself to the task of merely imparting religious instruction, but must claim and have a considerable influence in the business of education in general.* The means employed by the church in the exercise of its functions as teacher, are religious instruction to the youth at school (teaching of the catechism), in the church (Sunday school teaching), sermons, instruction by pastoral letters, etc., and, finally, by books. — When, through religious teaching, the soil has been prepared for a Christian life, the individual in the Catholic church is kept forever mindful of his duties by the means left by Christ, for the sanctification of the different situations in life. The power to administer these means is the *potestas ordinis*. The means are the seven sacraments (external symbols), instituted by Christ, to which is attached an inward grace: through one of which (baptism) man is introduced into the church after birth; through another of which he is strengthened for the service of God by the Holy Ghost (confirmation); rescued from his lapse into sin, the consequence of human frailty, by a third (penance); by a fourth, the eucharist, he partakes of the body and blood of the incarnate God. By matrimony, a fifth, he is sanctified and strengthened for the natural alliance of the family. By holy orders, the sixth, those called thereto are endowed with the gift-necessary for a particular spiritual alliance with the church. Finally, by extreme unction, on his death bed, the Catholic is prepared for his exit from this world. In a word, in all the situations

* We have here translated the German *Volksschulen* by *public schools*. In writing the article Dr. v. Schulte certainly did not have in view the public schools of the United States, in particular. The *Volksschule* is a school intended for the people. It seems certain that what Dr. v. Schulte says of the attitude of the Catholic church toward the *Volksschule* is true of its attitude toward the public schools of the United States.—Ed.

of life the Catholic is guided by the loving hand of his mother, the church. Besides the sacraments, hereto belong also the whole external divine worship (worship and liturgy), and what is connected with it (sacramentals, ceremonies, etc.). — The exercise of these two powers, the *potestas magisterii* and the *potestas ordinis*, requires a settled order of things. The establishment and development of the latter, on the basis of the fundamental principles given by Christ, given with the church itself, as well as its enforcement, constitute the third power of the church, the *potestas jurisdictionis*, or government, in the proper sense of the term. This triple power, in its totality, resides in the episcopate, the bishops. The *potestas jurisdictionis*, from the very nature of the case, is chiefly that activity of the church which is externally apparent, and, for that reason, most capable of juridical development, and which in fact has a part in that development. In the exercise of this power the church enters the domain of law, and comes in contact with states, individuals and religious bodies separated from it. The principal departments of this jurisdiction are the legislation and administration of the church, particularly the creation and filling of ecclesiastical offices, the supervision of the administration of the clergy, the exercise of the judicial authority of the church over the clergy and laity, and the administration of the property of the church. — 3. *Legal Rules for Ecclesiastic Administration.* The ecclesiastical law is the sum total of the principles according to which the church lives and acts in its internal and external relations. Its sources are, in the first place, the positive divine precepts contained in the New Testament, which are, however, as a matter of course, but few, because Christ gave only the broad outlines of the constitution of the church, the development of which, as indeed the development of all law, is the work of time. In the first centuries of the church the customary law, resting for the most part on traditions handed down from the time of the apostles, was the most abundant source of the law of the church, yet one which subsequently receded before other sources, but which, at the same time—because it is the criterion in accordance with which all rules are established (rules required by special circumstances, and which are therefore gradually developed), that traditional customary law, of which we are speaking—is of great importance, exists even at the present day, and continues to modify many laws of the church. It now finds expression in the *eigena ecclesie disciplina*, which in many points varies considerably from the state of things supposed by the written law, which latter must take into account circumstances and the times. There are, besides, the *canones*, that is, the decrees of the synods, and the papal constitutions. — III. *Relations of the Catholic Church to Non-Christians.* The church, as has been shown, maintains that membership in the Christian church is a fundamental condition to the attainment of the salvation of the soul. From this it deduces the right and

duty of announcing the gospel to non-Christians, and of receiving them into its fold. This activity of the church is designated by the word *mission*. A congregation in Rome, bearing the name *S. Congregatio de Propaganda Fide*, looks after the execution of this task. To this end the congregation has an institution, in which most of the Asiatic and other languages are taught, and large revenues for the support of missionaries. To this congregation, under the guidance of the pope, are subject all countries, in which the church is either not tolerated at all, or in which it has not yet been able to attain the full development of its legal organization. Such countries are called *terra missionis*, in contradistinction to countries which are ruled by the common law of the church and by the regular hierarchy, and which are *terra sedis apostolice*. The system of church government in missionary countries must, from the very nature of the case, be dictated more by prudence (the circumstances of place, time, climate, political constitution, the stage of civilization of the people) than by the strict letter of the law. As means of conversion, instruction *only* is admitted; all compulsion, etc., is excluded. The violent conversion of certain German tribes (the Saxons), by Charlemagne, that of the Jews in Spain, and other and similar conversions, did not proceed from the church, although a few individual bishops may perhaps have approved of them. Such conversions are sufficiently explained by the views held in those times, which knew only Christian society (the ecclesiastico-political), and when states considered it a matter of duty to convert all non-Christians, even against their will. But from the point of view of the church, only man's free will can call for admittance into the church. — It was an altogether different matter, when in many countries, during the middle ages, the Jews were ordered by the popes, at certain seasons of the year, to listen to Christian sermons, that they might become acquainted with Christianity. This was considered legitimate, because the duty of taking care that the truth should not remain hidden from the Jews was acknowledged. The Jews were tolerated and protected by the popes and bishops more than by any others, so that, relatively speaking, there are now more Jews living in countries formerly Catholic, and particularly in countries ruled by dignitaries of the church, than in others. But non-Christians, because they have not received baptism, stand in no relation to the church. For the same reason they are not subject to the laws of the church, nor can they, as such, be judged by the church. But the church, nevertheless, considers non-Christians bound by the laws which it calls divine, because engraved on the heart of every man. When, accordingly, there is question in its forum of the rightfulness of any act, the church does not decide it by its positive laws, but by the dictates of the *ius divinum*; for instance, it considers the marriage of non-Christians indissoluble. The matrimonial impediments created by the divine law (as, for in-

stance, the impediments between those in the ascending and descending lines, between brothers and sisters, etc.) the church regards as binding on non-Christians. With regard to the admission of grown-up non-Christians to her fold, the church maintains that religious conviction only is necessary, but not any definite age or further requirements. Since all compulsion must be regarded as illegitimate, it is not permitted by the Catholic church to baptize the children of non-Christians, as for instance, those of Jewish parentage, against the will of their parents, but it insists that a baptized child shall receive a Christian education. — Dating from the early centuries of the Christian era, and from the middle ages, there still exist a number of laws which forbid the intercourse of Catholics with non-Christians, or which restrict such intercourse to the absolutely necessary; but which forbid, above all, certain kinds of familiar intercourse with such persons (as the service as house maids, man servants, nurses, etc.), and which further absolutely forbid such intercourse with the Jews. Prohibitions of this kind existed until recent times in a few states (in Austria until the summer of 1859, but they were not enforced), and they still exist in several Italian states, in Spain, etc. The reason of such prohibitions, dating from early times, was the danger to the faith which that intercourse necessarily involved, so long as the Christian religion had not attained to full recognition, and so long as paganism had not entirely disappeared. With the Christian state this reason ceased to exist, when in the Neo-Latin, Germanic and Slavonic states the heathen religion was no longer tolerated. As reasons for the maintenance and renewal of these prohibitions in case of the Jews, may be alleged the embarrassing situations in which servants might be placed, the danger that they might become indifferent to their religion, particularly when not kept to the observance of it, or that they should be compelled to hear it ridiculed, etc. The civil condition of the Jews does not concern the church. For, although the state in many of its laws relating to the emancipation of the Jews places itself in contradiction with the principles of the Christian state, this implies no injury to the church so long as such laws do not affect the development of the church, and so long as the Christian foundations of states receive no injury from them. For I consider that the state has indeed the power but not the right to put itself in such contradiction.* Yet it implies no injury to the church that the state does not impose any legal restrictions on intercourse with Jews, the church having always tolerated such intercourse, and considered it unavoidable. On the other hand, the Catholic church can not be forbidden to employ suitable means

to prevent her children from being exposed to unnecessary danger to their faith, and hence can not be prohibited to warn them against the familiar intercourse referred to above. I am, however, of opinion, that we ought to regard the ecclesiastical laws which punish this intercourse with censures (ecclesiastical punishments) as abrogated by a *desuetudo generalis* (general disuse), by reason of the altered circumstances of the times, as well as because of the modern development of the state. — IV. *Relation of the Catholic Church toward the Greek, Protestant and other Christian Sects.* It follows from what has been said, that the Catholic church considers itself as *the* church, and consequently as the only church founded by Christ; that it maintains its doctrine to be *the Christian doctrine*, and every deviation from it as *error*; that its fundamental constitution, according to its dogma, is the one which was given by Christ to his church, and that the non-recognition of the latter and of the historically developed powers of the church implies unlawful opposition to Christ and to his church. Since the church not only exacts an inward, but also an external, visible acceptance of Christianity, any deviation from its teachings, or non-recognition of it, not only bears the character of a sin, but is the subversion of the legal order of things, and hence has the character of a crime. From the nature of the case, it is impossible to admit a will in opposition to the church, knowing it to be the only true church. For this reason the church looks upon the voluntary rejection of its doctrine as the crime of *heresy* (from *αἰρεῖν*, to choose), that is, the non-acceptance of its entire dogma, and on the rejection of the constitution of the church (especially of the primacy of the bishop of Rome) as the crime of *schism*, and punishes the same by exclusion from the church; and prescribes to the Christian state the obligation on its part to take action against such crimes. Such is the view that was maintained in all Christian states, after the pagan religion had been prohibited in the Roman empire, until the sixteenth century; in Catholic countries this view continued to be taken by the Italian states until the revolution of 1859, and by Spain and Portugal; in non-Catholic states, by Russia, practically; by Sweden, as to the abandonment of the Lutheran faith; and it is well known, that England retained the same view in part as regards the Anglican church. But in Germany this view was changed after the Passau decree of the states of the empire (1552), that of Augsburg (1555), and the peace of Westphalia (1648). Owing to the events of the sixteenth century, the effects of which were confirmed by the laws of the empire above referred to, there arose a condition of things which had for consequence not only the individual freedom of belonging to any one of the three Christian confessions (Catholic, Lutheran and Reformed), but which also brought about the complete political equality of Catholics and of the Catholic church on the one hand, and of the Protestants and the Protestant church on the other,

* In our opinion, Christianity is not only the basis but the living element of our civilization; yet the legal foundation of the state does not by any means rest on Christianity. The state has not grown out of the church, nor upon the church, but is completely independent of the latter and of her dogmas. — BLUNTSCHLI.

and even the individual freedom of Christians, to not belong to any Christian confession. At the same time, by the peace of Westphalia and the establishment of the normal year, 1624, a definite limit was put to the external jurisdiction of both the Catholic and Protestant church over foreign yet kindred religious bodies in the separate territories of the empire. In consequence of events since 1803, all jurisdiction of the kind has generally ceased to exist in Germany. — In this way was developed the equality of individuals and confessions. As a consequence of this, the rule of the canon law has naturally ceased to exist in respect to Germany, to France, England, Holland, Belgium, the United States, etc.; because it is impossible to regard as criminals persons who are born and educated in a Christian religious community, tolerated by the state, on an equal footing with, or even with greater privileges than, the Catholic body.* The church, therefore, regards dissenters from her teaching only as erring, as *heretici materiales*, as they are called in the language of the church. For this reason also the penal laws of the church, as well as the validity of older prohibitions, respecting the intercourse of Catholics with heretics, have ceased to have any force. What is said here of heretics applies also to the non-united Greek church and its adherents. That this is practically so, and that this view has been maintained by the popes, is well known to every one acquainted with the government of the Catholic church. Herewith has also ceased the external jurisdiction of the Catholic church over Protestants and non-united Greeks. But so far as persons who secede from the Catholic church to the Greek, or to any other Christian confession or sect, are concerned, the Catholic church maintains, even externally, its own dogmatic view, which is, the notion of criminal schism, and of heresy, and the applicability of the laws of the church above referred to. The external application of these laws is naturally limited to the infliction of censures (excommunication), for the reason that the employment of other and temporal punishments, which were formerly always inflicted by the state, has now been abandoned. Practically these ecclesiastical penalties play no part, except when an individual wishes to return to the church which he had abandoned. Thus, although Protestants and members of the Greek church are no longer, as such, subject to the external jurisdiction of the Catholic church, still the view of the Catholic church concerning its own domain remains the same. By baptism, every one, from the church's own point of view, becomes a member of the society founded by Christ, that is, of the Catholic church, and is subject to its regula-

tions, whether they rest on the divine law or on the positive laws of the church, enacted by virtue of the constitution of the church, and of the power bequeathed to it by Christ. Hence, when, in the church's forum, there is question of an act done, it does not apply those principles which non-Catholics regard as controlling the case, but its own. Practically this is of importance only as regards marriage, and the questions resulting therefrom in the several spheres of church life. For instance: the marriage of a Protestant separated from his wife, during the lifetime of the latter, is regarded by the Catholic church as void; and a son, the offspring of such a marriage, could not, without dispensation, be admitted to holy orders, *propter irregularitatem e defectu natalium*. It obviously follows from what has been said, that as regards Greeks and Protestants, in non-Catholic countries, the church must look upon the task it has to perform as a missionary one. And so it is in reality. — For the admission of dissenters to the church, which, from the point of view of the laws of the Catholic church, is only a return to it, the absolute inadmissibility, in accordance with the above exposition, because of the circumstances of our times and of the obsolescence of the older laws of the church, of all compulsion, or the employment of any means but instruction, must be considered as settled. — The clergy of the Catholic church are under no obligation to exercise the functions of their office for the benefit of persons of a belief different from their own. In practice this can be asked of them only as to baptism, marriage and burial, because their other functions can not be performed in favor of persons not Catholic. As a matter of course, the church has no objection to the baptism, by a priest, of children of Protestants, at the request of the parents. In regard to matrimony, the church *forbids* the marriage of a Catholic to a non-Catholic, without, however, attaching to such marriage any definite, external, ecclesiastical penalty, but it does not permit the marriage of a Catholic to a non-Christian, on account of the matrimonial impediment of difference of religion. The present state of things in this regard, resting on modern papal constitutions, is to the effect that a mixed marriage may be allowed when it is promised that the education of the children shall be in the Catholic religion, and when the non-Catholic party promises not to disturb the other in the exercise of his or her religion.† In such a case, that is, in the case of a mixed marriage, a dispensation is granted, and the nuptial ceremony of the Catholic church is allowed to be performed. But if the guarantees above referred to are not given, the Catholic priest grants only his so-called passive assistance in the nuptial ceremony. The Catholic priest may also attend the burial of non-Catholic

* Bluntschli here inserts a note to the effect that the state introduced religious freedom into the world. The remark is certainly a correct one. The principle of liberty of conscience forced itself into the world through blood, we might almost say, spite of church and state authorities, as a means "not to determine rights, but to repress violence and terminate quarrels."—Ed.

† There are those who consider this provision in conflict with the principle of the equal rights of confessions or creeds, and of freedom of conscience. But is not the member of a recognized Christian denomination, the statutes of which he freely accepts, bound by them?

Christians, in his priestly character, but only with the omission of all ceremonies, which, by their very nature, can be performed only over deceased members of the church. But there is no duty to perform such ceremonies, on the part of the Catholic priest, as that would manifestly imply unqualified compulsion, in view of the fact that purely political considerations do not demand ecclesiastical burial. For this same reason the state can not compel the church to officiate at the burial of nominal Catholics, whom the law of the church deprives of this benefit, or to accord them Christian burial. Catholic cemeteries, *campi sancti*, are considered as things ecclesiastical. Secession from the Catholic church, and going over to another confession, the Catholic church necessarily regards as apostasy and crime. Hence its law admits of no mode of leaving the Catholic church. The Catholic church makes admission to its fold dependent only on the knowledge of its doctrine, on the free will of the individual, uncontaminated by impure motives (as far as can be ascertained, for it is unable to examine hearts), and on the fulfillment of its precepts. When these conditions exist, it can not but admit the individual. But on this very account the church does not require for admission to its fold any definite age, any more than it does the consent of parents, guardians or of married people, to the change of the faith of either; because the conviction of the truth is an entirely individual matter, which, by reason of its consequences to the individual, can not depend on the pleasure of a second or third party. As regards the religious education of Catholic children, the Catholic church exacts unconditionally their education in accordance with its doctrines, and does not admit of any exception of whatever kind to this rule; a matter which has frequently been made a subject of reproach to it, but which manifestly is the natural consequence of its principles and convictions. The political point of view is here a different one from that of the church. — V. *Relation of the Church to the State.* It is impossible to enter here into the historical and philosophical exposition of this relation, or to support the views here developed by historical proofs. All we are concerned with at present is to describe the relation of the Catholic church from the point of view of *principle*, taking into consideration, at the same time, the principles proclaimed by the Catholic church itself. All the decrees and tenets which constitute the sources of ecclesiastical law on the relation of church and state, are, from the standpoint of principle, just as little prescriptive as the decrees of secular laws. For all such decrees and tenets did not proceed from the whole church; they have not the character of dogmas, but sprung from the circumstances of the times in which they originated, and in which they all find their sufficient justification and necessary explanation. To make these tenets of the middle ages, or the general condition of those ages, an absolute standard for all time, is an absurdity which neither has a rational basis nor is even of

any advantage to the church itself, but which, on the contrary, arouses a host of enemies against it, and thereby causes no little damage. The principles which result from Catholic teaching and from the development of its law, and which have no reference to special conditions, are these: the church is a power independent of the state, and self-dependent; its domain is a spiritual one, and therefore different from the political domain; it rests on divine institution; and hence, as to the powers bequeathed to it, and as to the means granted it for the fulfillment of its mission in the world, it is not dependent on any earthly power and requires no political commission. It is, therefore, subject to no state. It is not of the world but *in* the world, to lead mankind to eternal salvation. The Catholic church as the *one* church, the mystic visible body of Christ, the community of all Christian believers spread throughout all lands, is not the subject of the action or influence of any state, and is not, because it is the mystic, visible body of Christ, bound to obey the laws of any state. The Catholic church knows no limits, no nation, but only humanity united in the faith. But the worldly position and the worldly relation of individuals do not, therefore, cease to exist. Christ did not prescribe to his church the attainment of its end in any new way by the creation of artificial social relations previously unknown to the world, or of new political institutions or constitutions. The church's means for the reaching of its end are purely spiritual, moral and religious. Hence, the mission of the church is decidedly not a political one. That through the acceptance of Christianity, all social, and hence all political, relations should be gradually transformed as they actually were, was not the aim of Christianity, but the indirect result of its action, because through its influence humanity itself was renovated in a moral way. It therefore follows that the church in different countries does not and can not require that the people should abandon their political and social relations or circumstances, but, on the contrary, that individuals, each in the position in which Providence has placed him, should fulfill his duty, and, like a true Christian, whether as a citizen or official or soldier, as father or mother, as son or daughter, etc., merit heaven. Religious duties should not interfere with *human* duties, whether civil or political, and there should arise no conflict between civil and church duties. The task of the Christian state consists in the attainment of this end. — From what has been said, it follows, in the first place, that the church accepts the political order as resting on the divine will, and that the authorities of the state rule by divine right. All, accordingly, are bound to obey the latter. But it follows, too, that no definite form of political authority or of political constitution, no single political system, can be regarded as the *one* specially instituted by God, but that the church recognizes the actual lawfully existing political authority of a state as the one divinely established. Not the church, but international law and history,

must decide when any definite political authority can be said to exist *by right*; in other words, that decision lies outside the jurisdiction of the church. It is therefore perfectly true that the Catholic church as such is cosmopolite, and knows no special country; but it is wrong, on this account, to deny to Catholics individually, from the pope to the layman, the right of, or the capacity for, patriotism. Differences of political opinion and deep attachment to home, country and nation, are as natural to Catholics as to any others. — Thus, the church is not divided into state churches. History shows that there is nothing more crippling or deadening to the inward life and action of the church than a condition in which it becomes the instrument of state administration, even when it happens that it is the predominant religion in that state. Nor is the Catholic church a state within the state. This is not possible from the very nature of its existence in most states, and of its constitution, which is the same in all states, the centre of which (its constitution), even in the interest of all states having Catholic population, should not be subject to a state foreign to any other states. It is, however, no contradiction to what has been said, that the church partakes in the sufferings and joys of every individual state, in so far as its members belong politically to such state. — Within its own domain the church demands freedom of movement and autonomy, just as in the present day does every private individual, every community, every society, and every confession. The Catholic church can not on principle lay claim to privileges or rights of a secular or political nature; the loss of the old ones it possessed was, therefore, in principle no violation of right. But it can not be denied that the practical settlement of the relation of church and state, especially in Europe, is beset with great difficulties, because our age has broken with history in respect to the development of the political domain, and because the church and the state, in most European countries, have a too intimate and historical connection to render it possible soon to find the right solution in the conflict of opposing parties, one of which desires to retain the condition of things historically developed, another of which finds the right solution in the absolute dechristianization of the state, and a third in the freedom of the church within its own sphere, the like freedom of the state within its sphere, and in the action in common of both on a common ground. There are still other parties which do not well know what they want.* (For

* The above article (somewhat shortened here by the omission of matter relating exclusively to Germany) was written by a distinguished Catholic teacher of ecclesiastical law, John Frederick von Schulte, the author of a great number of works on the law of the Catholic church. It was written for the larger edition of Bluntschli and Brater's *Staatsverfassungsbuch*. After the promulgation of the decree of the infallibility of the pope by the Vatican council, Dr. von Schulte, with Dr. Döllinger and other learned Catholic divines and laymen, formed themselves into the body known as the "Old Catholics," a party which rejected the doctrine of papal infallibility as subversive of the ancient constitution of the church, as the absorption of the church by the pope,

the proper solution of the question of the relation of church and state, see CHURCH AND STATE, in Vol. I. of this work.—ED.) SCHULTE.

ROTATION IN OFFICE. (See CIVIL SERVICE REFORM.)

RULES. (See PARLIAMENTARY LAW.)

and as contrary to the doctrine *Quod semper, quod ubique, quod ab omnibus*. This is not the place to discuss whether the decree of papal infallibility changed the constitution of the Catholic church. What concerns us most in this work is to lay before its readers the meaning of that dogma, as understood by the best informed in the church itself—a meaning, which, therefore, may be considered the meaning of the Church. We give it in the words of probably the most eminent and learned of Catholic dignitaries, one whose name has long been familiar to Protestants and Catholics as well as to disbelievers both in Protestantism and in the Roman church. He says: "The Vatican definition, which comes to us in the shape of the pope's encyclical bull called the *Pastor Æternus*, declares that 'the pope has that same infallibility which the church has': * to determine, therefore, what is meant by the infallibility of the pope, we must turn first to consider the infallibility of the church. And again, to determine the character of the church's infallibility, we must consider what is the characteristic of Christianity, considered as a revelation of God's will. — Our Divine Master might have communicated to us heavenly truths without telling us that they came from him, as it is commonly thought he has done in the case of heathen nations; but he willed the gospel to be a revelation acknowledged and authenticated, to be public, fixed and permanent; and, accordingly, as Catholics hold, he framed a society of men to be its home, its instrument and its guarantee. The rulers of that association are the legal trustees, so to say, of the sacred truths which he spoke to the apostles by word of mouth. As he was leaving them, he gave them their great commission, and bade them 'teach' their converts all over the earth, 'to observe all things whatever he had commanded them'; and then he added, 'Lo, I am with you always, even to the end of the world.' Here, first, he told them to 'teach' his revealed truth; next, 'to the consummation of all things'; thirdly, for their encouragement, he said that he would be with them 'all days, all along, on every emergency or occasion, until that consummation. They had a duty put upon them of teaching their Master's words, a duty which they could not fulfill in the perfection which fidelity required, without his help; therefore came his promise to be with them in their performance of it. Nor did that promise of supernatural help end with the apostles personally, for he adds, 'to the consummation of the world,' implying that the apostles would have successors, and engaging that he would be with those successors as he had been with them. — The same safeguard of the revelation, viz., an authoritative, permanent tradition of teaching, is insisted on by an informant of equal authority with St. Matthew, but altogether independent of him: I mean St. Paul. He calls the church 'the pillar and ground of the truth'; and he bids his convert Timothy, when he had become a ruler in that church, to 'take heed unto his doctrine,' to 'keep the deposit' of the faith, and to 'commit' the things which he had heard from himself 'to faithful men who should be fit to teach others.' — This is how Catholics understand the Scripture record, nor does it appear how it can otherwise be understood; but, when we have got as far as this, and look back, we find that we have by implication made profession of a further doctrine. For, if the church, initiated by the apostles and continued in their successors, has been set up for the direct object of protecting, preserving and declaring the revelation, and that by means of the guardianship and providence of its Divine Author, we are led on to perceive that, in asserting this, we are in other words asserting, that, so far as the revealed message is concerned, the church is infallible; for

* Romanum Pontificem ea infallibilitate pottere, qua divinus Redemptor Ecclesiam suam in definienda doctrina de fide vel moribus instructam esse voluit.

RUSH, Richard, was born at Philadelphia, Aug. 29, 1780, and died there July 30, 1859. He was graduated at Princeton in 1797, was admitted to the bar in 1800, and became attorney general of Pennsylvania in 1811, and attorney general of the U. S. in 1814. He was minister to Great Britain,

1817-25, and secretary of state under John Quincy Adams. In 1828 he was the candidate of the Adams republicans for vice-president. (See **WHIG PARTY, I.**) He was minister to France, 1847-56. See his *Residence at the Court of London*, and *Court and Government of Louis Philippe*. A. J.

what is meant by infallibility in teaching but that the teacher in his teaching is secured from error? and how can fallible man be thus secured except by a supernatural infallible guidance? And what can have been the object of the words,

I am with you all along to the end, but to give thereby an answer by anticipation to the spontaneous, silent alarm of the feeble company of fishermen and laborers, to whom they were addressed, on their finding themselves laden with superhuman duties and responsibilities?—Such then being, in its simple outline, the infallibility of the church, such too will be the pope's infallibility, as the Vatican fathers have defined it. And if we find that by means of this outline we are able to fill out in all important respects the idea of a council's infallibility, we shall thereby be ascertaining in detail what was defined in 1870 about the infallibility of the pope. — 1. The church has the office of teaching, and the matter of that teaching is the body of doctrine which the apostles left behind them as her perpetual possession. If a question arises as to what the apostolic doctrine is on a particular point, she has infallibility promised to her to enable her to answer correctly. And, as by the teaching of the church is understood, not the teaching of this or that bishop, but their united voice, and a council is the form the church must take, in order that all men may recognize that in fact she is teaching on any point in dispute, so in like manner the pope must come before us in some special form or posture, if he is to be understood to be exercising his teaching office, and that form is called *ex cathedra*. This term is most appropriate, as being on one occasion used by our Lord himself. When the Jewish doctors taught, they placed themselves in Moses' seat, and spoke *ex cathedra*; and then, as he tells us, they were to be obeyed by their people, and that, whatever were their private lives or characters. 'The Scribes and Pharisees,' he says, 'are seated on the chair of Moses: all things therefore whatsoever they shall say to you, observe and do; but according to their works do you not, for they say and do not.' — 2. The forms by which a general council is identified as representing the church herself, are too clear to need drawing out; but what is to be that moral *cathedra*, or teaching chair, in which the pope sits, when he is to be recognized as in the exercise of his infallible teaching? The new definition answers this question. He speaks *ex cathedra*, or infallibly, when he speaks, first, as the universal teacher; secondly, in the name and with the authority of the apostles; thirdly, on a point of faith or morals; fourthly, with the purpose of binding every member of the church to accept and believe his decision. 3. These conditions of course contract the range of his infallibility most materially. Hence Billuart, speaking of the pope, says, 'Neither in conversation, nor in discussion, nor in interpreting Scripture or the fathers, nor in consulting, nor in giving his reasons for the point which he has defined, nor in answering letters, nor in private deliberations, supposing he is setting forth his own opinion, is the pope infallible.' (t. ii., p. 110.)* And for this simple reason, because, on these various occasions of speaking his mind, he is not in the chair of the universal doctor. — 4. Nor is this all; the greater part of Billuart's negatives refer to the pope's utterances when he is out of the *cathedra Petri*, but even when he is in it his words do not necessarily proceed from his infallibility. He has no wider prerogative than a council, and of a council Perrone says, 'Councils are not infallible in the reasons by which they are led, or on which they rely, in making their definition, nor in matters which relate to persons, nor to physical matters which have no necessary connection with dogma.' (*Præl. Theol.*, t. ii., p. 492.) Thus, if a council has condemned a work of Origen or Theodoret, it did not in so condemning go beyond the work itself; it did not touch the persons of either. Since this holds of a coun-

cil, it also holds in the case of the pope; therefore, supposing a pope has quoted the so-called works of the Areopagite as if really genuine, there is no call on us to believe him; nor again, when he condemned Galileo's Copernicanism, unless the earth's immobility has a necessary connection with some dogmatic truth, which the present bearing of the holy see toward that philosophy virtually denies. — 5. Nor is a council infallible even in the prefaces and introductions to its definitions. There are theologians of name, as Tournely and Amort,† who contend that even those most instructive *capitula* passed in the Tridentine council, from which the canons with anathemas are drawn up, are not portions of the church's infallible teaching; and the parallel introductions prefixed to the Vatican anathemas have an authority not greater nor less than that of those *capitula*. — 6. Such passages, however, as these are too closely connected with the definitions themselves, not to be what is sometimes called, by a *catachresis*, 'proximum fidei'; still, on the other hand, it is true also, that in those circumstances and surroundings of formal definitions, which I have been speaking of, whether of a council or a pope, there may be not only no exercise of an infallible voice, but actual error. Thus, in the third council, a passage of an heretical author was quoted in defense of the doctrine defined, under the belief he was Pope Julius, and narratives not trustworthy are introduced into the seventh. This remark and several before it, will become intelligible if we consider that neither pope nor council are on a level with the apostles. To the apostles the whole revelation was given, by the church it is transmitted; no simply new truth has been given to us since St. John's death; the one office of the church is to guard 'that noble deposit' of truth, as St. Paul speaks to Timothy, which the apostles bequeathed to her, in its fullness and integrity. Hence the infallibility of the apostles was of a far more positive and wide character than that needed by and granted to the church. We call it, in the case of the apostles, inspiration; in the case of the church, *assistentia*. Of course there is a sense of the word 'inspiration' in which it is common to all members of the church, and therefore especially to its bishops, and still more directly to its rulers, when solemnly called together in council after much prayer throughout Christendom, and in a frame of mind especially serious and earnest by reason of the work they have in hand. The Paraclete certainly is ever with them, and more effectively in a council, as being 'in Spiritu Sancto congregata'; but I speak of the special and promised aid necessary for their fidelity to apostolic teaching; and, in order to secure this fidelity, no inward gift of infallibility is needed, such as the apostles had, no direct suggestion of divine truth, but simply an external guardianship, keeping them off from error (as a man's guardian angel, without enabling him to walk, might, on a night journey, keep him from pitfalls in his way), a guardianship saving them, as far as their ultimate decisions are concerned, from the effects of their inherent infirmities, from any chance of extravagance, of confusion of thought, of collision with former decisions, or with Scripture, which in seasons of excitement might reasonably be feared. 'Never,' says Perrone, 'have Catholics taught that the gift of infallibility is given by God to the church after the manner of inspiration.' (t. ii., p. 253.) Again: '[Human] media of arriving at the truth are excluded neither by a council's nor by a pope's infallibility, for God has promised it, not by way of an infused or habitual gift, but by the way of *assistentia*.' (Ibid., p. 541.) But since the process of defining truth is human, it is open to the chance of error; what Providence has guaranteed is only this, that there should be no error in the final step, in the resulting definition or dogma. — 7. Accordingly, all that a council, and all that the pope, is infallible in, is the direct answer to the special question which he

* And so Fessler. "The pope is not infallible as a man, or a theologian, or a priest, or a bishop, or a temporal prince, or a judge, or a legislator, or in his political views, or even in his government of the church." (Intro.)

† Vide Amort, *Dem. Cr.*, pp. 205-6. This applies to the Unam Sanctam. Vide Fessler.

RUSSIA. This empire comprises three distinct states: Russia, Poland, and the grand duchy of Finland. Its area, according to the imperial almanac of 1872, is 19,152,725 square kilometres, divided as follows: Russia in Europe, 4,390,829 square kilometres; Poland, 123,738; Finland, 350,-

541; the lieutenancy of the Caucasus, 407,587; Siberia, 11,425,715; and Central Asia, 2,454,305. — The population in 1867 amounted to 81,745,307, as follows: Russia in Europe and Poland, 69,364,541; Finland, 1,843,253; the lieutenancy of the Caucasus, 4,583,640; Siberia, 3,327,627; and Cen-

happens to be considering; his prerogative does not extend beyond a power, when in his *cathedra*, of giving that very answer truly. 'Nothing,' says Perrone, 'but the objects of dogmatic definitions of councils are immutable, for in these are councils infallible, not in their reasons,' etc. (Ibid.)—8. This rule is so strictly to be observed that, though dogmatic statements are found from time to time in a pope's apostolic letters, etc., yet they are not accounted to be exercises of his infallibility if they are said only *obiter*—by the way, and without direct intention to define. A striking instance of this *sine qua non* condition is afforded by Nicholas I., who, in a letter to the Bulgarians, spoke as if baptism were valid, when administered simply in our Lord's name, without distinct mention of the Three Persons; but he is not teaching and speaking *ex cathedra*, because no question on this matter was in any sense the occasion of his writing. The question asked of him was concerning the minister of baptism, viz., whether a Jew or Pagan could validly baptize; in answering in the affirmative, he added *obiter*, as a private doctor, says Belarmine, 'that the baptism was valid, whether administered in the name of the Three Persons or in the name of Christ only' (*de Rom. Pont.*, iv., 12.)—9. Another limitation is given in Pope Pius' own conditions set down in the *Pæstor Æternus*, for the exercise of infallibility, viz., the proposition defined will be without any claim to be considered binding on the belief of Catholics, unless it is referable to the apostolic *depositum*, through the channel either of Scripture or tradition; and, though the pope is the judge whether it is so referable or not, yet the necessity of his professing to abide by this reference is in itself a certain limitation of his dogmatic action. A Protestant will object, indeed, that, after his distinctly asserting that the immaculate conception and the papal infallibility are in Scripture and tradition, thus safeguard against erroneous definitions is not worth much, nor do I say that it is one of the most effective; but anyhow, in consequence of it, no pope, any more than a council, could, for instance, introduce Ignatius' Epistles into the canon of Scripture; and as to his dogmatic condemnation of particular books, which, of course, are foreign to the *depositum*, I would say, that, as to their false doctrine, there can be no difficulty in condemning that by means of that apostolic deposit, nor surely in his condemning the very wording in which they convey it, when the subject is carefully considered. For the pope's condemning the language, for instance, of Jansenius is a parallel act to the church's receiving the word 'consubstantial,' and if a council and the pope were not infallible so far in their judgment of language, neither the pope nor council could draw up a dogmatic definition at all, for the right exercise of words is involved in the right exercise of thought.—10. And in like manner, as regards the precepts concerning moral duties, it is not in every such precept that the pope is infallible. As a definition of faith must be drawn from the apostolic *depositum* of doctrine, in order that it may be considered an exercise of infallibility, whether in the pope or a council, so too a precept of morals, if it is to be accepted as dogmatic, must be drawn from the moral law, that primary revelation to us from God. That is, in the first place, it must relate to things in themselves good or evil. If the pope prescribed lying or revenge, his command would simply go for nothing, as if he had not issued it, because he has no power over the moral law. If he forbade his flock to eat any but vegetable food, or to dress in a particular fashion (questions of decency or modesty not coming into the question), he would in like manner be going beyond his province, because such a rule does not relate to a matter in itself good or bad. If he gave a precept all over the world for the adoption of lotteries instead of tithes or offerings, certainly it would be very hard to prove that he was contradicting the moral law, or ruling a practice to be in itself good which was in itself evil. There are few persons but would allow that it is at least doubtful whether lotteries are abstractedly evil, and in a doubtful matter the pope is to

be believed and obeyed. However, there are other conditions besides this necessary for the exercise of papal infallibility in moral subjects: for instance, his definition must relate to things necessary for salvation. No one would so speak of lotteries, or of a particular dress, or of a particular kind of food; such precepts, then, did he make them, would be simply external to the range of his prerogative. And again, his infallibility in consequence is not called into exercise, unless he speaks to the whole world; for, if his precepts, in order to be dogmatic, must enjoin what is necessary to salvation, they must be necessary for all men. Accordingly, orders which issue from him for the observance of particular countries, or political or religious classes, have no claim to be the utterances of his infallibility. If he enjoins upon the hierarchy of Ireland to withstand mixed education, this is no exercise of his infallibility. It may be added that the field of morals contains so little that is unknown and unexplored, in contrast with revelation and doctrinal fact, which form the domain of faith, that it is difficult to say what portions of moral teaching in the course of 1800 years actually have proceeded from the pope, or from the church, or where to look for such. Nearly all that either oracle has done in this respect, has been to condemn such propositions as in a moral point of view are false, or dangerous, or rash; and these condemnations, besides being such as in fact will be found to command the assent of most men as soon as heard, do not necessarily go so far as to present any positive statements for universal acceptance.—11. With the mention of condemned propositions I am brought to another and large consideration, which is one of the best illustrations that I can give of that principle of minimizing, so necessary, as I think, for a wise and cautious theology; at the same time I can not insist upon it in the connection into which I am going to introduce it, without submitting myself to the correction of divines more learned than I can pretend to be myself. The infallibility, whether of the church or of the pope, acts principally or solely in two channels, in direct statements of truth, and in the condemnation of error. The former takes the shape of doctrinal definitions, the latter stigmatizes propositions as heretical, next to heresy, erroneous, and the like. In each case the church, as guided by her Divine Master, has made provision for weighing as lightly as possible on the faith and conscience of her children. As to the condemnation of propositions, all she tells us is, that the thesis condemned when taken as a whole, or, again, when viewed in its context, is heretical, or blasphemous, or impious, or whatever other epithet she affixes to it. We have only to trust her so far as to allow ourselves to be warned against the thesis, or the work containing it. Theologians employ themselves in determining what precisely it is that is condemned in that thesis or treatise; and doubtless in most cases they do so with success; but that determination is not *de fide*; all that is of faith is, that there is in that thesis itself, which is noted, heresy or error, or other peccant matter, as the case may be, such that the censure is a peremptory command to theologians, preachers, students and all other whom it concerns, to keep clear of it. But so light is this obligation, that instances frequently occur, when it is successfully maintained by some new writer, that the pope's act does not imply what it has seemed to imply, and questions which seemed to be closed, are, after a course of years, reopened. In discussions such as these, there is a real exercise of private judgment, and an allowable one; the act of faith, which can not be superseded or trifled with, being, I repeat, the unreserved acceptance that the thesis in question is heretical, or erroneous in faith, etc., as the pope or the church has spoken of it. In these cases, which in a true sense may be called the pope's *negative* enunciations, the opportunity of a legitimate minimizing lies in the intensely concrete character of the matters condemned; in his affirmative enunciations a like opportunity is afforded by their being more or less abstract. Indeed, excepting such as relate to

tral Asia, 2,626,246. The increase in the population can only be estimated on absolute bases since 1835; the following are the figures given by M. Schnitzler (*Empire des Tsars*): 1835, 59,000,000; 1851, 69,000,000; 1860, 75,000,000. The 81,000,000 of 1867, distributed over the whole surface, gives

only 4.2 inhabitants to the square kilometre. The most populous part is Poland, nineteen inhabitants to the square kilometre, while in Siberia there is only one inhabitant per 3.3 square kilometres. — The empire embraces nine distinct races: 1, the Slaves, who are the most numerous and who in-

persons, that is, to the trinity in unity, the blessed virgin, the saints, and the like, all the dogmas of pope or of council are but general, and so far, in consequence, admit of exceptions in their actual application, these exceptions being determined either by other authoritative utterances, or by the scrutinizing vigilance, acuteness and subtlety of the *Schola Theologorum*. — One of the most remarkable instances of what I am insisting on is found in a dogma, which no Catholic can ever think of disputing, viz., that 'out of the church, and out of the faith, is no salvation.' Not to go to Scripture, it is the doctrine of St. Ignatius, St. Irenæus, St. Cyprian in the first three centuries, as of St. Augustine and his contemporaries in the fourth and fifth. It can never be other than an elementary truth of Christianity; and the present pope has proclaimed it, as all popes, doctors and bishops before him. But that truth has two aspects, according as the force of the negative falls upon the 'church' or upon the 'salvation.' The main sense is, that there is no other communion or so-called church, but the Catholic, in which are stored the promises, the sacraments, and other means of salvation; the other and derived sense is, that no one can be saved who is not in that one and only church. But it does not follow, because there is no church but one which has the evangelical gifts and privileges bestowed, that therefore no one can be saved without the intervention of that one church. Anglicans quite understand this distinction; for, on the one hand, their article says, 'they are to be had accursed (*anathematizandi*) that presume to say, that every man shall be saved *by* (in) the law or sect which he professeth, so that he be diligent to frame his life according to that law and the light of nature; ' while, on the other hand, they speak of and hold the doctrine of the 'uncovenanted mercies of God.' The latter doctrine in its Catholic form is the doctrine of invincible ignorance—or, that it is possible to belong to the soul of the church without belonging to the body; and, at the end of 1800 years, it has been formally and authoritatively put forward by the present pope (the first pope, I suppose, who has done so), on the very same occasion on which he has repeated the fundamental principle of exclusive salvation itself. It is to the purpose here to quote his words; they occur in the course of his encyclical addressed to the bishops of Italy, under date of Aug. 10, 1868: 'We and you know, that those who lie under invincible ignorance as regards our most holy religion, and who, diligently observing the natural law and its precepts, which are engraven by God on the hearts of all, and prepared to obey God, lead a good and upright life, are able, by the operation of the power of divine light and grace, to obtain eternal life.' * Who would at first sight gather from the wording of so forcible a universal, that an exception to its operation, such as this, so distinct, and, for what we know, so very wide, was consistent with holding it? Another instance of a similar kind is the general acceptance in the Latin church, since the time of St. Augustine, of the doctrine of absolute predestination, as instanced in the teaching of other great saints beside him, such as St. Fulgentius, St. Proeper, St. Gregory, St. Thomas and St. Buonaventure. Yet in the last centuries a great explanation and modification of this doctrine has been effected by the efforts of the Jesuit school, which have issued in the reception of a distinction between predestination to grace and predestination to glory; and a consequent admission of the principle that, though our own works do not avail for bringing us into a state of salvation on earth, they do avail, when in that state of salvation or grace, for our attainment of eternal glory in heaven. Two saints of late centuries, St. Francis de Sales and St. Alfonso, seem to have professed this less rigid opinion, which is now the more common doctrine of the day. Another instance is sup-

plied by the papal decisions concerning usury. Pope Clement V., in the council of Vienne, declares, 'If any one shall have fallen into the error of pertinaciously presuming to affirm that usury is no sin, we determine that he is to be punished as a heretic.' However, in the year 1831, the Sacred *Pœnitentiaria* answered an inquiry on the subject, to the effect that the holy see suspended its decision on the point, and that a confessor who allowed of usury was not to be disturbed, 'non esse inquietandum.' Here again a double aspect seems to have been realized of the idea intended by the word *usury*. To show how natural this process of partial and gradually developed teaching is, we may refer to the apparent contradiction of Bellarmine, who says 'the pope, whether he can err or not, is to be obeyed by all the faithful,' (*Rom. Pont.*, iv., 2), yet, as I have quoted him above, sets down (ii., 29) cases in which he is not to be obeyed. An illustration may be given in political history in the discussions which took place years ago as to the force of the sovereign's coronation oath to uphold the Established church. The words were large and general, and seemed to preclude any act on his part to the prejudice of the Establishment; but lawyers succeeded at length in making a distinction between the legislative and executive action of the crown which is now generally accepted. These instances, out of many similar, are sufficient to show what caution is to be observed, on the part of private and unauthorized persons, in imposing upon the consciences of others any interpretation of dogmatic enunciations which is beyond the legitimate sense of the words, inconsistent with the principle that all general rules have exceptions, and unrecognized by the theological *Schola*. — 12. From these various considerations it follows, that papal and synodal definitions, obligatory on our faith, are of rare occurrence; and this is confessed by all sober theologians. Father O'Reilly, for instance, of Dublin, one of the first theologians of the day, says: 'The papal infallibility is comparatively seldom brought into action. I am very far from denying that the vicar of Christ is largely assisted by God in the fulfilment of his sublime office, that he receives great light and strength to do well the great work intrusted to him and imposed on him, that he is continually guided from above in the government of the Catholic church. But this is not the meaning of infallibility. * * * What is the use of dragging in the infallibility in connection with papal acts with which it has nothing to do? Papal acts, which are very good and very holy, and entitled to all respect and obedience, act in which the pontiff is commonly not mistaken, but in which he could be mistaken and still remain infallible in the only sense in which he has been declared to be so.' ('The Irish Monthly,' vol. II., No. 10, 1874.) † This great authority goes on to disclaim any desire to minimize, but there is, I hope, no real difference between us here. He, I am sure, would sanction me in my repugnance to impose upon the faith of others more than what the church distinctly claims of them, and I should follow him in thinking it a more scriptural, Christian, dutiful, happy frame of mind, to be easy, than to be difficult, of belief. I have already spoken of that unathletic spirit, which starts with a grudging faith in the word of the church, and determines to hold nothing but what it is, as if by demonstration, compelled to believe. To be a true Catholic a man must have a generous loyalty toward ecclesiastical authority, and accept what is taught him with what is called the *pietas fidei*, and only such a tone of mind has a claim, and it certainly has a claim, to be met and to be handled with a wise and gentle *minimism*. Still the fact remains, that there has been of late years a fierce and intolerant temper abroad, which scorns and virtually tramples on the little ones of Christ. — I end with an extract from the pastoral of the Swiss bishops, a pastoral which has received the pope's approbation: 'It in no way depends upon the caprice of the

* The pope speaks more forcibly still in an earlier allocution. After mentioning invincible ignorance, he adds: "Quis tantum sibi arroget, ut hujusmodi ignorantie designare limites queat, juxta populorum, regionum, ingeniorum, alliarumque rerum tam multarum rationem et varietatem!" (Dec. 9, 1844.)

† Vide Fessler '30; and I believe Father Perrone says the same

habit the centre of Russia; 2, the Lettes or Lithuanians; 3, the Finns, who inhabit the north of Russia and Siberia; 4, the Germans of Livonia, Esthonia and Courland; 5, the Turks, who inhabit the southeast; 6, the Caucasians; 7, the Jews; 8, the Mongols, or Tartars; 9, the Mandchous of Siberia.*—I. *Social and Political Condition.*

pope, or upon his good pleasure, to make such and such a doctrine the object of a dogmatic definition. He is tied up and limited to the divine revelation, and to the truths which that revelation contains. He is tied up and limited by the creeds already in existence, and by the preceding definitions of the church. He is tied up and limited by the divine law, and by the constitution of the church. Lastly, he is tied up and limited by that doctrine, divinely revealed, which affirms that alongside religious society there is civil society, that alongside the ecclesiastical hierarchy, there is the power of temporal magistrates, invested in their own domain with a full sovereignty, and to whom we owe obedience in conscience, and respect in all things morally permitted, and belonging to the domain of civil society."—JOHN HENRY CARDINAL NEWMAN.

* The Russian empire comprises one-seventh of the territorial part of the globe, and about one twenty-sixth part of its entire surface. Owing to the vast extent of the empire, and its social condition, no surveys that can lay claim to accuracy have yet been made, and the area is obtained in greater part from estimates. There has been, likewise, no general census of the population, but various enumerations, made by the government during the years 1870 to 1873, mainly undertaken for purposes of finance or war, serve to furnish an approximately correct return of the numbers of the people. The density of population of European Russia is considerably greater than that of the Asiatic part of the empire. Russia in Europe has, on the average, thirty-four individuals to the square mile, while Asiatic Russia has barely more than a single individual to the square mile.—By articles forty-two and fifty-nine of the treaty of Berlin, signed July 13, 1878, Russia added to its vast territories the province of Bessarabia, taken from Roumania, together with the districts of Ardahan, Kars and Batoum, in Asia Minor, detached from the Turkish empire. Bessarabia has an estimated area of 3,720 English square miles, with a population of 140,000. According to the most reliable estimates, the newly acquired district in Asia Minor, formed, provisionally, into the government of Kars, embraces an area of 5,670 English square miles, with a total population of 600,644, comprising 417,602 Mohammedans and 183,042 Christians.—In 1881 most of Kuldja was restored to China, leaving Russia only 5,500 square miles and 26,000 inhabitants. To the above have also to be added the trans-Caspian territory, 123,250 square miles, 275,000 inhabitants, and Fergana, 26,040 square miles, 800,000 inhabitants. More recent enumerations give the population of Poland (1872) as 6,528,017; Finland (1879), 2,028,021; Caucasus (1873-6, inclusive of additions), 5,391,744; Siberia (1873), 3,440,362; and the whole of Central Asia, 4,401,876.—According to official returns of births and deaths for the years 1867-70, the population progresses at an average increase of 781,000 a year; a percentage which, supposing the inhabitants always to multiply at the same rate, would double the population in fifty-eight years.—The vast majority of the population of Russia are devoted to agricultural occupations, and dwell in villages, spread thinly over the vast area of the empire. According to local enumerations made at various periods, there are but seventeen towns containing more than 50,000 inhabitants. The list is as follows:

St. Petersburg (1881)	861,900	Kasan	78,602
Moscow (1871)	611,970	Kief (1874)	127,251
Warsaw (1878)	386,703	Nicolaief (1875)	82,805
Odessa (1873)	164,819	Tiflis (1876)	104,024
Kichinef (Bessarabia) 103,998		Kharkof (1879)	101,175
Riga (1881)	160,000	Tula	58,150
Saratof	98,218	Berditchef	52,786
Tashkend (1879)	81,961	Samara	51,947
Vilna	79,265		

In the larger towns a considerable proportion of the trading and industrial population are either aliens, or of foreign ex-

The sovereign, as his title of emperor and autocrat of all the Russias indicates, is invested with a power without limit or control; not only is he supreme chief and legislator, but it is even only under his authority and by virtue of his delegation that the synod, charged with governing the national church, acts. In a vast country composed, like Russia, of heterogeneous elements more or less behind the times, this autocracy serves to give them the necessary cohesion, and, when it falls to a sovereign who is animated by love of the public welfare, may accelerate the progress of civilization; thus it allowed the emperor Alexander II. to bring about reforms and to found new institutions which are destined to be the glory of his reign.—The monarchy is hereditary in the males, in the order of primogeniture. When there is no male branch, the princess who is the nearest relation of the last sovereign, succeeds him; the others are called to the throne only in case she leaves no direct heir. (Family law of 1797.) The emperor has the power to provide for the case of his leaving, at his death, an heir who is a minor, and to appoint a regent and a guardian. If he dies without having taken this measure, the regency devolves on the empress dowager or on the nearest agnate, to the exclusion of the father-in-law or mother-in-law of the new sovereign, and the regent has to form a council of regency of six members. The sovereign attains his majority at sixteen years of age; the other princes of the family at eighteen. Their wives are not qualified to share their rank, and the children which they bear can not be called to the throne, unless they belong to a sovereign house and profess the orthodox Greek religion.—The dotation of the crown is fixed by the emperor. It consists of imperial appanages and of a civil list.—*Nobility.* There is a nobility of birth and a nobility of service. Peter the Great subordinated the first to the second, and classed by ranks the civil and military functions. There are fourteen classes, as follows: 1, chancellor of the empire, field marshal, admiral general, privy councilor of the first class; 2,

traction.—The population of Russia proper is composed of three groups: Great Russians, or Veliko-Russ; Little Russians, or Malo-Russ; and White Russians, or Bélo-Russ. The first, numbering 35,000,000, all belonging to the Slavonian race, occupy the central provinces; the second, numbering about 11,000,000, compose the bulk of the population of Poltava, Kharkof, Chernigof, Kief, Volhynia, Podolsk, Ekaterinoslaf, and the Taurida; the White Russians, about 3,000,000, inhabit the provinces of Moulief, Minsk, Vitiebsk and Grodno. Besides these three groups of Russians proper, there is a great variety of national elements in the general population of the Russian empire.—Since the emancipation act of 1861 the cultivable lands of Russia proper in Europe have been approximately distributed as follows:

	Per cent.
Town lands, about	0.4
Crown lands, about	34.6
Lands attached to mines	3.5
Lands held by peasants: 1, crown peasants, 15.6 per cent.	20.6
Lands held by peasants: 2, former serfs, 5.0 "	
Lands held by landed gentry and nobility	19.7
Lands held by other proprietors, or not surveyed	20.4

It will be seen, that about one-third of the cultivable land in Russia proper is held by the state; one-fifth by landed proprietors; and one-fifth by the peasantry.—F. M.

general-in-chief, admiral, privy councilor of the second class; 3, lieutenant general, vice-admiral, privy councilor; 4, major general, rear admiral, councilor of state of the first class; 5, councilor of state. The next four classes include the colonels, lieutenant colonels, majors, staff captains, and some civil functionaries. In the last five are ranged the inferior officers, with certain functionaries. Nobility is hereditary in the first five classes, and personal only in the next four; the functionaries of the last five classes become personal nobles by advancement. Every noble owes a personal service to the state, under penalty of forfeiture of nobility, if three generations pass without this condition being fulfilled. The titles are those of prince, count and baron. There were, in 1867, 591,266 hereditary nobles and 327,764 personal nobles. By a manifesto of April 2, 1801, no noble can, without a regular trial and sentence, be deprived of nobility, honor, life or property. A noble can be tried only by a tribunal composed of nobles, and if the sentence is loss of nobility, honor or life, it must be confirmed by the senate and by the sovereign. The nobles are exempted from all corporal punishment, if only non-commissioned officers or soldiers. If they are deprived of their property, it goes to the nearest heir. Their houses are exempt from all quartering of soldiers. In each government the nobles possessing at least 300 *déciatines* of land (328 hectares) or a house worth 15,000 roubles (60,000 francs), or else who are included in the first five classes, have the right to assemble in the chief town every three years. Those who do not fulfill these conditions, meet in each district to elect delegates to the assembly of the government. This assembly elects a marshal and district marshals, charged with watching over the interests of the nobility and representing it at the central administration. The same assembly elects the judges and assessors of the tribunals, as well as the chief of police of each district; it attends to the distribution of the taxes and deliberates as to the interests of the province. It also exercises a disciplinary power over the members of the nobility; it examines the titles, judges the nobles who are accused of dissipating their fortune, and places them under guardianship if occasion requires. The nominations of functionaries are submitted to the approval of the emperor or of the governor according to the importance of the function. — *Bourgeoisie*. The bourgeoisie, established by a statute of April 24, 1785, is divided into six classes: 1, owners of immovable property; 2, members of guilds; 3, domiciled foreign merchants; 4, notable bourgeois (see below); 5, artisans, members of trade corporations; 6, small tradesmen, small manufacturers, lesser employés, etc. A manifesto of 1832 established a *notable bourgeoisie*, for life or hereditary. The first can be conferred upon former students of universities who have obtained a certificate of having made good progress in studies, and upon artisans furnished with a diploma from the academy of fine arts. The hereditary bourgeoisie may be obtained

by merchants fulfilling certain conditions, doctors of a Russian university, pupils of the academy of fine arts furnished with a diploma, and foreign savants, artists, merchants or workers of industry after ten years' residence in the country. The sons of personal nobles are notable bourgeois by right of birth. The senate examines the titles and delivers the diplomas. It may confer notable bourgeoisie for life upon foreign savants, artists, merchants or manufacturers. — *Peasants*. The inhabitants of the rural districts form nine-tenths of the total population; they are distributed through about 800,000 villages or hamlets, and are subject to a poll tax. In 1861, when serfdom was abolished, the peasants of the domains of the state and of the imperial appanages, to the number of 25,000,000, were already almost all freed, and there were 23,000,000 others attached to the soil. These latter owed their respective lords three days' labor a week; the other four days were at their disposal to cultivate a lot of land the products of which were given to them to supply the wants of themselves and their families. They could not change their residence without permission from their lord. The latter could sell them or mortgage them for so much per head, with the piece of land to which they were attached: he had over them the authority of a father; he could impose a profession upon them, permit or forbid them to marry, and inflict corporal punishments, death excepted, upon them. The serfs of a domain formed, under the guardianship of the lord, a rural commune, administered by an assembly composed of heads of families and by a chief called *staroste*, whom they elected from among their own number. It was to the commune that the land was granted by the lord, and it was charged with dividing it among the families according to the number of able-bodied workmen they contained, and, consequently, according to the amount of days' labor they could furnish. Where the land did not furnish enough to support the peasants, the lord rented it and gave up his right to enforced labor. Besides the serfs employed in the cultivation of the land, there were those who were attached, as domestics, to the service of the lord, and others whom he could authorize, in consideration of a sum paid, called *obrok*, to carry on some trade, either in the domain or elsewhere. In return for the revenue which the work of the serfs procured for him, the lord was bound to protect them and to help them in case of need; he was subject, therefore, to the expense and trouble of administration which this obligation involved, and he was responsible for the payment of the taxes. — The number of owners of serfs was estimated at 103,195, of whom 3,700 possessed no land. (See the statistical work of M. Troïnzki.) The 103,195 owners were divided as follows: 42,978 possessing from 1 to 21 male serfs, in all, 339,586 serfs; 36,194, from 21 to 100 male serfs, 1,697,914; 20,165, from 101 to 500 male serfs, 3,974,629; 2,462, from 501 to 1,000 male serfs, 1,597,691; 1,396, possessing 1,001 male serfs and more; in

all, 3,074,033. Thus, among the small proprietors, the one who possessed twenty serfs derived from them, at eight roubles per head, only 640 francs a year, to which were added the products of the land. A large proprietor received, for 1,000 serfs, 32,000 francs. The number of those who possessed from 20,000 to 50,000 was very small. In 1850, 44,166 estates, with 7,107,184 serfs, were mortgaged in the banks for 425,503,061 roubles, 1,500,000,000 francs. (See the work of M. Schnitzler.)—The law, in freeing the serfs, regulated: 1, their rights and those of the former proprietors; 2, the means of existence of the freedmen; 3, the conditions by which they could become proprietors of the lands which they cultivated. The lords were freed from their duties of guardianship. They preserved their rights of property in the lands which belonged to them, but on condition of allowing the peasants, by the payment of a sum fixed by the law, to enjoy the pieces of ground which they occupied and also a quantity of land which varied according to its productive quality. These lands were intended to furnish the peasants with a living, and to place them in a position to fulfill the obligations which were imposed upon them for their redemption from serfdom.—It was not to the peasants but to the commune that these lands were granted. They belong to it in perpetuity, to be exploited in common according to immemorial custom or in separate lots. This second method is only the exception; it can be substituted for exploitation in common only with the consent of two-thirds of the inhabitants of the commune and of the proprietor.—The commune is charged with indemnifying the proprietor either with labor or in money, as the parties choose; moreover, it is responsible to the treasury for the payment of the taxes. From this double responsibility proceeds the right of using force against peasants who do not fulfill their obligations. Besides the ordinary proceedings, the commune has the right to hire out a man in arrears or some one of his family for outside work, in the same district or in a neighboring district, and the wages paid for his work must be given to the commune. Those who do not fulfill their obligations, through obstinacy, idleness, or in consequence of intemperance, can be hired out in other governments, provided the decision of the communal assembly be confirmed by the justice of the peace. In case the land is enjoyed in lots, the responsibility is personal, and may lead to expulsion from the commune and the sale of the lots granted. When it is arranged that the indemnity due the proprietor is to be paid in forced labor, such labor is limited to two days a week for both men and women. The dues are eight to twelve roubles for each grantee. The peasants who were subjected to the *corvée* have the right to pay money instead, without the proprietor being able to constrain them thereto.—The pieces of ground occupied by the peasants must be granted to them in full ownership as soon as they demand it; the price of sale is fixed by law. As for the lands the

enjoyment of which had to be allowed them, the proprietors are at liberty to consent to the sale, or to refuse it and to hold to the stipulations fixing the *corvée* or the dues. When the sale has taken place, and the purchasers, whether peasants or the commune, can not pay the price, the government intervenes; it capitalizes the dues at 6 per cent., and gives the sum to the proprietor, half in special certificates, issued in the name of the latter at 5½ per cent., and not negotiable at the Bourse, and half in bonds payable to the bearer at 5 per cent., and negotiable like the Russian public stocks; 20 per cent. of the capital is retained to cover the expenses of collection, arrears and worthless debts. If the sale is made with the consent of the peasants, the 20 per cent. must be paid by them; in the contrary case, it is charged to the proprietor; and, if the state institutions of credit hold a mortgage upon the property, the sum is taken out of the price of sale. The purchasers discharge their indebtedness to the state by paying, for forty-nine years, an annuity of 6 per cent., of which 5 represents the interest and 1 the amortization. As long as the peasants are indebted either to the proprietor, if they have treated directly with him, or to the state, if it has paid for them the price of redemption, they can not leave the commune without the consent of the proprietor and of the commune, and without justifying by depositing in the communal treasury a sum equal to the dues or fine capitalized at 6 per cent.—According to the official returns, the acts and transactions of redemption amounted to 79,599 on Jan. 1, 1873; 21,201 were concluded privately. The peasants who had become proprietors of the lands they cultivated, numbered 6,858,334, the extent of these lands was 21,120,152 *déciatines* (23,088,550 hectares), and the sums lent by the state amounted to 630,467,115 roubles. Of the sum of 41,222,629 roubles, which the peasants had to pay in 1872, there remained in arrears only 316,604 roubles. As in certain districts the amount fixed for reimbursement evidently exceeded the resources of the debtors, the government reduced their annual payments. The serfs called *dvororyé*, attached to the service of the lords, or authorized by them to practice a trade in consideration of the payment of the *obrok*, were freed at the expiration of two years.—The government, wishing to be informed of the changes produced by the emancipation, charged a commission to institute an inquiry, the results of which were published in 1873. The condition of the peasants has sensibly improved, both materially and morally, in the northwest, with the exception of the marshy districts of Pinsk and the banks of the Pripet. In the south, well-being increased without any advance in morality. No improvement has been produced in Little Russia. In the rest of the empire, the increase of well-being is scarcely apparent, and the intellectual and moral faculties are as little developed as before. Finally, in Great Russia the consumption of brandy has considerably increased. Exploitation in common continues to prevail; the

peasant is bound to the commune as long as he has not paid the price of redemption, and, in the meanwhile, he has scarcely effected anything but to exchange the guardianship of the lord for that of the commune. Now it would appear that there was little to boast of in the communal administration and in the administration of justice. Their burdens have increased; the communes expending much more than formerly, their taxes have reached (1874) a total of 30,000,000 roubles; the provincial taxes have increased in a similar manner; the state taxes have not diminished, and both weigh almost exclusively upon the peasants. Therefore the commission recommended new reforms to bring emancipation to a good result. (For the effects produced upon agriculture and upon the condition of the proprietors, see IX. *Resources*.) — In Poland the serfs numbered about 3,700,000. By virtue of four ukases of 1864, they acquired the ownership of the lands and buildings of which they had the usufruct, in consideration of *corvées*, prestations and dues of all kinds. All these charges, those which were arbitrary or exceptional being deducted, were converted into a land tax, and they served as a basis for the indemnity which was paid to the proprietors in bonds bearing 4 per cent. interest, and redeemable by an annual drawing by lot. — II. *Administration*. Below the emperor, to whom belongs the plenitude of executive power, the highest administrative authority is the council of the empire. The matters within its jurisdiction are the discussion and drawing up of legislative acts, the interpretation of the laws in case the tribunals do not catch the true sense of them, the establishment of the budget, new measures in the administration of the finances, the examination of the annual accounts rendered by the ministers, the solution of litigious questions relative to the administration or expropriation for public utility, finally, the political affairs upon which the council is consulted by the emperor. The ministers have a seat in the council, by right; the other members are unlimited as to number; the emperor chooses them as he pleases, and gives the presidency to one of the first personages of the state. The president is assisted by a secretary of the empire, an intermediary between the emperor and the council, and charged with the preparatory labors and the recording of the deliberations, copying the records of them, etc. — Another great body of state is the directing senate, which was established in 1718, and reorganized in 1802. It is at once a supreme court of appeal, judging in the last resort, with the exception of appeals to the emperor, in all civil and criminal matters, a supreme administrative tribunal, and a high political court in special cases. It is charged, besides, with seeing to the execution of the laws; it has the right to demand account of their management of all the functionaries, including the ministers; it watches over the collection of the taxes and the employment of public funds; it has the care of the archives; it appoints to a great number of offices; it orders all measures necessary to the

maintenance of order, subject to the right, which belongs to the emperor, of annulling these decisions; finally, it is charged with promulgating the acts emanating from the emperor. — The senate is divided into ten departments, of which five sit at St. Petersburg, three at Moscow, and two at Warsaw. In connection with each department there is a high imperial procurator, who has the right of control over the deliberations, and whose signature is necessary for a judgment to be executive. The senators are appointed by the emperor. — The ministries date only from 1802. They are twelve in number, namely: 1, the ministry of the imperial court, which includes the imperial orders, the appanages, the revenues of the emperor, the ceremonial, the imperial theatres and other establishments dependent on the crown; 2, the minister of war; 3, of foreign affairs; 4, of the navy; 5, of the interior; 6, of public instruction; 7, of postoffices and telegraphs; 8, of the finances, comprising the mines and salt works, the metallurgic factories, manufactures and domestic commerce; 9, of the domains of the state, comprising the inspection of farming, the direction of the agricultural schools and of the model farms, and the forests; 10, of justice, including the corps of surveyors, the schools of surveying, and the law school; 11, of the means of communication and public edifices; 12, of the control charged with the examination of civil and military accounts. The emperor has his own chancellery, which is charged, among other duties, with the publication of the laws, with political police, and the establishments of charity and instruction placed under the direction of the empress. To the same chancellery is attached the commission of requests or petitions. — *Territorial Administration*. Poland and the grand duchy of Finland each form a separate government. In the first, affairs are directed by a lieutenant of the emperor, assisted by a council of government. Under his presidency sits a deliberative assembly, called a council of state, and composed of fifteen permanent members and seven temporary members, appointed by the emperor. Finland is administered by a governor general, assisted by a senate, the members of which are appointed by the emperor. The legislative power belongs to the diet, composed of deputies of the nobility, of the Lutheran clergy, of the inhabitants of cities, and of peasants. The presidency belongs to the president of the nobility, who is appointed by the emperor. The decisions have the force of law only with the imperial approval. The rest of the empire is divided into fifty-eight governments, three city territories (Odessa, Taganrog and Kertch-Jénikalé), two countries (of the Cossacks of the Don and of the Tchernomorje), eleven oblasthes (provinces not as yet regularly organized), and three districts in the country of the Kirghises. — The six governments of the region of the Caucasus are placed under the direction of a lieutenant of the emperor. — Ten governors general, established at St. Petersburg, Moscow, Odessa, Kief, Riga,

Wilna, Orenburg, Tobolsk and Irkoutsk, have under their orders the civil and military heads of the governments comprised in their circumscription. Each civil governor is assisted by a council composed of three titular members and of one or more assessors. With this council, which is purely consultative, sit a government attorney and two deputies, charged with defending the interests of the crown and watching over the execution of the laws. At St. Petersburg the city and the suburbs are separated, since 1873, from the provincial government, and fall within the jurisdiction of a prefecture. — The governments are subdivided into districts, which are administered by a court composed of a president and two assessors elected by the nobility, of two other assessors elected by the inhabitants of the country, and of a substitute of the procurator of the government. This court serves, besides, as a tribunal of the first resort for the district. — Each government has, as a deliberating body, the assembly of the nobility, of which mention was made above, and provincial, government and district assemblies, created by a law of Jan. 13, 1864. Each government assembly is composed of delegates of the district assemblies. Moreover, in the governments which embrace imperial appanages, or domains of the state, the chiefs of the councils of administration of these appanages and domains are members by right of the provincial assemblies. The members of each district assembly are elected by three categories of electors, which assemble and act separately: these are, 1, the proprietors (nobles or not); 2, the inhabitants of cities; and 3, the inhabitants of rural communes. They must all be fully twenty-five years of age. To be an elector as proprietor, it is necessary to possess, outside of the cities, from 200 to 800 *déciatines* of land, or of immovable property, having at least a value of 1,500 roubles, or to carry on an industrial establishment doing a business of at least 6,000 roubles yearly, or to be a permanent holder of determinate church property. The electors may be represented by mandatories of their choice, but the holders of church property are always obliged to be represented. Small proprietors, who have not the required number of *déciatines*, can join together, so as to reach (two or more uniting) the electoral property qualification, and appoint a mandatory to represent them. The inhabitants of cities must, to be electors, produce a merchant's license, or possess an industrial establishment doing an annual business of at least 6,000 roubles, or immovable property worth from 500 to 3,000 roubles, according to the amount of the city's population. As for the rural communes, their representatives are appointed by electors, which the district assembly itself chooses. Minors, absentees and women can delegate their right to vote to a mandatory. The members of the assemblies are elected for three years, and receive no remuneration. The government assemblies come together once a year for twenty days, and the district assemblies for ten days. Each of these assemblies is presided

over by the marshal of the nobility. Their duties comprise: 1, the administration of the property, capital and revenues of the province; 2, the construction and maintenance of buildings belonging to the province, and of roads which are in its charge; 3, measures useful for the welfare of the population; 4, measures of public assistance, the administration of charitable institutions and the construction of churches; 5, the administration of mutual insurance companies established in the province; 6, measures proper to develop commerce and industry therein; 7, measures concerning popular instruction, public health and prisons; 8, measures to be taken against epidemics and the ravages of noxious animals; 9, the distribution of certain state taxes, the voting and distribution of local taxes, and the application of the product of these taxes to the expenses of the government and the district; 10, the choice of members of the permanent executive commission, which sits in the absence of the assembly. The government commission is composed of a president, and of two to six members, elected for three years, who receive a salary fixed by the assembly. The district commissions are composed of two or three members. The presidents must be confirmed by the minister of the interior. This organization is not yet applied to all the governments; in some of them the anterior system is retained for various reasons. — *Municipal Administration.* Each city has its municipal body, composed of the *golova* (mayor), deputies, and a deliberative assembly. All the members of the municipal body are elected by an assembly, composed: 1, of owners of immovable property paying a tax to the city; 2, of proprietors and directors of commercial and industrial establishments; 3, of all persons domiciled in the city for at least two years, and able to prove that they pay a tax to the city. The duties of the municipal body include, besides the management of municipal affairs, the maintenance of order, the taking of measures of public safety and health, making regulations concerning the ports, markets, exchanges and institutions of credit; the organization of charitable establishments and hospitals, the foundation of libraries, museums and theatres, and measures suited to develop public instruction, commerce and local industry. A council of six members, elected in the municipal body, performs the functions of a police court, of a chamber of commerce and a tribunal of commerce, taking cognizance of litigation among the inhabitants. — *Rural Communes.* The rural commune is, as before the emancipation of the serfs, an association of peasants exploiting a fixed territory. The great seigniorial and private estates are outside of the communes and within the jurisdiction of the provincial administration. The cities are likewise classed apart. The heads of families form an assembly which elects the *staroste*, chief of the commune, as well as his various functionaries, the treasurer and collector of taxes, the trustee of the school or schools, the delegate to the reserve warehouses of wheat, the hospital inspect-

or, the rural guard, the forest guard, and the scribe. The assembly draws up the budget of the commune, fixes the taxes necessary for the payment of expenses, and regulates the apportionment of the taxes due the state. If the enjoyment of the land is in common, as is most frequently the case, the assembly divides the lots among the families; if it is in individual lots, the division is limited to the lots which are not in process of cultivation. The assembly gives their dismissal to peasants who wish to live elsewhere, on their fulfilling the prescribed conditions; it decides as to the admission and settlement of new heads of families; it gives guardianship to minors, and authorizes family divisions; finally, it sits as a police court and deals out penalties, from the simplest fine to the expulsion of peasants judged "harmful or vicious" from the commune. The decisions are made by the absolute majority, except in certain cases in which a two-thirds vote is required: for example, the substitution of individual enjoyment of the land for enjoyment in common, the renewing of the lots, and exclusion from the commune. In the rural communes in which the dues are paid in money and in labor, the inhabitants subject to the *obrok* and those subject to the *corvée* may form separate assemblies. — The *staroste* is the president of the assembly, and sees to the execution of its decisions. He takes all simple police measures; he pays into the proper hands the taxes and the payments for redemption; he controls the employment of the communal funds; finally, he is the representative of the commune in the *volosth* (see below), and with the authorities of the district, the province and the state. — Above the commune is the *volosth* or canton, which includes many communes belonging to the same district, or comprises only a single commune when the population is large enough. The administration of the *volosth* is composed of a chief called *starchina*, of two or three assistants, of an assembly of delegates of the communes (one to every ten families), and of a council in conjunction with the *starchina*, to assist him in his functions, and composed of his assistants, the *starostes* of the communes of the *volosth*, and collectors of the taxes. The assembly comes together in the most central or the most important village; it regulates the common interests of the *volosth*, decrees the measures of public assistance, controls the accounts, and fixes the taxes and the dues. The duties of the *starchina* are similar to those of the *staroste*, but of a higher degree. He decides, in the last resort, on cases of simple offenses against the police regulations. To be eligible to the office of *starchina*, *staroste*, assistant, collector of taxes, or as a member of the *council of regency*, it is necessary to be at least twenty-five years of age. The term of office is three years; office can not be refused unless one can prove that he is sixty years old or has serious infirmities, or unless he has already filled it. Substitutes are appointed to avoid the occurrence of vacancies. — III. *Religion*. The population of Russia in Europe, in 1874, was divided, as regards religion, as follows: Orthodox

Greeks, 58,169,019; Dissenters (*raskolniks*), 926,631. United Greeks, 229,260; Gregorian Armenians, 37,136; Roman Catholics, 7,209,464; Protestants, 2,565,354; Israelites, 2,612,019; Mohammedans, 2,359,372; Pagans, 255,975. The inhabitants of the grand duchy of Finland (1,843,253) are nearly all Lutherans. For Asia, the almanac of the empire gives the following figures: Orthodox Greeks, 4,936,917; Dissenters (*raskolniks*), 166,985; Gregorian Armenians, 560,684; Roman Catholics, 54,106; Protestants, 16,337; Israelites, 34,857; Mohammedans, 3,267,650; Pagans, Guebres, Shamanists, 295,734. The orthodox Greek religion is the religion of the state; but other creeds, as well as the Pagans, enjoy an equal liberty. — The national church is governed by a college called the very holy synod, under the authority of the emperor and by virtue of his delegation. Peter the Great established this college in 1721, and at the same time sanctioned the laws which govern the church. The synod is composed of titular members and of assistant members; the first, to the number of eight or nine, are the principal prelates of the empire, metropolitans, archbishops or archimandrites; the second are prelates who leave in turn their dioceses or monasteries to attend the sessions, as well as three laymen, one of whom is a high agent invested with powers by the emperor, and the two others functionaries by whom he is assisted. The first metropolitans and the exarch of Groussia are members by right and for life; the others are appointed by the emperor for a certain time. The acts emanating from the holy synod are valid only on condition of their receiving the imperial approval. The candidates for ecclesiastical offices are presented by the holy synod for appointment by the emperor, who can displace or remove a priest whom he judges unworthy of his office. But he does not decide in matters of faith; in case of disagreement upon a question of doctrine, he refers the matter either to the holy synod or to a special synod. — The dioceses number fifty-two; they comprised, in 1872, 38,809 churches and 3,534 chapels. In each diocese is a consistory, subordinate to the holy synod. These consistories preside over the acts of the civil state, watch over the exercise of worship, the police of the churches, the conduct of members of the clergy, and decide in all matters ecclesiastical. — The metropolitans receive 3,000 roubles at most, the archbishops 2,500, the bishops 2,000, and the coadjutors 500. The salary of the curates does not reach 100 roubles; but they receive fees; in the country, they have a house, from twenty to forty *décutines* of land, and wood is furnished them gratuitously. The churches receive legacies and possess property in most of the dioceses. — The clergy is divided into secular or white, and into regular or black. The latter are forbidden to marry; they live in monasteries, and from among them the prelates are chosen. The nobles, therefore, who embrace an ecclesiastical career, enter the ranks of the black clergy. The white clergy are recruited almost entirely from among the sons of *popcs*, or

curates; they must be married before ordination, and they generally take their wives from the families of priests, so that this clergy forms a veritable caste. The secular clergy was composed, in 1872, of 1,160 archpriests, 36,440 priests, 13,250 deacons, and 56,886 curates. The convents numbered 532, of which 383 were for men and 149 for women. They contained 5,810 monks and 3,280 nuns, with 5,617 lay brothers and 11,258 lay sisters. Each monk receives an annual pension of from twelve to fifteen roubles; the nuns are not paid anything except in exceptional cases; most of them live on alms and the product of their labor. — Missionaries are established in Siberia and in the region of the Volga, to labor for the conversion of the Pagans and Mohammedans. (See CHURCH, GREEK.)* — IV. *Justice*. The organization and administration of justice commenced, during the reign of Nicholas I., to receive improvements, which were continued and completed during the reign of Alexander II. In 1833 Nicholas I. had collected, arranged and published, under the name of *svod*, 36,000 civil and criminal laws made by his predecessors; he promulgated in 1845 a penal code, and in 1848 a criminal code. Alexander II. regulated the judicial organization and criminal and civil practice. The judicial power is entirely separate from the other two; it is exercised by the tribunals of the *volosth*, the police courts of the cities, the justices of the peace, the assemblies of justices of the peace, the district tribunals, the courts of justice, and the senate in its quality of supreme court of appeal. The tribunals of the *volosth* are composed, according to the population, of from four to

twelve judges, elected by the assembly and taken from that body. Their functions are gratuitous. They take cognizance of controversies among peasants, unless another person is interested therein; in this latter case the affair is referred to the ordinary court. Judgment is not given until after an effort at conciliation has been made; the decisions are then final and without appeal. Moreover, the peasants are authorized, when there is no crime or misdemeanor in question, and when the interests of minors are not engaged in a controversy, to refer it to a third person. This arbitration is executory, after it has been recorded in a register deposited with the *council of regency* of the *volosth*, and it can not be appealed from. — The justices of the peace exercise three orders of functions: 1, a power of conciliation; 2, extra-judicial functions, such as the placing and removal of seals, etc; 3, judicial functions. They take cognizance of personal matters and cases involving personal property, without appeal, up to the value of thirty roubles, and with the privilege of appeal up to the value of fifty roubles. In real estate cases they have no jurisdiction; they can only pronounce the re-establishment in their rights of proprietors dispossessed six months before at the most. In criminal cases the limit of their jurisdiction is determined by the punishment to be inflicted; reprimand, remonstrance, a fine of thirty roubles at the most, detention for three months, or imprisonment for a year at most. An appeal is not allowed when the penalty does not exceed three days' detention or five roubles' fine. Appeals are brought before the assemblies of justices of the peace, except recourse is had to the court of cassation. — Each district tribunal is divided into two sections, one civil and the other criminal. The proceedings are public. When the penalty inflicted carries with it loss of civil rights, and there is no question of a crime against the faith or against the state, nor of a press offense, the tribunal is assisted by juries selected from among persons of all classes, and their verdict is subject only to be reversed by the court of cassation. Press matters are brought before the court of justice of the government. In case of a crime against the state, the court of justice that tries it is assisted by the marshal of the nobility of the government, by a marshal of the district, and by a *golova* or *staroste*. — Civil procedure is oral. The assistance of advocates or barristers, optional before the justices of the peace, is obligatory before the superior courts. The advocates or barristers are subject to the disciplinary power of a syndical chamber. — Connected with each tribunal and each court there is an imperial attorney, with one or more substitutes; and to each department of the court of appeals there is attached a superior procurator. — In 1863, Alexander II. modified the system of corporal and correctional punishments, and abolished the use of the knout, as well as that of rods or sticks. The punishment of the *plète*, a whip composed of several twisted straps, remains. The death penalty is reserved for military justice and for cases of an

* The prohibition of celibacy in the Greek church is carried to such an extent that no priest can perform any spiritual function before he is married, nor after he becomes a widower; and as, by the rules of the church, he is not allowed to remarry, the death of his wife occasions the cessation of his clerical functions. A priest may, however, on the death of his wife, enter into a convent, and enjoy the privilege of becoming eligible to be a dignitary of the church. There are in Russia nearly 600 cathedrals and about 29,000 churches attached to the established faith, the latter employing (1883) about 70,000 secular or parochial clergymen. The Russian church formerly possessed immense wealth, but it was partly confiscated by Peter I. and partly by Catherine II. The latter sovereign appropriated the whole movable property of the church for the use of the state, assigning, in compensation, pensions to the chief ecclesiastical dignitaries. But, with the exception of a few benefices in St. Petersburg, Moscow, and other principal cities, the stipends of the clergy, even when increased by the offerings of the people, and by the fees on occasions of births, marriages and funerals, are scarcely adequate to provide for their subsistence. The total number of the established clergy, of all ranks and orders, is stated (1883) at 254,000. — No member of the Russo-Greek church is permitted to renounce his creed; and when a marriage takes place between one of its members and a person belonging to another faith, the children must all be brought up in the established church. — The number of members of the principal creeds in European Russia was returned as below for 1879:

Orthodox Greek Catholics	63,885,000
United Greeks and Armenians	55,000
Roman Catholics	8,300,000
Protestants	2,950,000
Jews	3,000,000
Mohammedans	2,600,000
Pagans	26,000

—F. M.

attempt against the state or against the person of the sovereign. But condemnation to forced labor in the mines is fully equivalent to the last punishment, and simple transportation to Siberia, which is always preceded by corporal punishment, is extremely rigorous. Only the women and the sick are transported in wagons or by train; the men have to make the journey on foot, loaded down with chains. Some are condemned to temporary deportation to a fortress for a year at least, others to transportation to a penal colony, and others to transportation with forced labor, temporary or perpetual. Forced labor "in perpetuity" can not exceed, except in case of a second offense, twenty years; after this period the condemned is set at liberty, and placed, if he can be utilized, among the colonists of Siberia. The number of exiles in 1874 was about 100,000. — V. *Public Instruction.* Public instruction commenced only in 1863 to be organized according to a studied plan and one comprising the different kinds of instruction. There are now nine universities established: at St. Petersburg, Moscow, Kharkof, Kasan, Dorpat, Kief, Warsaw, Odessa and Helsingfors. There were about 6,800 students and 600 free attendants on the lectures in 1874. The best attended courses are law and medicine. 2,400 students are admitted gratuitously. Each university is administered by a rector and a council over which he presides. The rector and the members of the council are elected for four years by the professors. There are, besides, the imperial institute of history and philosophy, established at St. Petersburg in 1867; the Lazareff institute, for instruction in the oriental languages; the two academies of agriculture and forestry of Warsaw and Pétrovskóe; a law school; a school of engineering; three medical schools, at St. Petersburg, Moscow and Wilna; three veterinary schools, at Kharkof, Dorpat and Warsaw; and an institute of technology at St. Petersburg. — In 1872 the state established commercial and industrial schools. There were, the same year, 123 gymnasia and 23 progymnasia, in which Latin and Greek were taught; the number of pupils was 42,791. The expenses amounted to 4,467,644 roubles, of which 3,215,887 were charged to the state, 513,534 to the provinces and cities, and 738,223 to the pupils. For girls, there were 54 gymnasia, 108 progymnasia, and 24 other schools. The pupils numbered 23,400. — Superior primary instruction is given in the district schools, and elementary primary instruction in the parish and village schools. The number of the latter is estimated at 24,000, and the number of pupils at 870,000. The state established, in 1872, ten normal primary schools, which brought the number of these institutions up to twenty-five. Grants are voted annually by the provincial assemblies for the establishment and maintenance of primary and normal schools, and to these grants are added the private contributions, which, from 1865 to 1871, amounted to the sum of 1,183,540 roubles. Every one feels that the emancipation of the serfs has rendered the spread

of primary instruction still more urgent. * — VI. *Army and Navy.* The organization of the army and of military service was reformed by a ukase of Jan. 1, 1874. "The service," it is said in this act, "weighed exclusively upon the bourgeois class and the peasants, and a large part of the Russian subjects were freed from a duty equally sacred to all. This system does not answer the military exigencies of the age. Contemporaneous events have proven that the strength of states does not consist alone in the numerical value of the army, but principally in its intellectual and moral qualities, which only reach their highest degree of development when the defense of the fatherland becomes the common work of the nation; when all, without distinction of rank and class, unite for the accomplishment of this sacred task." — In accordance with these principles, the emperor sanctioned a number of laws in 224 articles, the principal provisions of which are as follows: The male population, without distinction of class, shall be subject to military service. The paying of a sum of money to escape the service, and substitution, are hereby forbidden. The armed force of the empire shall be composed of a standing army and a militia; the latter shall be called into service only in extraordinary circumstances in time of war. The standing army shall consist: 1, of the active army, recruited by levies of men throughout all the empire; 2, of the reserve, which serves to complete the effective force of the troops, and is composed of men sent on leave till the end of their term of service; 3, of Cossack troops; 4, of troops formed of foreigners. The naval army is composed of the fleet and of its reserve; the number of men necessary to complete the effective force of the army and the fleet is fixed by law each year. — Entrance into the service is determined by a drawing of lots. The individuals whose numbers do not call them into the active service are enrolled in the militia. Each year the young men who have attained the age of twenty years by the first of January, are liable to service. For the marine

* Under the ministry of public instruction, Russia is divided into eleven educational districts, each presided over by a curator. The nine universities, in 1878, were attended by 6,350 students. In 1876 there were 24,456 primary schools, with 1,019,488 pupils; in 1877 there were sixty-eight normal schools, with 4,596 pupils; while the various secondary establishments—lyceums, gymnasiums, district schools, etc.—had 88,400 pupils. In the budget for the year 1882, a sum of 18,030,867 roubles was set down for public education. — The mass of the population of Russia is as yet without education. In 1860 only two out of every hundred recruits levied for the army were able to read and write, but the proportion had largely increased in 1870, when eleven out of every hundred were found to be possessed of these elements of knowledge. In the grand duchy of Finland, which has a system of public instruction separate from that of the rest of the empire, education is all but universal, the whole of the inhabitants being able at least to read, if not to write. The empire, Finland excepted, is divided, as above stated, into educational districts, each of which has a number of lycéums, at which the young men intended to fill civil offices are mostly instructed, besides gymnasiums, high schools and elementary schools, varying according to area and population. The eleven districts are those of St. Petersburg, Moscow, Kharkof, Kasan, Dorpat, Kief, Odessa, Wilna, Warsaw, Caucasus and Orenburg. — F. M.

the young men best fitted for that service are chosen. In the land army the term of service is fifteen years, six in active service and nine in the reserve. In the marine the term is ten years, seven of active service, and three in the reserve. In war time all the men remain in active service as long as the needs of the state demand it. The soldiers and marines can be sent into the reserve before their term of active service expires. The men of the reserve are subject to the ordinary laws, and enjoy the rights peculiar to their station. When they are called into active service, in case of war, their families are supported by the city or rural corporations, in which they are domiciled. Soldiers incapable of continuing in service and deprived of resources, receive from the treasury three roubles a month, or are placed in the hospitals. The militia comprises the men who do not form part of the standing army, but who are capable of bearing arms, from the age when they are liable to be conscripted up to forty years completed.— Besides the exemptions for bodily defects or for family reasons, reprieves are granted as follows: 1, two years, at the most, for individuals who personally manage their landed property or who direct the commercial or industrial establishments belonging to them, excepting dealers in strong liquors; 2, from two to seven years, to pupils of various ecclesiastical, collegiate or artistic establishments, divided into five classes. Moreover, the term of active service is reduced, according to circumstances, to four years, three years, and even to six months, and that of the reserve to eleven years, in favor of young men who have graduated at certain establishments of public instruction. Members of the Christian clergy only are completely exempt. Young men who have the rank of doctor of medicine or of licentiate in the veterinary art or in pharmacy, or who are pensioners of the academy of fine arts sent to a foreign land, or who are professors in establishments of public instruction, are enrolled at once in the reserve for fifteen years. There are also certain temporary exemptions in the fleet, and reductions of service from one to two years in certain cases.— Volunteers are received into the land army, on their proving: 1, that they are at least seventeen years of age; 2, that they are minors, and that their parents or guardians have consented to their enlistment; 3, that they have passed an examination in the complete course of studies in an establishment of public instruction, or a special examination determined by the ministers of war and of public instruction. They serve for three months, if they have passed the examination in an establishment of the first class; for six months, if in an establishment of the second class; and for two years, if they have only passed the special examination. At the expiration of these terms they are allowed, in time of peace, if they are not officers, to remain in the active service or to pass into the militia, where they are kept for nine years. Volunteers admitted into the guard or into the cavalry must support themselves at their own expense; in

the other troops they are supported by the state. In the navy the special examination is appropriate for that service; volunteers are held for two years' active service and five years in the reserve.— The annual contingent is divided among the provinces by the minister of war; then that of each province is divided among the subdivisions by a recruiting board. In each district or city a committee is charged with drawing up the lists of names, subject to the drawing by lot, with visiting the young men, and deciding upon their admission or exemption. The provincial assembly controls the operations, examines the complaints, and decides upon or refers them to superior authority.— The ukase does not apply to Cossacks and the other population whose military obligations are determined by special provisions.— The regular army presented, on a peace footing, Jan. 1, 1872, an effective force of 760,000 men, of which 28,000 were officers of all ranks, and 732,000 non-commissioned officers and soldiers, forming 82 battalions of infantry and 281 squadrons of cavalry. The 732,000 non-commissioned officers and soldiers were thus divided: infantry, 572,400; cavalry, 61,700; artillery, 80,500; engineer corps, 17,400. To these figures must be added 560,000 men on leave, who could be called for in case of war.— The naval forces were composed, in 1870, of 216 vessels of all classes, 194 of which were steamships, and 22 sailing vessels, carrying 1,464 pieces of ordnance. There were eight iron-clad frigates, three bomb-protected batteries, thirteen iron-clad batteries, five ships, twelve frigates, and fifteen corvettes. The effective force of the military marine was 75 admirals, vice-admirals and rear admirals, 2,340 officers, and 20,986 marines and sailors. There are two admiralties, one at St. Petersburg for the fleet of the Baltic, and one at Nicolaïef for the fleet of the Black sea. The principal dock yards are in these two cities, and at Okhta, Cronstadt, Kherson and Archangel. A great arsenal is established at Kolpina, near St. Petersburg.*— VII. *Finances.* Peter the Great, according to historians, had, to meet all his enterprises, a revenue of only 5,000,000 roubles, with tributes in kind, and the expenses were proportioned to the receipts. Both increased after his reign, but the expenses chiefly. Catherine II., having exhausted all other expedients, had recourse to a paper currency, which, in 1817, amounted to 210,000,000 roubles. To reduce it, recourse was had to internal loans; then, this recourse not being sufficient, in 1820, foreign loans were nego-

* The following was the composition of the regular Russian army in 1882 :

	Peace Footing.	War Footing.
Battalions	1,045	1,766
Squadrons	404	412
Guns	1,562	3,772
Horses	94,789	258,056

The nominal strength of the various divisions of the Russian

tiated. In 1847, the debt bearing interest reached the sum of 815,000,000, with 184,000,000 of paper money in circulation; and in 1860, in consequence of the increase in the military expenses and the construction of the first railways, the amount of the debt was more than doubled. But the em-

army, according to the returns of the ministry of war, was as follows in 1882 :

ARMS.	Peace Footing.	War Footing.
1. Regular army:		
Infantry	625,617	1,915,709
Cavalry	85,860	94,466
Artillery	106,610	210,772
Engineers	20,624	43,352
Total	840,711	2,264,293
2. Irregular army:		
Infantry	6,500	8,510
Cavalry	34,196	142,400
Artillery	2,912	12,650
Total	43,608	163,560
General total	884,319	2,427,853

To this has to be added the staff, gendarmerie, militia (raised only in time of war), etc., which would raise the war forces to a total of 2,733,305 men. — By the law of Dec. 18, 1878, which came into force Jan. 1, 1881, personal military service is declared obligatory in Finland. The Finnish troops form nine battalions of riflemen, each with eighteen officers and 505 men, and number in all 4,833. — Among the irregular troops of Russia the most important are the Cossacks. The country of the Don Cossacks contains from 600,000 to 700,000 inhabitants. By imperial decree, dated April 29, 1875, every Cossack of the Don, from fifteen to sixty years of age, is bound to render military service. No substitution is allowed, nor payment of money in lieu of service. Exemption from military service is granted, however, at all times, to the Christian clergy, and, in times of peace, to physicians and veterinary surgeons, apothecaries, and teachers in public schools. The regular military force consists of fifty-four cavalry regiments, each numbering 1,044 men, making a total of 56,376. The number of Cossacks is computed as follows :

COSSACKS.	Heads.	In Military Service.
On the Black sea	125,000	18,000
Great Russian Cossacks on the Caucasian line	150,000	18,000
Don Cossacks	440,000	66,000
Ural Cossacks	50,000	8,000
Orenburg Cossacks	60,000	10,000
Siberian Cossacks	50,000	9,000
Total	875,000	129,000

The military organization of the Cossacks is in eight districts, called *woisksos*. Each *woisko* furnishes a certain number of regiments, fully armed and equipped, and undergoing constant military exercise, so as to be prepared to enter the field, on being summoned, in the course of ten days. The two larger districts are the *woisko* of Kuban, which has the privilege of furnishing a squadron of picked men for an imperial escort in time of war, and the second the *woisko* of Terak, which furnishes a like escort in time of peace. — The Cossacks are a race of free men; neither serfage nor any other dependence upon the land has existed among them. The entire territory belongs to the Cossack commune, and every individual has an equal right to the use of the land, together with the pastures, hunting grounds and fisheries. The Cossacks pay no taxes to the government, but, in lieu of

peror brought about improvements in the management of the finances; he wished to have a regular budget, and for the first time that of 1863 was given to the public. This was, according to L. Faucher's expression, a veritable revolution. According to the financial accounts, the ordinary receipts in the years 1864 and 1871, in roubles, were as follows :

ITEMS.	1864.	1871.
Direct taxes	35,760,000	94,470,000
Licenses	9,630,000	12,230,000
Indirect taxes :		
Liquors	127,800,000	149,780,000
Salt	9,630,000	12,680,000
Beet-root sugar	580,000	3,480,000
Tobacco	4,010,000	8,390,000
Customs	35,670,000	47,320,000
Stamps	5,490,000	7,590,000
Registration	2,530,000	5,170,000
Passports, maritime duties and tolls	5,280,000	6,110,000
Regalian rights :		
Mines	2,500,000	3,720,000
Coinage	2,500,000	4,060,000
Postoffice	7,700,000	9,700,000
Telegraphs	1,960,000	3,980,000
Domains of the state	53,230,000	35,010,000
Miscellaneous receipts	38,250,000	54,060,000
Revenue of Transcaucasus	3,450,000	5,240,000

The only diminution is in connection with the domains of the state, and is a result of the eman-

this, they are bound to perform military service. They are divided into three classes: viz., 1, the minors, or *maloletniye*, up to their sixteenth year; 2, those on actual service, the *sluzhilye*, for a period of twenty-five years, therefore until their forty-second year; 3, those released from service, the *ostavniye*, who remain for five years, or until their forty-seventh year, in the reserve, after which period they are regarded as wholly released from service and invalidated. Every Cossack is obliged to equip, clothe and arm himself at his own expense, and to keep his horse. While on service beyond the frontiers of his own country, he receives rations of food and provender, and a small amount of pay. The artillery and train are at the charge of the government. Instead of imposing taxes on the Don Cossacks, the Russian government pays them an annual tribute, varying in peace and war, together with grants to be distributed among the widows and orphans of those who have fallen in battle. Besides the regular Cossacks, there are, on the Orenburg and Siberian lines, the Bashkir Cossacks, numbering some 200,000 men. — The Russian navy (1883) consists of two great divisions, the fleet of the Baltic, and that of the Black sea. Each of these two fleets is again subdivided into sections, of which three are in or near the Baltic, and two in or near the Black sea. The divisions, like the English, carry the white, blue and red flag, an arrangement originating with the Dutch, but without the rank of the admirals being connected with the color of the flag. — At the end of the year 1880 the strength of the various divisions of the Russian navy was returned officially as follows : 1, the Baltic fleet, consisting of one hundred and thirty-seven men-of-war, comprising twenty-seven armor-clad ships, forty-four unarmored steamers, and sixty-six transports; 2, the Black sea fleet, consisting of thirty-one men-of-war, comprising three armor-clad ships, twenty-five unarmored steamers, and three transports; 3, the Caspian sea fleet, consisting of eleven unarmored steamers and eight transports; 4, the Siberian fleet, consisting of fifteen unarmored steamers and twenty-one transports. The total comprises 223 men-of-war, all steamers, armed with 561 guns, with engines aggregating 188,120 horse power. — The iron-clad fleet of war of Russia, comprising thirty ships, twenty-eight in the Baltic and two in the Black sea, was made up, at the end of 1880, of the following classes of ships : 1st class, three mastless turret ships, 12 and 14 inch armor thickness; 2d class, nine sea-

icipation of the peasants. If the expenses of collection and the anticipated deficit in receipts are deducted, viz., 42,000,000 for 1864 and 52,000,000 for 1871, we find, for the first of these years, a total of 304,246,000, and for the second a total of 487,966,000. But as the budget of Poland has been joined to that of the empire, 30,000,000 must be added to the first of the two totals, and by adding them we find an increase in the receipts, of 153,720,000 roubles, without any increase in taxes except upon liquors. The following table shows the ordinary expenditure for the years named, in roubles :

ITEMS.	1864.	1871.
Public debt.....	59,630,000	85,060,000
Grand body or corps of the state.....	1,200,000	2,450,000
Clergy.....	5,340,000	9,320,000
Imperial household.....	7,750,000	10,930,000
Foreign affairs.....	2,080,000	2,470,000
War.....	119,950,000	159,250,000
Navy.....	21,680,000	21,140,000
Domains of the empire.....	9,120,000	9,680,000
Interior.....	23,490,000	42,460,000
Public instruction.....	6,240,000	10,810,000
Means of communication.....	25,180,000	34,020,000
Justice.....	6,490,000	10,700,000
General control of the empire.....	320,000	1,910,000
The stud.....	590,000	640,000
Expenses of Poland.....		1,310,000
Administration of the Caucasus.....	3,610,000	6,600,000

Deducting the expenses of Poland, we have for 1864 a total of 851,346,000 roubles, and for 1871 a total of 498,422,000 roubles, consequently an increase which is not the result alone of the increase in the debt and the military expenses, but also of the improvements made in the different services. — The expenditure of 1864, compared with the receipts, presents a deficit of 47,000,000; in 1871 we find 10,000,000 deficit, but we shall see, further on, that the debt had increased. — The expenses connected with the construction of railways and of certain ports, are paid separately from a special fund raised by means of loans. The budget of 1874 was thus fixed: receipts from all sources, 539,851,656 roubles; expenses, 536,683,836 roubles. — The debt is divided into the public debt properly speaking, or consolidated debt, the floating debt, and the paper currency. The consolidated debt is composed of loans effected at different periods since 1798, at different rates and under different forms, some domestic and some foreign; some to be liquidated or redeemable at a fixed time, others at no determinate period; lastly, some to reduce the paper currency, others to cover the deficits, and others to pay the expense of the con-

going cruisers, 4 to 6 inch armor; 3d class, sixteen vessels for coast defense, 4 to 4½ inch armor; 4th class, two circular monitors, 11 and 18 inch armor. — The imperial navy was commanded, in 1860, by 17 admirals, 32 vice-admirals, 31 rear admirals, 201 first-class captains, 98 second-class captains, 303 captain lieutenants, 443 lieutenants, and 129 midshipmen of the special corps attached to the navy. The navigation detachment contained, at the same date, five generals and 508 staff officers; the naval artillery, four generals and 197 staff officers; and the naval engineers, six generals and 139 staff officers.—F. M.

struction of railways or of advances for the redemption of serfs. In 1863, this debt amounted to 759,000,000 roubles, and, Jan. 1, 1872, to 966,000,000. It had, therefore, increased 207,000,000. Moreover, the debt of Poland having been charged to the treasury, in 1869, and this debt amounting to 92,000,000 in 1872, the debt of Russia was therefore increased to 1,058,000,000. The floating debt is composed of treasury bonds, of fifty roubles each. It amounted, in 1863, to 189,000,000 roubles; from 1866 to 1872 it remained fixed at 216,000,000. The paper currency consists of credit notes put into forced circulation by the bank of Russia. They do not bear interest, and are not guaranteed by a metallic reserve, like the other credit notes issued by the same bank for its own operations. In 1863, after 118,000,000 roubles had been retired from circulation or burned, there remained 643,000,000. In 1872 there were 724,000,000, and adding the notes issued to replace those of the former institutions of credit to which the bank of Russia succeeded in 1860, the circulation amounted to 959,000,000. As to the debt arising from the redemption of the serfs, the advances made by the treasury amounted, from 1861 to Jan. 1, 1871, to the sum of 559,931,289 roubles, out of which 251,500,000 were retained for the mortgage debts of the former owners.* — VIII. *Means of Communication.* When Peter the Great tried to remedy the enormous greatness of the distances which separated and still separate the groups of habitations, it was by means of interior waters, seas, lakes, streams and rivers that he undertook to create means of communication. He commenced the junction of the Volga with the basin of the Neva and that of the Dwina of the north, by a system of navigation which was continued by his successors; and is

* The public revenue of the empire is derived to the extent of two-thirds from direct and indirect taxes, while nearly two-thirds of the total expenditure is for the army and navy, and interest on the public debt. There are annual budget estimates published by the government, and also, since 1866, accounts of the actual receipts and disbursements of the state, which, entering into minute details, can not be issued till after the lapse of a number of years. — The following table gives the total actual revenue and expenditure of the imperial government, in roubles, for each of the years 1875-81 :

YEARS.	Revenue.	Expenditure.
1875.....	532,306,209	529,050,426
1876.....	534,791,290	534,705,120
1877.....	537,784,596	537,776,074
1878.....	625,972,735	600,510,612
1879.....	661,954,192	641,924,957
1880.....	651,016,683	694,505,313
1881.....	651,754,009	762,393,837

The expenditure 1876-81 is exclusive of the large expenses incurred during the war with Turkey, which in 1876 amounted to about 51,000,000 roubles, in 1877 to over 429,000,000, in 1878 to 408,000,000, in 1879 to 128,000,000, and in 1880 to about 59,000,000. It should also be remembered, that, during the last five years, the actual value of the rouble has only been about two English shillings. — The following table shows the principal sources of revenue and the chief branches of ex-

composed to-day of three branches, measuring, altogether, 3,460 kilometres, 553 of which are of canal. This system unites the Caspian sea with the Baltic and the White sea. In the west the Baltic is placed in communication with the Black sea by three lines of navigation, composed, one

penditure of the government in roubles, according to the budget estimates for 1882 :

Sources of Revenue.

1. Ordinary revenue :	
Direct taxes	128,291,700
Indirect taxes	390,687,940
Mint, mines, post and telegraphs	26,183,323
State domains	42,562,237
Miscellaneous receipts	49,158,117
Revenue of Transcaucasia	9,834,548
Total ordinary revenue	656,717,870
2. " Recettes d'ordre"	22,165,068
3. Extraordinary receipts	83,121,574
Total revenue	762,004,512

Branches of Expenditure.

1. Ordinary expenditure :	
Interest and sinking fund of the national debt	191,776,287
Imperial chancery	1,650,230
Holy synod	10,300,800
Ministry of the imperial house	8,954,000
Ministry of foreign affairs	3,686,185
Ministry of war	183,489,042
Ministry of the navy	27,507,721
Ministry of finance	78,430,477
Ministry of the imperial domains	19,244,892
Ministry of the interior	65,120,548
Ministry of public instruction	18,090,867
Ministry of public works and railways	16,072,905
Ministry of justice	14,780,868
Department of general control	2,367,225
Civil administration of the Transcaucasus	7,252,291
Various	931,329
Total ordinary expenditure	658,595,151
2. Anticipated deficits in receipts	8,500,000
3. " Dépenses d'ordre"	22,165,068
4. Extraordinary expenses	72,744,293
Total expenditure	762,004,512

It is expected that the actual revenue will show a deficit of 4,500,000 roubles. The budget estimates for 1882 balance the revenue and expenditure at 778,505,423 roubles, or £111,215,000. — In the budget estimates for the year 1882, the total amount, in roubles, required for interest on the public debt and sinking fund, was divided as follows :

Foreign loans :	
Terminable	23,481,601
Perpetual	23,486,172
Internal terminable loans :	
Debt to sundry departments	125,837
4 per cent. bank bills (metallic)	4,500,000
5 per cent. bank bills	13,450,000
First and second lottery loans	13,285,000
First and second oriental loans	44,000,000
Treasury bills	9,331,200
Polish obligations	1,890,000
Debt on Polish "Fenilles de liquidation"	8,184,123
Internal perpetual loans	10,117,646
Interest and sinking fund on consolidated bills issued for construction of railways, etc.	51,924,706
Total	198,776,287

— The finances of Russia, almost since the beginning of the century, exhibit large annual deficits, caused partly by an enormous expenditure for war, and partly by the construction of reproductive works, such as railways. But the war expenditure was by far the greatest cause of the deficits. — According to official returns, issued in 1881, the total war outlay incurred by Russia during the four years 1876 to 1880, amounted to 1,075,396,653 roubles, or £153,628,093. — To cover a series of annual deficits, and, at the same time, to procure the capital for the construction of a net-work of railways throughout the empire, a number of foreign loans were raised during the thirty-two years from 1850 to 1882. The

of the western Dwina, and the canals of the Beresina and the Dnieper; the second of the Chara, a tributary of the Niemen, and of the Pripet, a tributary of the Dnieper; the third, of the Vistula, the Boug and the Pripet. The south does not fare so well, the Caspian sea has no direct communi-

most important of them were, first, a loan of £5,500,000, issued in 1850, to meet the expenditure for the railway from St. Petersburg to Moscow; secondly, a loan of £12,000,000, issued in 1859; thirdly, a loan of £8,000,000, issued in 1860; and fourthly, a loan of £15,000,000, issued in 1862, the latter three contracted partly for the covering of financial deficits and partly for the construction of railways. The subsequent foreign loans were: one for £2,600,000, issued in 1863, and two for £6,000,000 each, issued respectively in 1864 and 1866. The next was a foreign loan of £15,000,000, brought out in September, 1872, and the second raised in December, 1873. The following table gives the year of issue, nominal capital, interest per cent., and price of issue, of the foreign loans of Russia, fifteen in number—including early liabilities dating back to 1822—contracted up to 1882 :

YEAR OF ISSUE.	Nominal Capital.	Interest.		Price of Issue.
		Per Cent.	Pr Cent.	
1822	6,400,000	5	77	
1850	5,500,000	4½	93	
1859	12,000,000	3	68	
1860	8,000,000	4½	92	
1862	15,000,000	5	94	
1863	2,600,000	5	85	
1864	6,000,000	5	86	
1866	6,000,000	4	61	
1867-9	23,110,000	4	61-3	
1870	12,000,000	5	80	
1871	12,000,000	5	81	
1872	15,000,000	5	89½	
1873	15,000,000	5	90	
1874	1,480,000	5½	87½	
1875	15,000,000	5½	85	
1877	15,000,000	5½	85	
1880	24,000,000	4	75	
1882	8,900,000	3	55	
Total	202,990,000			

Not included in the above list are several loans for railways, guaranteed by the imperial government. The earlier of the foreign loans of Russia have become largely reduced at present, through the operation of sinking funds. Of the 1822 loan, issued by Messrs. Rothschild, more than one-half had been repaid at the end of 1875; of the 1850 loan, contracted for by Baring Brothers, the outstanding sum was £2,950,000, of the 1859 loan, issued by Thomson, Bonar & Co., the amount was £5,100,000; and of the 1860 loan, issued by Baring Brothers, it was £6,600,000 at the same date. But the repayments of the subsequent loans, through sinking funds, were comparatively small. — The entire public debt of Russia, interior and foreign, was estimated to amount to 2,450,000,000 roubles, or £350,000,000, on Sept. 1, 1878, the total including an internal loan of 210,000,000 roubles, or £30,000,000, issued in 1877, soon after the commencement of the war against Turkey, and another internal loan, called "the second eastern loan," to the amount of 300,000,000 roubles, or £42,857,142, issued in August, 1878. On Jan. 1, 1880, the total debt had increased to 4,490,812,699 roubles, or £640,116,099. — Included in the debt here enumerated is a very large quantity of paper money, with forced currency. According to official reports, the total amount of bank notes in circulation on Jan. 1, 1876, was 797,313,480 roubles, or £118,901,925. There were new issues of paper money to a very large amount during the years 1876-9. The total debt represented by paper money of forced currency, was estimated at 1,500,000,000 roubles, or upward of £210,000,000, in January, 1880. — The destruction of public credit, through an unlimited issue of paper money, as, as remarked above, of old standing. In the reign of Catherine II., the first attempt, on a large scale, was made to cover the annual deficits by a very liberal supply of paper roubles, the sum total of which at the death of the empress, 1796, amounted

cation with the Black sea, and the basin of the sea of Azof is entirely isolated. There are in all 30,337 kilometres of natural navigable lines, connected by 1,381 kilometres of canals. There are navigation and steam-towage companies upon the Volga, the Neva, the Dnieper and the Vistula. But the rivers are only open usually six months in the year in the north, and eight to nine months in the south, and the cold closes the canals even longer. The transports are subject to a tax of a quarter of 1 per cent. of the value declared; this tax is applied to the maintenance of navigation works. According to the official *Vremennik* of 1866, the quantities of merchandise carried by water in that year were :

	Poods.
Basin of the Volga.....	170,258,765
Basin of the Neva.....	145,750,265
Basin of the Dnieper.....	20,354,041
Basin of the Duna.....	8,257,734
Basin of the Dwina.....	6,952,839
Basin of the Niemen.....	3,748,440
Total.....	355,322,084

— *Highways.* The roads practicable in all seasons date only from 1816. They were in 1867, in Russia in Europe, only 8,416 kilometres in length. The post roads had, in 1874, an extent of 94,000 kilometres. Transportation is possible on wheels during four months of the summer, and on runners over the snow during four months of the winter. There are not more than 200 days in the year when communication is easy; but in proportion as the roads are insufficient, horses, cattle and fodder are procurable at a small price, so that grain and the products of the mines are carried considerable distances for a less price than that of transportation in more favored climates. The principal highways are those from St. Petersburg to the Chinese frontier, by way of Irkoutsk (6,616 kilometres), from St. Petersburg to the Prussian frontier, via Warsaw (1,173 kilometres) and via Tilsit (816 kilometres), and from St. Petersburg to Abo (613 kilometres).— *Railways.* The first was that from St. Petersburg to Tsarskoé-Sélo, which is only

to 200,000,000. During the subsequent wars with France and Turkey, new emissions of paper followed, with the consequence that in 1815 the notes had fallen to 418, that is, one silver rouble was worth four roubles eighteen kopecks in paper. Great efforts were now made by the government to improve this state of things, by withdrawing a portion of the paper from circulation. After ten years of improved financial management, there remained, however, still 600,000,000 of notes, circulating at the rate of three paper roubles to one silver rouble. As a final remedy, the imperial government withdrew, in 1843, the whole of the old paper money, introducing, in its stead, a new form of bank notes, with forced currency. By these and other means, particularly the establishment, in 1850, of a state bank, the bank of Russia, under the control of the minister of finance, the nominal value of the paper money was considerably raised, with a prospect of the resumption of specie payments in the course of a number of years.—The grand duchy of Finland had a revenue of 32,320,714 marcs, or £1,262,828, and an expenditure of 33,131,146 marcs, or £1,405,245, in 1882. Its total debt on Jan 1, 1882, amounted to 61,422,865 marcs, or £2,456,944. In December, 1882, Finland contracted an additional loan of 4810,000 at 4 per cent., for forty-two years. The special budgets of Poland ceased in 1867, on the final incorporation of the kingdom with Russia.— F. M.

twenty-six kilometres long; it was built by the state and finished in 1835. The state commenced in 1842 the railroad from St. Petersburg to Moscow, 643 kilometres long, and opened it in 1851. Since 1856, the undertakings of new lines have been granted to private individuals, and in 1858 the state gave up the management of those under its control. The railroads in running order Jan. 1, 1872, represented a total length of 14,003 kilometres; the lines in course of construction had 1,454 kilometres. (See note at the end of IX.)—IX. *Resources.*— *Agriculture.* Russia, from the agricultural point of view, has one hundred and seventy-five millions of hectares in arable lands and meadows, one hundred and eighty-eight millions in forests, fifty-seven millions in steppes which can be utilized as pasturage, and eighty millions in non-productive lands. Of the first one hundred and seventy-five millions, ninety-eight, situated between the fifty-first and fifty-fourth degrees of latitude to the west, and between the fifty-seventh and fifty-fourth to the east, constitute the region called the region of the black earth, and which is especially productive. In Finland the extent devoted to rural economy is estimated at thirty-one millions of hectares, and in Poland at ten and a half millions.—The progress of agriculture is trammelled by various unfavorable circumstances: the lack of capital, the lack of hands, absenteeism, and, above all, communism applied to the lands. Labor, besides, because of the climate, is suspended during seven months of the year, and extremely hurried during four others; which greatly restricts cultivation. Serfdom has disappeared, but ignorance and carelessness continue. A very great number of proprietors, whose property was weighed down with mortgages, found themselves greatly impoverished when the *corvées* failed them. The laborers, whom it was necessary to employ and pay, have shown, it is said, in general, little zeal and even little good faith in the execution of their engagements. Moreover, they did not have the knowledge which less rude methods demanded. Some proprietors have tried to farm out their lands, but good farmers are only found in the southwest. The proprietors are contented, under these circumstances, with small rents on long leases, and the rent is double for leases by the year. In a great part of the empire the proprietors have been compelled to divide up their estates and lease them by the year in small lots; cultivation has not been improved thereby. Another system consists in having the work done by contract with the implements of the cultivator; sometimes the seeds are furnished by the proprietor, sometimes by the cultivator, and the latter is paid either in money, or by the grant of a piece of land. Finally, in the south the metayer system exists.—Live-stock does not receive the care necessary to insure its increase and improvement. Little attention is paid to the development of artificial prairies. Manure is not much used, and the low price of meat on the premises does not encourage production. Hence cattle, in the twenty years from

1851 to 1871, increased only by 640,000 head, of ordinary quality. The increase is larger among sheep and hogs; but horses have diminished from 16,155,000 to 15,540,000. — Two-thirds of the forests belong to the crown. Those belonging to individuals had already suffered much by bad management, when the emancipation of the serfs necessitated considerable clearing. A great number of proprietors were forced to sell wood to procure the means they needed; taxes, besides, are often very heavy in comparison with the revenue, and it is difficult to prevent theft and incendiarism. The consumption of wood is enormous; the annual exploitation of it is estimated at 135,000,000 roubles. — *Industry.* For the seven or eight months during which work in the field is suspended, the peasants carry on various industries in their villages; such as, weaving of cloth, oil pressing, wood work, the manufacture of tar, turpentine and potash, the making of mats, drying and salting of fish, preparation of glue and caviar, tanning, horse-hair work, charcoal burning, basket work, working of quarries, and the manufacture of woolen stuffs. The sheep-skin pelisses give occupation to entire villages. In one place, furniture is made; in another, pictures are painted; in a third, boots and shoes are manufactured. Some families do filigree work; thousands of hands make lace. One village is devoted to iron foundries; another to locksmiths' work or cutlery. There are turners, fullers, and boat and raft makers. — The gold mines have been worked since 1814. The product amounted to 22,000 kilogrammes in 1841, and since then it has varied from 23,000 to 24,000 kilogrammes. The iron mines are abundant; but the working of them is difficult, because of their distance from inhabited places and the lack of means of communication. The yield of the copper mines is estimated at 51,000 metric quintals. There are four coal basins in course of exploitation; the product has considerably increased of late; it amounted, in 1871, to 830,000 tons. The salt mines, the salt marshes and the salt works give 4,637,000 metric quintals. Many of the provinces, because of the distances, are obliged to procure their provisions from abroad. There are numerous naphtha and petroleum wells, whose product (1874) is 100,000 metric quintals. — Of all the industries, the most lucrative is that of spirits; the manufacture is estimated at 300,000,000 roubles. According to an abstract prepared in 1863, the consumption in Russia in Europe was then more than 107,000,000 hectolitres, and it has increased since that time. — The manufacture of beet-root sugar has diminished; the number of sugar factories was 427 in 1860, but fell, in 1872, to 233. Honey is preferred in consumption, hence apiculture has greatly increased. — The cotton factories had, in 1867, 1,600,000 spindles, a great number of which were worked day and night. They used 46,000,000 kilogrammes of cotton, and spun only to No. 50. The weaving employs 12,000 looms, run by machinery, and seven or eight times as many run by hand. Red and blue calicoes of

good quality are manufactured. The spinning and weaving of flax and hemp are not sufficient for the consumption, especially of the upper classes. At Moscow are manufactured rich silk stuffs, worked and embroidered with gold and silver, for priests' vestments. The white embroideries of the Caucasus are highly praised. Tanning remains backward, but Morocco leather manufacture is renowned. Nijni-Novgorod manufactures beautiful cutlery of excellent steel from the mines of the Oural. The jewelry and gold and silver work are of the best, both in design and execution. — *Commerce.* The domestic commerce of Russia is five or six times greater than its foreign commerce. The two principal commercial seats are Moscow and Warsaw. After these two cities come those in which fairs are held, notably Nijni-Novgorod, the principal one, in which the merchandise sold amounted to 128,000,000 roubles. M. Schnitzler estimates the whole of the domestic commerce at 6,000,000,000 francs. The merchants are divided into three classes: 1, the members of the three guilds; 2, the persons engaged in industry with certificates or licenses; 3, the tradesmen of the villages. The members of the first guild must have a capital of 15,000 roubles at least; the declaration which they make as to the amount of their capital serves as a basis for the credit which the banks open to them. They can carry on wholesale commerce, banking, insurance business, and equip merchant vessels. The same rights are conferred upon the members of the second guild, except that they can not obtain from abroad merchandise worth more than 90,000 roubles, nor carry on banking or insurance business. Their capital must be at least 6,000 roubles. Those of the third guild must have a capital of 2,400 roubles at least; they can carry on retail commerce, keep inns, and have transport boats and weaving looms. Failure, with aggravating circumstances, involves expulsion. The total of the members of the three guilds was 200,760 in 1874, and their capital was estimated at 2,400,000,000 francs. — The certificates or licenses issued annually, to the number of about 190,000, give those who obtain them the right to carry on small industries or commerce on a very small scale. In the villages the peasants may, without paying any tax, sell objects of customary consumption. — The following is the amount of the commercial movement in the years mentioned, in roubles :

YEARS.	Imports.	Exports.	Total.
1869	339,860,000	270,690,000	610,550,000
1870	332,330,000	375,110,000	707,440,000
1871	367,920,000	379,330,000	747,250,000

Russia in Asia is included in these results for a total movement of 28,880,000 roubles in 1870, and of 24,830,000 in 1871. — Considering the movement of precious metals, since 1861, by itself, we find, at that time, an importation of seven millions, which fell off gradually to two in 1866, rose to thirty-

three millions in 1867, and to thirty-nine in 1868; then diminished again to two millions in 1869 and 1870, and rose to seven in 1871. The exportation, which was fifteen millions in 1861, rose to thirty-seven in 1862 and to sixty-seven in 1863; then it fell to fourteen in 1867, and to five in 1868, to rise again to fifteen in 1869 and to seventeen in 1871. — The maritime commerce is about two-thirds of the land commerce. From 1863 to 1867 it amounted, without Finland, to an average of 266,000,000 roubles in Europe, and to 11,000,000 in Asia. There were, in 1869, 2,532 sailing vessels and 114 steamships; 753 sea-going ships and 1,893 coasting vessels. — The principal article of exportation consists of cereals. This trade commenced to be developed in 1817; it is subject to great fluctuations; sometimes grain forms 30 per cent. of the total exports, and sometimes only 6 per cent. In 1839 the greatest quantity was exported; it represented 332,000,000 roubles. The ten years previous to 1867 gave an average of 58,000,000. In 1870 the exportation was 163,000,000, and 183,000,000 in 1871. Next comes flax, 49,000,000 roubles in 1871; linseed, 28,000,000; wool, 7,000,000; tallow, which decreased from 12,000,000 before 1867 to 4,600,000 in 1871; wood, which increased from 6,500,000 before 1867, to 14,000,000 in 1871; hemp, 12,000,000; hogs' bristles, 9,000,000; hides, 2,000,000; live

stock, 6,000,000; unmanufactured metals, 1,800,000 in 1870 and 1,200,000 in 1871; oleaginous seeds, 3,400,000. — The principal article of importation is raw cotton. Before 1867 the average of ten years was 18,000,000 roubles; in 1870, 31,000,000 was imported, and in 1871, 48,000,000. Unmanufactured metals also increased from 4,500,000 roubles before 1867, to 17,000,000 in 1868, 30,000,000 in 1870, and 31,000,000 in 1871. Machinery, from an average of 8,000,000 before 1868, rose to 25,000,000 in 1870. An increase has also taken place in the following: metal works, 18,000,000 in 1871; tea, 20,000,000; paints, 16,000,000; oils, 12,000,000; wines and liquors, 11,000,000, (three-fourths coming from France); wool, 13,000,000; woolen fabrics, 10,000,000; fruits, 8,000,000; spun cotton, 8,000,000; coffee, chemical products, plants and seeds, 5,000,000; silk textile fabrics, 5,000,000; fish, 4,000,000. — The different countries participated (1874) in the foreign commerce of Russia in the following proportions: Great Britain, 160,000,000 roubles in 1866, 269,000,000 in 1871; Prussia, 98,000,000 in 1866, 203,000,000 in 1871; France, 46,000,000 in 1871; Austria, 30,000,000; Hanseatic cities, 22,000,000; Turkey, 21,000,000; The Netherlands, 20,000,000; Italy, 18,000,000; the United States, 17,000,000; Belgium, 14,000,000; China, 10,000,000.* (See NIBILISM, ORIENTAL QUESTION.) L. SMITH.

S

SAINT-SIMONISM. (See SOCIALISM.)

SALARY GRAB (IN U. S. HISTORY), the popular name for the general increase of federal salaries in 1873. — The constitution provides that "the senators and representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the treasury of the United States"; that the president "shall, at stated times, receive for his services a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them"; and that the judges of all federal courts "shall, at stated times, receive for their services a compensation, which shall not be diminished during their continuance in office." The act of March 3, 1873, provided that, on and after March 4, 1873 (the beginning of President Grant's second term), the salary of the president should be \$50,000 a year, of the chief justice \$10,500, of the vice-president, cabinet officers, associate justices, and speaker of the house, \$10,000, and of senators, representatives and delegates in congress, \$7,500; and that the salaries of employes of both houses should be increased in various proportions. The salaries named had previously been as follows: president, \$25,000; chief justice, \$8,500; other

officers, \$8,000; and senators, representatives and delegates, \$5,000. Although the act was in other respects to go into force "on and after March 4, 1873," the members of the congress which passed it were to be included in the increased salary, so that the act, as to them, was retroactive for the

* The commerce of Russia with foreign countries is officially divided into trade with Europe, and trade with Asia: the former being subdivided into trade through the Baltic ports, through the White sea ports, through the southern ports, and over the European land frontier. The immense extent of the empire, and its ever-changing limits eastward, make it difficult to obtain exact returns of the aggregate amount of its foreign commerce, which must be partly estimated. According to official statements, the total value of imports in the five years 1876-80 averaged, in round numbers, 455,000,000 roubles, or £35,000,000, while the value of the exports during the same period averaged 476,000,000 roubles, or £38,000,000 per annum. The four principal articles of import during the period were raw cotton, iron and other unwrought metals, tea, and machinery of all kinds, while the staple articles of export were grain and other agricultural produce. — The two principal countries trading with Russia (1883) are Great Britain and Germany. Of the imports, about 40 per cent. annually came from Germany, and 20 per cent. from Great Britain; and of the exports 35 per cent. went to Great Britain, and 20 per cent. to Germany, on the average of the five years 1876-80. — The commercial navy of Russia consisted, at the end of the year 1879, of 2,568 sea-going vessels, of an aggregate burden of 261,231 ship last, or 522,462 tons. The total comprised 925 ships engaged in trading to foreign countries, and 1,780 coasting vessels, many of them belonging to Greeks, sailing under the Russian flag. Not included in the return were 389 trading steamers on the rivers and lakes

two years just closing. This was the essence of the "salary grab," which excited so much popular indignation that many of the members were moved to repay their increase to the treasury. The act was repealed, as to all except the president and the justices, by act of Jan. 20, 1874, and salaries reverted to the former standard. The increase of the salaries of the president and justices was retained. — The acts to ascertain and fix the compensation of members of congress have been as follows: The act of Sept. 22, 1789, fixed the salaries of senators and representatives at \$6 per day,

of the empire, very nearly two-thirds of this number being on the river Volga and its affluents. — The internal commerce of the empire, as well as its foreign trade, has been greatly extended by the establishment, in recent years, of a comprehensive net-work of railways. The latest official returns state, that on July 1, 1880, the total length of the railways of Russia in Europe, open for traffic, amounted to 22,037 versts, or 14,145 English miles. At the same date 1,110 miles more of lines were in course of construction. The progress of railway construction in Russia is shown succinctly in the following table, which gives the length of lines opened at successive periods:

YEARS.	Versts.	English Miles.
1838 to 1865.....	3,578	2,886
1866 to 1870.....	6,514	4,343
1871 to 1875.....	7,606	5,071
1876 to 1878.....	2,719	1,812
Total.....	20,417	13,611

On the proposition of the minister of public works, the emperor sanctioned, in June, 1875, the extension of the then existing system by 6,500 versts, or 4,833 English miles, which, added to the 2,500 versts, or 1,666 English miles, previously sanctioned, raised the total to 9,000 versts, or 6,000 English miles. The new net-work is divided into four classes, according to different degrees of urgency, and the first of these classes will include the Siberian railway and the seven projected lines in the coal basin of the Don; 2,600 versts, or 1,734 English miles, are assigned to this class, at the head of which has been placed the immense Siberian line, reported as "most urgent" by a special commission on railways summoned in 1870. It is from a station on this line, probably Tinmen, that the Central Asian line to Tashkend is to take its rise, the continuation of the Orenburg line in that direction having been condemned as impracticable, owing to the inhospitable nature of the country it would have to traverse. The importance of the seven lines for the coal fields of the south is great, as the new railways will traverse this field in every direction, and connect it on one side with the Black sea and the sea of Azof, and on the other with the existing trunk lines of the empire. — In 1860-81 a railway for military purposes was constructed from Mikhailovsk, on the southeast shore of the Caspian, to Kizil Arvat, and a tramway thence to Beurma, near Bami, about 200 miles in all; within 100 miles of Askabad, and 260 of Sarakhs, on the northwest frontier of Afghanistan. — On Jan. 1, 1879, there were forty-five railway companies existing in the empire. Of this number ten had constructed their lines altogether without government assistance; while the remaining thirty-five were guaranteed, fifteen to the full amount of their capital, and the other twenty only to a partial extent. The entire sum guaranteed in 1874 by the state, in the shape of interest and repayment of capital, amounted to 51,177,627 roubles, or £7,311,069. In the year 1878 the sum of 14,592,172 roubles, or £2,094,566, being 78.52 per cent. of the sum total, was paid out of the exchequer to the railway companies. The charters granted to railway companies are for the most part terminable after between seventy-five and eighty-five years; but some small companies have charters only for thirty-seven years. The following table shows the gross receipts, the

and \$6 for every twenty miles of travel, until March 4, 1795, after which date senators were to receive \$7 per day, and \$7 for every twenty miles of travel. The act of March 10, 1796, fixed the salaries of both senators and representatives at the rate fixed in 1789. The act of March 19, 1816, increased this salary to \$1,500 per annum for "this and every future congress." This "salary grab" excited so much popular feeling that it was repealed by act of Feb. 6, 1817. The act of Jan. 22, 1818, fixed the salary at \$8 per day, and \$8 for every twenty miles of travel, dating the increase back to March 3, 1817. The act of Aug. 16, 1856, increased the salary to \$3,000 per annum, and mileage as before, and enacted further, that "this law shall apply to the present congress" In all these ascertainments of salary, the speaker's salary had been double that of the other members. The act of July 28, 1866, increased the salary of members to \$5,000 per annum, and that of the speaker to \$8,000. All these increases had been retroactive, and it is probable that the criticism on the increase of 1873 came mainly from the lavish generosity of congress in increasing so many salaries, heightened by the unfortunate fact that the congressional increase alone was retroactive. — See 1 *Stat. at Large*, 70, 448 (for acts of Sept. 22, 1789, and March 10, 1796); 3 *Stat. at Large*, 257, 345, 404 (acts of March 19, 1816, Feb. 6, 1817, and Jan. 22, 1818); 11 *Stat. at Large*, 48 (act of Aug.

working expenses and the net receipts, in roubles, of the Russian railways during each of the eleven years 1869-79:

YEARS.	Gross Receipts.	Working Expenses.	Net Receipts
1869.....	65,272,518	35,469,953	29,802,565
1870.....	78,820,633	46,719,992	32,100,642
1871.....	95,075,742	60,366,666	34,689,076
1872.....	102,645,916	66,061,549	36,584,367
1873.....	123,696,906	72,248,948	51,447,958
1874.....	141,632,640	89,124,000	52,508,640
1875.....	142,004,655	92,941,455	49,063,200
1876.....	147,396,236	100,267,449	47,128,787
1877.....	193,223,874	121,494,777	71,729,097
1878.....	211,905,758	133,120,261	78,785,497
1879.....	212,771,418	151,175,558	61,595,860

It appears from official returns referring to the end of the year 1878, that at that date the capital of all the railway companies amounted to 1,450,288,196 roubles, or £207,184,028. The capital consisted of £135,446,153 in bonds, and £71,737,875 in shares. No less than £92,101,350 of the bonds and £9,055,750 of the shares were held by the government itself; 48 per cent. of the whole railway property of the country was therefore held by the government. — The postoffice in the year 1880 conveyed 128,817,612 letters and post cards, 8,960,721 wrappers and parcels, and 88,168,700 newspapers. There were 4,458 postoffices in the empire in 1880. The total receipts of the general post in the year 1880 did not cover the expenditure. — The length of telegraph lines in Russia, in 1880, was 59,000 English miles, and the length of wire 134,000 English miles. Of the total system, about seven-eighths was the property of the state. There were at the same date 2,338 telegraph offices, 1,183 belonging to the state, and the remainder to private companies. The total number of telegrams carried in 1880 was 7,296,429, comprising 5,766,255 inland dispatches, and the rest on international service. The receipts of the telegraph office, which were £1,226,762 in 1878, have shown, in recent years, a small annual surplus, which is, by imperial decree, always devoted to the extension of the telegraphic system.—F. M.

ALEXANDER JOHNSTON.

SAN DOMINGO. The republic of San Domingo (*Republica Dominicana*), founded in 1844, is governed under a constitution bearing date Nov. 18, 1844, reproclaimed, with changes, Nov. 14, 1865, after a revolution which expelled the troops of Spain, who held possession of the country for the two previous years. By the terms of the constitution, the legislative power of the republic is vested in a national congress of two houses, called the *consejo conservador*, and the *tribunado*, the first consisting of twelve, and the second of fifteen members. The members of both houses are chosen in indirect election, with restricted suffrage, for the term of four years. But the powers of the national congress only embrace the general affairs of the republic; and the individual states, five in number, have separate legislatures. — The executive authority is vested in a president, chosen in indirect election for the term of four years. Constant insurrections have allowed very few presidents to serve the full term of office. The administrative affairs of the republic are in charge of a ministry appointed by the president, with the approval of the *consejo conservador*. The ministry is composed of the heads of the departments of the interior and police, finance, justice, war and marine, and foreign affairs. — The financial estimates of the republic for the year 1882 set down the revenue as \$1,500,000, or £300,000, with an expenditure to the same amount. The branches of expenditure were as follows:

Interior and police.....	\$ 253,514
Foreign affairs.....	146,486
Justice, etc.....	255,832
Finance, etc.....	144,168
War and marine.....	437,823
Extraordinary expenses.....	102,177
Balance.....	160,000
Total.....	\$1,500,000

The revenue for 1883 is estimated at \$1,750,000, mainly derived from customs duties, which average 40 per cent., while a large part of the annual expenditure is for the maintenance of a standing army. Besides a large internal debt, of unknown amount, San Domingo has a foreign debt, contracted at the London stock exchange in 1869. The debt, to the nominal amount of £757,700 at 6 per cent., was issued at the price of 80; but it was stated officially that the government had actually received only between \$190,000 and \$250,000 from the contractors for the loan. ("Report of the Select Committee on Loans to Foreign States," 1875.) It is officially stated that the government is now (January, 1883) engaged in ascertaining the amount of the debt, and a commission has been appointed for the purpose. — The area of San Domingo, which embraces the eastern portion of the island of Hayti (the western division forming the republic of Hayti), is estimated at 18,045 Eng-

lish square miles, with a population, in 1880, of 300,000 inhabitants, or sixteen to the square mile. — The republic is divided into the five provinces, or states, mutually independent, of San Domingo, Azna de Compostela, Santa Cruz del Seybo, Santiago de los Caballeros, and Concepcion de la Vega, besides four maritime districts. The population, like that of the neighboring Hayti, is composed mainly of negroes and mulattoes, but the whites, or European-descended inhabitants, are comparatively numerous, and, owing to their influence, the Spanish language is the prevailing dialect. The capital of the republic is the city of San Domingo, founded in 1494, at the mouth of the river Ozama, with 10,000 inhabitants. — The commerce of the republic is small, owing in part to customs duties of a prohibitory character. The principal articles of export are lignum vitæ, log-wood, coffee and sugar. Cocoa is also cultivated. In 1881 the value of the imports amounted to £352,263, and of the exports to £338,215, the foreign commerce being shared by the ports of San Domingo and Puerta Plata. The commerce of the republic is mainly with the United States and Great Britain. — The country is stated to be making rapid progress. A railway is being constructed between Samaná and Santiago, embracing the whole of the rich provinces in the northern portion of the republic, and another line will soon be made between Barahona and the salt mountain of "Cerro de Sal." Large sugar plantations and factories are stated to be now in full work in the southern and western parts of the republic, and a large factory for concrete owned by an English company. — The bay of Samaná, on the northeast coast of San Domingo, one of the greatest natural harbors in the world, thirty miles long and ten miles broad, was ceded, with the surrounding country, to a company formed in the United States, by a treaty signed by the president of the republic, Jan. 10, 1873. Under another decree, passed March 25, 1874, the rights of the company were confiscated, on the ground of non-payment of a stipulated annual rent. — **BIBLIOGRAPHY.** Samuel Hazard, *Santo Domingo, Past and Present: with a glance at Haiti*, London, 1873; W. Jordan, *Geschichte der Insel Haiti*, Leipzig, 1849; D. B. F. M.

— In 1869 a movement took shape for the annexation of San Domingo to the United States. Much of the impelling force of the movement undoubtedly lay in the selfish interests of various American citizens in San Domingo, in their loans to the republic, their claims against it, and their unproductive grants from it; but a further incentive was the naval importance of the bay of Samaná, as a coaling station for United States vessels, and a commanding position for the Mona passage, the eastern avenue to the gulf of Mexico. In July,

1869, Gen. Babcock was sent to San Domingo by President Grant; and, on his favorable report, a treaty for the annexation of the republic was made, Nov. 29, 1869, with a convention for the lease of the bay and peninsula of Samaná to the United States. The treaty was ratified by popular vote in San Domingo; but in the United States it met instant opposition. A new article was added to the treaty, May 14, 1870, in order to remove some of the reasons for opposition, and President Grant, in a special message of May 31, urged the ratification of the whole treaty. He believed that it would maintain the Monroe doctrine, prevent the acquisition of Samaná by a European power, build up our lost merchant marine, abolish slavery at once in Cuba and Porto Rico, and ultimately in Brazil, support a population of 10,000,000 in luxury, and pay off the foreign debt of the United States. Nevertheless, the senate rejected the treaty, June 30. — In his annual message of Dec. 5, 1870, President Grant proposed that congress should authorize a commission to negotiate an annexation treaty with San Domingo, and reiterated his former arguments in favor of the project. Congress went with the president far enough to pass a resolution, Jan. 12, 1871, authorizing the appointment of a commission to examine into the condition of San Domingo, but added the proviso "that nothing in these resolutions contained shall be held, understood or construed as committing congress to the policy of annexing the territory of the said republic of Dominica." The commissioners, B. F. Wade, Andrew D. White and S. G. Howe, visited San Domingo in January - March, 1871, and made an exhaustive and rather favorable report. They specially reported that they could find no trace of the corrupt grants of land to United States officials which had been declared by common report to be the real moving cause of the treaty. But the "San Domingo scheme," with its accompanying charges of fraud, corruption, bargain and jobbery, had by this time become highly unpopular, and the president, in a special message of April 5, 1871, abandoned the question to congress, appealing to the candor and intelligence of the people for a justification of his own action. No further action was taken in the matter. President Baez, of San Domingo, had been the most efficient agent of the proposed annexation; and his government was completely overthrown by a successful revolution, 1872-3. — One of the most active opponents of annexation was Senator Charles Sumner (see his name). The controversy between him and the president became personal and angry, and in 1871 he was removed from his place of chairman of the senate committee on foreign relations, at the request of the president, by vote of the other republican senators. From that time he was in opposition to the administration until his death, in 1874. A. J.

SANDWICH ISLANDS. These islands are situated in the Pacific ocean, at an equal distance from the shores of America and Japan, between

19° and 22½° of north latitude and 155° and 160° of Paris longitude. The archipelago is composed of fifteen islands, of which only seven are inhabited or inhabitable. Their names and respective area in square kilometres are as follows: Hawaii, 12,620, Maoui, 1,966; Oahu, 1,822; Molokai, 468; Kaouai, 2,010; Nihaou, 308; Kahoulai, 94. On a total area of 19,756 square kilometres, the number of inhabitants was, in 1872, 56,897, of which 40,044 were natives. Since 1798, the date of the discovery of these islands by Cook, their population has been constantly diminishing. It amounted at that time to at least 300,000; in 1823, Mr Ellis found less than 150,000, of whom 85,000 were in the great island of Hawaii. The statements of subsequent censuses have shown still further diminutions: in 1832, the population was 130,313, in 1836, 108,579; in 1849, 84,163; in 1853, 71,019; in 1860, 67,979. These diminutions are attributed to the dissolute habits of the inhabitants. The introduction of civilization and Christianity has not yet succeeded in establishing the institution of the family there. Marriage exists only in name. The children are, for the most part, brought up by persons other than by those who begot them. The children brought up by their parents are no better taken care of. The father scarcely able to exist, his protection is almost entirely lacking. The mother, desirous of preserving her charms, which nursing children might destroy, and especially her freedom, hastens to rid herself of her progeny. The children, born spite of attempts at abortion, are, notwithstanding all the severity of the criminal laws, regularly put to death during the first year after their birth. The practices of abortion and infanticide are common in all classes of society. In the lower classes, births are very numerous; but, despite the advantages and exemptions from taxes granted to families which have more than two children, it is rare to find a family which has more than one. — The governmental and social system was for a long time a sort of feudal communism. The union of the islands under the sole rule of Kamehameha I in the beginning brought about no change in this state of affairs. The sovereign alone was proprietor of the land. It was not until 1848 that the right of possessing landed property was granted to individuals. — In 1838 all power was concentrated in the hands of royalty. At that time Kamehameha III., yielding to the advice of American missionaries, made himself a constitutional king. The constitution of 1840, which created a chamber of nobles, composed of sixteen persons, five of whom were women, with the king for president, did not prove very successful. It was necessary to revise it in 1848, and to confide the executive power to a council of ministers, presided over by the minister of the interior. This new constitution, which recognized an order of nobility, has also been reformed. The two parts of the national representation were replaced by a privy council, composed of the king, the queen, the ministers, the governors of the four largest

islands, the chancellor, the judges of the supreme court, and of eight elected members; but since that time the constitution of Aug. 4, 1864, doubled the number of the elected members of the privy council, eight of whom are chosen from among the natives, and eight from among foreigners. This parliament deliberates at will in the native or in the English language. After the death of king Kamehameha V., the author of the constitution of 1872, a descendant, in the female line, of the chief of the dynasty of Lunalilo I. was elected king, not, as has been stated, by universal suffrage, but by a vote of parliament. (He only reigned two years.)—The press plays a great part in the political system of the islands. The government is represented by the "Polynesian," a journal whose chief editor is appointed by the government, with the title of director of the press; the opposition, by the "Commercial Advertiser," the "Friend," and the "Star of the Pacific."—Almost all public offices are in the hands of English or American naturalized Hawaiian subjects. The constitution of 1840 accorded freedom of conscience; no religion has succeeded in improving the population; the ministers of all religious sects are agreed in acknowledging that their flock is Christian only in name. Schools, however, are numerous.—During 1859–60, the revenues amounted to \$656,006, and the expenditures to \$643,000. During 1870–72 the receipts amounted to \$964,956, and the expenditures to \$969,784. The customs figured in the receipts for \$396,418, the domestic taxes for \$98,983, the direct taxes for \$215,962, the *regalian* rights, postoffice, renting of domains, etc., for \$124,071. The national debt was estimated, in 1874, at \$177,971. — The soil is very fertile, and its present products would be sufficient to feed a population five times as large as that now occupying the islands. To the native nutritious plants have been added the cultivation of tobacco, indigo, potatoes and sugar cane. The exports, in 1860, amounted to more than \$1,200,000; those of 1871, to \$2,145,000, of which \$1,403,000 were native products. Oils and whalebone, sugar, coffee, wool and peltry formed the principal articles of export. The imports represented an amount of more than \$1,500,000. Six-tenths were furnished by the United States, and the other four-tenths by England, the Hanseatic cities, Sweden and Russia. The Sandwich islands are connected with all these countries and with France by commercial treaties. The independence of this archipelago was, in 1863, the object of a special recognition, in which the United States joined the following year.*

LOUIS GOTTARD.

* The Sandwich islands are also known as the Hawaiian islands, Hawaii being the largest of the group. The latest statistics give the population at 57,985, 5,916 of whom are Chinese and 4,561 whites. The capital is Honolulu, with a population (1878) of 14,114. The receipts of the state from April 1, 1876, to March 31, 1878, amounted to \$1,151,713, and the expenditures to \$1,110,472. The state debt on March 31, 1878, was \$444,900. The standing army consists of only seventy-five men. There is a volunteer corps of 400 men.—M.

SANITARY SYSTEM. I. *Public Health.*

The administrative organization of the sanitary regimen, in Europe, may be divided into three distinct systems: the French system, the English system and the German system. Other states adopt one or the other of these systems, with some modifications. — 1. *The French System.* This is characterized by the institution of collective authorities, under the name of councils of public health, and by the purely consultative powers with which they are invested. The right of execution belongs to the prefect, who is president *ex officio* of these councils. From the time of the new organization of police in the city of Paris, in 1667, the first magistrate charged with this administration, De La Reynie, formed a commission of physicians to consult upon a question relative to the making of bread. The opinions were found to be so diverse that he appealed to the faculty of medicine, which, at that time, embraced the entire medical body. In this assembly the disagreement was no less, and a commission, composed this time of six physicians and six "notable and expert" citizens, had to decide the question. Afterward, recourse was had again, more than once, to the advice of this commission, and, toward the end of the last century, the state of the sanitary police of the capital of France was relatively superior, and it filled with enthusiasm J. P. Frank, who may be considered as the founder of scientific hygiene. "I found there," he exclaimed, "a model of those courageous applications of *heroic* remedies, which will never escape criticism in certain German provinces. For many centuries the enlightened vigilance of the magistrates of this immense city has descended to the slightest details, and an eminently salutary (*segnstoll*) order of things confirms the value of most of the prescriptions which have their origin there."—The royal society of medicine was religiously faithful to that part of its duties, the usefulness of its work, in the domain of public health, extended far beyond the precincts of Paris, and has outlived the existence itself of the illustrious company. Whoever has had to treat any subject of hygiene, notably of endemics or epidemics, appreciates with real gratitude, in the memoirs of the society published from 1779 to 1790, the instructive developments of its programmes and the wealth of material it has bequeathed to students. — M. Dubois, prefect of police, took up these excellent traditions, when, by a decree dated the 18th Messidor, year VIII (July 6, 1802), he established a board of health, composed of four paid members. Since then, this board, consulted as to all questions relating to public health, has seen the number and importance of the affairs submitted to its deliberation increase in proportion as Paris has increased. Its organization was fixed by the decree of the prefect of police of Dec. 24, 1832, somewhat modified in 1838 and 1844. The decree of Dec. 15, 1851, only confirmed the existing institution. The powers of this board extend only over Paris, but there are, in each of the arrondissements of

the city of Paris and in those of Sceaux and Saint Denis, health commissions; with less extensive powers. — The example given by the capital was slowly enough followed by the administrations of the principal cities of France. From 1822 to 1832, Lyons, Marseilles, Lille, Nantes, Troyes, Rouen, Bordeaux, Toulouse and Versailles were provided with boards of health. In 1836 the government thought of a general and definitive organization of the sanitary régime in France. The academy of medicine joined eagerly in this effort with a long and remarkable report by Dr. Marc; but these projects were not realized. They were revived by the revolution of February. In the midst of the ardent aspirations for the well-being of the masses, which agitated this epoch, public health could not be forgotten. A plan was drawn up under the direction of M. Tourret, then minister of agriculture and commerce, and became the decree of Dec. 18, 1848. This act applied only to the departments; it organized commissions of health in each department, arrondissement and canton, composed of physicians, apothecaries, architects and other specialists. Their powers extended over the healthfulness of the public highways, houses, workshops, schools, etc.; over the slaughterhouses, factories and other industrial establishments, the nuisances of all kinds, dangerous animals, cemeteries, epidemic and endemic diseases, as well as over epizootics. Their powers also extended to the surveillance of the quality of the foods, beverages, condiments and medicines of commerce. The decree mentions also many other points; but, as they seem to be entirely neglected, we may pass them over in silence. In fact, the occupation of the boards of health consists chiefly, as M. Tardieu admits, in examining demands for the licensing, removing or abolishing dangerous, unhealthy or incommodious establishments, governed by the decrees of Oct. 15, 1810, and Dec. 31, 1866. The committees find at times useful auxiliaries in the *physicians of epidemics* and the *cantonal physicians*. The first, established since May 2, 1805, in each arrondissement, must, at the first request which they receive from the subprefect, go to the localities in which an epidemic has broken out, examine into the circumstances of the situation, the habits of the people, etc., which might have caused it to originate or which favor it, and prescribe the measures proper to arrest its progress, as well as the method of treatment. The cantonal physicians date from April 13, 1835, and are as yet in only a certain number of departments. — The organization of the *Comité consultatif d'hygiène publique de France* was regulated by the decrees dated Aug. 10, 1848, Oct. 23, 1856, and Nov. 5, 1869. It is composed of physicians, a chemist, an engineer of roads and bridges or of mines, an architect, and various functionaries. The province of the committee extends to quarantines and to the service of the sanitary physicians established in the orient; to the measures to be taken to prevent and combat epidemics; to the improvement of the thermal

establishments, and to means of rendering the use of them more accessible to invalids who are poor. — The law of April 13, 1850, also instituted, besides, "in each commune where the municipal council shall have declared it necessary," commissions of unhealthy houses, furnished with the power necessary to bring about the purification of such houses. — The academy of medicine is the completion of the aggregate of the institutions with which we have to deal here. It encourages by honorary rewards the study of epidemics, centralizes the results which this study produces, and presents annually, in its learned memoirs, a tableau of the diseases which have prevailed in the different parts of France. The care of propagating vaccine, and the centralization of the observations made in the establishments of thermal or mineral waters, are also confided to it. — Italy, Belgium and Spain follow, in their sanitary system, the way of the French. But it would be departing from the truth to place these countries in the same line. In the middle ages, Italy had already preceded other countries on this road, and to-day it still occupies an honorable rank among countries which give their attention to public health. — 2. *The English System.* Intelligent provisions relative to the construction and maintenance of public highways, dams and sewers; regulations concerning unhealthy trades and the construction of houses, dating from the reigns of Henry VIII. and Queen Elizabeth, had fallen into disuse. Under George IV. a law declared that each person had the right to remove objects which were "to the annoyance of all the king's subjects," and "of doing one's self justice." Then it was necessary to bring long and expensive lawsuits, which were very much disapproved of by everybody. And yet there was the appearance of a sanitary police. It was confided to local juries; their organization and the services which could be expected from them may be inferred from the following example. In a district frequently ravaged by contagious fevers "of the gravest kind," the jury was composed of twelve members, of whom six were toll-keepers, one or two cheesemongers, three or four tailors or drapers, one mason, one house builder, and no physician. No one, they acknowledged themselves, knew anything of the business in hand, except how to examine weights and measures; and without the fortuitous presence of the builder, they would neither have understood, nor been able to do anything of, what was incumbent upon them. — Such was the situation when the invasion of the cholera brought to an end this too long continued security. The tribute paid by England to the scourge was great. In one year alone she lost 70,000 individuals, of whom 30,000 were adults. This was 10,000 more men than the wars of 1800 to 1815 had cost her. And this was not all. In presence of these hecatombs, it was recalled that other epidemic diseases, almost unknown elsewhere, subjected, at all times, the English populations to a regular diminution, and it had to be acknowledged that those wealthy cities

and those sunny stretches of country were as if poisoned by murderous miasmas; that those majestic rivers, the pride of the country, carried death in their corrupt waters; that the royal residences and even the interior of the palaces were filled with dangers. As soon as these cries of alarm were heard, England looked the enemy in the face, and understood that, to conquer it, radical measures were necessary. — From 1848 new laws paved the way for a general healthfulness by means of the drainage of the marshes, the streets and the houses, as well as the establishment of aqueducts and sewers. This vast undertaking was confided to a general board of health, furnished with great executive authority and powers proportioned to the difficulties of the enterprise. In the special interest of the new sanitary police, the entire country was divided, by geological basins, into districts wholly independent of the administrative arrangements of the parishes, etc.; physicians were charged with the medical care of the poor, who were, moreover, visited and aided by a great number of relief officers — This organization appears to have been only partially successful, especially outside of the capital; complaint was made of the multiplicity of laws and authorities, one charged with the poor, another with the sewers, others still with unhealthy houses, etc. A law of 1872 (Aug. 10, 35 & 36 Victoria, chap. lxxix.; see also the sanitary act of 1866) concentrates this service in the hands, either of the municipality in the cities, or of poor boards. All power is given them to take the necessary measures and to levy taxes, to appoint and pay physicians, and to have charge of the execution of measures of sanitary police. The sanitary service comes within the functions of the board of local government, which causes its execution to be seen to by inspectors appointed for that purpose. — 3. *The German System.* The principle of cantonal physicians, official guardians of the public health, and expert physicians attached to the courts, charged with visiting the poor gratuitously, is everywhere in force. A hierarchy, similar to that of the administrations, binds them to a medical college forming part of the provincial authority. At the top of the pyramid is a superior committee. This system does not seem, however, to be sufficiently efficacious, at least as regards epidemics, for in 1872, the government appointed a commission to devise the organization of a service embracing all Germany, public health being within the functions of the federal government. — Holland, Russia, Sweden and Denmark have organized their sanitary institutions after the German system. — II. *Endemics and Epidemics; Contagious Diseases; Quarantines.* The diseases which have a right to the attention of the legislator and of the administration constitute three classes. They are: endemic, epidemic and contagious diseases. *Endemic* diseases arise from the conditions of the configuration of a country, from its meteorology, from the geological structure of its soil, from the distribution of its waters and their qualities, from its vegetation and all its prod-

ucts, from the food of its inhabitants, from their mode of life, from their ease or their poverty. The number of affections of this order is large, if one considers them in all the zones of the globe. Here it is sufficient to cite the most prominent examples in certain climates: cretinism, with the endemic goitre, intermittent fevers, pellegra, etc. When we consider that the goitre and cretinism constitute a veritable physical and moral degeneration of man; that it is fatally propagated by heredity; that on the territory of France live more than 100,000 of these unfortunates, and that the number of them is still more considerable in Switzerland, Piedmont, Austria, etc.; that the endemic intermittent fevers, in their various pernicious forms, very often carry death in their train, and when they are of an intense degree, keep entire populations in an habitual state of debility, incapacity for labor, and sunk in profound poverty, we must admit that the ravages produced by this category of evils outweigh every other danger which can temporarily threaten public health. — Fortunately, the state can do much to improve this state of things. The drainage and cultivation of the marshes, the planting of the downs, irrigating canals, drainage practiced on a sufficient scale, are sure means of producing healthfulness. A government must not even recoil before the removal of a small population, when it is absolutely impossible to modify the topography of the localities which it inhabits, as may happen in certain narrow valleys, and mountain gorges, seats of cretinism. These great public works necessitate, it is true, very considerable expense. But public interest counsels these productive expenses as much as humanity commands them. — Any disease which attacks simultaneously in a place a more or less considerable number of individuals, is called an *epidemic*. Strictly speaking, we should not have to cite examples here, for we would have to pass in review almost all the immense repertory of medical practice. We see even epidemics of erysipelas and of brain fever; as, on the other hand, we observe isolated cases of affections which we are most used to regard as being of an epidemic character, such as small-pox, cholera, etc. Epidemics belong to those cases in which society finds the compensation of the sacrifices it has undergone to increase the well-being and strength of its members even in the lowest ranks. The evil is always so much the more formidable and is so much the more extensive as it encounters the less resistance; and where can this resistance be found except in the vital energy of those who are exposed to the attacks of disease? Moreover, hygienic and healthful measures, hastily improvised when an epidemic is imminent or has already broken out, present the double inconvenience of being particularly expensive and of a very limited efficacy. — A *contagious* disease is one which can be transmitted, by the contact of an individual who is already affected by it, to one or more other individuals predisposed to catch it. This definition differs essentially, we see, from the

one we gave in the preceding paragraph; it establishes a well-defined line of demarcation between the two classes of diseases. There exist undoubtedly contagious diseases which are never epidemic, just as there are important epidemics into which the element of contagion never enters; for these latter, the question is only one of isolation, sequestration, quarantine. — Antiquity, although it was acquainted with very terrible epidemics, opposed to them only a stoical courage and a few measures of general hygiene. In the middle ages only, at the same time that the frequency and violence of the "pests" took a frightful development, did efforts of direct defense against them begin to be taken. The terror which they inspired was extreme, the weapons with which they were fought were often barbarous. Society saw itself powerless to attack the evil in its source, by transforming the physical state of Europe and improving the material and moral existence of its people. It conceived the idea of closing access to its cities to the enemy, and of hemming it in, like a conflagration, when it had once penetrated there. The disease considered especially contagious, leprosy, had its permanent quarantines. Veritable centres of an unclean and crowded population, the settlements of lepers soon became themselves, by hereditary propagation, more surely than by contagion, immense centres of infection, which that heartless time ended by recognizing only one way of opposition, the funeral pile and the stake, its last argument in hygiene, as it was in politics and theology. — The Italian republics sought, from the second half of the fourteenth century, in *quarantines* a means of protection against the invasion of pestilential diseases, although the greater part of these diseases, far from being the real eastern plague, were not even contagious. Milan possessed a lazaretto with nearly 500 rooms. Having at that time the monopoly of the trade with the Levant, Venice instituted, in 1403, the first maritime quarantine; Genoa followed this example in 1467. The regulations designed for these institutions were drawn up with Draconian severity, and the traces of them have been very slowly effaced. Scarcely a century ago, shipwrecked men, who were supposed to come from a port where an epidemic prevailed, were driven from the shores of Holland with cannon, and in our day we have seen pitiless instructions given to the troops who, on the frontiers of Poland and Russia, formed the sanitary cordon against the cholera. Despite a permanent sanitary cordon, maintained, from 1728, by Austria upon all its eastern frontier, its provinces were ravaged by the plague in 1738, and from 1755 to 1757. — In France, up to the year 1822, there existed no sanitary law, although Marseilles, in obedience to the wants which its relations with the east created, had for a long time developed the institutions bequeathed by previous centuries, and had evolved from its old *captains of health* the magistracy of *sanitary supervision*, no less independent than they. The invasion of the yellow fever into Catalonia

soon brought about the promulgation of a law, dated March 3, 1822, followed by a royal ordinance of Aug. 7 of the same year. The precision with which, in 1830, it was believed the advance of the cholera could be followed from the delta of the Ganges to the centre of Europe, revived with new force the hope that the progress of diseases considered to be communicable might be arrested. The experiment was not fortunate for the contagionist doctrines, which had been previously shaken so far as the yellow fever and the plague were concerned. Legislation had to undergo modifications, which were formulated by the royal ordinance of Aug. 17, 1847 (which instituted European sanitary physicians in the Levant), a decree of Aug. 10, 1849, and a decree of Dec. 24, 1850. Then France took an initiative, the happy influence of which must be acknowledged. She was the instigator of an *international sanitary conference*, formed by the various powers which have joint interests in the Mediterranean. In 1850 there assembled at Paris delegates from France, Austria, the Two Sicilies, Spain, the Roman States, Greece, Portugal, Russia, Sardinia, Tuscany and Turkey, who, after thorough discussion, decided on a project for an international convention and for sanitary international regulations. England was also represented at this congress, but she did not sign the convention which was the result of it. Adopting the advice of her general board of health, she renounced all organization intended to keep away from her shores the cholera, the plague and the yellow fever. Neither in France nor elsewhere did people dare to break, in so radical a manner, with deep-rooted ideas and apprehensions. But the new code has freed commerce from a great part of the shackles and the injury which were becoming more onerous in proportion as the circle of communications between nations enlarged. — The imperial decree promulgating this international convention bears date May 27, 1853; the decree relative to its being put into execution is dated June 4 of the same year, and was followed by detailed instructions. After having declared that this act applied especially to the plague, the yellow fever and the cholera, the convention sets forth in principle that besides any healthy port has the right to fortify itself against a ship having on board persons affected by a disease reputed contagious, such as typhus fever and malignant small-pox. It maintains the *foul bill* and the *clean bill*: the former, for the proven presence of the disease in the country from which the ship comes, the latter, for the attested absence of all contagious disease. Every ship arriving with a *foul bill* shall be declared in quarantine. The latter is divided into quarantine of observation and close or rigorous quarantine. In what concerns the plague, the minimum of the quarantine is fixed at ten full days, and the maximum at fifteen. For the yellow fever, the minimum is five days and the maximum seven; for the cholera, the quarantine of observation is five full days, including the time of the voyage. — For merchandise, three categories have

been established, and they must be treated according to the class to which they belong. The execution of the prescriptions is confided to sanitary authorities, who are everywhere organized upon uniform bases. The *director of health*, taken when possible from the medical body, is the head of the active service. A council, composed of local scientific elements, watches over the interests of the public health, exercises a general surveillance over the sanitary service, gives advice as to the measures to be taken in case of invasion, and controls its execution. — Besides the provisions common and applicable to all the countries signing the convention, Turkey in Europe and Turkey in Asia, as well as Egypt, are the object of particular provisions, intended to prevent the development of the plague, to stop this disease when it exists, to give notice of it, and to oppose its introduction into other countries. To this end a superior board of health has been established at Constantinople, and a sanitary board at Alexandria; foreign delegates, who must as much as possible be specialists, form a part of these boards. — This organization is completed by the development of the institution of sanitary physicians, established in 1847, who are divided into two classes: central physicians and ordinary physicians. Appointed by the contracting powers, they preserve their independence of the local authorities, and are dependent only on the governments which appointed them. Their functions consist in studying, in its relation to public health, the country where they are, its climate, its diseases and all the conditions attached thereto, as well as the measures taken to combat these diseases; to inform the central physician of the arrondissement or district (a central physician resides at Constantinople, Smyrna, Beyrouth and Alexandria), and the local consular body and the local authorities, of everything which has to do with the general health. — Finally, physicians, commissioned by the minister of agriculture and commerce, are shipped upon the steamers, which are the most active intermediaries between France and the Levant. These men are there, as so many posts of observation, whence they must signal the slightest suspicious disease which may arise during the voyage.

M. BORCHARD, D. M. P.

SAVINGS. Saving is the intended conservation of the whole or part of a useful object; it is the setting apart of what is not indispensably necessary for actual wants; it is a provident reserve for certain contingencies, a provision or resource which perseverance increases from day to day, to guard against the necessities of an uncertain future. The saving is direct when it is exercised on the object itself, which is not actually consumed. It is, however, generally indirect, taking the form of money laid by until a profitable investment is found for it, or it is intrusted to some private or public savings institution. — Adam Smith was the first to study the nature of *savings*, and he did it like a profound economist, politician and philosopher. Smith values highly the man

who saves, as a benefactor of society, as the originator of a public workshop, which furnishes employment to a greater or less number of producers; the constant, uniform and uninterrupted effort of individual saving, he raises to the rank of a principle, and he sees in this principle the prime source of national wealth. The spirit of saving, he adds, is always more extensive than the wastefulness of prodigality can possibly be; its reparatory power is enormous, and no matter how great the waste of individual or governmental imprudence, it is still at work in the nation, unknown and in silence, from the irresistible necessity of assuring the future; this spirit realizes such an amount of saving, that, from one historical period to another, we may easily recognize a constant improvement in public and private fortunes. According to that illustrious economist, the immediate cause of the increase of a nation's capital is saving, and not industry. Industry, it is true, furnishes the material which is to be placed in reserve, but saving alone accomplishes this reserve, and without it, capital, being entirely consumed as fast as it is produced, would never become any greater. — Frederick Bastiat, in an unfinished chapter of his "Economic Harmonies," bases the résumé of his entire doctrine, exchange and value, upon the definition of saving. "To save," he says, "is voluntarily to place an interval between the time when we render a service to society, and the time when we demand back an equivalent therefor. Thus, a man may, every day, from his twentieth to his sixtieth year, demand from his fellows, services equivalent to only three-fourths the value of the services he renders them in the practice of his profession or trade. Thus he acquires the right of drawing from society, in his old age, when he can no longer work, the unpaid fourth of his labor of forty years. The fact of his having received and accumulated titles, in the form of bills of exchange, sight drafts, bank notes and specie, is an entirely secondary matter and of no moment; it has reference only to the manner of accumulation; it can not change either the nature or the effects of saving. * * To save, therefore, is to have rendered a service, and granted time for the return of its equivalent, or, to speak more generally, it is to allow a certain space of time to elapse between the service rendered and the service received." — One of the most dangerous anti-economic prejudices advanced, is that which considers saving as a veritable injury to society, and especially to labor. It is urged by unthinking men, that, to encourage commerce, it is necessary to spend, and to spend a great deal. This is even made a governmental rule in too many cases. This disastrous sophism, which, as Adam Smith has remarked, has not yet succeeded in ruining nations, because the power of saving is greater than that of prodigality, at least impedes the development of general prosperity, and impoverishes or overburdens with debt, the cities which administer their affairs in accordance with it. It is based upon a singular illusion, which identifies the man who saves with

the avaricious miser, whose only care is to hoard up treasure. In times of invasion or trouble, in the absence of all security, when men's minds are tortured by the fear of pillage, the man who has received money in exchange for his services, may be driven to imbed it in a wall, or bury it in the ground, in order to save it from brutal cupidity. But in the normal state of society, unless a man be a fool or most profoundly ignorant, he will find some more profitable place for his spare capital; he will buy interest-bearing notes, or a direct interest in some industry, or he will purchase produce with the speculative chance of selling it again at a profit, or, better still, he will become an owner of real estate. How can these different operations be prejudicial to society, to industry, or even to the laborer, who is always pitied in the same breath which blames the man who saves? Workmen are the most interested of all in the general increase of capital, and, as we have seen, capital can only be increased by means of saving. In considering expense as a benefit, we must always bear in mind the great distinction that should be made between the free and voluntary outlay of a private individual who makes use of his own revenue as he wills, and public or forced expense. In the latter case, if it is intelligent and reproductive, it may turn to the profit of those who bear the expense; if foolish and unproductive, it impoverishes them, since they do not receive any equivalent advantage in return, and it benefits only a few, whose accidental or frivolous and superfluous labor it makes use of. Unfortunately such errors are regarded as incontestable truths and irrefutable axioms, by men who are otherwise most enlightened, in the official world, and they have long been the cause of disorders whose direful consequences are simply incalculable.

LOUIS LECLERC.

SAVINGS BANKS. (See **BANKS, HISTORY AND MANAGEMENT OF SAVINGS.**)

SAXONY. The kingdom of Saxony forms part of the German empire; it has an area of 14,963 square kilometres; its frontiers, with a total length of 1,191 kilometres, border on Prussia to an extent of 306 kilometres, and on Austria to an extent of 644 kilometres; the rest is bounded by various other states of Germany. — The population of the kingdom of Saxony was 2,225,280 in December, 1861, and 2,556,022 at the end of 1871; in 1880 it was 2,972,805; the country is therefore one of the most densely populated of Europe. In 1815 there were only 1,178,802 inhabitants; the population has therefore more than doubled since that time. — *Constitution.* The constitutional act of Saxony dates from Sept. 4, 1831, but it has been modified by the laws of May 5, 1851, Nov. 27, 1860, Oct. 19, 1861, Dec. 3, 1868, and Oct. 12, 1874, without, however, being altered in its spirit. The diet is composed of representatives of the various orders. The first chamber comprises the adult princes, five *mediatized* lords, two deputies of Protestant estab-

lishments, one deputy of a Catholic establishment (*stift*), one deputy of the university of Leipzig, two Protestant prelates, twelve proprietors of equestrian property elected for life by their order, ten equestrian proprietors appointed for life by the king (the first must possess a net income from lands of 2,000 thalers, and the second of 4,000 thalers), eight burgomasters of the principal cities, and five persons chosen by the king. The second chamber consists of twenty deputies of equestrian proprietors (having an income from land of at least 600 thalers), twenty-five deputies of the cities, twenty-five deputies of the peasants, and ten deputies of the merchants and manufacturers. All these deputies must belong to the order or the class or the district which sends them to the chamber. The whole political organization is conceived in a conservative spirit. Thus, the chambers assemble only every three years; the budget is voted for a triennial period; the deputies are elected for nine years. The formation of political parties is hindered by the fact that the deputies can not choose their own places in the hall where the sittings are held, the places being determined by law or distributed by lot. The government alone has the right of initiative. When a bill has been adopted by one chamber, the other can not reject it except by a majority of two-thirds of the votes of the members present. Ministers can not be impeached except by an agreement of the two chambers. The high court of justice, which is the court of last resort, has jurisdiction in such cases as well as of every question as to the interpretation of the constitution. It is composed of twelve members, of whom six are appointed by the king from among the judges of the kingdom, three by the first and three by the second chamber, outside of the diet; the high court is presided over by one of the presidents of the courts of appeal chosen by the king. In Saxony the power of the crown is less limited than in most other constitutional monarchies, which results in part from the antiquity of the dynasty and in part from the moderation and spirit of justice which, for many generations, have animated the princes of the house of Saxony. However, as long as the royal family remains Catholic, it will not be invested with the episcopal power which Protestant sovereigns enjoy; three or four members of the ministry are charged with the exercise of that power. — *Administration and Justice.* The country is divided into four circles (departments) the smallest of which had (1874) 330,000 inhabitants and the largest 959,000 inhabitants. At the head of each circle is a directory charged with the administrative affairs, with those of worship and instruction. The circles are divided into grand bailiwicks (*amts-hauptmannschaft*) to the number of fifteen in all, and the grand bailiff may be considered as the subdelegate of the directory. In the inferior hierarchical degree of administration we find in forty-eight cities, city (municipal) councils, and in the country 121 bailiwicks (districts of 4,000 to 86,000 inhabitants), which the large proprietors gratuitously

aid as justices of the peace. The city communes possess a certain degree of autonomy. Civil justice includes as of first resort the 121 bailiwicks and (for more important matters) sixteen tribunals, whose jurisdictions extend over 84,000 to 265,000 inhabitants; above these tribunals figure four courts of appeal, one in each circle; and finally, the supreme court of appeal (third resort) sits at Dresden. In criminal cases, the trials are public, the pleadings oral, and there is a public prosecutor. Leipzig is the seat of the supreme court of commerce for all Germany. — *Worship and Instruction.* There were, in 1874, 1,243 churches, of which 1,211 were Lutheran, distributed among 897 parishes, which form thirty-seven superintendent circumscriptions. There are only 51,000 Catholics in Saxony. Public instruction includes 1,977 primary schools (instruction is obligatory), seventy Sunday schools, eight primary normal schools for male instructors and one for female instructors, eleven gymnasia (lyceums), one university (Leipzig), one academy (school) of mines, two agricultural and forestry institutions, one veterinary school, seven *realschulen* (schools of the exact sciences), two polytechnic schools (of arts and manufactures), two conservatories of music, two academies of fine arts, five schools of architecture, three commercial schools, etc. There are few countries so rich in institutions of learning, both elementary and superior, in museums, collections, and other means of instruction. — *Finances.* In the triennial financial period 1861-3, the revenue, net receipts, was 12,356,352 thalers; in the period 1864-6 it was 13,227,924 thalers; in 1872-3, 13,752,919 thalers, not including the extraordinary budget of nearly 26,000,000, intended for the construction of railways, and derived from the disposable funds of the state, principally from loans. The ordinary revenues, the only ones with which we need to occupy ourselves here, proceeded, in 1872, from the following sources :

Domains :	Thalers.
Forests	1,727,523
Agricultural domains	137,074
Mines	230,000
Royal manufactory of porcelain at Meissen	48,480
Miscellaneous	64,813
Total domains	2,197,890
Crown rights, net product:	
Railways	4,900,900
Taxes on the mines	261,536
Highway and bridge tolls	225,965
Miscellaneous	20,600
Total crown rights	5,417,301
Special resources (which the Saxon budget wrongly places under the head of "productive capital") :	
Interest of debts	1,230,000
Lottery	818,520
Charges of justice	52,900
Reserve of official salaries	40,950
Miscellaneous	5,138
Total special resources	2,147,508
Direct taxes :	
Real estate	1,677,870
Industrial and personal	1,298,500
Total direct taxes	2,976,370

Indirect taxes :	Thalers.
Customs and consumption	613,860
Stamps	400,000
Total indirect taxes	1,013,860
Total direct and indirect taxes	3,990,230

The total amount of the taxes was reduced by the fact that the postoffice, telegraphs, customs, salt and other direct taxes were given to the German empire, which, in return, charged itself with certain expenses. Let us only remark that the customs are mentioned in the above table because Saxony appoints the customs officers the whole length of its frontiers, and retains out of the receipts which it turns into the coffers of the German empire the necessary sums to pay the agents and for material expenses. — The following are the principal items of expense of the state, in thalers :

ITEMS.	1864.	1872.
Civil list	600,000	675,000
Appanages	205,666	191,162
Interest of the public debt	2,285,231	5,487,551
Liquidation	836,293	44,166
Diet	51,520	51,520
Ministry of state, archives of the state, court of accounts	31,890	35,390
Ministry of justice	565,547	587,452
Ministry of the interior	995,944	1,327,718
Ministry of finances	510,209	511,402
Ministry of war	2,255,957
Ministry of worship and public instruction	453,177	853,898
Ministry of foreign affairs	98,745	51,755
Quota to the expenses of the German empire	35,900	1,781,807
Pensions	596,910	544,875
Public works (and railways)	3,420,820	2,172,620
Other expenses	192,370	207,580
Unforeseen expenses	100,000	113,304
Total	13,236,179	14,637,185

The public debt amounted, in 1819, to more than 25,000,000 thalers; in 1842, it had decreased to 13,155,000; in 1861, the construction of the railroads raised it to 56,133,333 thalers bearing interest, and to 7,000,000 of paper not bearing interest. Jan. 1, 1873, the debt amounted to 103,003,250 thalers, besides 12,000,000 of paper money. Eighty-four millions of this debt must be charged to the railroads. The property of the state is worth nearly one hundred millions, about eighty-four of which are in real estate, and fourteen millions in personal property. — *Army.* Military service is regulated by the German legislation. (See GERMAN EMPIRE.) — *Agricultural and Industrial Resources, etc.* The kingdom of Saxony is one of the most advanced countries. Agriculture has been brought to a high degree of perfection. 50.31 per cent. of the total area of the country consists of arable land, 2.85 of gardens, 11.28 of meadows, 0.12 of vineyards, 2.1 of pasture land, 30.95 of forests, and 2.39 of uncultivated lands. The soil is but little parceled out into small properties, for so populous a country. This results in part from the law which permits each rural domain the exploitation of a third only of its extent. The 971 equestrian properties, possessed in part by people who

are not nobles, form 13 per cent. of the private estates; 24 per cent. of the remainder of the real estate belongs to inhabitants of the cities, and 63 per cent. to the actual cultivators of the soil. An equestrian property is worth, on an average, 90,000 thalers; six only exceed in value 420,000 thalers. The peasants, free since 1830 from all feudal tax, are in comfortable circumstances; yet, Saxony imports 7.2 per cent. of its consumption of cereals. According to the census of 1873, the country possesses 115,667 horses, 120 asses and mules, 647,074 horned cattle, 206,830 wool-bearing animals, 301,091 hogs, 105,401 goats, and 64,283 hives of bees. — Saxony is an industrial country, for less than a third of the population lives by agriculture, while more than two-thirds are devoted to industry, commerce and the liberal professions. In 1862 there were in the manufactories 290,108 masters, clerks and workmen. There were employed 303,397 spindles for carding wool, 104,622 for combing wool, 707,387 in the cotton mills, 13,082 in the flax mills, and 520 in the silk manufactories. Small industry gives occupation to 61,129 masters and 101,178 artisans; the corporations did not lose their privileges till 1861. The distribution of steam machines is remarkable: 275 (6,442 horse power) belong to the mines and works; 75 (374 horse power) to agriculture; 32 (630 horse power) to the mills; 247 (30,898 horse power) to the transport establishments; 605 (8,071 horse power) to the manufactories. Progress has been so rapid for some time that in 1874 the number of spindles and that of the machines may be considered to have doubled. — The value of the commercial movement can not be separately settled, but Saxony must furnish a considerable share to the commerce of the zollverein. The city of Leipzig, notably, is celebrated for its great fairs, where millions of quintals of merchandise are gathered together; this city, besides, is the centre of the German book trade; and it alone has 217 bookstores. — The length of the state railways in 1874 was 108.8 miles of 7½ kilometres, the cost of constructing which, up to 1871, was 74,479,430 thalers; the length of the private lines is 34.4 miles; the length of the highways is 406 miles, and that of the roads 88½ miles. The postoffice carried, in 1861, 12,083,513 letters and packages, and in 1871, 28,819,176, not including 1,042,381 and 1,841,940 local letters in these years respectively; in 1861, 2,012,433, and, in 1871, 2,902,698 money packages, containing nearly \$231,000,000 in 1861, and \$279,000,000 in 1871. In 1861 the number of telegraphic dispatches was 4,015 official, and 132,552 private. There are three banks, two of which have the right to issue bank notes. — Saxony is the country in which saving is carried to the greatest extent. There is a savings bank to every 2.5 square miles (in England to every 9.4, in France to every 24, and in Prussia to every 11); or, one to every 19,400 inhabitants (in England to every 44,300, in France to every 87,000, and in Prussia to every 38,257). There is one depositor out of every 8 inhabitants (in England out of every 18, in France 32, and in

Prussia 31). The average amount on each depositor's book has been 59.6 thalers (in England 184, in France 80, and in Prussia 80). Finally, dividing the amount deposited among the whole population, the average is 7.5 thalers to each inhabitant (10.2 in England, 2.5 in France, and 2.6 in Prussia).*

WILLIAM ROSCHER.

SCHOOLS. (See EDUCATION AND THE STATE)

SCHURZ, Carl, was born near Cologne, Germany, March 2, 1829. He took part in the revolutionary troubles of 1848, came to the United States in 1852, entered political life as a republican, and reached the grade of brigadier general during the rebellion. He then settled down to newspaper work, and in 1867 became editor of a St. Louis newspaper. In Missouri he was one of the leaders of the "liberal movement" (see LIBERAL REPUBLICAN PARTY), and was elected United States senator in 1869 for the full term. His abil-

* At the census of Dec. 1, 1880, the population of Saxony was composed of 2,876,138 Lutherans; 72,946 Roman Catholics; 1,467 German Catholics; 10,235 members of other Christian sects; and 6,516 Jews. The clergy are chiefly paid out of local rates and from endowments, the budget contribution of the state to the department of ecclesiastical affairs amounting to but 85,593 thalers, chiefly spent in administrative salaries. The government of the Protestant church is intrusted to the *Landes-Consistorium*, or national consistory. Public education has reached the highest point in Saxony, every child, without exception, partaking of its benefits. By a law of June 6, 1835, attendance at school, or under properly qualified teachers, was made compulsory. The kingdom has the second largest university in Germany, that of Leipzig, founded in 1409, and attended, on the average of recent years, by nearly three thousand students. — The financial period extends over a term of two years. In the financial accounts, both the revenue and expenditure are divided into "ordinary" and "extraordinary," the latter representing income from state domains and disbursements for public works. The ordinary revenue for each of the two years 1882-3 was returned at 67,767,236 mark, and was balanced by the expenditure. The extraordinary revenue for each of the two years 1882-3, likewise balanced by the expenditure, was returned at 4,014,905 mark. More than one-half of the total revenue of the years 1881-2 was derived from domains and state railways. The chief branch of expenditure is that of interest and sinking fund of the public debt, amounting to 31,593,138 mark, for the years 1882-3. The debt was incurred almost entirely for the establishment and purchase of a net-work of railways and telegraphs, and the promotion of other works of public utility. The total debt had risen on Jan. 1, 1881, to 669,568,425 mark, and in 1882 to 673,445,475. — The population of Saxony, by the census of Dec. 1, 1880, was 2,972,805, comprising 1,445,330 males, and 1,527,475 females. The area, in English square miles, and the population, of the *Hauptmannschaften*, was as follows at each of the two enumerations of Dec. 1, 1875, and Dec. 1, 1880:

Kreis-Hauptmannschaften.	Area, in Eng. Sq. Miles.	Population	
		Dec., 1875.	Dec., 1880.
Dresden	2,229	749,503	808,722
Leipzig	1,290	639,731	707,426
Bautzen	1,232	339,203	351,326
Zwickau	2,086	1,031,905	1,165,141
Total	6,777	2,760,342	2,972,805

ity as a speaker and writer induced the republican party to condone his offense of "liberalism," and he became secretary of the interior under Hayes. — See Davis and Durrie's *History of Missouri*, 598; Schurz's *Speeches*, 1865. A. J.

SCIENCE, SOCIAL. (See SOCIAL SCIENCE.)

SCOTLAND, the northern part of the island of Great Britain. The length of the mainland, from the Mull of Galloway, in latitude 54° 39' north, to Dunnet Head, in Caithness-shire, in latitude 58° 40' north, is 278 miles; the breadth, from Buchanness, in Aberdeenshire, in longitude 1° 41' west, to the most westerly point in Ross-shire, in longitude 5° 52' west, is 150 miles, while between the firths of Forth and Clyde, the breadth is only thirty miles. The area, including the islands, 186 in number, is 29,819.09 square miles, or about half the size of the state of Michigan. Its population in 1881 was 3,735,573; in 1811 it was but 1,805,864. — Although small in size, thinly populated and poor, Scotland, for many centuries, has occupied an important place in the annals of western Europe. Respectable historians have prefaced the history of Scotland with an imaginary line of kings descended from a fabulous daughter of Pharaoh, called Scots, who, fleeing from the plagues sent to punish her father's obstinacy, peopled Scotland. — The first reliable knowledge we have of Scotland is derived from Julius Cæsar, who invaded the island in the year 55 B. C. Julius Agricola first explored its northern coasts with his fleet, and informed the Romans that Britain was an island. In the 80th year of the Christian era, Agricola led the legions of Rome across the line which in later days marked the boundary between England and Scotland, and his son-in-law, Tacitus, in recording his achievements, first made Caledonia familiar to the Roman world, and brought a new country within the scope of authentic history. — Although the Romans effected no permanent conquest beyond the neck of land between the firths of Forth and Clyde, yet they more than once pushed their armies far northward. There are more known Roman ramparts, forts, camps and roads in Scotland than in all the rest of the world—vestiges of a close, continued and doubtful warfare. The Caledonians, who so long and so effectually kept the conquerors of the world at bay, are described as barbarous and warlike, with red hair and large limbs, and rugged as the land they inhabited. They painted their bodies, and could stand great hardships. Their arms were bows and arrows, small shields, short spears, and pointless swords; they fought also with chariots drawn swiftly by small horses. They were polygamous and idolaters, their religion being druidical. The name Caledonia, although used by the Romans, had no place among the natives, whose name for Scotland was Albin. The Roman civilization had no influence on Scotland except as it reached that country in after times from the continent. — When the Romans withdrew, the in-

habitants of Scotland consisted of the Romanized Britons of Strathclyde on the south, the Dalriads, or the Scots of Ireland, on the west, and, largest of all, the kingdom of the Picts, embracing the whole of Scotland northward and eastward from the firth of Forth. The archaeological hosts have long fought over the Picts. Were they Celts, or Teutons? Were they the same as the Caledonians of Tacitus, or the Scots of Ireland? What language did they speak? These are questions which will probably never be settled. — The most important event in the history of the Picts was their conversion to Christianity, in the sixth century, by St. Columba and other missionaries from Ireland, who settled in the isle of Iona. — When the writers of the early Christian centuries speak of Scotia, they refer to Ireland. The Mull of Cantyre, in Argyleshire, is only twelve miles from the county of Antrim, and the Scots spread in great numbers into Argyle and the western isles, so that there came to be two Scotias, and, prior to the twelfth century, a Scot might have meant a native of Ireland or of Scotland. The colony of Irish Scots in Albania, or present Scotland, continued to enlarge till it became a powerful and compact state, and the term Scotia gradually became dissociated from its original country, and attached entirely to the country which now bears the name. — How it came about, history does not state; but near the middle of the ninth century the Pictish kingdom disappears from history, and Kenneth MacAlpin, king of the Scots, is found reigning over its people. It is not unlikely that the barbarous Picts succumbed to the superior aggressive civilization of the Scots. At this time the Celts were known as a lettered people, and it is not improbable the Picts felt honored in accepting the Dalriadic sovereignty as their own. — Scotland was long subject to incursions from the great Viking fleets of Scandinavia, and from the fourth to the tenth century large numbers of the Northmen settled on the coasts, and mingled with the existing population or gradually crowded them westward. The population of Scotland is probably of the most composite origin of any nation in Europe, a fact which has, no doubt, greatly influenced their national characteristics. Picts, Franks, Angles, Scoto-Galwegians, Saxons, Celts and Norsemen, all contributed to make the Scotsmen of to-day. — After Kenneth, the first king of the united Scots and Picts, followed a number of royal successors, such as Gregory the Great, Duncan, and Macheda or Macbeth, around whom has gathered a most interesting history; but unfortunately it is largely mythical. — The first monarch of whose coronation we hear, was Malcolm III., son of Duncan, known as Malcolm Canmore, who was crowned at Scone, in 1057. His wife, the good Queen Margaret, or St. Margaret, had a greater influence on the destinies of Scotland than even her husband. Through her influence the "Lord's Day" was first sanctified from labor, and she did much to introduce a higher civilization. — In the tenth year of Malcolm Canmore's reign occurred the Norman

conquest of England. The subjection of the southern kingdom by the restless and ambitious Norman opened a serious future for the Scots, and for centuries they had a ceaseless struggle to prevent their absorption by their aggrandizing and powerful neighbors. — The system of the Celts, even to their latest times, was patriarchal, and not feudal. The Highlander fought for his chief as the head of his family or clan, and not because he was his landed superior. For the same reason the early Scots fought for their king, who, indeed, was oftener called king of Scots than king of Scotland. — The Normans gradually introduced the feudal usages of the continent. Under them the king was theoretically the owner of all the land. Those cultivating the lands held them from some lord or superior, who in turn held them from the king or some other superior who did so. Each subordinate had to do homage to his superior for the lands he held, for he held them solely through the special favor of his lord, who, in return, had a right to call for military and other service. The king of Scots had estates in England, and for these, under the feudal system, had to do homage to the king of England as his superior. The English soon claimed that he did homage as king of Scotland to the king of England as his superior, and that the crown of Scotland was vassal to the crown of England. Notwithstanding that folios on folios were written by the English to prove their king lord paramount of Scotland, the Scots contested the claim for generations in many a costly war. — After Malcolm Canmore came Donald Bane, Duncan II., Edgar, Alexander I., and David I. The last named was the third son of St. Margaret, and succeeded his brother Alexander in 1124. As a true son of his good mother, he had a great influence on the condition of Scotland. In his reign the old traditional usages were first superseded by written laws. He established the bishoprics of Dunkeld, Moray, Aberdeen, Ross, Caithness, Brechin, Dunblane and Galloway, and built the abbeys of Holyrood, Melrose, Jedburgh, Kelso, Dryburgh, Newbattle and Kinloss. He so lavished the lands of the crown on the Catholic church that King James I. said that "he was ane sair sanct for the crown." David reigned twenty-nine years. He was all to Scotland that Alfred was to England. After him came his grandson, Malcolm IV., who was not twelve years old when he began to reign. He was king twelve years, but leaves no special mark on history. — He was succeeded, in 1165, by William I., surnamed the "Lion," who was taken captive at the siege of Alnwick. King Henry granted him his release only after he had signed an obligation of absolute homage to the English king for Scotland, and placed the Scots under feudal subjection to England, as if a proud and warlike people could be handed over by a slip of parchment signed under duress. Richard the Lionhearted, of England, for 10,000 marks, released the Scots from all the conditions extorted by his father from William. — William the Lion was succeeded by his son, Alexander II., a mon-

arch of great wisdom and ability, who was in turn succeeded by his son, Alexander III., whose accidental death left the crown to an infant granddaughter, Margaret, the daughter of the king of Norway, who died in one of the Orkneys, while returning to Scotland. The death of Alexander III. closed a period of prosperity, which the kingdom did not again enjoy for five hundred years. No fewer than ten competitors for the crown appeared, the chief being John Baliol and Robert Bruce, grandfather of the great Bruce. The matter was referred to Edward I. of England, who decided in favor of Baliol, stipulating that he should do homage to him as his feudal superior. The case was under discussion and consideration for eighteen months, and the decision in favor of Baliol was no doubt a correct one according to the law of hereditary descent as now established. — As Edward claimed to be lord paramount of Scotland, so the king of France made a like claim on England, and summoned Edward as his vassal to appear and do homage before him. King Philip even fixed the day when Edward should appear in Paris. Edward prepared for war, and summoned his vassal Baliol to his aid. In the war between England and France Scotland saw her opportunity, and not only refused to aid England, but formed a league offensive and defensive with France. This was the first of that ancient league which for three centuries bound the kingdoms of France and Scotland in the closest intimacy against their common enemy, England, and had a great influence, not only on the politics of Scotland, but even on its language and manners. — The Scots invaded England, which so exasperated Edward that he decided to concentrate his force on Scotland, and marched northward as far as Elgin with a great army, taking Berwick, Edinburgh, Stirling, Aberdeen, and all the other strongholds of importance. From the abbey of Scone he carried to Westminster the stone of destiny, the palladium of Scotland. It was enshrined in the chair on which the kings of Scotland were crowned. The Scots reverently believed it to be the very stone which Jacob used as a pillow at Bethel, and that it was brought to Scone by Pharaoh's daughter Scota, from whom the Scottish kings were descended. Wherever that stone might go, it was believed the Scots would be supreme, a belief which was confirmed when, afterward, James VI. of Scotland was crowned in Westminster king of England. Edward I., as he marched back, garrisoned the strongholds with English soldiers, and many of the old castles in Scotland must be assigned to this period, 1296, and their style of architecture is properly called Edwardian. The Scots found the English planted in large numbers in strongholds in their very midst, and harassing them in many most exasperating ways. While the nobility, the natural leaders of the nation, had sworn allegiance to Edward, the smaller gentry and the common people sullenly awaited an opportunity for revenge. — At this juncture appeared the renowned Sir Will-

iam Wallace of Ellerslie, not only a brave soldier, but a man of great political and military genius. Gathering around him a band of heroic spirits, he harassed the English till his successes enabled him to collect an army of some 40,000 men, with which he totally defeated a larger English army under Surrey at Stirling bridge. This battle of Stirling bridge gave great encouragement to the Scots, as it showed that their haughty neighbors were not invincible, and being the first pitched battle of importance between the two nations did much to inspire and render permanent that international animosity which has disappeared only in recent years. After defending his country with heroism for several years, Wallace was betrayed into the hands of Edward, who caused him to be executed in London in 1305. His head was placed on London bridge, and a quarter of his body exposed at New Castle, Berwick, Stirling and Perth, respectively. These bloody trophies, far from frightening the Scots into submission, aroused their wrath and strengthened their courage. They only wanted a leader to attempt summary revenge. In the meantime, Edward, believing he had conquered Scotland, took steps to incorporate it with England. The crown was to be represented in Scotland by a governor or lieutenant, to be assisted by a council. Scotland was also to be represented in the English parliament by ten representatives; three were to be selected by the prelates, two by the abbots, two by the earls, two by the barons, and two by the community or commonalty. When parliament met, an ordinance was passed for the government of Scotland, complete in all its details. Edward showed a broad statesmanship in all this, and a desire to propitiate the Scots. Being seventy years of age, he hoped for a peaceful close of his stormy life. But it was too late. The Scots had seen the effect of Norman power in England; and Stirling bridge, Falkirk and the quartering of Wallace, were not to be so easily forgotten. — In February, 1306, Robert Bruce, lord of Annandale, was missed from Edward's court, and it was found that he had left for Scotland. He was now thirty-two years old, and had been carefully trained in the English court. On his way north he met Comyn, his only rival for the crown of Scotland, in the church of the Grey Friars, Dumfries, and during a heated controversy stabbed him with his dagger. He and his followers then attacked the English judges at that time sitting in Dumfries, and drove them across the border. The die was cast, the Rubicon was crossed, and there was no retreat for Bruce. The tidings spread rapidly all over Scotland, that Bruce was in the field against the English, and the people rose like one man. In March of the same year he was crowned king in the chapel royal of Scone. King Edward promptly determined on such an invasion of Scotland as would forever suppress all opposition. The flower of England's chivalry, with all the fighting power of England, was enlisted in the cause; and the king, broken down as he was, exacted a promise that his body should be carried

with the army till Scotland was subdued. Some of the nobles of Scotland and Bruce's nearest relatives were executed as traitors, and their bodies quartered; but the Scots were not a servile people, to be cowed by such cruelties, which only served to arouse them to greater deeds of daring. King Edward died within sight of Scotland, on July 7, 1307. — The first undertakings of Bruce were unfortunate; but the death of King Edward proved a favorable turning point in the destiny of Scotland, for his son, Edward II., was no such leader as a contest like that demanded. — June 24, 1314, is the most momentous day in Scottish history, the day on which the battle of Bannockburn was fought. The Scots had between 30,000 and 40,000 men, while the English had 100,000. They had, according to agreement, to relieve the English garrison in Stirling castle before St. John's day, or it was to capitulate; and it therefore behooved them to attack the Scots in a field which the latter had selected in front of Stirling. The generalship of Bruce and the bravery of his men inflicted on England, that day, a defeat and a humiliation greater than ever befell her in all her history before or since, with the exception of the battle of Hastings. Her mighty host became a very chaos. The confusion of their flight was irremediable. The booty obtained was very rich, and articles taken at Bannockburn were treasured as heirlooms for centuries. An immense sum was also acquired by the Scots as ransoms for their noble captives. — The battle of Bannockburn marks an important epoch in Scottish history. The patriotic feelings excited and the glory acquired on that day consolidated the nation as it had never been before. It engraved on the Scottish heart a pride of their independence as a nation, which for centuries prevented a union with England; and to this day, like Thermopylæ and Marathon, it fires many a heart with an enthusiasm for liberty. The war continued for fourteen years longer, during which time England was twelve times invaded, and ravaged with fire and sword; and Edward III. was compelled to ratify a treaty in 1328, in which the claims of Bruce and the independence of the kingdom were acknowledged. — David II. was only eight years old at his father's death, in 1329, and Randolph, earl of Murray, was appointed regent. Edward Baliol, son of John Baliol, being assisted by Edward III. of England, claimed the throne, and was crowned at Scone in 1332. David, being a mere boy, was sent to France, and Baliol, being defeated soon afterward by the supporters of the Bruce dynasty, fled into England. An active warfare continued along the borders, the Scots making a diversion in favor of their ally, France, on whose soil the English king about this time gained the famous battles of Crecy and Poitiers. David returned from France in 1341, and though but eighteen years of age, he at once put himself at the head of his forces, and while invading England was taken prisoner, and remained one for eleven years. He reigned thirty-nine years, and was succeeded

by Robert II. (1371-90), grandson of Bruce of Bannockburn, being the son of his daughter Marjory, and Walter, lord high steward of Scotland, whence came the name of the Stuart dynasty, of which he was the first. Probably no regal line ever encountered so many misfortunes as did the royal house of Stuart, of more than one of whom it has truly been said that they never learned and never forgot. He was succeeded by his son, Robert III. (1390-1406), who being weak-minded, the government devolved upon the duke of Albany. He killed the king's oldest son, David, and his second son, James, fleeing to France, was captured by the English, and detained as a prisoner for nineteen years, during the greater part of which time Albany ruled as regent. It was now over one hundred years after Bannockburn when James I., being ransomed, began his reign, in 1424. He was an accomplished prince, poet and legislator, and made many necessary reforms in the administration of the country, establishing the court of session and other tribunals. He with a firm hand checked the powerful and turbulent nobility, and did much to introduce law and order. He was cruelly assassinated (1437) in the midst of his beneficent work, leaving his son, James II., then a boy of but six years of age, to succeed him. He was a brave and vigorous ruler, and was killed by the bursting of a cannon at the siege of Roxburgh, in 1460. — James III., his son, was crowned when seven years old. He was unpopular with the nobility, who rebelled against him, and persuading his son, a youth of sixteen, to join them, the king was defeated and slain in the battle of Sanchieburn in 1488 — His rebellious son succeeded, as James IV., in the sixteenth year of his age. In 1489 he married Margaret, eldest daughter of Henry VII. of England, and from this marriage eventually came the union of the crowns of England and Scotland. This Margaret, daughter of Henry VII., being great-grandmother of James VI. of Scotland, on the issue of Henry VIII. becoming extinct by the death of Elizabeth, James was next heir. James IV., desirous of assisting his ally, France, declared war against Henry VIII. of England, and was slain on Flodden Field, in 1513, where Scotland suffered the greatest defeat in her national annals. Twelve earls, thirteen lords, five eldest sons of noblemen, and an immense number of barons, fell with their king, and the land became one house of mourning. — At the death of James IV. his son James V. was but five months old, and the office of regent was conferred on his cousin John, duke of Albany. James first married Magdalen, daughter of Francis I., king of France, who dying without issue, he married Mary of Lorraine, daughter of the duke of Guise. By her he had two sons, who died young, and in 1542 the queen was delivered of a daughter, the famous but unfortunate Mary Queen of Scots. When she was seven days old her father died of a broken heart, caused by the mutinous conduct of his nobles, and the defeat of his army at Solway Moss. When told of the birth of his daughter,

the dying man is said to have murmured, "It came with a lass, and it will go with a lass," in allusion to the throne coming to the Stuarts by the daughter of Bruce. Little did he think that the son of that lass, now but seven days old, would sit on the English throne. James V. was affectionately remembered by his people as the "King of the Commons," and he long held a place in literary renown as the "People's Poet." — It will help us somewhat to realize the troublous character of the times and the unhappy condition of Scotland, to state that, from 1390, when Robert III. began to reign, to 1567, when James VI., thirteen months old, succeeded his mother Queen Mary, a period of 177 years, every king of Scotland was succeeded by a minor. During all those years the nation was shaken by the continued quarrels of the nobles. They were a haughty, fierce and turbulent class, those Hamiltons, Huntleys, Douglasses, Albanys, Atholes, Arrans and Argyles. Combining the most indomitable courage with an utter want of principle, they seldom hesitated to endanger the interests of their sovereign, and even the interests of their country, to avenge fancied insults to their family, or to carry on personal feuds. Still, the country was advancing in wealth, and gradually taking an influential place among the powers of Europe, notwithstanding the clouds of misfortune which had encircled the personal history of her Jameses. "Battle, murder and death had swept away four of them, the fifth died of a spirit broken down by the weight of calamities." — During the latter part of the reign of James V. Protestantism began to make considerable headway in Scotland. Although she had for centuries been a faithful daughter of the Roman Catholic church, she was so far removed from Rome that she received but little of that attention bestowed so assiduously on the powerful countries of continental Europe. On this account her clergy had received but little supervision, and had become very ignorant and very corrupt. For this reason the hold of the Catholic church upon the moral sense of the people was very weak, and it was not a difficult task to alienate them from the papal see. Under Henry VIII. England had become a base of operations whence those who favored the Protestant faith could influence Scotland. Attempts made by Cardinal Beaton, the Catholic primate, to crush out the spirit of inquiry by persecution, not only failed in their object, but had a contrary effect. — With the rise of Protestantism, there came a party in Scotland which preferred an alliance with England to the ancient league with France; and by and by two well-defined parties existed, the Protestant or English party, and the Catholic or French party. The Protestant party hoped to unite the crowns of England and Scotland by the marriage of the Princess Mary, the young Queen of Scots, to Edward, son of Henry VIII., and they might have succeeded had it not been for the imperious conduct of Henry, who so roused the Scottish pride that the Catholic party gained the consent of the nation to her marriage with the dauphin

of France, an event which brought upon her and upon Scotland many trying calamities. Mary, through the influence of her mother and the French party, was sent to France to be educated, when only six years old. In 1558 she married Francis, then dauphin, afterward king, of France; but, he dying without issue, she returned to Scotland, and in July, 1565, married Henry Stuart, known as Lord Darnley. It was a fearful mistake, for there was scarcely the vestige of a good quality to be found in his character. He was vicious, vainglorious, presumptuous—a fool. On June 19, 1566, a son was born, who was afterward James VI. of Scotland and James I. of England. Darnley was murdered in February, 1567, and in May of the same year Mary married the earl of Bothwell, who was generally believed to have directed the murder. The nobles soon after drove Bothwell out of the kingdom, and, having confined Mary in Lochleven castle, compelled her to abdicate in favor of her infant son, with her half-brother, the earl of Murray, as regent. She escaped from Lochleven, and rallied a powerful force around her, which was defeated at Langside by the regent Murray. Mary then fled to England, claiming the protection of her cousin, Queen Elizabeth, but this princess ungenerously confined her in different prisons for eighteen years, and then the accomplished and beautiful, but most indiscreet and unfortunate, Mary Queen of Scots, being accused of conspiring against the life of Elizabeth, died with heroic bravery on the scaffold at Fotheringay castle, on Feb 8, 1587. There is probably no instance in history where one so able, lovely and accomplished became to such a marked degree the victim of untoward circumstances. Her life proved a burden to herself and a misfortune to her people. — From the time of her father's death to that of her own, the religious aspect of Scotland had undergone a most wonderful change. While she was in France, and her mother, Mary of Lorraine, was regent, the conflict between the Catholic and the Protestant faith was intense. During those eventful years, when individual convictions were struggling with the traditions of centuries, and the religious thoughts and emotions of the people were stirred to their depths, there appeared upon the scene a man of no ordinary power, the fearless, stern, eloquent reformer, John Knox. His life and work have made a more marked impression on Scotland than those of any other man, and no grander figure can be found in the history of Protestantism in Great Britain. It can hardly be doubted that Knox saved Protestantism in Scotland, and in saving it in Scotland he saved it in England; for, if Scotland had been Catholic, it would have furnished the great Catholic powers of the continent a base of operations against England, and in all probability, under such circumstances, a revolution would soon have driven Elizabeth from the throne, and England would have been reclaimed to the Catholic church. But Knox breathed into the commons of his country a spirit which lives to-day, a spirit of individuality and

independence which taught them that the humblest peasant, as an immortal soul, is equal in the sight of God to the proudest peer. They may have been hard, narrow and fanatical, but, "heated red-hot in the furnace of a new faith," they could never again be trodden under the foot of tyranny. Protestantism in England proceeded from the king downward, but in Scotland it originated and developed in the bosom of the people themselves. Many of the nobility joined the Protestant ranks from mercenary motives, but the common people did so from their convictions of right. Knox tried to have the lands and revenues of the church set apart for educational purposes, but the greed of the nobility was too much even for him. The year before Mary returned from France, 1560, a meeting of the estates abolished forever in Scotland the power and jurisdiction of the papal see, and made the confession of faith drawn up by Knox and his associates the standard of faith in Scotland. — Mary on her return failed to understand the true state of affairs. She had been educated in a wrong school to meet in a conciliatory spirit the public feeling of Scotland as it now was. If she had but realized that Scotland could not be brought back to the Catholic church, and conformed herself to the necessities of her condition, she might have reigned a happy queen over a happy people; but that was not to be. — Mary's son, James VI., had been crowned king in 1567, when but thirteen months old. His uncle, earl of Murray, who was appointed regent, being assassinated in 1570, the office was held in succession by the earls of Lennox, Mar and Morton, when the king took the reins into his own hands. During the government of the regents the kingdom was distracted by civil wars, which continued largely to partake of a religious character. Protestantism retained its supremacy, and Presbyterianism became the established religion of the country. At three o'clock, Thursday morning, March 24, 1603, Queen Elizabeth died; and, a feat unmatched in that age, Sir Robert Cary galloped into Holyrood Court on Saturday night and wakened King James to announce to him that he was monarch of England, Scotland, France and Ireland. The two nations, which for centuries had been bitter enemies, and had crossed swords on a hundred bloody fields, were now united under one head. On the 5th of April James set out for London, and as he journeyed leisurely through England he was received with enthusiasm everywhere. He arrived in London on the 22d of May, to take possession of the government of his new state, and at this point ends the history of Scotland as a distinct kingdom. — The domestic condition of Scotland was but slowly influenced by the union of the crowns, but its external relations underwent a radical change. The ancient league with France, though never formally abrogated, was now and forever after a dead letter, while it was a matter of pride to the Scots that their king now ruled over their "auld enemy," England. The national institutions of Scotland remained un-

touched, so that from this source there was nothing to arouse their national jealousy. The parliament still remained in Edinburgh, and there was no occasion for the nobility and landed gentry to go to London, as was the case in 1707, when the union of parliaments took place. However, as the way was now open, a large number of Scots flocked southward to better their condition, and they generally succeeded. Political economy was not understood then, and the prosperity of the Scots was supposed to be at the cost of the English, and in consequence they were much disliked and much maligned. — Immediately after the accession of James, steps were taken for an incorporating union of the kingdoms, which signally failed. It was proposed that the new state should be called "Great Britain," a name which the king himself claimed to have suggested. A decision by the courts, that all persons born in Scotland after the union of the crowns in 1603 were entitled to all the privileges of Englishmen, did more than anything else to unite the two peoples. An attempt was made to force the church of Scotland to adopt the episcopal form of government; but it failed, and James gave it up as a hopeless task "to make that stubborn kirk stoop more to the English pattern." — For centuries Scotsmen found their native land too small for their energies, and both before and after this period, under Gustavus, Frederick and Peter the Great, as well as in the Low Countries, France and even in Turkey, they in large numbers attained distinction; and, now that the era of colonization and commerce had dawned, they were not slow to avail themselves of its opportunities. This was first manifested in the settlement of New Scotland, or Nova Scotia. — Charles I., on his accession, learning nothing from the past, commanded the use of Laud's liturgy in the churches in Scotland, as "the only form which we think fit to be used in God's public worship in this our kingdom." An outbreak was of course unavoidable, and tumults arose in various parts of the kingdom. Under the lead of Archibald Johnston of Warriston, the solemn league and covenant was renewed. In 1638 it was signed in Greyfriar's churchyard amid the wildest enthusiasm, some drawing their own blood, which they used for ink. It has been estimated that a large proportion of the adult male community of Scotland subscribed their adherence to it, as copies were placed in all the churches and other public places. The cause of their national religion had come to be considered as one with that of their national independence. — The close of the thirty-years war released thousands of Scottish soldiers experienced in the wars of Europe, who now returned home and contributed not a little to the important part which Scotland took in the great civil wars of the seventeenth century. — After the restoration of Charles II. to the throne, in 1660, unmindful of the failures of his father and grandfather in a similar attempt, he tried to force episcopacy on the Scottish church, but he met with most ignominious failure. — The estates of Scot-

land were not slow to indorse the revolution of 1689, and to tender the crown of Scotland to William and Mary, declaring that King James VII. had "forefaulted" all right to the crown. The attempt to compel the Highlanders to conform to the new state of affairs resulted in one of the most cruel and treacherous transactions which has ever blackened history. It is known as the massacre of Glencoe, and occurred in 1692, leaving a stain upon the name of William of Orange, which his admirers have found it hard to wipe out. — Now that the activity and enterprise of the Scots could no longer find a field in the wars of their country against England, or in the greater contests of continental Europe, they began to make themselves felt in the field of commerce. Wm. Paterson founded the bank of England in 1695, while, some years later, John Law drove France wild with his Mississippi company and other financial bubbles. The Darien and African companies were products of the same period, all showing the active though misguided enterprise of the Scottish mind at that time. — On the accession of Queen Anne, in 1702, the first business of importance which came up was to incorporate the union of the two kingdoms. The succession to the throne and the union of the two parliaments were readily agreed upon, but the English commissioners would not agree to allow the Scots to participate equally with them in the foreign and colonial trade, and the negotiations were a failure. In April, 1706, a new set of commissioners, representing both kingdoms, met at Whitehall; in two short months their labors were finished; and so much and so important business has probably never been concluded in so short a time. The union was bitterly opposed in Scotland; but, after nine months' discussion, on Oct. 16, 1707, an act ratifying its terms was passed in the estates by a vote of 110 to 69. At this time the population of England was about 6,000,000, while that of Scotland was probably not over 1,000,000. Nothing so much reconciled the Scots to the union as the prospect of equality in trading privileges and reciprocity of citizenship. — George I., the first of the Hanoverian line, was proclaimed king on Aug. 5, 1714, at the market cross of Edinburgh, amid apparent quietness through the whole country. Next year, however, the chiefs of the Highlands, under the earl of Mar, commenced a Jacobite insurrection in the north, which, although encouraged by the appearance in Scotland of the pretender, the son of James VII., was speedily suppressed. This added greatly to the stability of the new government, which now attempted to disarm the Highlands, and in the interests of peace constructed a system of excellent roads through that heretofore almost impassable region. The Highlanders were irritated by and restless under the industrial civilization of the Saxon, and when Prince Charles Edward, "Bonnie Prince Charlie," the oldest son of the pretender, under promise of help from France, raised his standard at Glenfinnan, in August, 1745, many a chieftain with his

clan rallied around him. The Jacobite army, marching southward, after defeating Gen. Cope at Preston Pans, entered Edinburgh in triumph. With an army of but 6,000 men, remarkable to say, the prince pushed as far as Derby, only two days' march from London, when the approach of the duke of Cumberland with a larger force compelled him to retreat. On April 16, 1746, his half-starved, exhausted army was routed on the field of Culloden, and with it forever fell the house of Stuart. — The British government, unwilling to lose the benefit of the fighting qualities of the Highlanders, organized Highland regiments, with Highland officers and Highland uniforms, nine of which are still in the British army. These regiments have become famous for their never-failing bravery, shown on many a well-fought field in every quarter of the globe. The Gaelic-speaking population of Scotland in 1881 numbered only 231,594, or 6.20 of the whole. — For years the union was very unpopular in Scotland, and it was some time before its beneficent effects began to be felt. In recent times the prosperity of Scotland has been such as could never have been possible without the union. Although occasionally at the present time complaints are made that Scotland receives neither her share of parliamentary attention, nor her proportion of disbursements from the imperial treasury, yet no voice is ever heard expressing a doubt as to the beneficial results of the union. — While Scotland is an integral part of the United Kingdom, she still retains her own courts and practices of law, and her own church government. At the head of the judiciary is the court of session, which consists of thirteen judges, and is supreme in civil cases. Five of its judges comprise the court of justiciary, which is supreme in criminal cases. The full court sits in Edinburgh, but circuit courts are held in the principal cities of the country. Criminals are indicted by the lord advocate or his deputies, and are tried at the expense of the state. In case of the lord advocate failing to prosecute, any private person may do so on his own responsibility. Criminal cases are tried by a jury of fifteen persons, a majority only being necessary for a verdict; and when the case is not clear, a verdict of "not proven" may be brought in. Appeals from the Scottish courts go to the house of lords. The subordinate courts in the counties are held by justices of the peace, and the sheriffs, the functions of the latter being judicial in Scotland, and not ministerial, as in England. — In the cities the chief magistrate is not called the mayor, but the "lord provost," and the aldermen are called "baillies." In many particulars the law as well as the titles and duties of public functionaries differ wholly from those of England and the United States, and show distinct traces of the ancient league with France. — The Scottish peers elect sixteen of their number to represent them in the house of lords; but, in addition, many Scottish peers, being also British peers, sit in the house of lords in their own right, and without an election. Scotland is represented

in the house of commons by sixty members, of whom thirty-two represent the counties, twenty-six the burghs, and two the universities. Fifty out of the sixty members belong to the liberal party. The strength of the bodies dissenting from the established church has probably much to do with Scotland being so overwhelmingly liberal in politics. The number of electors on the registers in 1881 were: in the counties, 98,328; in the burghs, 216,851. — The established church of Scotland is Presbyterian in form of church government. It embraces but a minority of the people, two non-established Presbyterian churches, the Free and United Presbyterian, having together more adherents than the state church. Some sanguine minds think the day is not far distant when the church of Scotland will be disestablished, and all the Presbyterian bodies of the country be united in one grand Presbyterian church, the church of almost all the people of Scotland. The Free church left the established church in 1843 under the lead of the celebrated Dr. Thomas Chalmers, and the result was another church and manse in almost every parish in Scotland. — For centuries Scotland had a system of national education superior to that of any country in Europe. As early as 1262, Master Thomas Bennum writes himself as "Rector Scholarum de Aberdeen," and in 1478 the master of the "Grammar Schules of Aberdene" had a salary of £5 annually. John Knox and his associates, 300 years ago, ordained that there should be a school in every parish, and there is no doubt but that to her parish school system is to be attributed the high place her sons have commanded in the fields of religion, literature and science. It was truthfully said of Scotland that every Scot had a mouthful of learning, but not a mouthful of meal. The imperial parliament has, in a recent educational act, wholly changed the system in Scotland by providing for local school boards and compulsory education. The number receiving education in 1881 was 720,099, being 19.28 of the whole population. Of those between the ages of five and fifteen no fewer than 79 per cent. were receiving education, which will compare favorably with the school statistics of any state in the American Union. There are four universities in Scotland, viz., St. Andrew's, Glasgow, Aberdeen and Edinburgh, founded, respectively, in 1411, 1450, 1494 and 1582. They are more popular in their privileges than those of England, and were framed after the pattern of the continental universities of the fifteenth century. During the session of 1880–81 there were 6,619 students of all classes in attendance. The graduates elect two members of parliament; those of Aberdeen and Glasgow electing one, and those of Edinburgh and St. Andrew's the other. — Out of 20,000,000 acres of land in Scotland only 5,000,000 can be cultivated, yet her agriculture is not surpassed by any country in the world. Her deposits of iron and coal are very rich, and her shipbuilding and manufacturing interests are very large. The tonnage built on the Clyde is larger than that on any other river on the

globe, and Glasgow is the second city of importance in the British empire. — There has been a great reduction in pauperism and crime during the last ten years. In 1872 there were 117,611 paupers, while in 1881 there were only 97,787; in like manner the number of convicted criminals fell from 2,259 in 1872 to 1,832 in 1881, showing a remarkable diminution of crime as well as pauperism accompanying an increase of population. — Notwithstanding the barren soil, the inhospitable skies and the scant population of Scotland, few nations, since the days of ancient Greece, have produced so many names illustrious as historians, philosophers, scholars, essayists, novelists, scientists, theologians and poets.* — **BIBLIOGRAPHY.** The historical works of Buchanan; Hume, Lond., 1657; Guthrie, 10 vols., Lond., 1767; Dalrymple, 2 vols., Edinb., 1776-9; Robertson, 2 vols., Lond., 1758; Pinkerton, 2 vols., Lond., 1797; Heron, 6 vols., Pesh, 1794-9; Laing, 4 vols., Lond., 1804, new ed., 1819; Chalmers, 2 vols., Edinb., 1807-10; Mackintosh, 2 editions, Lond., 1822. JOHN JOHNSTON.

SCOTT, Winfield, was born near Petersburg, Va., June 13, 1786, and died at West Point, May 29, 1866. He was educated at William and Mary college, and was admitted to the bar in 1806, but three years afterward obtained a captain's commission in the army. During the ensuing war he rose rapidly to the rank of major general. He remained in the army at the end of the war, becoming commander-in-chief in 1841. His peace service was varied by an abortive quarrel wrongfully forced upon him by Jackson; the latter accusing him of "pompous insolence," "slander," and "the designs of an assassin"; and by services during the nullification excitement at Charleston 1832-3, and on the Canadian and Maine frontier in 1837-41, in both of which he judiciously and successfully attempted to keep the peace. During the Mexican war he assumed chief command of the army, and captured Mexico. In 1852 he was the last candidate of the whig party for the presidency. In 1859 he was made lieutenant general of the army. He was too far advanced in years to come up to the high expectations of the public, and in November, 1861, he retired from active service. See his *Autobiography*, and Mansfield's *Life of Scott*. ALEXANDER JOHNSTON.

* Scotland has given to the world more than its share of genius, a fact largely attributable to its social, religious and political conditions. We may mention — 1. *Poets*. John Barbour, Sir David Lyndsay, George Buchanan, Dr. Arthur Johnston, Gavin Douglass, Allan Ramsay, Robert Blair, James McPherson, John Logan, Dr. James Beattie, James Thomson (of the "Seasons"), Thomas Campbell, John Skinner, Lady Anne Barnard, Jane Elliott, John Leyden, William Laidlaw, John Graham, James Montgomery, Mrs. Joanna Baillic, Robert Burns, Baroness Nairn, Robert Tannahill, James Hogg (the "Ettrick Shepherd"), Allan Cunningham, William Motherwell, William Edmonstone Aytoun, J. Ballantine, Robert Buchanan. — 2. *Novelists*. Tobias George Smollett, Sir Walter Scott, Elizabeth Hamilton, John Galt, Susan Edmonstone Ferrier, Mrs. Christian Isabel Johnstone, Sir Thomas Dick Lauder, George Macdonald, William Black, etc. — 3. *Theologians*. John Knox, Ebenezer Erskine, Ralph Erskine, George Campbell, John Brown, Andrew Thomson, Thomas Chalmers, Edward Irving, Robert S. Candlish, Thomas Guthrie, Norman Macleod, John Tulloch, John Caird, John Ker. — 4. *Metaphysicians, etc.* Dr. Thomas Reid, Dugald Stewart, Lord Monboddo, John Abercrombie, M. D., George Combe, Sir William Hamilton, Sir James McIntosh. — 5. *Historians*. Hector Boece, David Hume, Dr. William Robertson, Patrick Fraser Tytler, Lord Hailes, Dr. John Gillies, Bishop Burnet, John Pinkerton, Sir William Napier, James Boswell, Dr. Thomas McCrie, Cosmo Innes, J. G. Lockhart, W. Stirling Maxwell, John Lord Campbell, Henry Lord Cockburn, Lord Macaulay, John Hill Burton. — 6. *Miscellaneous Writers, Essayists, etc.* Sir Andrew Fletcher, Dr. Adam Smith, Archibald Alison, Prof. John Wilson (Christopher North), John Gibson Lockhart, J. R. M'Culloch, Francis Jeffrey, Lord Erskine, Henry Lord Brougham, Robert Mudie, Prof. Masson, Dean Ramsay, Dr. Robert Chambers, Rev. George Gillilan, James Mill (father of John Stuart Mill). — 7. *Discoverers and Travelers*. Mungo Park, Hugh Clapperton, Captain Grant, James Bruce, Sir John Ross, David Moffat, David Livingstone, etc. — 8. *Scientists*. John Napier (inventor of logarithms), Sir David Brewster, James Watt, Prof. J. D. Forbes, Sir John Leslie, John P. Nichol, Sir James Clark, M. D., Thomas Clark, Dr. Alexander Bain, Sir William Fairbairn, Sir Charles Lyell, Sir Roderick Murchison, Hugh Miller, Prof. John Fleming, Archibald Geikie, Prof. John Playfair, etc.

SCRATCHING. The rejection of a candidate by drawing a line through his name on the printed ballot, whether or not the voter writes in another name in its place. In the "Australian system" of voting, for some time in use in England, the names of all candidates are printed on an official ballot, and the voter designates those for whom he votes by "scratching" the other names. In the United States the name and practice have been identified with "independent" voting, and the practice of scratching the names of unsatisfactory candidates from the ballot supplied to the voter by his own party, and replacing them with names from the opposite ticket or of his own choice, has long been common with individuals as a means of protest. The term acquired political notoriety in 1879, when a number of younger republicans in New York state, having little or no previous connection with politics except as individual voters, united against "the machine," and advised the "scratching" from the republican ticket of the name of the candidate for governor, Alonzo B. Cornell, and that of the candidate for state engineer, How ard Soule. The reasons for this action were: the dissatisfaction with the Saratoga convention, and the belief that under the control of the "machine"

leaders the republican party could not win in the presidential election of 1880. The call for what afterward became the independent republican organization, popularly known as the "young scratchers," was a private letter printed in the "New York Evening Post," of Sept. 6, 1879; and the name of "scratchers" came from a phrase in the address soon after issued to republican voters, which concluded: "We urge true republicans not to stay at home from the polls, not to bolt, but to scratch, not to desert their party, but to attempt to purify it from within. We believe this is the only means to insure in 1880 the needed republican victory, not of politicians, but of statesmen who may be trusted to carry into practical operation the republican principles of national supremacy, sound finance, and administrative reform." The movement was much ridiculed by the party press, but the election showed that Gov. Cornell fell behind his ticket 19,686 votes, a fact which became an important factor in the succeeding presidential campaign.

R. R. BOWKER.

SEARCH, Right of. M. Hautefeuille is of opinion that the search of vessels at sea is not, properly speaking, a right, but the manner of exercising various rights which may belong to belligerents. — Martens expresses himself thus: "The mere hoisting of a neutral flag by a merchant vessel met with, not being sufficient proof that it is not a vessel of the enemy, natural law can not refuse to belligerent powers the right of searching merchant vessels encountered by their men of war or privateers in a place where it would be allowable to seize an enemy's vessel, and therefore to conduct such vessels into port if the proof that they are not subject to confiscation be insufficient. But according to universal international law, the decision of the suit between the subjects of the two nations as to the lawfulness of the capture does not belong exclusively to either of them, and in default of an amicable settlement, a mixed tribunal must be established to decide it. (*Précis du droit des gens*, t. ii., § 317.) A merchant vessel which refuses to allow itself to be searched is suspect, and runs the risk of being declared a good prize. — M. Cauchy is right in saying that "the right of search would never have given rise to any objections if the thing had not gone beyond what the term conveys." It is against the abuse of it that objection has been taken; for, as Hubner, Lampredi, and, we may say, all impartial men, acknowledge, the flag is not of itself a proof of the nationality of a vessel; it is also necessary to know if the ship has a right to the colors which it carries. — M. Cauchy (*Droit Maritime*, t. i., p. 55) distinguishes three degrees of verification: 1, the production of a pass, or *congé du prince*, a naval passport which shows the nationality, the port from which the vessel sailed, and its destination; 2, the representation of the charter parties or freighting, in which are found the nature and the quantity of the merchandise on board; and 3, the visit of the vessel, or the direct search of its

contents. The first two means have raised no serious debate, while the third has been much disputed. M. Cauchy compares the first two modes of verification to the proofs usual in civil procedure, and the third to a beginning of criminal proceedings. The visit of a ship appears to us a means which should be employed only in cases where there is suspicion that it carries contraband of war, or where there is suspicion of any other serious fraud. As a rule, the ship's papers should be sufficient. — It appears clearly from the foregoing that the right of visit is practiced only in time of war; in time of peace there would be no occasion for visiting a ship except in pursuance of especial conventions, and for the object indicated in such conventions. Thus, the United States and England concluded, April 9, 1862, a treaty granting to each other for a period of ten years the mutual right of visit and search of vessels suspected of being engaged in the slave trade. France did not ratify a similar treaty proposed by England in 1841; but she concluded another, May 29, 1845, which shows clearly her repugnance to grant this right, under no matter what pretext, in time of peace. — Men of war are not, in any case, subject to the right of visit or search.

MAURICE BLOCK.

SECESSION (IN U. S. HISTORY). The constitutional apology for the right of secession by one of the states of the American Union may be very briefly dismissed; it is entirely dependent upon the theory of state sovereignty. (See that title.) Grant that the states are still individually sovereign; that their citizens owe a primary allegiance and obedience to their state, and a secondary obedience to the federal government because their state remains a member of the Union; that the Union is a voluntary confederacy, not a nation: and the right of secession must be admitted as a matter of course. The *advisability* of secession, the propriety of severing the ancient relations with friendly and confederate states, is entirely a matter for the state's decision: when the decision is made, every law-abiding citizen is bound by his allegiance to his state to obey it. (See **ALLEGIANCE**, III.) However fallacious the doctrine of state sovereignty and its progeny, secession, may be, there is at least this apology for the action of the seceding states in 1860-61: that the doctrine of state sovereignty, in both its premises and its consequences, had been familiar almost from antiquity; that its technical language had been used constantly, even by those who would have scouted its logical consequences, and that the system of negro slavery, with all its countless influences, had shut out the south from that educational process which had made state sovereignty either a meaningless formula, or a political heresy, in the north and west. (See **NATION**.) It must be noticed, however, that the right of secession has never been admitted by any department of the national government: joint or separate resolutions have been passed by the two houses of congress, assert-

ing the sovereignty of the states; decisions have been made by the supreme court of much the same character; but the right of secession itself has never been admitted. Leaving the theory of state sovereignty to be considered under its appropriate head, it is the object of this article to trace the more practical idea of secession in our history: I., as a mere incident of particularism, of state sovereignty; II., as complicated with slavery; and III., in practice. — I. The union of 1643 (see NEW ENGLAND UNION) experienced in miniature most of the perils to which the perfected and national Union was afterward exposed: nullification attacked its commercial regulations, and even put a veto on its wars; but its final disappearance was due not so much to any secession as to the inherent weakness of its nature, and the dislike of the crown. With the introduction of the attempt at a more general union in 1754 (see ALBANY PLAN OF UNION), the idea of secession first comes plainly into view. The plan of Franklin contemplated its establishment by act of parliament, a very unusual acknowledgment of the power of parliament over the colonies. In explanation of this feature of his plan, he states the various interests of the colonies, and their jealousy of one another, and adds: "If ever acts of assembly in all the colonies could be obtained for that purpose, yet as any colony, on the least dissatisfaction, might repent its own act, and thereby withdraw itself from the union, it would not be a stable one, or such as could be depended on; for, if only one colony should, on any disgust, withdraw itself, others might think it unjust and unequal that they, by continuing in the union, should be at the expense of defending a colony which refused to bear its proportionable part, and could therefore one after another withdraw, till the whole crumbled into its original parts." The theory of secession could hardly be more exactly stated; in its final application in practice it was only improved in one respect, the passage of the ordinances of secession by state conventions, instead of by the assemblies. — Accession to, and secession from, any union, were of course equally unconstitutional, without the king's consent, while the colonies remained a part of the British empire. But, as the American revolution itself was frequently appealed to in after years, as the first great example of, and precedent for, secession, it may be well to lay stress here on one essential difference between them, that the former was an exercise of the undeniable right of revolution, a revolt of an unrepresented fraction of the empire against the usurpations of parliament, and afterward against the king for sustaining parliament; while the latter was attempted to be justified as a constitutional right of the states, which could not rightfully be resisted by any other state, by all the other states, or by the federal government. A revolt of a territory, unrepresented in the federal government, against what it might consider the usurpation of the federal government, and its attempt to establish a separate government, might claim the Amer-

ican revolution as a precedent; the seceding states in 1860-61 could not. A revolutionist hazards his life upon the issue, with the pains and penalties of treason as a possible result; a secessionist claims all the advantages of revolution, without any of its responsibilities or dangers. — Notwithstanding the early and general dissemination of the theory of state sovereignty, its practical consequence, the right of secession, was for some years unheard of, perhaps unthought of. Until 1783 the common dangers of war were a fence outside of which none of the thirteen states dared to stray; after 1783 the authority of the congress of the confederation was so weak a fence that none of the states cared to give it importance by formally demolishing it. The ugly word "secession" first appears in the convention of 1787, July 5, though it then referred to the states as represented in the convention itself: Gerry remarked that, unless some compromise should be made, "a secession, he foresaw, would take place." The subsequent ratification of the constitution by eleven of the thirteen states, on the original refusal of Rhode Island and North Carolina to ratify, has often been appealed to as a brilliant example of peaceable secession; and so it must be considered, if the ratifications were really, as they purported to be, the acts of "sovereign states." The articles of confederation had expressly provided that no change should be made in them unless with the assent of the legislatures of every state; and yet, in the face of this covenant, eleven of the states not only formed a new government, but inserted in it a provision for future amendment by three-fourths of the states. On the theory that the states were sovereign until the adoption of the constitution, how can such a proceeding be anything but a secession, albeit of the majority from the minority? But another power was present in the ratification, the power which had held the states together even before the adoption of the articles of confederation, the sovereign power of the nation, of the national people as distinguished from the people of the state. Its non-recognition by the state conventions can not alter the fact of its already established existence; and, without its existence, the assumptions of the continental congress, from 1775 until the ratification of the confederation in 1781, would be even a more colossal sham than the ratification of the constitution. The historic truth is, that the people of the nation, which had alone validated the revolutionary acts of the continental congress, and which had tolerated the articles of confederation, had now at last interposed to bring order out of chaos; that it was disposed to deal very tenderly with the rights and even with the prejudices of the peoples of the several states; that it chose to maintain state lines in the ratifications; but that, when nine of the states, including a heavy majority of the territory, wealth and population of the nation, had expressed their decision in favor of the new form of government, factious opposition was to cease. It is true that the status of the possible non-ratifying states was carefully ignored

everywhere, as being what the "Federalist" called a "delicate question"; but it is impossible to suppose that two, or even four, recalcitrant states would ever have been allowed to escape from the national jurisdiction. Gouverneur Morris' warning in the convention of 1787, July 5, "This country must be united; if persuasion does not unite it, the sword will," which provoked so much contrary feeling, was the simple truth. The forms of ratification would never have been neglected; but ratification, willing or unwilling, would have been extorted from Rhode Island and North Carolina by a pressure increasing continually until finally successful. The passage of the senate bill, May 18, 1790, to prohibit bringing goods, wares and merchandise from the state of Rhode Island "into the United States," and to authorize a demand of arrears of money from the said state, is a fair example of the sort of pressure which would have been increased indefinitely but for the ratification by the state on the 29th of the same month. The nation has always been thus gentle and considerate in allowing the assertion of state sovereignty in non-essentials; in essentials state sovereignty must yield or be crushed. — Under the constitution the Union was at first spared any internal dissensions of such magnitude as to suggest secession as a remedy. Projects for separation from the Union were undoubtedly on foot before 1795 in Kentucky (see that state), and in western Pennsylvania (see WHISKY INSURRECTION); but these were rather the product of frontier freedom from restraint than the consequence of state sovereignty. Soon after 1795 a series of articles were published in the "Connecticut Courant," urging "the impossibility of union for any long period in the future," and laying down the permanent dogma that "there can be no safety to the northern states without a separation from the confederacy." These letters met no general approval in the north, and the election of Adams to the presidency in 1796 took away for the time their moving cause, a fear of southern domination in the federal government. The idea of state sovereignty, with secession as a possible consequence, next appeared, on the other side of Mason and Dixon's line, in 1798. (See KENTUCKY RESOLUTIONS.) The author of the Kentucky resolutions, Jefferson, explains his feeling on the subject of secession at some length in his letter of June 1, 1798, to John Taylor. "If, on a temporary superiority of the one party, the other is to resort to a scission of the Union, no federal government can ever exist. It, to rid ourselves of the present rule of Massachusetts and Connecticut, we break the Union, will the evil stop there? Suppose the New England states alone cut off, will our natures be changed? Are we not men still to the south of that, and with all the passions of men? Immediately we shall see a Pennsylvania and a Virginia party arise in the residuary confederacy. If we reduce our Union to Virginia and North Carolina, they will end by breaking into their simple units. Seeing that we must have somebody to quarrel with,

I had rather keep our New England associates for that purpose." The objections, it will be noticed, lie to the advisability, not to the right, of secession. This defect, however, was common to most of the public men of the time; and for years afterward state sovereignty, with all its consequences, was the first refuge of a minority. The existence of the nation was hardly recognized, even by the courts, for twenty years after 1798 (see NATION, JUDICIARY); though its existence was not often denied in such plain language as that employed by Tucker, in his edition of Blackstone in 1803. After summing up, to his own satisfaction, the proofs that Virginia had always been a sovereign state, and enumerating the powers which Virginia had delegated to the federal government, he thus concludes: "The federal government, then, appears to be the organ through which the united republics communicate with foreign nations and with each other. Their submission to its operation is voluntary: its councils, its engagements, its authority, are theirs, modified and united. Its sovereignty is an emanation from theirs, not a flame by which they have been consumed, nor a vortex in which they are swallowed up. Each is still a perfect state, still sovereign, still independent, and still capable, should the occasion require, to resume the exercise of its functions, as such, to the most unlimited extent. But, until the time shall arrive when the occasion requires a resumption of the rights of sovereignty by the several states (and far be that period removed when it shall happen), the exercise of the rights of sovereignty by the states individually is wholly suspended, or discontinued, in the cases before mentioned; nor can that suspension ever be removed, so long as the present constitution remains unchanged, but by the dissolution of the bonds of union: an event which no good citizen can wish, and which no good or wise administration will ever hazard." Herein is contained, for the first time, the sum and substance of the doctrine of secession. — When the idea of secession next appeared, it was again in the north, and closely connected with the question on which it was finally put into practice in the south, the territories of the United States. The acquisition of Louisiana (see ANNEXATIONS, I.), in 1803, was very objectionable to the federalist politicians of New England. They had been beaten in the contest with the south alone: to re-enforce the southern line of battle with six, nine or a dozen future states, peopled by "the wild men on the Missouri," seemed simply suicidal, a condemnation of New England to perpetual nullity. They therefore resisted the annexation to the utmost, and claimed that, as the constitution was made only for the original territory comprised within the United States, an extension of territory was unconstitutional without the consent of all the states. "Suppose, in private life, thirteen men form a partnership, and ten of them undertake to admit a new partner without the concurrence of the other three, would it not be at their option to abandon the partner-

ship after so palpable an infringement of their rights? How much more so in the political partnership." The annexation was consummated; but it was not until Jan. 14, 1811, on the enabling act for the first of the dreaded new states, Louisiana, that Quincy, of Massachusetts, fairly declared, in the house, the federalist conception of its consequences. "It is my deliberate opinion, that, if this bill passes, the bonds of this Union are virtually dissolved; that the states which compose it are free from their moral obligations; and that, as it will be the right of all, so it will be the duty of some, to prepare definitely for a separation, amicably if they can, violently if they must." Quincy was called to order, but the house decided that he was in order. Ex-President Adams, in reply to a copy of the speech, could only say that "prophecies of division had been familiar in his ears for six and thirty years." — In the meantime the opposition to the democratic administration, confined chiefly to the New England politicians on the annexation question, had become more popular with the introduction of the restrictive system. (See EMBARGO, III.) It is beyond question that some project of secession had been mooted in New England in 1803, though probably confined to a very few; and that Burr's candidacy for governor of New York in 1804 was a part of it. (See BURR, AARON.) By taking in the great state of New York, and by yielding the leadership-in-chief to a New York democrat, who was highly popular with the democrats of New England, it was hoped that a new republic might be formed, compact, homogeneous, and strongly defended by nature in every direction. Burr's defeat had much to do with the failure of this project, but the indifference of the people of New England probably more. The strong and general popular feeling which was aroused by the embargo revived the project. How many took part in it is uncertain; they were probably very few. The whole truth is probably expressed in a letter of Joseph Story, afterward supreme court justice, Jan. 9, 1809: "I am sorry to perceive the spirit of disaffection in Massachusetts increasing to so high a degree; and I fear that it is stimulated by a desire, in a very few ambitious men, to dissolve the Union." Henry's letter, of March 7, 1809 (see HENRY DOCUMENTS), goes further, and details the federalist programme as follows: that, in the event of war, "the legislature of Massachusetts will declare itself permanent until a new election of members; invite a congress, to be composed of delegates from the federal states; and erect a separate government for their common defense and common interest." Henry's assertions, however, are usually only proof that the contrary is the truth, and that is probably the case here. It is only certain that the accounts of the feeling in the eastern states, as given by John Quincy Adams and Story, caused a panic among the democratic leaders, and ended the embargo. — During the war of 1812 the feeling in New England grew still higher. Ultra federalists undoubtedly used language aiming di-

rectly at secession; the student will find a large collection of such utterances in Carey's "Olive Branch," as cited among the authorities. Indiscreet references to "the New England nation," occasional flaunting of a flag with five stripes and stars, the firing of "New England national salutes" of five guns, and other similar indications, when combined with the general discontent in New England (see CONVENTION, HARTFORD), kept the administration in a chronic state of alarm. The discussion of secession in any form by the Hartford convention has been denied by its president and secretary; its journal shows no trace of it; and Mr. Goodrich has collected every available proof to the contrary. It appears certain that no such active design was considered or desired by its members; but a few of the opening sentences of its report are at least suggestive. "If the Union be destined to dissolution, by reason of the multiplied abuses of bad administrations, it should, if possible, be the work of peaceable times and deliberate consent. Some new form of confederacy should be substituted among those states which shall intend to maintain a federal relation to each other. But a severance of the Union by one or more states, against the will of the rest, and especially in a time of war, can be justified only by absolute necessity." The report concluded by advising, that, if no attention should be paid to their remonstrances, and the war should continue, a new convention should be called in the following June, "with such powers and instructions as the exigency of a crisis so momentous may require." — With the close of the war of 1812 the first period of the history of secession ends. It continued immanent in the doctrine of state sovereignty; but nothing occurred to call it to active life. It was threatened as a possible alternative to its illegitimate brother, nullification (see that title), but was never enforced. Secessionists proper in South Carolina had a contempt for nullification, and composed the so-called "Union party" of 1831-3 in that state. Indeed, Jackson's nullification proclamation was offensive to them, as laying down "the tyrannical doctrine that we have not even the right to secede." — II. Throughout its subsequent history secession is always connected with slavery or the opposition to slavery. The right to secede, after it had been completely formulated by Tucker in 1803, was asserted again and again for the next thirty years, but always as a mere particularist formula, a corollary of state sovereignty. The most striking of these, and particularly as coming from the north, is that of Judge Rawle, of Pennsylvania, in his commentaries on the constitution, as cited below, in 1825. "The secession of a state from the Union depends on the will of the people of such state. * * The state legislatures have only to perform certain organical operations in respect to it. To withdraw from the Union comes not within the general scope of their delegated authority. But in any manner by which a secession is to take place, nothing is more certain than that

the act should be deliberate, clear and unequivocal; and in such case the previous ligament of the Union would be legitimately and fairly destroyed. * * In the present constitution there is no specification of numbers after the first formation. It was foreseen that there would be a natural tendency to increase the number of states. It was also known, though it was not avowed, that a state might withdraw itself. The number would therefore be variable. Secessions may reduce the number to the smallest integer admitting combination. They would remain united under the same principles and regulations, among themselves, that now apply to the whole. For a state can not be compelled by other states to withdraw from the Union, and therefore, if two or more determine to remain united, although all the others desert them, nothing can be discovered in the constitution to prevent it." It is notable that, so late as Nov. 9, 1860, Horace Greeley upheld "the practical liberty, if not the abstract right, of secession," only insisting that the step should be taken "with the deliberation and gravity befitting so momentous an issue." It is true that these two utterances are almost the only ones from a representative northern man after the war of 1812 in support of the theory of secession; and that all the other utterances which have been laboriously collected are simply the expression of state feeling, of state opposition to the annexation of Texas, the fugitive slave law, and similar measures, without any apparent thought of the right of secession which was involved in it. Nevertheless, it is painful to consider the result which would have followed in 1860-61, if the action of the seceding states had been slow, calm, and the evident outcome of popular desire, instead of hasty, violent, and the work of the politicians. In that event, the issue of the struggle would have been painfully doubtful. — Secession came in again with Texas, whose independent existence was itself a brilliant instance of successful secession from the Mexican republic. As the probability of its annexation grew stronger, the language used in advocacy of or in opposition to it grew with it. March 3, 1843, John Quincy Adams and a few anti-slavery whigs issued an address to their constituents, warning them that the annexation project had never been given up, and that it would result in and fully justify a dissolution of the Union. Through this and the following summer, on the other hand, "Texas or disunion" became a frequently expressed sentiment in the south, particularly in South Carolina, but this died away as the success of annexation became assured. But even this did not drive the northern states into any action looking to secession, or a dissolution of the Union, though this was unofficially suggested. In January, 1845, at an anti-annexation convention in Boston, Wm. Lloyd Garrison urged the calling of a Massachusetts convention to declare the Union dissolved, and to invite other states to join with her in a new union based on the principles of the declaration of independence. "Although,"

says May, "his motion was not carried by the convention, it was received with great favor by a large portion of the members and other auditors, and he sat down amidst the most hearty bursts of applause." But the final annexation of Texas, operating against the feelings of the most thoroughly nationalized section of the Union, was insufficient to call forth any dangerous or even irritating desire for a dissolution of the Union. That was reserved for the question of the settlement of the new territories (see WILMOT PROVISIO). — CO-OPERATION. The theory of secession involved the right of any state to withdraw from the Union singly; and yet the silent proof of its inherent fallacy is that single secession was never attempted, and probably never thought of. In 1847 Calhoun had endeavored unsuccessfully to obtain the "co-operation" of the slave states in the following programme: 1, the calling of a slave state convention; 2, the exclusion of the sea-going vessels of the northern states from southern ports; 3, the prohibition of railroad commerce with the northeastern, but not with the northwestern, states; 4, the present maintenance of the freedom of trade on the Mississippi; 5, the continuance of this interstate embargo system until the northwest should be "detached" from the eastern states, and should unite with the south in opening the new territories to slavery. Calhoun's programme opened the way, however, for a bolder idea of "co-operation" in 1850, according to which a number of slave states were to secede in company, for mutual defense, if any prohibition of slavery in the new territories should be enforced. But the southern states held to the resolutions of the Georgia state convention of 1850, declaring that the state accepted the compromise of 1850, but would resist, even to secession, such anti-slavery legislation as the abolition of slavery in the District of Columbia, or in the territories, or of the interstate slave-trade. There can be no doubt that South Carolina was ready to secede in 1850, but not alone. Her state convention of April 26, 1852, declared her right to secede, but forbore to exercise it, out of deference to the wishes of other slaveholding states, that is, because no other slaveholding state wished to secede with or after her. Co-operation was, therefore, never practically attempted, because of the compromise of 1850, by which the Wilmot proviso was really enforced in California, by its admission as a free state, while nothing was said of it in the organization of the territories of Utah and New Mexico, and the fugitive slave law was accepted by the south as a make-weight. (See COMPROMISES, V.) But, though this attempt at secession by a section was unsuccessful, there had grown up an alienation between the north and the south which boded no good for the future. Calhoun's last speech in the senate, March 4, 1850, described the manner in which many of the multitudinous cords that bound the Union together had already snapped. Of the five great Christian denominations which had been national in their organization, two, the

Methodists and Baptists, had split into two sectional parts; and the Presbyterians were evidently close to the point of division. Political bonds were also stretched almost to breaking, and their preservation depended on the willingness of the northern states to satisfy the south by not excluding slavery from the territories. "If you," says Calhoun, who "represent the stronger portion, can not agree to settle the great questions at issue on the broad principle of justice and duty, say so; and let the states we both represent agree to separate and depart in peace. If you are unwilling we should part in peace, tell us so, and we shall know what to do." The last sentence shows the remarkable underlying consciousness in every advocate of secession, of the truth so forcibly stated by Webster three days afterward: "Secession! Peaceable secession! Sir, your eyes and mine are never destined to see that miracle. The dismemberment of this vast country without convulsion! The breaking up of the fountains of the great deep without ruffling the surface! Peaceable secession is an utter impossibility." (See, in general, UNITED STATES, II., 5.)—This underlying consciousness, that secession meant war, was for some time sufficient to make any attempt at open secession hopeless *ab initio*, and no such attempt was made. Indeed, the south had been very well satisfied with the compromise of 1850; and the impediments to the execution of the fugitive slave law (see FUGITIVE SLAVE LAWS, PERSONAL LIBERTY LAWS), while they excited great discontent in the south, were not commonly looked upon as reasonable cause for secession. Those final causes were three in number, with a supplementary cause, "coercion," which will be stated in the next section. 1. Nothing is more noteworthy in the extreme southern states than the sudden development of large estates, the freezing out of small planters, and their emigration after the absorption of their property. "In a few years large estates are accumulated as if by magic." In large sections of each state the population consisted almost wholly of negroes, with the few whites owning or managing them. But in all these states representation was on the basis of the "federal population": that is, three-fifths of the negroes were represented, while the voting and office-holding pertained to the few whites. Thus, apart from the natural influence belonging to the wealthy class of the population, the counties in the "black belt" were practically the pocket boroughs of the slave-owners therein. These thus held far more than their fair share of power in state legislatures and conventions, and in some states absolutely controlled them. With every year, from 1850 to 1860, the power of this class was growing stronger, and their desire for secession for the protection of their property in slaves was not weakened. (See SLAVERY, IV.) 2. But there was still another and much larger class in the south, owning few or no slaves, not wedded to the protection or extension of slavery, but high-spirited, and determined not to submit to

oppression, or, above all, to the evasion of a fair compromise. The results of the passage of the Kansas-Nebraska bill (see that title) served to bring these into the secession programme. They had never asked for the abrogation of the Missouri compromise; but, when it had been abrogated by fair agreement, it seemed to them an unworthy evasion to turn Kansas and Nebraska into free states by organized, not voluntary and natural emigration from the north. This was the class to which was addressed the argument which A. H. Stephens says carried Georgia, the key-stone of a successful secession, out of the Union: "We can make better terms out of the Union than in it." 3. The Harper's Ferry insurrection (see BROWN, JOHN) had a silent influence everywhere. Those who desired secession were active, persevering, and in earnest; those who did not, were at the best negative; for they saw one great chance of good, even in a successful secession, a release from national association with future John Browns, and the ability to protect themselves from such invasions by open and national warfare.—With so many influences at work in its favor, it is matter for wonder that secession in 1860–61 was only forced through by the influence of the first two classes over the delegates to the state conventions, and that the popular demand for secession was so conspicuous by its absence that the conventions, except in Texas, did not venture to submit their ordinances to popular vote. For, in a popular vote, be it remembered, the "federal representation" disappeared; only the votes of the whites went for anything; and the total vote of the state might very easily show that their nominal representatives did not really represent them. There must have been an enormous mass of Union feeling in the south, blind, leaderless, and rendered powerless first by the belief that their primary allegiance was due to the state, and then by the organization of the new national government at Montgomery, but still genuine and hearty.—III. The threat that secession would have followed Fremont's election, in 1856, was probably only an electioneering device. When his election seemed probable, Gov. Wise, of Virginia, called a meeting of southern governors at Raleigh, for Oct. 13; but only three governors appeared, those of Virginia, North Carolina and South Carolina, and these did nothing. The meeting was of some influence, however, upon the northern vote. (See REPUBLICAN PARTY, I.) Practical secession was hardly as yet possible. The alienation between the sections was not yet sufficient; and the power of the secessionist class over the state conventions was not yet great enough. Four years made a great difference in both respects. In December, 1860, Senator Iverson, of Georgia, pictured the situation in the senate thus: "There are the republican northern senators on that side. Here are the southern senators on this side. How much social intercourse is there between us? You sit on that side, sullen and gloomy; we sit on ours with portentous scowls. Yesterday I observed there was

not a solitary man on that side of the chamber came over here, even to extend the civilities and courtesies of life; nor did any of us go over there. Here are two hostile bodies on this floor, and it is but a type of the feeling that exists in the two sections. We are enemies as much as if we were hostile states. I believe the northern people hate the south worse than ever the English people hated France; and I can tell my brethren over there that there is no love lost on the part of the south." From this picture, the fact is carefully eliminated that the southern senators represented, not the southern people, but its slaveholding class; but, even barring this defect, the picture is well worthy of study. With such a tightly strained tension of international relations between the governments of the two sections, the real feeling of the people was a matter of but secondary importance, and there was but little need of open threats of secession in case of Lincoln's election. Such threats were undoubtedly made, but unofficially; and the question of secession played no formal part in the campaign of 1860. The whole congress of 1859-61 was inundated by threats of secession in the event of the election of Seward as president in 1860, the object seeming to be to commit the southern people to that policy beyond the possibility of an honorable withdrawal. It has been asserted that the disruption of the democratic party, in 1860, was contrived by the secessionist class for the purpose of insuring Lincoln's election, and thus obtaining an excuse for secession; but such a design is very doubtful. (See DEMOCRATIC PARTY, V.) The more natural explanation of their course is in their hope that the electoral vote would be so divided up as to give no candidate a majority; that the choice of the president would thus go to the house of representatives; and that they would there be able to obtain the election of either Breckinridge or Bell. That their hopes had some foundation, may be seen from the facts that the opposition to Lincoln, after his election, still controlled both houses of congress; and that the republicans, throughout the whole rebellion, were indebted for their majority in congress to the voluntary absence of the southern delegations. — As it resulted, however, Lincoln obtained the electoral votes of all the northern and western states, with the exception of a part of New Jersey's vote, and was elected beyond cavil. What was to be the next step in the political game? Were the southern states to go on debating about co-operation, without taking any practical steps toward secession, until the popular impression caused by Lincoln's election had worn off, and his administration was found to be nothing out of the ordinary? In that case, the idea of secession might as well be laid permanently on the shelf, with other worn-out political stage thunder. The southern politician class felt, that, rather than give up what they had grown accustomed to consider the only life-preserver of their section, or rather of slavery, they would prefer to go over the cataract with it. — Nevertheless, there remained that dread of the practical attempt to secede by a

single state, which was always the surest internal condemnation of the whole theory of secession. Gov. Gist, of South Carolina, had already sent a circular letter to the other southern governors, Oct. 5, 1860, asking their advice and plans. His state, he said, would secede with any other state, if Lincoln should be elected; or she would secede alone, if she should receive assurances that any other state would follow her; "otherwise, it is doubtful." Not one governor answered that his state would secede alone. Florida, Alabama and Mississippi would secede with any other state; North Carolina and Louisiana would probably not secede at all; Georgia would wait for some overt act. At first sight, these answers seem discouraging; but there was hope in them. If three states were only waiting for a leader, South Carolina would take the plunge, though the gallantry of the act is considerably diminished by this preliminary probing for assurances of support. A movement begun even by four states, would probably swing the other gulf states; any attempt at "coercion" by the federal government would bring the border states; and the confederacy of the slave states would then be complete. — The South Carolina legislature, which chose presidential electors until 1868, was in session to choose them, Nov. 6, 1860, and remained in session until Lincoln's election was assured. It then called a state convention, made appropriations for the purchase of arms, and adjourned. The convention met at Columbia, Dec. 17, adjourned to Charleston, on account of an epidemic in Columbia, and there unanimously passed the following ordinance, Dec. 20: "We, the people of the state of South Carolina, in convention assembled, do declare and ordain, and it is hereby declared and ordained, that the ordinance adopted by us in convention, on the 23d day of May, in the year of our Lord 1788, whereby the constitution of the United States was ratified, and also all acts and parts of acts of the general assembly of this state ratifying amendments of the said constitution, are hereby repealed; and that the Union now subsisting between South Carolina and other states, under the name of the United States of America, is hereby dissolved." On the 24th a declaration of causes for secession was adopted. It recapitulated the arguments in favor of state sovereignty and the right of secession, and assigned as a cause for immediate secession the general hostility of the northern states to the south, as shown in their union under a sectional party organization, and in their refusal to execute the fugitive slave laws (see PERSONAL LIBERTY LAWS); and it concluded with an imitation of the closing paragraph of the declaration of independence. On the same day the governor by proclamation announced the fact of secession. Having adopted ordinances to enforce the existing laws of the United States for the present under state authority, to transfer to the legislature the powers hitherto exercised by the federal government, to make the state ready for war, and to appoint commissioners to form, if possible, a permanent government for

all the states which should secede, the convention adjourned, Jan. 5, 1861. The action of the state then ceases to relate to secession, and falls under other heads. (See CONFEDERATE STATES, REBELLION.)—The action of Georgia comes second in importance politically, if not chronologically; for the rank, wealth and position of the state would have made its persistent refusal to secede a most annoying brake on the secession programme. The legislature called a state convention, Nov. 18, 1860, and the whole struggle took place on the election of delegates. There was hardly any denial of the right of secession; but a strong state party, under the lead of Alexander H. Stephens, warmly denied the advisability of secession. The convention met at Milledgeville, Jan. 17, 1861, and on the following day, by a vote of 165 to 130, declared it to be the right and the duty of the state to secede. This really settled the question. Jan. 19, the formal ordinance of secession was adopted by a vote of 208 to 89. In order to maintain the position of the state, every delegate but six signed the ordinance; and these six yielded so far as to pledge themselves to the defense of the state. After passing the other necessary ordinances for a transfer of powers from the federal government to the legislature, the convention adjourned, but re-assembled in Savannah, March 7, and on the 16th ratified the confederate constitution. — In Mississippi the convention was called for Jan. 7, at Jackson, and passed an ordinance of secession on the 9th by a vote of 84 to 15. March 30, the confederate constitution was ratified by a vote of 78 to 7. — In Florida the legislature passed the bill calling a convention, Dec. 1, 1860, and the convention met at Tallahassee, Jan. 3, 1861. Jan. 10, an ordinance of secession was passed by a vote of 62 to 7. — In Alabama the election for delegates was ordered by the governor (see ALABAMA), and the convention met at Montgomery, Jan. 7, 1861. Jan. 11, an ordinance of secession was adopted by a vote of 61 to 39. March 13, the confederate constitution was ratified. — In Louisiana the legislature, Dec. 11, 1860, passed the bill calling a convention, and it met at Baton Rouge, Jan. 23, 1861. Jan. 26, an ordinance of secession was adopted by a vote of 113 to 17, and on March 21 the confederate constitution was ratified. Louisiana was the only original seceding state in which the popular vote for delegates was a close one. It is stated at 20,448 for, and 17,296 against, immediate secession. — In Texas, secession was forced through with great difficulty, and altogether as a revolution. The governor refused to call an extra session of the legislature until, early in January, 1861, he found that steps were being taken to call it together without his authority. He then summoned it for Jan. 22. But this gave very little time for the passage of a convention bill, the election of delegates, and the meeting of the convention. An entirely unofficial call was therefore issued, delegates were elected, and the convention met at Austin, Jan. 28. Feb. 1, an ordinance of secession was passed by a vote of 166 to 7; but, as the conven-

tion itself was entirely without any basis of law, the ordinance was to be submitted to popular vote, Feb. 23. The legislature, Feb. 4, validated the convention, apparently with a view to overriding a possibly adverse popular majority. The popular vote was reported to the convention as 34,794 for the ordinance, and 11,235 against it. But even before the popular ratification, the convention had appointed delegates to the confederate congress, Feb. 11, and the federal troops in the state had been captured and paroled. The confederate constitution was ratified March 23. One week before that day the convention had declared vacant the office of Gov. Sam Houston, who had shown no inclination to favor the convention or its purposes. — These seven states, South Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana and Texas, were the original seceding states; and the details of their action seem to show that the first three named were the only ones in which convention action represented the majority of the white voters. In Georgia and Louisiana the result was due to the lack of any abiding principle in the unionist representatives for resistance to the earnest body of secessionists; in Alabama, to the control of the convention by the southern portion, or "black belt"; and in Texas, to the revolutionary action of the secessionist politicians. These considerations, however, are not of much practical importance, for in all the states unionists and secessionists alike acknowledged the abstract right of secession, the citizen's paramount allegiance to his state, and the unconstitutionality of "coercion" by the federal government. The secession of even a single state, and an attempt to coerce it, would therefore have brought about the secession of the other states named, as it afterward did in the cases of Arkansas, Tennessee, North Carolina and Virginia. — COERCION. It is noteworthy that originally the most extreme particularists had the least objection to the coercion of a state by the federal government. In writing to Monroe, Aug. 11, 1786, Jefferson says: "There never will be money in the treasury till the confederacy shows its teeth. The states must see the rod: perhaps it must be felt by some one of them. * * Every rational citizen must wish to see an effective instrument of coercion, and should fear to see it on any other element than the water." And still more fully, Aug. 4, 1787: "It has been so often said as to be generally believed, that congress have no power by the confederation to enforce anything, for example, contributions of money. It was not necessary to give them that power expressly; they have it by the law of nature. When two parties make a compact, there results to each a power of compelling the other to execute it." This was the general ground on which the democratic members of congress, in 1861-5, while still holding the constitution to be a "compact," voted for the prosecution of the war. It may also explain the reason why both the Virginia and New Jersey plans in 1787 (see CONVENTION OF 1787) included a power to coerce disobedient states; and why Madison and

others in the convention wished to give the federal government an absolute veto on the legislation of state governments, to remove the necessity for any forcible "coercion." — Either of these plans would have been hazardous. Madison himself said that "the use of force against a state would look more like a declaration of war than an infliction of punishment, and would probably be considered by the party attacked as a dissolution of all previous compacts by which it might be bound." This expression, justified as it is by common sense, has often been quoted as a condemnation of "coercion." But it must be noted that no such "use of force against a state" was ever authorized by the constitution. That instrument gave an indirect and far safer power of coercion, 1, in the case of states, by extending the power of the federal judiciary to state laws involving the construction of the constitution (see JUDICIARY, I.); and 2, by giving the power to compel individuals to obey the federal government in any conflict with the state. — Nevertheless the opinion was strangely prevalent in 1860-61, that, because congress had no power to "coerce" a state, secession could not be interfered with. The simplest argument for this view can be found in President Buchanan's message of Dec. 3, 1860. It was the main encouragement to secession by a single state; it was announced again and again by the border states during the winter of 1860-61; and the consciousness of its general existence threw the Lincoln administration at first altogether upon the defensive. (See BORDER STATES, and the names of their states in detail.) It was not until the popular uprising in the north had taught the administration what states it could rely upon, that the federal government was encouraged to begin the work of coercion by exercising its power to execute the laws and suppress insurrection by means of the armed militia. From that time coercion took the form of repression of individual resistance, the federal government ignoring the action of the state as entirely *ultra vires*. This is the form which coercion took in its first operation in our history, the "force bill" of 1833 (see NULLIFICATION), and which it must always take. If a state should see fit to form a treaty with a foreign power, the federal government would ignore such action, and would compel individuals to ignore it also, by the use of the courts in cases of mild resistance, and of the army and navy in case of resistance by force. This process of "coercion" could hardly be better stated than in a pamphlet cited below, by Gov. H. A. Wise, of Virginia, published in 1859, though aimed at a very different object. He supposes the state of Vermont gradually coming to forcible resistance against the execution of the fugitive slave laws, her state convention making the arrest of a slave felony, and her magistrates and officers resisting the federal writs of *habeas corpus* by force. "The president must then command a sufficient force of the army or navy or militia of the United States to overcome the rebellion and treason; and

that would not be all. The jailor and judges and governor of Vermont, and all persons guilty with them of rebellion against the faithful execution of the laws of the United States, would have to be arrested and tried according to law, or, if their resistance was serious enough to require it, to be slain in battle of rebellion against the laws of the Union. And I am sure, that, if civil war should thus be brought on to battle and carnage, every patriot and lover of the laws would march to the order of coercing a state, to compel her authorities and her people to obey the supreme laws, to lay down their weapons, and to renounce the state laws and ordinances commanding their rebellion." — Voluntary secession had really spent its force in carrying Georgia, Alabama, Louisiana and Texas with it; but it relied on carrying the other slave states with it on the plea of resistance to coercion, when President Lincoln should call for troops to enforce the laws. In two of them it succeeded fairly: Arkansas passed an ordinance of secession May 6, and North Carolina May 20. (See those states.) In Virginia and Tennessee, another plan had to be adopted. The convention, while nominally submitting the ordinance of secession to popular vote, first formed "military leagues" with the confederate states; confederate troops at once swarmed over their territory; and under their auspices the popular vote became a farce. In this way Virginia's ordinance was ratified May 23, and Tennessee's June 18. Here the current stopped: in Maryland, Kentucky and Missouri much the same plan was tried as in Texas, but it was a failure. (See those states.) In Delaware alone of the slave states, secession seems to have had no advocates. — The United States supreme court has finally decided that the ordinances of secession were entirely void, and that a state government steps out of its sphere when it undertakes to organize armed resistance to the federal government. Reconstruction by congress does not seem to have been founded on the notion that the ordinances of secession had so far taken the states out of the Union as to require their readmission, but on the theory that the state governments had either been vacated by the fault of the individual citizens of the state, or had been seized upon by usurpers; that in either case the reconstruction must be under the authority of the federal government; and that individuals who had been guilty of treason were estopped from objecting to the methods which congress might see fit to employ. (See RECONSTRUCTION, I.) — Finally, the suppression of the doctrine of secession by force has established the political existence of the nation, as distinguished even from *all* the states. It has done so, not by the facts that all the seceding states, in their new constitutions, expressly disavowed any right of secession, and declared the primary allegiance of the individual citizen to be due to the United States; but by the higher fact that the nation has plainly expressed and successfully enforced its will in the matter. For the future, all men are bound to take notice that it is the nation

that wills that there should be state governments, and not states which will that there should be a national government. The ultimate results of secession in this way no man can foresee. (See NATION, III.)—The theory of the right of secession will be found in Centz's *Republic of Republics*; Fowler's *Sectional Controversy*; 1 Calhoun's *Works*, 300; 1 Tucker's *Blackstone*, Appendix, 187; 1 Stephens' *War Between the States*, 495; Rawle's *Commentaries on the Constitution*, 302; Appleton's *Annual Cyclopædia*, 1861, 614 (Davis' Message of April 29). The study of Mr. Fisher's theory of "constitutional secession," by amicable agreement between the federal government and a seceding state, will also be found interesting and profitable: see Fisher's *Trial of the Constitution*, 160, 167. ALEXANDER JOHNSTON.

SEDITION LAWS. (See ALIEN AND SEDITION LAWS.)

SEMINOLE WAR. (See SLAVERY, II.)

SENATE (IN U. S. HISTORY). This name is given to the smaller of the two branches of the state legislatures, but, when used without distinctive description, usually refers to the smaller of the two houses of congress. (See CONGRESS, HOUSE OF REPRESENTATIVES.)—In the congress

of the confederation there was but one house, and each state had an equal vote in it. (See CONFEDERATION, ARTICLES OF.) There was some effort in the convention of 1787 to continue the arrangement of a single house, but it found no influential support, except from Franklin and the "Jersey plan," and was abandoned. The greatest difficulty, which seems very slight now, but was almost insuperable in the beginning of the convention's work, was to find a different basis of existence for the two houses. It was comparatively easy to fix the membership of the house of representatives by fair proportions of the whole population of the country. (See APPORTIONMENT.) But it was then very difficult to hit on any radically different basis for the senate, which should be satisfactory to all concerned. There was no different class, as in Great Britain, from which to select a house of lords (see that title); and the formation of a smaller house, on the same basis as the other, would have ended in the establishment of two houses, both controlled by precisely the same ideas, and the loss of all the advantages of two houses.—The same difficulty has attended the formation of state senates, and has been met there by the division of the state into different territorial units for the two houses. (See ASSEMBLY.) The convention of 1787 hit upon a simple and natural basis for the senate, and formed a body as efficient in practice as it is apt to strike the imagination of an observer favorably. The senate is certainly the most dignified and impressive part of the American constitutional system, unless we except the supreme court. But this brilliant success of the convention must not blind us to the fact that the convention itself gained it blindly, or was forced into it; that it was the product of no single clear design or desire; and that it was due to the gradual and unwilling compromise of conflicting purposes. (See CONVENTION OF 1787; COMPROMISES, I.) If the scheme of the senate, as we admire it in its final form, had been offered to the convention in the first place, it would almost certainly not have received a single vote.—The Virginia plan, when first introduced, provided that the senate, without as yet giving it a name or defining its powers or term of office, should be chosen by the house of representatives out of a proper number of persons nominated by the state legislatures. Pinckney's plan proposed that it should be chosen by the house from residents of the various states to serve for three years; that the senators from New England, the middle and the southern states, should constitute three classes, to go out of office on successive years; and that the senate should have sole power to declare war, make treaties, appoint foreign ministers and judges of the supreme court, and decide territorial disputes between the states. Hamilton's plan proposed that senators should be chosen by electors chosen by the people of each state in election districts; that they should serve during good behavior; and that the senate should have the power to declare war and approve treaties and appointments. The New Jersey plan

provided for no senate. In the debate three other plans of selection were brought up: 1, by the national executive, out of nominations by state legislatures; 2, by the people; and 3, by the state legislatures; and the last was adopted unanimously, June 7. As yet it was not settled whether the states were to be equally or proportionately represented in the senate, the small states urging the former plan, and the large states the latter. This question, on which, said Sherman, of Connecticut, "everything depended," came up June 11. A motion that each state have one vote was lost, and another for proportionate representation in both branches was carried, the six "large states" in both cases voting against the five "small states." On the next day the term of senators was fixed at seven years. June 13, the committee of the whole reported that the "second branch" was to be chosen for seven years by the state legislatures, according to the population of each state, and to be paid out of the national treasury; its members to be at least thirty years old, and to be ineligible to office under the United States for a year after the end of their term of office. The constitution of the senate, in its first form, was thus completed; and though it still lacked a name, the words "senate" and "senatorial" were frequently used in debate. — The report of the committee of the whole as to the composition of the senate was adopted by the convention, June 24–25, except that the term of seven years was changed to six. The convention was then brought face to face with the all-important question, the rule of representation in the senate. For days the debate went on. The five small states, Connecticut, New York, New Jersey, Delaware and Maryland, knew that they would be outvoted by the six large states in the end; and a motion was made, June 30, that the president of the convention write to the executive of New Hampshire, asking for the attendance of that state's delegates; but it was voted down. Dr. Franklin proposed that each state have an equal representation in the senate, with a vote on money bills proportionate to its share of taxation; but this was not considered. The large states were determined to have a proportional share of the senate; the small states were equally determined to have an equal share. The debates grew unusually warm, for this convention; and one of the Delaware delegates went so far as to declare, that, if the large states should push the matter to an unjust issue, they would dissolve the confederation, and then "the small ones will find some foreign ally, of more honor and good faith, who will take them by the hand and do them justice." The temper of the small states rose so high that the matter was not pushed to an issue. It was settled by compromise, and the equal representation of the states in the senate was the result. (See COMPROMISES, I.) — July 14, the large states made a fresh effort to apportion senators among the states in numbers varying from one for Rhode Island and Delaware to five for Virginia, or thirty-six in all, but it was voted down. During the

debate, Elbridge Gerry threw out the idea, which was afterward adopted, of allowing the senators to vote *per capita*, instead of by states. From this time the large states yielded, and the equal state representation in the senate was secure. The line of division still existed: the small states usually endeavored to throw as much power as possible into the senate, while the large states did the same in regard to the house of representatives. But the struggle was now most temperate and amicable: "the little states had gained their point." In the report of the committee of detail, Aug. 6, the name "senate" was formally given to "the second branch." Its composition and voting *per capita* were just as in the final constitution, except that there was as yet no vice-president to preside over it. (See ELECTORS, I.) Its powers were very different: it was to make treaties, appoint ambassadors, judges of the supreme court, and commissioners to give final and conclusive judgment in territorial disputes between the states (see TERRITORIES, I.); but it had not yet the power to try impeachments, confirm the president's appointments, or alter or amend money bills. The introduction of the electoral system, Sept. 4, brought with it, as part of the plan, the power of the senate to try impeachments, and the functions of the vice-president as presiding officer of the senate; but, in case of a failure of choice by the electors, the senate was to choose the president, leaving the vice-presidency to the other person having the highest number of electoral votes. The next day another report from the committee of detail gave the senate power to alter or amend money bills. All these new provisions were adopted in the next three days, except that the election of the president was transferred to the house. The constitution of the senate was not further altered, except that the provision was unanimously added, Sept. 15, that no state should be deprived, without its consent, of its equal suffrage in the senate. As a rough summary, we may say that the fundamental idea of the senate was brought in by the compromise of July 5, and that it took almost complete shape, as it now stands, Sept. 4. Alterations at other periods of the convention were comparatively unimportant; and, since the adoption of the constitution, its provisions with regard to the senate have never been altered, except by giving to that body, in 1804, the choice of the vice-president when the electors failed to choose. — In the form which it finally took and has since retained, the senate is a body composed of two members from each state, voting *per capita*. In 1803, Tucker said, of the number of senators, that "it is not probable that it will ever exceed fifty." The number is now (1883) seventy-six, from thirty-eight states. How far this may be increased in the future can not even be guessed. It is true that there are but eight available territories remaining (see TERRITORIES); but there are many indications that the process of forming new states may be turned to the division of old states. (See *State Rights*, under STATE SOVEREIGNTY.) Sena-

tors are to be at least thirty years old, nine years citizens of the United States, and inhabitants of the states for which they are chosen. They are chosen by the state legislatures for six years; and congress may at any time, by law, make regulations, or alter state regulations, as to the manner and time of their election, but not as to the place. For many years there was hardly any field for political manœuvre more fertile than this of the choice of senators by the legislatures. In some states senators were elected by concurrent vote of the two branches of the legislature; in others, by joint convention; in others, a concurrent vote was first to be tried, and then, if necessary, a joint convention. In all the states there were chances for intrigue which were not neglected. A party majority in one house would refuse to go into a joint convention in which it was certain to be beaten; or would resign or absent themselves. (See, for example, INDIANA.) One of the most curious of these manœuvres took place in New York, in 1825. (See that state.) Finally, the act of July 25, 1866, regulated the manner of election. Each house of the legislature is to vote *viva voce* for each senator, on the Tuesday following its organization. On the following day the houses are to hold a joint meeting. If it appears that the same person has received a majority in each house, he is elected. If not, the joint meeting is to take at least one *viva voce* vote a day during the session of the legislature, until some person shall receive a majority of all the votes of the meeting, a majority of each house being present. In the case of a vacancy occurring during the session of the legislature, the same course of procedure is to begin on the Tuesday after the notice of the vacancy is received. If a vacancy occurs when the legislature is not in session, the constitution empowers the governor to fill it by appointment until the legislature meets. — When the first senate was organized, ten states were represented. May 14, 1789, they were divided into three classes: one of six members, the other two of seven each. One member of each class then drew lots, the class drawing number one to serve two years, number two to serve four years, and number three six years. The classes were so arranged that no two senators from one state fell in the same class. As the other three states sent senators they were assigned by lot in the same way, a blank being so used as to keep the classes even. As the terms of the classes expired, their successors were elected for six full years. Senators from new states are so assigned as to keep the three classes nearly even. Thus one-third of the senate goes out of office every two years; but there is never any complete alteration of its membership at one time. Theoretically, it has been the same body since 1789, in spite of the periodical changes in its constituent elements. This permanence seems, from the debates of the convention, to have been intended mainly to give foreign nations a sense of security as to the treaty power of the United States, but it has had important influences in every direction. — In legis-

lative matters the senate holds an equal rank with the house of representatives (see, in general, CONGRESS); it may not originate bills for raising revenue, but it may propose or concur with amendments, as on other bills. Its officers are much the same as those of the house (see HOUSE OF REPRESENTATIVES); but it has no such binding code of rules of order and debate. In place of them it relies on the "courtesy of the senate," which the older senators of all parties unite in maintaining; and vivacious graduates from the house of representatives are rapidly chilled down to the orthodox temperature of debate in the senate. The vice-president presides, but has no vote, except in case of a tie. In presiding, he is but the spokesman of the senate, and is expected merely to express its will, or in doubtful matters to call upon it for an expression of its will. He addresses the members only as "senators"—a brief and impressive mode introduced by vice-president Calhoun, instead of the form previously in use, "gentlemen of the senate." (For the succession to the presidency, see EXECUTIVE, V.)—In addition to its legislative functions the senate has peculiar executive and judicial characteristics, which greatly increase its dignity and importance. Its power to confirm the president's nominations is fully treated elsewhere. (See CONFIRMATION BY THE SENATE, TENURE OF OFFICE.) It sits as a court to try impeachments preferred by the house of representatives. (See IMPEACHMENTS.) It has the power to advise and consent to treaties made by the president, and they are not valid until so ratified. (See JAY'S TREATY.) It is even held, on good authority (see Curtis, as cited below), that the senate may propose a treaty to the president; and this interpretation is certainly rather unusual than strained. In transacting its executive business, the confirmation of nominations and treaties, the senate acts in secret. Many unsuccessful efforts have been made to make these debates public. — The senate chamber is in the centre of the north wing of the capitol at Washington, and its simplicity of appearance harmonizes well with the proceedings of the senate. The senate committees are forty-two in number, the most important being, as a general rule, the committee on foreign relations.—See 5 Elliot's *Debates* (index under *Senate*); *The Federalist*, lii.—lxvi.; 2 Curtis' *History of the Constitution*, 417 (and also index under *Senate*); Story's *Commentaries*, §§ 688, 1499 foll.; Poore's *Manual of the Senate*; the act of July 25, 1866, is in 14 *Stat. at Large*.

ALEXANDER JOHNSTON.

SERGEANT-AT-ARMS. (See PARLIAMENTARY LAW.)

SERGEANT, John, was born at Philadelphia, Pa., Dec. 5, 1779, and died there, Nov. 23, 1852. He was graduated at Princeton, in 1795, was admitted to the bar in 1799, and was a federalist congressman 1815–23 and 1837–9. In 1832 he was the whig candidate for vice-president, and

was defeated. (See WHIG PARTY, I.; ELECTORAL VOTES, XII.) He was again in congress as a whig, 1837-41.

A. J.

SERVIA, Principality of. A semi-sovereign state, the youngest member of the European family, to use the expression of an English publicist, formed of a part of the old Servian empire founded by Douchan the Strong in the fourteenth century, the dismemberment of which followed soon after the death of that prince (1356). After the fatal day of Kossovo (1389), which paved the way for the subjection of the different Slave states of Turkey in Europe, the Servians acknowledged themselves vassals of the Ottoman porte by virtue of particular agreements, the tenor of which recalls the capitulations concluded about the same time between Turkey and Moldo-Wallachia, and which succeeded no better than the latter in protecting the national independence. Deprived of its *despotes*, or native chiefs, Servia was gradually reduced to the condition of a simple *pashalic*, until the day when, at the call of Kara-George and Miloeh, it rose *en masse* against its oppressors, and alone, without other aid than its courage and the diplomatic assistance of Russia, forced, after twenty-two years of fight and negotiation (1804-1826), the porte to restore to it a part of its former rights. In 1826 the additional act of the convention of Akkerman (Oct. 7), confirmed three years after by the treaty of Adrianople, raised Servia into a tributary principality of the Ottoman porte, with the privileges of an independent internal administration. — These privileges were stated and specified in a *Hatti-shérif* of Sultan Mahmoud, dated Aug. 3, 1830, which fixed the limits of the new state, and recognized, by a *berat* dated the same day, Miloeh and his descendants forever as *kniazes* (princes) of Servia: a title which had been unanimously conferred upon the liberator three years before the Servian grand *skoupchtina* (national assembly). A second *Hatti-shérif*, promulgated in December, 1838, framed the *oustav*, or Servian statute, in sixty-six articles relative to the government, administration, finances, etc. — The rights and immunities derived from these *Hatti-shérifs* received a new sanction by the treaty of Paris of 1856, which abolished the protectorate that Russia had established over Servia, substituting for it the collective guarantee of the contracting powers, and stipulated, at the same time, for the neutrality and inviolability of the Servian territory, as may be seen from articles twenty-eight and twenty-nine, worded thus: "Art. 28. The principality of Servia shall continue to depend upon the sublime porte, in conformity with the imperial *Hattis* which fix and determine its rights and immunities, placed henceforth under the collective guarantee of the contracting powers. Consequently, the aforesaid principality shall preserve its independent and national administration, as well as full freedom of conscience, legislation, commerce and navigation. Art. 29. No armed intervention shall take place in Servia without previous agreement between

the high contracting powers." — The situation of Servia, stationary during the reign of Alexander Karageorgevitch (September, 1842, to December, 1858), was improved both externally and internally in consequence of the revolution which called the Obrenovitchs to the throne. In 1862 the Turks consented to evacuate the fortresses of the Danube and the Save, with the exception of Belgrade, Semendria and Chabatz, which, in turn, were not long afterward restored to the Servians (1867). Two years after (July, 1869), the *oustav* was abolished by the *skoupchtina*, and replaced by the constitution which now rules Servia. — *Political State.* It results from the preceding that Servia enjoys exactly the same rights as a state, and is placed in the same position toward Turkey, as Roumania. Like the latter, its government and administration are completely independent of the suzerain power, to which it is only obliged to pay an annual tribute of 4,600 Turkish purses. It furnishes neither troops nor money in time of war. It preserves its national flag of tricolor bands with the arms of the principality embroidered in relief (a field of gules with a cross of silver, strewn with four sabres, and surmounted by a crown), and maintains at Constantinople, like Moldo Wallachia, an agent or resident (*kapou kiaia*) accredited to the porte. — *Area and Population.* The area of the principality is estimated at 49,500 square kilometres. It forms five great territorial circumscriptions, divided, for administrative purposes, into seventeen departments (eighteen with the city of Belgrade), subdivided into sixty arrondissements, comprising 1,199 communes, of which forty are city communes and 1,159 are rural communes, with 2,200 villages. — The population amounted, according to the census of 1866, to 1,215,576, as follows: Servians, 1,057,540; native Wallachians, 127,326; Jews, 5,539; and Bohemians (gypsies), 25,171. The domiciled foreigners (6,960) are not included in this number. — *Government.* The government is a constitutional monarchy, hereditary in the family of Obrenovitch. The prince, or *kniaz*, with the title of most serene highness, as well as the *domnu* of Roumania, exercises the powers and enjoys the prerogatives devolving upon the sovereign in constitutional states, promulgates the laws and ordinances, appoints the public officials, commands the military forces, signs agreements and treaties, and alone represents the nation with foreign powers. He governs with the aid of responsible ministers. The number of ministerial departments, limited to three by the *oustav* of 1838, was raised to seven by the law of 1861, interior, finances, foreign affairs, justice, public instruction and worship, war, public works. The prince shares the legislative power with the national assembly (*skoupchtina*). There are two kinds of *skoupchtinas*: the *ordinary* *skoupchtina*, which assembles every year, and the *extraordinary* or grand *skoupchtina*, convoked only in certain exceptional and fixed cases. The ordinary *skoupchtina* is composed of representatives elected by the nation, and of deputies (one-third) appointed by

the executive power. Every tax-paying Servian is an elector at twenty-one years of age; every elector paying thirty francs tax is eligible. The constitution guarantees to the citizens equality before the law, individual liberty, religious liberty, liberty of the press, and the abolition of confiscation. — *Administration.* The departments (*okroužje*) are administered by prefects (*natchalnik*), the arrondissements by subprefects appointed by the government; the communes by *kmètes* elected by the inhabitants, and fulfilling both the functions of mayors and justices of the peace. — *Justice.* Justice is administered: 1, by a court of appeal (Belgrade), divided into three chambers; 2, by a court of appeal also sitting at Belgrade; 3, by tribunals of first resort sitting in chief towns of the departments; 4, by rural courts, established from time immemorial in each commune, and composed of the *kmète* and two assessors. The jury system was introduced in 1871, but only for certain cases. The proceedings before all the tribunals are public and oral. The death penalty is no longer inflicted in political offenses. Moreover, it is resorted to only in cases of premeditated murder. The duration of the punishment of forced labor or of imprisonment can not exceed twenty years. — *Public Instruction.* According to published official accounts, there were in the principality, at the end of the scholastic year 1870-71, 484 communal schools, which furnish only elementary instruction, eighteen establishments of secondary instruction, one academy (Belgrade), composed of three faculties (law, science and philosophy); in all, 505 establishments, attended by 27,761 pupils (10,973 in 1861), which is only an average of 2½ to every 100 inhabitants. But it is only just to remark that before 1830 Servia did not possess a single school, and that instruction was so far from being general, that the two founders of Servia's independence, Kara-George and Miloš, did not even know how to read. Instruction in all the schools is gratuitous; primary instruction is, in a certain measure, obligatory. — *Worship.* The prevailing religion is the Greek Catholic. All other creeds are freely professed. The Servian church is autocephalic (autonomous), that is, it governs itself, entirely independent of the ecumenical patriarchate of Constantinople, by a synod composed of the archbishop of Belgrade, metropolitan of Servia, and three diocesan bishops of Chabatz, Négotine and Oujitzé. The four dioceses together contained, in 1871, 379 churches and chapels, with 742 priests, and 42 monasteries, with 135 monks. The bishops are chosen by the synod and confirmed by the prince. The metropolitan is appointed directly by the synod. — *Internal Relations.* The principality maintains official relations: 1, with the Ottoman porte by means of a Servian *chargé d'affaires* at Constantinople; 2, with the six guaranteeing powers (France, Austria, Great Britain, Italy, Prussia, Russia) through the medium of agents and consuls general of these powers accredited to the prince at Belgrade; 3, with Roumania, by

means of the Servian agency at Bucharest (1862), and the Roumanian agency at Belgrade (1863). The principality also sends a delegate to the permanent river commission of the Danube, established by article seventeen of the treaty of Paris. — *Military Forces.* The military forces are composed of two distinct elements, although each completes the other: the *standing army*, which is, properly speaking, only a collection of the organizations of different sorts; and the *militia*, the organization of which resembles somewhat that of the Prussian landwehr. The first, which is recruited by lot, does not exceed 4,000 men. The second, composed of all the citizens from twenty to fifty years of age who do not form part of the standing army, is divided into three classes or *bans*. The first *ban*, formed of men from twenty to thirty years of age, has an effective force of 68,364 men, in infantry, cavalry and artillery, divided into five commands, or *voivodies*. — *Finance.* There are few countries in which the finances are administered with more wisdom than in Servia. Almost all the budgets show an excess of receipts. Thus the budget year 1870-71 showed an excess of receipts of 1,352,281 francs, out of a total of 14,309,242 francs. The principal sources of revenue are the direct taxes (7,661,200 fr.) and the customs (2,363,296 fr.). Among the expenditures (12,956,096 fr.) figure the general services of the ministries for a total of 10,765,090 francs, the civil list of the prince (504,000 fr.), the tribute to the Ottoman porte (494,027 fr.), the dotation of the legislative bodies (163,461 fr.), etc. — *Commerce.* The value of the imports for the four years 1868-71 presents an annual average of about 25,000,000 francs. The average of the exports for the same period was 29,426,100 francs. In 1868, in consequence of the extreme abundance of cereals, it rose to 38,000,000. The principal articles of export are: hogs, cattle, wool, hides, tallow, suet, brandy (plum) and cereals, which, until 1865, figured among the articles of import.*

A. UBCINIL

* The independence of Servia from Turkey was established by article thirty-four of the treaty of Berlin, signed July 13, 1878, and was solemnly proclaimed by Prince (now King) Milan at his capital, Aug. 22, 1878. — The revenue of Servia is derived chiefly from direct imposts, including a general capitation tax, classified as to rank, occupation and income of each individual, and which is assessed, in the first instance, on the different communes or parishes. The budget for 1883 is as follows: revenue, £1,392,000; expenditures, £1,391,000; showing £900 surplus; and being an increase of revenue to the amount of £86,500 over the previous year. The increase (about the same) in the expenditure is chiefly due to the expenses incurred in reorganizing the Servian army on the German system. The national debt is about £5,500,000, £3,500,000 being incurred for the new railway (Belgrade-Vranja), the interest and amortization of which, during fifty years, is 6 per cent.; £1,500,000 for a lottery loan, to repay the war requisition; £250,000 due to Russia; and £250,000 incurred in 1882 to pay the claims of the disinherited Turks in the annexed provinces. The interest and expenses on the debt amount to £310,000 in the budget for 1883. — The standing army of Servia, on a peace footing, is 9,710 men—infrantry, artillery, engineers and cavalry. Besides the standing army, there is the national militia; so that, on paper, in 1883, the total war force of Servia amounted to 210 battalions, with 225,000 men in all.

SESSIONS OF CONGRESS. (See CONGRESS, SESSIONS OF.)

SEWARD, William H., was born at Florida, N. Y., May 16, 1801, and died at Auburn, N. Y., Oct. 10, 1872. He was graduated at Union in 1820, was admitted to the bar in 1822, and entered political life as an "anti-mason." (See ANTI-MASONRY.) He was a member of the state senate 1830-34, and, on the union of the various elements of opposition into the whig party, he became its candidate for governor. Defeated in 1834, he was elected in 1838 and 1840. In 1849, he became United States senator from New York, and at once became the most prominent of the anti-slavery whigs. He had organized a faction of his own way of thinking in the state, in opposition to the Fillmore, or "silver gray," whigs, and seems to have believed that he would finally be as successful with the national party. The attempt was a failure; but Seward's speeches in the senate made him the acknowledged leader of the new republican party from its first organization. In one of them, he made the startling assertion that there was a higher law in politics than the constitution. But the vigor of his speeches had made him a dangerous candidate for a new party; and, although he confidently expected the nomination for the presidency in 1860, it was given to Lincoln. Nevertheless, he became Lincoln's secretary of state in 1861, and served until 1869. (See ALABAMA CLAIMS, RECONSTRUCTION.) See Baker's *Life of W. H. Seward*; Welles' *Lincoln and Seward*; C. F. Adams' *Memorial Address on Seward*; Jenkins'

Governors of New York, 607; *Savage's Living Representative Men*, 404; W. H. Seward's *Works*.

ALEXANDER JOHNSTON.

SEYMOUR, Horatio, was born in Pompey, Onondaga county, New York, in 1811, studied and practiced law for a time, and was elected mayor of Utica in 1840, and member of the legislature in 1841. He there became one of the leaders of the conservative, or hunker, democrats, supporting Gov. Bouck's administration. In the democratic dissensions which followed, he took no active part on either side, and, in 1850, was unanimously nominated for governor by a united convention of all the factions, and was beaten by about 300 votes in a poll of about 430,000. In 1852, he was again nominated, and was elected. In 1854, he was again the regular candidate in the "scrub-race" of that year, and was defeated by Clark, the fusion (afterward republican) candidate, by 309 votes. In 1862 he was again elected governor, by about 11,000 majority over Wadsworth, republican. (See DRAFTS.) His party orthodoxy, together with his moderate and conciliatory course, had long since made him the recognized leader of the New York democratic party; and the inclination toward him spread until, in 1868, the national convention nominated him, against his own desire, for president. He was defeated, and has since refused to take any active part in politics. (See DEMOCRATIC PARTY, VI.) See *Savage's Representative Men*, 428; *Jenkins' Governors of New York*, 706; *Croly's Lives of Seymour and Blair* (1868); *McCabe's Life of Seymour* (1868).

ALEXANDER JOHNSTON.

This army has 810 officers, and some 300 pieces of artillery. The army is, however, being reorganized on the German system. By the new law every able-bodied Servian will be in the army from his twentieth to his fiftieth year. At twenty he enters for two years the regular army, afterward passing into the reserve until he reaches his thirtieth year. From thirty to thirty-seven he is in the first-class militia, and from thirty-seven until fifty in the second-class militia. The infantry will have fifteen battalions, and the cavalry two regiments. The total war force will be 135 battalions, with 160,000 men. — Servia had, in 1883, a population of nearly 1,750,000. The inhabitants are almost entirely Slaves, the Turkish population on the territory (4,250 square miles) acquired from Turkey by the Berlin treaty having rapidly disappeared. There are less than 2,000 Jews (who have much of the commerce of the country in their hands). The gypsy population, it is stated, is turning to the cultivation of the land, on the advantageous terms offered to them by the government. — The state is divided into twenty-one counties. In religion Servia is almost independent of the patriarch of Constantinople. There are about 10,000 Roman Catholics, chiefly subjects of Austria-Hungary, with about 460 Protestants. The excess of births over deaths amounted to 15,355 in 1880, and to 36,836 in 1881. — The chief trade of Servia is with Austria. Besides, with that country, as remarked above, commercial intercourse is mainly carried on with France, the United States, Turkey and Roumania. The total imports are officially valued at about £2,000,000, and the exports at considerably less, mainly to and from Austria and Turkey. Live animals are the chief article of export, particularly pigs, which are kept in countless herds, feeding on the acorns which cover the ground for miles. Large quantities of cereals, hides and prunes, are also exported. The commercial resources of Servia are as yet wholly undeveloped, chiefly for want of roads, but a railway from Belgrade to Vranja is being constructed. There are 1,370 miles of telegraph. — F. M.

SHAY'S REBELLION. (See CONFEDERATION, ARTICLES OF.)

SHERMAN, John, was born at Lancaster, O., May 10, 1823, was admitted to the bar in 1844, and entered political life as a whig. He was a republican congressman from Ohio, 1855-61, and United States senator, 1861-77. He then became secretary of the treasury under Hayes, serving with such brilliant success that, in 1880, he was one of the three leading candidates for the republican presidential nomination. (See REPUBLICAN PARTY, III.) See *Sherman's Select Speeches and Reports*. A. J.

SHIMONOSÉKI INDEMNITY. The town of Shimonoséki commands the narrow straits leading into the Inland sea from the sea of Japan, which, at this point, are about a half-mile wide. On June 25, 1863, in obedience to orders from the mikado to close the straits, the clansmen of Chōshū fired on the American steamer *Pembroke*, but without injury to the vessel. On July 16, by order of the minister of the United States, Capt. McDougall, of the United States steamship *Wyoming*, attacked the batteries, and sunk two vessels moored under them. French and Dutch vessels, being fired on, also shelled the batteries, the

French with a landing force destroying one of the redoubts. On Sept. 5, 1864, a combined squadron of one American, nine British, three French and four Dutch ships of war, with 208 guns and 7,590 men, attacked the forts and destroyed them. The American portion of this force consisted of the chartered steamer *Takiang*, with one Parrot gun, commanded by Lieut. Pearson, who had 258 men under him; the expenses being in all less than \$25,000. The allied representatives claimed from the shōgun's government, at Yedo, compensation for damage done, \$420,000, or \$140,000 apiece to the Dutch, French and Americans, out of the "indemnity" of \$3,000,000, to be divided among the four treaty powers, making the share of Great Britain \$645,000, and of each of the others \$785,000. The bill presented for damage to the *Pembroke* (loss of time, freight and passengers) was \$10,000; the further claim for "annuities to dead and wounded" of the Wyoming, not being allowed. The last installment of the indemnity was paid to the treaty powers by the mikado's government in Tokiō, in 1875. This "Shimonoski Indemnity Fund," deposited in the treasury of the United States, amounting, in 1882, with interest, to more than double the original sum, has never been applied to public use, the whole business being looked upon, as it indeed was, as iniquitous and extortionate. A bill authorizing the return of this money to Japan, after deducting a small part of it for the officers and men of the Wyoming, has repeatedly passed one house of congress.*

W. E. G.

SHINTŌ. We shall improve the space at our command by outlining the features of pure Shintō, the indigenous religion of Japan, which has exerted so great a political influence upon the empire, which is so enthusiastically studied by Anglo-Japanese scholars, which has given rise to a large portion of modern Japanese literature, including the finest works of erudition in the language, which furnishes the basis of some vigorous polemics against advancing Christianity, and the original scriptures of which have been denominated by Basil Hall Chamberlain "the earliest authentic and connected literary product of that large division of the human race which has been variously denominated Turanian, Tartar and Altaic, * * even preceding by at least a century the most ancient extant literary compositions of non-Aryan India." — The pure Japanese term for the native religion is *Kami no Michi*, the Way of the Gods; or, Religion of the Kami. The later and more concise Chinese term, Shintō (*Shin* god, and *tō* doctrine, *i. e.*, theology), was invented to distinguish it from the Way or doctrine of the Chinese sages, or of Buddha. Tō in Shintō is the same as the *Tau* of Lao-tse, or Tauism. It seems no longer doubtful that the Japanese islands were peopled by a race from northeastern Asia, who made their way

from the continent through Corea, long before Buddhism entered China, or before Chinese culture had greatly influenced the nations around the Middle Kingdom. The invaders found on the soil the Ainos and other tribes, whom they subdued as they moved northwardly and westwardly. They obtained ascendancy, not only by their superior arms and prowess, but by their fetiches and religious beliefs. The political order established by the conquerors resembled feudalism, and of the many shrines, established upon the allotted lands by the victors or their descendants, for the reverence of ancestors, some attained great eminence and renown. The invaders professed to have come originally from heaven, and so called themselves the heavenly race, and their ancestors the heavenly gods, while their serfs or conquered people were the earthly race, and their chiefs the earthly gods. — Until the introduction of writing from China, in the fourth century, the prayers, odes and traditions of this essentially ancestral cult were handed down from mouth to mouth and were not committed to writing until the eighth century. Upon the introduction of Buddhism, in 552 A. D., which served to spread Chinese literary culture, the superiority of both the religious and the literary forms and codes of India and China were so apparent that native developments were smitten with paralysis, and, instead of originating, the people borrowed wholesale. Ancient Japanese civilization may be compared to the wooden caissons, on which modern engineers build their lofty towers of bridge masonry; for soon after the *Kojiki* (Book of Ancient Records) 711–12 A. D., and the *Nihongi* (Chronicles of Japan) 720 A. D., were completed, all that was peculiar to ancient Japan was rapidly overlaid by Chinese institutions and culture in every department of human activity, and the old features of national life and faith faded from view. In 927 A. D. the code of ceremonial law, *Engishiki*, was reduced to writing, though in reality it contains a ritual older in many portions than the historic period, which latter, in the light of present historical research, can not probably be stretched beyond 400 A. D. — The *Kojiki* pictures creation as evolution out of chaos, in which matter existed before intelligence, the first imperfectly formed beings springing like sprouts from the warm mud, and arriving at completed spirit and form only after successive stages of advance. Japan was the first created land, and the first pair, *Izanagi* and *Izanami*, furnished the Japanese archipelago with everything needful, and populated it with gods, men and animals. Heaven and earth were still united, but gradually a separation took place. The most famous child of the divine pair was a daughter, who became the sun. Her grandson, *Ninigi*, was sent from heaven to earth to subdue the turbulent inhabitants, who, in multiplying, became rebellious. Descending from the skies to mount *Kirishima* in *Hiuga*, *Kiushiu*, he subdued his enemies, and his grandson, *Hohodemi*, born of a dragon mother, set out on a tour of conquest, and fixing his seat of govern-

* Since this article was written, the indemnity has been paid, but paid without interest.

ment near Kiōto, became the first mikado of Japan, being, many centuries afterward, canonized as Jimmu Tennō. By an edict of the 123d mikado, Mutsuhito, promulgated Dec. 15, 1872, the date of Jimmu's accession to the throne was fixed at 660 B. C., so that the Japanese year corresponding to 1883 A. D. is 2543d of the Japanese empire. The mikado is thus the personal centre of the Shintō religion, which consists in the practice of the worship of ancestors, of the sun and other forces of nature, of the gods of grain, of the trees, of the watercourses, of the roads, and of various local influences. Even animals, trees, swords and jewels were, in the primeval cult, called *kami*, and thus deified, though not probably worshiped. Some of the *kami* were evil, some good.—The Japanese mythology is abundant, fanciful, extravagant, and far from being harmonious in its statements. Three cycles of myths are distinguished by Mr. Chamberlain, having their origin respectively in Kiu-shiu, Yamato and Idzumo. All the deities of Shintō were once men, and the chief of them are now worshiped by the leading noble families of the imperial court as their ancestors. It is to be noticed, that while ideas or expressions from the Chinese classics are to be detected in the *Kojiki*, the ancient liturgies are in pure Japanese. In addition to these monuments of the archaic speech, special prayers and hymns are still composed on great occasions, a notable instance being that in Kiōto, in 1868. On this occasion the mikado took an oath to form a parliament for the discussion of national affairs, and the most solemn invocations were made to the Heavenly Gods to ratify the august vow which became the foundation of the new government. Yet, notwithstanding its impressive ritual, Shintō, in comparison with Buddhism or the system of Confucius, lacks dogma and formulated codes; teaching no ethics, unless reverence to the dead and unquestioning submission to the mikado's will may be called ethics. Most of the elements composing positive religion are absent, such as precise doctrines, casuistry, a polemic propaganda, and distinctly marked ministers of religion. In its unpainted and unglilded shrines, severely simple, and built on the type of the dwelling house of ancient Japan, are no idols, or emblems, except the notched strips of white paper—the economical substitute for the ancient offerings of white silk. Closets may contain written prayers, and vases the same or folded paper, while offerings of fruits, grain and fish, are made at stated seasons. The ancient *torii* (bird rest), or perch for the sacred chanticleers, have now become the holy archways through which worshipers approach the shrine. In stone or wood, red or unpainted, these "gateways" are as striking objects in the landscapes of Japan as are spires in northern christendom. Ancient sacrifices, as the liturgies show, consisted of rice-beer, grain, fine cloth, coarse silk, brocade, and boars and cocks, which latter, however, were never slaughtered. Actual lustrations and prayers for cleansing were frequent, and now survive in the washings of the hands and rinsings of the

mouths of worshipers. Indeed, the radical idea of offenses was that of defilement, and that of amendment purification. The religious distinction between "good" and "bad" was, in general, "clean" and "unclean." Mr. Ernest Satow, in "The Mythology and Religious Worship of the Ancient Japanese" (Westminster Review, No. cccxxvii, p. 25), says that of the two classes the Asiatic invaders were agriculturists, while the primitive inhabitants were hunters or fishermen, and that the "heavenly" offenses mentioned in the rituals were those peculiar to an agricultural class living among a people pursuing different hereditary occupations, while the "earthly" offenses were more general in their nature.—Left alone by itself, Shintō might have developed into a perfected system, with all the appurtenances of a religion properly so called. This, however, was not so to be. Instead of resisting Buddhism, it became, in contact with it, weaker and weaker in the struggle for existence. It was not only overlaid by Buddhism, but, in the ninth century, it was practically absorbed by the India cult through the Philo-like irenicism of Kōbō, a Japanese priest, learned and perhaps unscrupulous, who, after a professed revelation from the *kami*, proclaimed that all the chief gods of Shintō, the native heroes and patriarchs, were but previous imperfect manifestations of Buddha to Japan before his avatar as the perfect teacher to India. The native myths, legends and doctrines were explained according to Buddhist ideas, the old gods were baptized with Buddhist names and titles, and henceforth Shintō, as a religious system, except in a few obscure temples, and among a few noble families, among which its purity was sacredly maintained, disappeared from view, and was utterly forgotten by the mass of the people. When, however, in the seventeenth century, the political genius of Iyōyasu gave "the peace of absolutism," after centuries of civil war, and scholars had leisure for research, a school of zealous Shintō scholars arose. The ancient texts were unearthed, deciphered, edited and lectured upon with literary acumen and polemic zeal. Shintō was again set forth in its primal purity, appealing alike to patriotism and the religious instinct. The logical consequences followed. The conviction flashed itself upon the minds of those who especially hated the despotism of the Tokugawa rulers at Yedo, that if the mikado was the descendant and representative of the Heavenly Gods of the Divine Country (Japan), he ought, by virtue of his divine descent, to reign as emperor, as well as pope, and rule his people without a lieutenant between himself and them. Reverence for the mikado and hatred of the usurper increased, forming a public opinion hostile to the duarchy. When the revolution of 1868 broke out, the most potent moral force behind the cannon balls of the imperialists was the belief in the divinity of the mikado and in his right to govern in person, and expel the alien from the polluted Land of the Gods (Japan). The shōgunate was abolished, and

duarchy ceased. No sooner was the new government established in Tōkiō than the Buddhist emblems and ritual war purged from the ancient Shintō temples, and in place of incense, gilding, images and altars, were seen the austere simplicity of virgin wood, white paper and natural offerings. A vigorous propaganda throughout the empire ensued, and for a time it seemed as though Japan was to be led back to the ideas and mental attitude of a world that had passed away fifteen centuries before. But such a miracle was not to be wrought. Experience soon showed the mikado's ministers that in the nineteenth century men could not be born again into the primitive barbaric age. The foreigners refused to be expelled. — With the revolutionary movement came the multifarious demands of complex government, foreign relations and popular rights. Practical politics jostled state religion aside, and the ancient Council of the Gods of Heaven and Earth (Jin-gi Kuan) which had once outranked the Council of the Great Government (Dai-jō Kuan) was reduced first to a department, then to a bureau, again to a sub-bureau, and finally, in 1880, abolished utterly. Nevertheless, Shintō is still a living force with millions of the Japanese; and the grave problem now before the minds of earnest patriots is the transmutation of the old popular reverence for the throne and person of the mikado as divine, into the new loyalty of intelligent respect. The period between the disintegration of old sanctions and motives and the inrooting and growth into strength of new political habits of thought, is always a period fraught with peril, but it is to be hoped that with the decay of the old may come a purer and stronger religious faith as well as new political theory and fabric, and that the throne of the oldest living dynasty on earth may find even a securer foundation than the stilts of myth, when resting upon constitutional foundations "broad-based upon the people's will." — LITERATURE. Nearly all the best writing upon Shintō is found in the *Transactions of the Asiatic Society of Japan*, by Ernest Satow and Basil Hall Chamberlain. See also *Westminster Review*, July, 1878, and *The Mikado's Empire*, New York.

WM. ELLIOT GRIFFIS.

SIAM. When first known to the Portuguese explorers of the sixteenth century, this country, full of brown-skinned people, or "Moors," was called Siam, from a Malay word (*Sāyam*) meaning "brown race," and quite unknown as a proper name to the Siamese, who call their land Muang Tai, "The Free Kingdom." This national designation of the Tai people is significant of the victory of Buddhism, which knows no caste, over Brahmanism, in which men are fixed, as by decrees of predestination, in various ranks of subordination to the Brahmans. Tai (Siam) constantly rejoices in its deliverance from the dogmas of caste, and in the purity of its Buddhism, which is of the "southern" or less modified form of Shaka Muni's teachings. Occupying the heart of the Indo-

Chinese peninsula, Siam proper is, geographically, the basin of the Meinam river. A long, narrow strip of land, which runs southward from the head of the gulf of Siam to near latitude 4, forms the isthmus of Kraw, and nearly half of the lessening "Malay" peninsula. The other frontagers of Siam are the wealthy Chinese province of Yunnan on the north, and Annam and Cambodia on the east and south. Siam is thus an axe-shaped country, with an extreme length of 1,350 miles, with a breadth varying from 60 to 400 miles, with a coast line nearly equal to its land frontiers. The greater portion of the kingdom is an unexplored wilderness of forest land, the settled portion consisting of teeming alluvial plains, which in many respects resemble the Nile lands of Egypt. The reports of the area vary from 320,000 to 180,000 square miles, a fact which is due partly to genuine ignorance of topography, and partly to the elastic nature of boundaries in those portions whose inhabitants fluctuate in their loyalty to the lord of the golden umbrella. Politically, the neighbors of Siam are the British in Burmah and Wellesley province, the Malays in the peninsula, the Chinese, the Cambodians, the Annamese, and the French who are near enough for possible close relations. The vassalage of some of the people under Siamese rule is of a nominal character; but the tendency is to the increase, rather than the contrary, of Siamese supremacy. Two seasons, the wet and the dry, rule the year. Most of the habitable portion of the Meinam's basin is overflowed from June to August, by which latter month the snows of Thibet have fully melted, and the cities and villages rise like islands out of the Nile-like flood, the people living in boats and moving over the crops beneath. This abundance of never-failing water in a tropical land makes it a perpetual garden. Plant life attains its maximum, and animal forms are abundant. The dry season lasts from November to April. The thermometer ranges from 64° to 99°, averaging 81°. On the whole, the climate is salubrious, though malarial disorders prevail during the wet season. Europeans, with an occasional visit to a cooler climate, can maintain health, and work during most of the days of the year. Food is excessively cheap, clothing light, and shelter easily erected. The people manifest the traits of a weak and passive race. Their bodies are frail and slim, and their minds quick rather than strong. Their virtues and vices are those usually found in a climate in which nature is an over-indulgent mother, and are fostered by a religion that, like southern Buddhism, of which Siam is the citadel, is full of intellectual subtlety, but allows little outward manifestation. — Most of the land was formerly held on a semi-feudal tenure, the farming population being kept in practical serfdom, and compelled to work at forced labor during portions of the year. This system of debt-slavery which formerly prevailed, by which millions of debtors in bondage to creditors were branded with the seal or mark of their owners, is now radically modified, and

is in course of extinction. Yet the rice is still badly cultivated; and, notwithstanding the fertility of the soil, famines are far from unknown. Yet better methods of agriculture are being introduced. The old plan of driving herds of buffaloes over the fields to level the weeds and turn up the soil, which was afterward harrowed with thorny shrubs, has given way to improved labor, which has greatly increased the output of cereals, and made the export of grain possible and profitable. Rice, cotton, sugar, indigo, various woods, gums, spices, metals and ivory are now exported. — Of the 12,000,000 souls under Siamese rule, one-third only are of the Tai race, another third are Chinese, the remainder being Laotians, Malays, Hindoos, Cambodians, etc. The Siamese are a mixed people, sprung from Mongolian and Aryan ancestors, and possess the mental and physical traits of both the Hindoos and the Chinese. Nearly half of the words in their language have their roots in Sanskrit. The written language has an alphabet of sixty-four letters, of which forty-four are consonants and twenty vowels. Like most alphabets or syllabaries of Chinese Asia, the Siamese system has been derived from ancient India by Buddhism, though in this instance mediately through Cambodia, the ancient Cambodian character being still used in their sacred books. The vocabulary, which is meagre and mostly monosyllabic, is eked out by tonic inflections, by which one word does duty for several distinct meanings. The language is simple in structure, with few idioms, and in general features resembles Chinese. The spelling, like that of Corea, and most countries having an alphabet unnecessarily large, is in a state of chaos. Writing is from left to right. The national literature is of local importance only, most of what is excellent in it being borrowed from Chinese or Hindoo sources, or closely formed on foreign models. The Buddhist writings are very voluminous. The homely wisdom and keen wit of the people are best expressed in their proverbs. Education is almost entirely in the hands of the priests, who constitute a large and influential class. Siam for over 1,200 years has been intensely and only Buddhist, and it is estimated that the priests obtain for their personal and bodily support alone, the sum of \$25,000,000 annually. — The government is nominally a duarchy, the supreme king possessing about two-thirds, and the lesser king one-third, of the power, the latter acting as a prime minister or first counselor, though, like the other high nobles, taking semi-annually the oath of allegiance to the supreme king. The legislative power is vested in a council of state and the senabawdi or ministry; the former consisting of from ten to twenty counselors, presided over by the king, with the ministers who sit without voting; and the latter, of the ministers or heads of departments. The king can not promulgate laws without the consent of this council, which also confirms the succession to the throne, which, though nominally hereditary, is not always to the eldest son. — The untrust-

worthy annals of the Siamese extend back centuries before Christ, but history, in the modern critical sense, begins with the founding of the capital, Ayuthia, A. D. 1350. The civil era, as used by the ruling dynasty, begins at 638 A. D., so that the present year 1883 is the 1245th of Siam. In the sixteenth century the Siamese extended their sway over Cambodia and the Malay peninsula. Among the people trading with them, or serving in their armies, were the Japanese. Relations with Europe were first established in 1513, when the king of Siam sent an embassy with gifts to the great Portuguese buccaneer Albuquerque, who had conquered Malacca. Commerce with Portugal was established, and in 1604 the Dutch took a share in the profits of trading between Bangkok and Europe on the one hand and Nagasaki on the other. The first English vessel arrived at Ayuthia in 1612. Later on a Greek adventurer, named Phaulkon, who had found his way to Siam, ingratiated himself in the king's favor, was appointed by degrees to high office, and persuaded the Siamese to send an embassy to France. This was done, the envoys visiting Paris, and also London, concluding treaties with Louis XIV. and Charles II. The French king sent out embassies in 1685 and 1687, and through the influence or treachery of Phaulkon, a force of five hundred French soldiers were given possession of the citadel at Bangkok, which they held until 1690, when they were expelled, and French influence suffered a bloody, decisive overthrow. In 1782 the Burmese, having invaded Siam, sacked and burned Ayuthia, the present ruling dynasty was founded, and the capital removed to Bangkok. Since the foundation of Ayuthia, in 1350 A. D., forty sovereigns have ruled over Muang Tai. Treaties with the East India company were made in 1822 and 1825. The American sea captain Edmund Roberts, of Portsmouth, N. H., was commissioned by President Jackson to make a treaty with Siam, which was accomplished March 20, 1833. Townsend Harris, in 1856, negotiated a second treaty on behalf of the United States, which allowed greater privileges to American citizens. The court of Bangkok has already signified its intention of sending an embassy to the United States, and of establishing a legation at Washington. The present king, Chulalankarana I., born Sept. 21, 1853, succeeded his father Oct. 1, 1868. The second king is George Washington (Kroma Phraracha). During the past two generations, the American missionaries in Siam have been very active in promoting science, education and the introduction of American ideas, methods and machinery, and have been very influential for good at the court. The present kings are well educated, and have begun a series of reforms which promise a new life for the nation, and show that Siam, like Japan, has begun to abandon Asiatic ideals of civilization, and to put herself in harmony with the political ideas of Christendom. In regard to education, schools after the American model have been established for sons of nobles, and an increas-

ing number of Siamese young men are being educated in western science and literature. Dress and etiquette are less restricted by servile customs, trade is being gradually unfettered, and in place of the old fractional currency in paper promises, bronze tokens, minted in England, form, with the silver coins stamped with the effigy of a white elephant, the circulating medium of commerce. — In 1880 the foreign trade was valued at \$10,000,000, the imports being mainly hardware, machinery, dry goods and opium, with which latter article Americans have nothing to do. An increasing fleet of steamers, and square-rigged vessels in the commercial marine, and war vessels after the British model, and army drilled according to western tactics, the adoption of a national flag bearing the design of a white elephant on a crimson field, the granting of perfect religious freedom, the abolition of slavery and feudal or debt bondage, and the beginnings of a diplomatic usage similar to that of western nations, illustrate the earnestness of the rulers of Siam to enter the comity of nations and pursue national prosperity along the lines marked out by the leading governments of the earth. — LITERATURE. Crawford's *Embassy to Siam*, London, 1628; Pallogoix, *Description du Royaume Thai*, Paris, 1854; Bowring's *Kingdom and People of Siam*, London, 1857; Leonowen's *An English Governess at the Court of Siam*, Boston, 1870; Vincent's *Land of the White Elephant*, New York, 1874; *Diplomatic Correspondence of the United States*, 1868.

WM. ELLIOT GRIFFIS.

SILVER, one of the precious metals, of a white color, and, when polished, of a brilliant, shining lustre, scarcely inferior to that of highly polished steel. It is next to gold in malleability, ductility and resistance to oxidation in air and water. Relatively to gold, its tenacity is about one-fourth, and power of electrical conduction about one-third greater, and its power of conducting heat as 973 to 1,000. In modern chemistry, the symbol for silver is ag., from the Latin name *argentum*, denoting silver; its atomic weight, 108. Molecular weight, 216; hardness, 2.5-3. Specific gravity, when pure, 10.5. It fuses at about 1873 Fah., and volatilizes at a higher temperature. When melted, it absorbs oxygen, of which it may take up twenty-two times its own volume, and which it expels on cooling with a peculiar sound known as spitting. — Silver is dissolved by nitric acid at all temperatures, and by hot concentrated sulphuric acid. It can be alloyed with many other metals. Alloys of gold and silver are of a greenish white color, more ductile, harder and more sonorous than either metal; 50 parts of silver in 1,000 are sufficient to lower the color of gold. Silver increases the toughness of gold, and gold coins containing a small per cent. of silver are less liable to abrasion than if alloyed with copper alone. Gold alloyed with 80 per cent. of silver has a greenish color; with two-thirds silver, pale or white. The color of silver is not modified by a copper alloy

up to about 850 parts in 1,000. Alloys of silver and copper have a less specific gravity than the mean of the two metals, and are harder and more ductile, elastic and sonorous than pure silver. The maximum of hardness is reached by an addition of 200 parts of copper. — Silver is found in its native state, and also occurs in combination with other substances in the form of ores and alloys, but is principally obtained from its sulphide, and from those ores of which it is a variable constituent, but existing in such large quantities as to be an object of metallurgical operations. — The native metal is usually alloyed with a small quantity of copper, gold, and sometimes antimony, bismuth, mercury or platinum. It occurs in masses, and in fine and coarse threads, but generally has the appearance of metallic twigs and branches. A mass taken from the Konigsberg mines, in Norway, in the royal collection at Copenhagen, weighs upward of 500 pounds. A mass discovered at Huantaya, Peru, weighed 800 pounds; while another in Sonora, Mexico, is said to have weighed 2,700. A specimen from Batopilas, Mexico, weighed 400 pounds. — Metallic silver has also been found in Saxony, Bohemia, Hungary, and in the Hartz, Altai, Ural, and some of the Cornish mines; while in the United States it is found in some of the mines in North Carolina, Colorado, Utah, Nevada and California. In the Lake Superior region, the silver generally penetrates the copper in masses and strings, and is nearly pure, notwithstanding the copper about it. — The following are some of the most important silver ores:

Silver in combination with Sulphur.

- Argentite**—Silver glance—Sulphide of silver. This is the common and most valuable ore of silver, and possesses considerable malleability. It has a metallic lustre, is of a dark gray color, shining streak and an uneven fracture. Its composition is: sulphur, 12.9; silver, 87.1. Hardness, 2-2.5. Specific gravity, 7.196-7.365.
- Stephanite**—Brittle silver ore. Lustre metallic, color and streak iron-black, fracture uneven. Composition: sulphur, 16.2; antimony, 15.3; silver, 68.5. Hardness, 2-2.5. Specific gravity, 6.269.
- Polybasite**. This mineral contains from 65 to 75 per cent. of silver, in combination with sulphur, copper, arsenic and antimony. Lustre, metallic; color and streak, iron-black; fracture uneven. Hardness, 2-3. Specific gravity, 6.214.
- Pyrrargyrite**—Ruby silver—Dark red silver ore. The dark red or antimonal variety contains sulphur, 17.7; antimony, 22.5; silver, 59.8. Lustre, metallic, adamantine; color, black, sometimes approaching cochineal red; streak, cochineal red. Hardness, 2-2.5. Specific gravity, 5.7-5.9.
- Pyrostilite**—Ruby silver—Light red silver ore. The light red or arsenical variety contains sulphur, 19.4; arsenic, 15.1; silver, 65.5. Lustre, adamantine; color and streak, cochineal red; fracture, uneven. Hardness, 2-2.5. Specific gravity, 5.42-5.56.
- Stromeyerite**—Sulphide of silver and copper. Composition: sulphur, 15.7; copper, 31.2; silver, 53.1. Lustre, metallic; color, dark steel gray; streak, shining; fracture, subconchoidal. Hardness, 2.5-3. Specific gravity, 6.2-6.3.
- Sternbergite**—Sulphide of silver and iron. Composition, nearly equal parts of sulphur, iron and silver. Lustre, metallic; color, pinchbeck brown; streak, black. Hardness, 1-1.5. Specific gravity, 4.21. It resembles graphite, and, like it, leaves a tracing on paper.
- Miargyrite**—Sulphide of silver and antimony. Composition: sulphur, 21.8; antimony, 41.5; silver, 36.7. Lustre, submetallic; color, iron-black; streak, dark cherry red; fracture, subconchoidal. Hardness, 2-2.5. Sp. gr., 5.4.

Freieslebenite. An antimonial silver and lead sulphide, containing about 24 per cent. of silver. Lustre, metallic; color, steel gray. Hardness, 2-2.5. Specific gravity, 6-6.4.

Silver fahlore—Gray copper ore. A compound of silver, copper, iron, antimony, arsenic, sulphur, zinc and lead, and sometimes gold and mercury, containing silver in variable proportions up to 31 per cent. Sometimes this metal is almost entirely wanting. Lustre, metallic; color, steel gray to iron-black; streak, brown or black. Hardness, 3-4.5. Specific gravity, 4.5-5.1. This ore is quite common, but the silver is obtained from it with the greatest difficulty.

Silver in combination with Chlorine, Bromine and Iodine.

Cerargyrite—Chloride of silver—Horn silver. Composition: chlorine, 24.7; silver, 75.3; but usually contains a small quantity of the peroxide of iron. Lustre, resinous, passing into adamantine; color, pearl gray or grayish green, and when pure becomes a violet brown on exposure; streak, shining; fracture, conchoidal. Hardness, 1-1.5. Specific gravity, 5.552. This ore resembles and cuts somewhat like horn or wax, and will, by rubbing, silver the surface of an iron plate. Its varieties are:

Iodide of silver. An admixture of iodine with 46 per cent. of silver. Lustre, resinous; color, yellow; streak, yellow.

Bromide of silver. An admixture of bromine with 57.7 per cent. of silver. Lustre, splendid; color, bright yellow.

Embolite. Composed of chlorine 13, bromine 20, silver 67 parts.

Silver combined with other Metals.

Bismuth silver. An ore containing from 15 to 60 per cent. of silver. Lustre, metallic; color, grayish white.

Native amalgam. A compound of silver and mercury, the per cent. of silver varying from 26.5 to 86.6, dependent upon the manner in which it is combined.

Dyscrasite, or antimonial silver. Consists simply of antimony and silver; antimony 22, silver 78; and has a nearly white color. Hardness, 3.5-4. Specific gravity, 9.4-9.8.

Silver combined with tellurium, or Telluride of silver (Heesite). Composition: tellurium, 37.2; silver, 62.8. Lustre, metallic; color, steel gray. Hardness, 2-3.5. Specific gravity, 8.3-8.6. It is slightly malleable.

Silver in combination with selenium; naumannite or selenide of silver. Selenium, 20.8; silver, 79.2. Lustre, metallic; color and streak, iron-black.

Eucalrite—Films of silver and copper containing selenium. Composition: selenium, 31.6; copper, 25.3; silver, 43.1. Lustre, metallic; color, lead gray; streak, shining; so soft that it may easily be cut with a knife. It also tarnishes easily.

—The processes for extracting silver from ore may be grouped into three general divisions: amalgamation, smelting, and lixiviation. In amalgamation, the silver is collected by the use of mercury; in smelting, it is made to combine with lead or copper; and, in lixiviation, is drawn off in a solution containing silver as the base, in combination with acids. Each of these methods has processes which differ, each from the others, methods known by the names of the inventors, or of the localities where first introduced. — Ores, for their metallurgical treatment, are generally classified in reference to their constituents, as well as the amount of silver contained. Those from which the silver can be obtained by simple mechanical processes, are called "free milling ores." Ores from which the silver can be extracted by fusion at high temperatures and then drawing off separately the earthy materials and metals, as they arrange themselves according to their specific gravities, are called "smelting ores." When ores do not readily part with their

silver by fusion, or by the use of chemicals and the ordinary mechanical processes, they are called "rebellious" or "refractory." — *Amalgamation.* The method of extracting silver from ores by amalgamating them with mercury, was first discovered in 1557 by Bartolome Medina, a native of Pachuca, Mexico, and has since that time, with some modifications, been in general and continuous use. Ores treated by this process may be divided into classes, dependent upon the amount of silver contained and other substances associated with the silver, and require somewhat different metallurgical treatment. Ores containing silver combined with sulphur, chlorine, iodine or bromine, but free from arsenic and antimony, which largely increase the expense, together with the loss of both mercury and silver, are most easily worked by amalgamation. Such ores containing silver assaying less than \$150 to the ton, are generally treated by the so-called Washoe or pan process, in which the ores are first crushed to a suitable size, and then, by means of a stamp mill, are pulverized in water into particles of the size of fine sand, and subsequently are ground in cast-iron pans or amalgamators with hot water and mercury, sometimes with, and sometimes without, the addition of chemicals. The silver and mercury, in the form of an amalgam, are placed in small bags, through the interstices of which the redundant mercury oozes and is strained out. The remainder of the mercury is afterward vaporized and separated, by heating the amalgam in an iron retort. The silver, alloyed with more or less of other metals left in the retort, is melted into bars, while the condensed mercury collected from the retort is again used for amalgam. Ores of this character assaying below \$90 to the ton, require, for their treatment, a longer time for amalgamation and a greater quantity of chemicals and mercury. Ores assaying in silver over \$150 per ton, and associated with arsenic, antimony or iron, so as to render their reduction difficult, are generally crushed dry, roasted with salt in a reverberatory furnace, and then amalgamated in barrels. — *Smelting.* Silver and lead in a state of fusion possess a strong affinity for each other, and advantage is taken of this in the reduction of argentiferous ores. When silver exists in the ore in a metallic state, an alloy is easily made by fusing together the ore and metallic lead, or the ores of lead. In case silver is associated with large quantities of iron pyrites or sulphides other than galena, the ore is frequently fused for a matte, which is then roasted and remelted with lead, and from the alloy thus obtained the silver is afterward separated. Lead and other base metals are removed by different methods, dependent upon the cost of the agents and material employed, and the use to be made and value of the base metals or of the by-products obtained. — *Leaching.* To extract silver from ore by this process the silver must enter into chemical combination with some substance that will form with it a soluble compound. Chlorine, under the proper conditions, readily combines with silver,

and has been found the cheapest and most suitable agent for this purpose. The silver is converted into a chloride by roasting the crushed ore in a furnace with common salt, of which from 5 to 20 per cent. is used, according to the richness of the ore. The chloride, being insoluble in water alone, is leached out from the mass by running through it a solution of calcium hyposulphite, from which the silver is afterward precipitated as a sulphide of silver by a solution of calcium polysulphide (pentasulphide). The precipitated sulphide, in the form of black mud, is collected, roasted, dried, roasted and then melted at a high temperature, with an addition of scrap iron, which takes up the sulphur remaining after the roasting, and reduces the silver to a metallic state. The leaching process is quite satisfactory in its results when it is desired to obtain silver bullion of the highest degree of purity. — *Silver Refining.* Silver is refined either by the dry method, fire, or the wet process, acid. In refining by fire the base metals are converted into their oxides and flow from the melted silver, or are removed by absorption or dissolved in alkaline fluxes. Where large amounts are to be operated upon, the silver is usually refined by cupellation in a reverberatory furnace. The bullion is placed upon a cupellation hearth, made of suitable material, such as crushed slag, quartz and clay, bone-ash, calcareous marl, composed chiefly of carbonate of lime and silicate of alumina, etc., etc., the chief requisite being that the cupel should be infusible, sufficiently porous to absorb the oxides of the base metals, and contain in its composition no reducing agent. The base metals are oxidized by a current of air, and run off as melted oxides, or are absorbed by the cupel. Silver is brought without difficulty by this process to a fineness of over 99 per cent. — Refining by the use of oxidized fluxes is conducted in crucibles, and the agent employed is generally nitrate of potash or of soda. The nitrate is decomposed by the heat of the furnace; its oxygen, combining with the base metals, forms oxides, which are dissolved or held in suspension by silicious or alkaline fluxes. Borate of soda is the flux usually employed in the mints in refining. — Silver is refined by the wet process by dissolving the bullion in acids, precipitating the silver by chlorine, and subsequently reducing it to a metallic state, or by precipitation with copper. This is rarely employed otherwise than as an incident to the parting of gold and silver, or when silver containing base metals can at the same time be advantageously melted and used as alloy for quardation in refining gold. This process is described in the article on GOLD in Volume II. — *Occurrence.* Silver, though not so widely diffused as gold, has been found in every grand division and in many of the principal islands of the globe. In ancient times it was obtained from Nubia and other parts of Africa, from western Asia and many countries in Europe, principally Spain, Hungary and Austria, Germany, Turkey, and Russia. Upon the discovery of America rich mines were

soon opened in the countries of South America adjacent to the Pacific coast—Peru, Chili and Bolivia—and also in the northern and western portions of Mexico. Of late years it has been found in greater abundance in the territories and western states of the United States. — *Production.* Silver seems to have been one of the earliest metals known, and, as money, is the first mentioned by the ancient sacred and profane historians. From the mines known to them considerable quantities were obtained, although the methods employed for treating the ores and refining the metal were crude and expensive. Pliny states that silver was found in all the Roman provinces, and both he and Diodorus mention the Spanish mines as the principal source. From the latter it is said that Hannibal extracted 300 pounds daily (equal to \$1,500,000 annually), and that one tunnel had penetrated a mile and a half into the mountain. Although new mines were from time to time discovered, the total annual production of silver, as well as the stock previously accumulated, became gradually reduced until the discovery of America. How much then existed in the world, either in the form of coin or personal ornaments, plate and bullion, is a matter of conjecture. The average yearly production for the first fifty-three years after the discovery of America (1492 to 1545) was, according to an estimate made in 1830 by John White for the secretary of the treasury, \$640,000; according to Mr. Alex. Del Mar, formerly chief of the United States bureau of statistics, \$600,000; and according to Dr. Soetbeer, \$2,716,000. The total production of both gold and silver in the western world, America, Europe and Africa, from 1492 to 1800, on the estimates of Mr. Jacob, would be \$5,708,000,000; on those of Danson, \$5,482,000,000. Mr. White's estimate of the silver production for the period amounts to \$3,725,000,000; Mr. Del Mar's to \$4,260,000,000, and Dr. Soetbeer's to \$4,855,000,000. Their estimates of the gold production during the same time are: White, \$1,675,000,000; Del Mar, \$1,872,300,000; Soetbeer, \$2,332,000,000; which, added respectively to their estimates of the silver production, would make the total production, according to Mr. Del Mar, \$6,560,000,000, and according to Dr. Soetbeer, \$7,187,000,000, both of which amounts exceed those given by Danson and White. Mr. Del Mar's estimate of the yearly production of silver from 1800 to 1876 amounts to \$2,638,500,000, and adding to this the yearly production for the remaining four years to 1880, as estimated by the director of the mint, amounting to \$368,800,000, would bring Del Mar's estimate up to \$3,007,300,000, which is \$161,000,000 less than Soetbeer's estimate. The total production of silver in the western world, since the discovery of America, would be, according to Soetbeer, \$8,034,819,000; according to Del Mar, \$7,267,300,000. — The yield of silver from the mines of all the countries of the world in each century since the discovery of America, has been estimated by Dr. Soetbeer as follows:

PERIOD.	Kilograms.	Value at the Coinage Rate of the U. S. Dollar.
1493 - 1600.....	22,834,400	\$ 948,998,000
1601 - 1700.....	37,284,000	1,547,445,000
1701 - 1800.....	57,094,900	2,370,370,000
1801 - 1880.....	78,227,275	3,168,006,000
Total.....	193,330,575	\$8,034,819,000

— Among the silver-producing countries of the world the United States stands first, and, with Mexico and Bolivia, furnishes four-fifths of the entire amount. Germany is fourth, with a yield from her mines of nearly \$9,000,000, followed by Chili with \$5,000,000, and Spain with \$3,000,000. The amount of silver obtained from the principal silver producing countries of the world in 1882 was stated by the director of the mint to be:

COUNTRIES.	Kilograms	Value.
United States.....	1,123,083	\$ 46,800,000
Russia.....	11,301	473,519
Australia.....	2,475	102,878
Mexico.....	703,508	29,237,798
Germany.....	214,982	8,934,652
Austria-Hungary.....	47,118	1,958,224
Sweden.....	1,176	48,875
Norway.....	4,812	199,987
Italy.....	432	17,949
Spain.....	74,500	3,096,220
Turkey.....	2,164	89,916
Argentine Republic.....	10,109	430,225
Colombia.....	24,057	1,000,000
Bolivia.....	264,677	11,000,000
Chili.....	122,275	5,081,747
Japan.....	22,450	916,400
Dominion of Canada.....	1,641	68,205
Total.....	2,633,860	\$109,416,595

The special report of the director of the mint on the production of the precious metals in the United States for 1882 makes the total yield for that year in the United States \$46,800,000. The largest amount was obtained from Colorado, which produced \$16,500,000, the greater part from the Leadville mines. Arizona comes next, with \$7,500,000, mostly obtained from the Tombstone district; then Utah, furnishing \$6,800,000; while Nevada, once first among the silver states, with a production in 1878 of \$28,000,000, now stands fourth with but \$6,750,000.

STATES AND TERRITORIES.	1881.	1882.
Arizona.....	\$ 7,300,000	\$ 7,500,000
California.....	750,000	845,000
Colorado.....	17,160,000	16,500,000
Dakota.....	70,000	175,000
Idaho.....	1,300,000	2,000,000
Maine.....	5,000	—
Montana.....	2,630,000	4,370,000
Nevada.....	7,060,000	6,750,000
New Mexico.....	275,000	800,000
North Carolina.....	—	25,000
Oregon.....	50,000	35,000
Utah.....	6,400,000	6,800,000
Total.....	\$43,000,000	\$46,800,000

— *Use and Consumption of Silver.* Silver is largely used in ornamentation, manufactures and coinage. For these purposes it is almost invariably alloyed

with copper. In the United States the standard for coin is 900 parts silver and 100 parts copper. The English standard, called "sterling silver," contains 7.5 per cent. copper, with a fineness of .925. In France several standards are employed: 950 parts for metals and plate, 900 for standard silver coin, and 850 for bullion and subsidiary coin. — A considerable amount of silver is annually consumed in the arts, and a larger quantity converted into plate or articles for personal ornamentation. Silver is also dissolved in solutions, or used in combination with acids, metals, or alkaline bases in chemical and medicinal preparations, and for manufacturing purposes, in a manner which prevents its recovery for further use. When silver is used for electro-plating, or beat into thin leaves, but a small proportion, if any, can be again collected. Nearly the whole is practically lost, and unavailable for use in coinage or the arts, although ornaments and plate of solid silver are often remelted and used in coinage. But the statistics of all countries show that the plate and jewelry annually brought to their mints for coinage are less than the amount of bullion of recent production found to be annually appropriated for ornamentation and in the arts, etc. At the United States mints the silver of this character deposited for conversion into coin or bars is scarcely one-tenth of the \$6,000,000 estimated to be consumed in the United States in the arts, manufactures and ornamentation. — Efforts have been made to ascertain the silver appropriated in various countries and in the world for these purposes. In 1830 Mr. W. Jacob published his work on the production and consumption of the precious metals, which contained much valuable information on this subject. He placed the annual consumption of silver, other than for coinage, at \$4,000,000 for Great Britain, and of gold and silver for Great Britain at \$12,000,000, and for Europe, \$28,000,000. The inquiries instituted in 1879 by the United States director of the mint, and continued for three years, to ascertain the amount thus consumed in the United States, elicited replies which for the year 1881 showed that 1,143 persons and firms consumed in their business over \$3,000,000 of silver for the purposes and of the character and description stated as follows:

United States coins.....	\$ 72,190
Fine bars.....	3,127,432
Foreign coin, jewelry, plate, etc.....	188,799
Total.....	\$3,388,421

— Inquiries were also made, at the request of the director of the mint, through representatives of the United States government, as to the consumption of silver in foreign countries. From the information obtained in this manner, and from other sources, the director in 1881 estimated that the annual consumption in the world for uses other than coinage was not less than \$35,000,000. — Upon information contained in official reports, and additional facts collected from various sources, Dr. Soetbeer, of Germany, made a detailed estimate

of the consumption of silver in various countries, and placed the net amount in the civilized world at 471,000 kilograms (\$19,500,000), distributing that amount as follows :

United States	\$ 4,239,000
Great Britain	2,992,000
France	3,117,000
Germany	3,117,000
Switzerland	997,000
Austria-Hungary	1,330,000
Italy	790,000
Russia	1,330,000
Total of above countries	\$17,912,000
Other civilized countries	1,663,000
In all	\$19,575,000

As by his estimation the United States and seven countries in Europe consumed \$17,900,000 of the whole \$19,500,000, leaving but \$1,600,000 for the remaining countries of Europe, North and South America, while the large consumption of China and India (the latter placed by the director of the mint at \$10,000,000) is wholly omitted, the director's estimate of \$35,000,000 as the total consumption of the world is probably below the real amount. — *Coinage.* Silver coins are reported to have been struck and used in Greece and Rome as early as the third century preceding the Christian era. The amount of silver coined, however, in that period, and subsequently until the discovery of America, is insignificant, compared with the amounts issued from the coinage mints in the nineteenth century. The records of the English coinage show an annual average coinage of silver of less than \$35,000 in the fourteenth and fifteenth centuries, while the value of the silver coinage of Great Britain from 1816 to 1876 exceeded \$120,000,000, being over \$2,000,000 annually. — In England, however, as well as in Portugal, where the value of the silver coinage from 1852 to 1880 was \$48,174,692, the coin circulation consisted of gold rather than silver; but in France, where silver largely circulates, its coinage in sixty years, 1726–85, is stated to have been 1,500,000,000 livres, while from 1795 to 1880, inclusive, silver to the value of 5,511,952,864 francs was coined, equal to \$1,100,000,000, being over \$12,000,000 annually. — The silver coinage in Mexico in 1809 was \$26,172,000, in 1812 \$4,409,000, then varying with the disturbed condition of the country, but of late years it has averaged from twenty-two to twenty-eight million dollars. — During the eight years from 1875 to 1883 the silver coinage of a number of the principal countries—the largest portion of which, for the last five years, was executed by the United States, Mexico and India—was as follows:

YEARS.	No. of Countries.	Amount.
1875	18	\$119,105,467
1876	15	126,577,164
1877	16	114,359,332
1878	15	161,191,913
1879	10	104,888,313
1880	11	82,397,154
1881	14	108,478,624
1882	12	107,997,952

— In 1882 Mexico manufactured into coin nearly all the silver obtained from its mines, while the United States used for that purpose but seven-twelfths and Germany three-fourths of its silver product. The India mints coined the largest amount. The coinage of silver for the year for the principal countries was :

United States	\$27,972,035
Mexico	25,146,260
Great Britain	1,021,381
India	29,386,322
Germany	6,407,157
Austria-Hungary	3,122,819
France	223,853
Netherlands	608,312
Norway	123,280
Sweden	19,703
Spain	10,671,842
Japan	3,294,968
Total	\$107,997,952

— The following silver coins of the United States can now be legally issued, except the trade dollar, the coinage of which was, in 1878, suspended by order of the secretary of the treasury as authorized by law :

DENOMINATIONS	Authorized.	Present Weight.	Coinage to June 30, 1883.
Trade dollar	Feb. 12, 1873	grains. 420 1	\$ 35,969,360.00
Dollar	April 2, 1792	412.5	8,045,838.00
	Feb. 28, 1873		147,255,899.00
Half dollar	April 2, 1792	grains. 12 5	122,761,270.00
Quarter dollar	April 2, 1792	6 25	38,482,066.25
Dime	April 2, 1792	1 25	17,628,012.20

— The principal silver coins of chief European countries, now in circulation or coined by the mints in Europe, their weight and fineness, with the quantity of fine silver they contain, are shown in the following table .

COUNTRIES.	Coins.	Weight	Fine ness.	Silver con
				tained in.
Austria	florin	grs. 190 51	900	171.46
Belgium	5 francs	385 8	900	347 22
Belgium	1 franc	77 16	835	64.43
Denmark	crown	115 74	900	92.59
England	shilling	87 27	925	80 74

— *Abrasion of Coins.* In all estimates of the amount of silver in the world at any period, an allowance must be made for the loss by abrasion, which will vary with the composition of the coins and the frequency of their circulation. The loss by friction is less when coins are alloyed with

copper. Silver coins lose by abrasion, according to Mr. W. Jacob, more rapidly than gold coins. He placed the wear of English standard silver at about $\frac{1}{100}$ part annually. Tests were made at the London mint in 1826 to ascertain the loss on silver coins of different denominations respectively in circulation for three brief periods, taking 300 coins of each denomination for each period, with the following results:

AVERAGE CIRCULATION	Per Cent. of Loss in Circulation.		
	Half Crowns	Shillings.	Sixpences.
Two years.....	.07	.24	36
Six years.....	.76	1 60	2 38
Ten years.....	99	2 30	3 53
Mean.....	.086	.205	.309

—The experiments made by the officers of the English mint in 1787 to ascertain the deficiency in weight of the silver coins in actual circulation at that time, showed a loss upon the crown pieces of 3.3 per cent.; half crowns, 9.9 per cent.; shillings, 24.6 per cent. — In 1872–3 a quantity of light gold coins were sent to the mint for recoinage; among them 6,000,000 gold dollars were found to be deficient in weight .478 per cent., being little less than $\frac{1}{2}$ per cent. As the issue of these coins was authorized in 1849, and not quite 20,000,000 were issued, and after 1863, during the suspension of specie payments, they were practically out of circulation, twelve years may be considered as the average period of their circulation, which would give a loss by abrasion of about 1 per cent. in twenty-five years. The loss on 5,000,000 quarter eagles was .00506, being a little over $\frac{1}{2}$ per cent. These doubtless were coined since the reduction of the value of gold coins in 1834, and had been in circulation under forty, and probably not over thirty, years; the loss by abrasion was at the rate of a little over $1\frac{1}{10}$ per cent. in a century. The loss on 10,000,000 half eagles was .005214. These may have been in circulation for the same length of time as the quarter eagles, in which case the loss by abrasion would be at the rate of about from $1\frac{1}{2}$ to $1\frac{1}{4}$ per cent. in a century.

—*Silver Circulation.* It is impossible to tell with certainty the amount of silver in circulation at any given period in any particular country, or the total amount used by commercial nations. Mint reports of most countries furnish meagre information as to the character of the bullion used in coinage, and seldom state the country from which it was obtained, or whether it consisted of bars or coins remelted. Where, however, the recent legislation of a country has changed the denomination or legal-tender character of its coins, an approximate estimate of the coin circulation can be made by deducting from the total coinage subsequent to the change that portion exported and estimated to have been received, and used in the arts. Such an estimate is more reliable where the silver coins are valued relatively to gold higher than the value

of the bullion they contain, in which case few will be exported, except to those countries where they pass at the legal home valuation. In this case, and in countries where the customs returns give the amount and character of the coin exports, the silver circulation can be stated with sufficient exactness and reasonable certainty. — As to the silver circulation of the United States at the present time (1883), it can be stated approximately without much hesitation, because the country had no silver in general circulation in 1873, and its present stock has been accumulated since that time, with the exception, possibly, of five millions. In 1883 the silver coin in the country on the first of October was estimated by the director of the mint to have been 154,000,000 silver dollars, and \$81,000,000 in fractional silver. — *Relative Value of Silver to Gold.* As the principal ultimate demand for silver has been to coin or use it as money, the legislation at different periods of the world and in different countries, establishing for each country the relative debt-paying power of given weights of gold and silver, has, probably, more than any other cause, affected the market value of the two metals. Tables have been published giving their relative values at various periods; but an inspection of their dates, compared with the legislation of the country, shows that either the relative value of the gold and silver coins, or, in some cases, their value less mint charges, is given as the market value of the metals. The production of silver and gold, and their relative values for stated periods subsequent to the discovery of America and prior to 1881, were examined for each country by the eminent German statistician, Dr. Adolph Soetbeer, and his conclusions have been given to the public. During that period the production of gold and silver, and values relatively to each other, as stated by him, were as follows:

PERIODS.	Relative Production.		Relative Value.	
	Silver.	Gold.	Silver.	Gold.
1493—1600.....	66 2 to	33 8	1 to	10 12
1601—1700.....	72 6 to	27 2	1 to	12 15
1701—1800.....	65 9 to	34 1	1 to	14 97
1801—1850.....	64 1 to	35 9	1 to	15 70
1851—1875.....	29 2 to	70 8	1 to	15 53

This comparison, as remarked by Seyd, shows that the relative value of the two metals has been largely affected, though doubtless not wholly controlled, by other causes than the relative amount produced. In the legislative changes made by different nations in the relative value as established in the coinage, it will be found that the higher valuation of the one or the other metal, and the course of exchange and balances of trade between nations, have had much to do with the disturbance of their values, and a great, if not a controlling, influence in determining their relative price. — Alexander Hamilton, in his report as secretary of the treasury to congress on the establishment of a mint, in 1791, clearly stated the effect of such legislation: "If two countries are supposed, in one of which the proportion of gold to

silver is as one to sixteen, in the other as one to fifteen, gold being worth more, silver less, in one than in the other, it is manifest, that, in their reciprocal payments, each will select that species which it values least to pay to the other, where it is valued most. Besides this, the dealers in money will, from the same cause, often find a profitable traffic in an exchange of the metals between the two countries. And hence it would come to pass, if other things were equal, that the greatest part of the gold would be collected in one, and the greatest part of the silver in the other. The course of trade might, in some degree, counteract the tendency of the difference in the legal proportions by the market value; but this is so far and so often influenced by the legal rates, that it does not prevent their producing the effect which is inferred. Facts, too, verify the inference. In Spain and England, where gold is rated higher than in other parts of Europe, there is a scarcity of silver; while it is found to abound in France and Holland, where it is rated higher in proportion to gold than in the neighboring nations." — To understand all the causes which have affected the relative price of gold and silver, it would be instructive to trace the history of the successive changes of each nation, and their contemporaneous valuations. This is not easy to do, because the legal rating of the coins seldom corresponds with the relative amount of bullion necessary to be brought to the mints to obtain them, by reason of deductions for seigniorage to the sovereigns, and fees for the mint officers and workmen. Some of the more important changes have been as follows: For twelve hundred years prior to the time of Xenophon (400 B. C.) the ratio of gold to silver is stated to have been 13.33 to 1. The Greeks and Romans established in their coinage a value of 12 to 1; although it is said that at the time of the return of Julius Cæsar to Rome the value of gold had fallen to the ratio of 7.5 to 1. For the first centuries of the Christian era the relative value of gold in the Roman empire appears to have been as 12.5 to 1. Different countries have from time to time established different ratios, none of which permanently stood, and the rate of valuation was about or a little above or below 12 to 1 until the close of the fifteenth century. But early in the seventeenth century the valuation of gold was raised, first by England to about 13.7, and subsequently by Holland to 13.62, and again raised about the middle of the century by Holland to 14.93, and later, in 1665, by edict of Charles II., to 14.5 in England; and the coinage of both gold and silver, in the succeeding year, was made free to all at current rates, at which time the valuation in Italy and Spain is stated to have been 15 to 1. — The value of gold and silver in European countries in 1640 is reported by reliable authorities to have been: France, 13½ to 1; Flanders, 12½ to 1; Germany, 12 to 1; Netherlands, 12½ to 1; Milan, 12 to 1; England, 13½ to 1; Spain, 13½ to 1; France (1726), 14½ to 1. — In the eighteenth century Great Britain, in 1717, made the value 15.21 to 1.

France, nine years later, established the ratio of 14.42 to 1, and Spain, in 1730, 16 to 1. In 1785 France adopted the ratio of 15½ to 1, Portugal had increased the valuation of gold compared with silver to 15.8 to 1, and Spain, first to 16 and then to 16.5 to 1. In 1798 England suspended silver coinage, without, however, changing the ratio. The average valuation during the eighteenth century was a little less than 15 to 1, while the United States adopted as the basis of its value 15 to 1. — In the nineteenth century the most notable change was made by Great Britain, which demonetized silver, increasing its valuation and the amount to be offered in legal tender, and excluding the public from the right to deposit it at the mint for coinage. In 1834 the amount of pure gold in the gold coins of the United States was reduced, bringing the relative value as nearly 16 to 1. In 1835 gold was demonetized in British India, and silver made the only legal tender. In 1847 Holland demonetized gold, and adopted an exclusive silver standard. — The increased production of gold, after its discovery in California and Australia, affected prices in Europe, and largely increased the imports from India, necessitating a greater export of money to that country to settle balances of trade. As silver only was legal tender coin, gold having been demonetized, the demand for silver for transportation raised its price in the London market above the French mint value, as compared with gold, of 1 to 15½; and for some years, until a greater supply from the mines was able to satisfy the demand, silver was generally higher in London than its coining value at the European mints open for public coinage. The countries giving the lowest legal valuation to silver were denuded of their silver coins. The scarcity of the latter induced the United States, in 1853, following the example of Great Britain, in 1816, to commence the coinage of silver on government account, and to issue fractional silver coins of reduced weight and limited legal tender. All United States silver coins of less denomination than one dollar, issued since that date, are of a weight that makes the value of the silver contained, compared with gold, as 1 to 14.88. — In 1870 Germany, and in 1873 the United States, passed laws demonetizing silver and discontinuing the privilege to the public of coining it at their mints. This action was followed later by the states of the Latin union agreeing to suspend the coinage of silver, which, following the large increase in the production of silver from the mines of the United States, largely depressed its value, which, compared with gold, has averaged in the London market, for the eight years subsequent to 1875, about 1 to 18.

HORATIO C. BURCHARD.

SILVER BILL. (See HAYES, R. B.)

SINKING FUND. This fund may be defined as a financial arrangement intended to redeem or extinguish the public debt upon certain determined

conditions, by means of a sum to be annually set aside from the produce of taxes, and to be used in sinking or paying a part of the debt through the purchase of a portion of the public indebtedness. Historically, this is not a strictly accurate definition, but it is generally correct when applied to the financial methods of the present day. The sinking fund has ever been regarded as an instrument for reducing the public indebtedness, but through false systems it has sometimes proved fallacious, and has often even increased the debt. The simplest method of creating such a fund would be by economizing in the expenditures of government, and setting apart the sum saved for the purchase and the cancellation of the state's securities or certificates of indebtedness. But the more common method is to create a special fund, to be controlled and managed by a special board or commission, and to be supplied out of the receipts of taxes. — Before the beginning of the eighteenth century the general practice in England was to provide a special tax for each new loan, so that the particular loan was said to be "funded," or provided for by a tax. In 1716, however, on the suggestion of the earl of Stanhope, Sir Robert Walpole carried a measure which rendered the taxes formerly distributed among the South sea aggregate and general funds perpetual, and consolidated whatever surplus might be collected by these taxes into a sinking fund, that was to be applied to the discharge of the national debt, and to no other purpose. This fund was still further augmented by what had been saved through successive reductions in the interest of the debt, and between the period of its formation and 1733 discharged £11,648,000 of the debt. Soon after, however, what should properly have gone into the sinking fund was applied to other purposes, and this practice became general. So that, according to the figures of Dr. Price, the amount of debt canceled by this fund between 1733 and 1775 was only £8,500,000. "On the whole," says Hamilton, in his "Inquiry concerning the National Debt of Great Britain," "this fund did little in time of peace, and nothing in time of war, to the discharge of the national debt. The purpose of its inviolable application was abandoned, and the hopes entertained of its powerful efficacy entirely abandoned." This fund was, in 1786, superseded by Mr. Pitt's new fund. — The rapid increase in the amount of the debt during the eighteenth century had directed attention to the burden, and not a few predicted national bankruptcy as a result. In 1713 the total debt, funded and unfunded, was nearly £35,000,000. The Spanish, the seven years' and the American wars ran the debt up to a total of £245,300,000. On the proposal of Dr. Price, a parliamentary inquiry into the national finances was instituted, and, as a result, a sinking fund was established, but on a different system from that embodied in the fund of 1716. Under this new system the sum of £1,000,000. was to be annually appropriated by parliament to the fund, and this amount was to be expended, either in the redemption of stock, if

at par, or, if under par, in the purchase of it in the open market at the current rate. The interest arising from all stock so redeemed was to be added to the principal, and laid out in the same manner, until, by their joint accumulation at *compound* interest, they should amount to the annual sum of £4,000,000, when this fund should thenceforth continue to be laid out at simple interest only, leaving the amount of interest annually redeemed at the disposal of parliament. (26 Geo. III., cap. 31. See Speech of Mr. Huskisson, March, 1813.) The most extravagant expectations were formed of this law, and the writings of Dr. Price, which had wide circulation, tended to foster such beliefs. "The smallest *fund* of this kind," he wrote, "is, indeed, *omnipotent*, if it is allowed time to operate." In order to secure the inviolability of this fund, its management was intrusted to a commission composed of the speaker of the house of commons, the chancellor of the exchequer, the master of the rolls, the accountant general of the court of chancery, and the governor and the deputy governor of the bank of England. In 1793 a change was made in the manner of accumulating this fund, and at the same time a permanent provision was made for future debts by the framing of a permanent system of a sinking fund. "It was enacted," says Ricardo, "that, besides a provision for the interest of any loan which should thenceforward be contracted, taxes should also be imposed for a 1 per cent. sinking fund on the capital stock created by it, which should be exclusively employed in the liquidation of such particular loan; and that no relief should be afforded to the public from the taxes which constituted the 1 per cent. sinking fund, until a sum of capital stock, equal in amount to that created by the loan, had been purchased by it." The wisdom of this provision can not be questioned, as it tended to maintain confidence in the credit of the government, which was then at a low point. It made the government not only a seller of securities (while issuing loans), but also a buyer (while purchasing with the sinking fund). And while the expectation was, that every loan would, under the operations of a 1 per cent. sinking fund, be redeemed in about forty-five years, yet the lower the price of the securities fell, the more efficient would the fund become, so that in proportion to the depression existing at the time, would this sinking fund operate as a check to prevent a further fall, and as a lever to produce, at no distant period, a probable rise in the market. Mr. Huskisson said of Mr. Pitt's plan, that it was "framed with the specific view of holding out to the public a guarantee, that any future debts which the states might have occasion to contract, should from the moment of their being incurred, be placed in a course of liquidation, uniform and unalterable. This plan contained within itself a principle of permanency, which being applied to every loan at the time of making the contract, could not, from that moment, be varied or departed from, without a breach of such contract. * * That every future

loan should, from the moment of its creation, carry with it the seeds of its destruction; and that the course of its reimbursement should, from that moment, be placed beyond the discretion and the control of parliament." From 1786 to 1798 the fund effected some reduction in the debt; but in the following years, when through the war the expenditures of government greatly exceeded the income, it was attempted to maintain the annual reductions, it became a wretched piece of jugglery, although the form and machinery were continued. — It remained for Dr. Hamilton to expose the fallacies of such a sinking fund, and he showed that so far from reducing the debt it had really increased it. "The extent of the sinking fund is artificial, and may be brought, by a mere change in the arrangement of the public accounts, to bear any proportion to the amount of debt, without the slightest advantage, or any tendency to promote its discharge. In time of war we raise a certain sum by taxes for the expense of the year, and borrow what further is wanted. If a sinking fund be maintained, the sums appropriated are deducted from what would have otherwise been expended on the war, and a greater loan is required. We may throw into the sinking fund any share of the revenue we please. We have only to add as much to the loan, and we shall raise a larger sum in the form of loan with the same facility, by the effect of the sums thrown into the money market for the stock purchased by the commissioners. In time of war the sinking fund is nominal; in time of peace a large sinking fund will discharge the debt more quickly; but this amounts to no more than that a continuance of the taxes which we paid in war, after peace is restored, will be attended with a speedier reduction of debt than what would take place if a large part of these taxes were repealed." Hence he was led to assert that the excess of revenue over expenditure was the only fund by which any part of the public debt could be discharged. "The increase of revenue, or the diminution of expense, are the only means by which this fund (sinking) can be enlarged, and its operations rendered more effectual; and all schemes for discharging the national debt, by sinking funds operating at compound interest, or in any other manner, unless in so far as they are founded upon this principle, are completely illusory." — Dr Hamilton's work was first published in 1813, the very year in which important changes were made in the fund under the administration of the finances by Mr Vansittart. But the farce of borrowing to supply the requirement of the fund continued. In 1819 Dr. Hamilton's views were so far recognized as to induce the house of commons to resolve, that to provide for the exigencies of the public service, to make such progress in reductions of the national debt as may adequately support public credit, and to afford to the country a prospect of future relief from a part of its present burdens, it is absolutely necessary that there should be a clear surplus of the income of the country over the expenditure,

of not less than £5,000,000. In 1822 the committee of public accounts recommended that the annual sinking fund loans be discontinued, and that the whole of the redeemed capital stock of funded debt remaining in the name of the commissioners be canceled. In the following year their recommendation was carried into effect, but the last remnant of the fund was not abolished before 1828. — This sinking fund had proved an unfortunate and costly experiment; but how costly it had been was not proved until 1869, when it was made the subject of parliamentary investigation. "During the whole period, from Jan. 5, 1793, when the French war broke out, up to 1829, there was only one year (1817) in which money was not raised by loan, in order to aid the sinking fund, besides what was required for war expenditure. After excluding the period from Aug. 5, 1786, to Jan. 5, 1793, during which £8,147,631 was applied to redeem £10,241,100 of 3 per cent. stock, bearing an interest of £307,263 per annum, there remains £321,902,824, which was applied between 1793 and 1829 to redeem £472,942,703 capital stock, carrying £14,488,388 annual interest, the mean rate on the sum paid being almost exactly 4½ per cent. per annum. During the same period the total sum of £702,163,075 was raised by loans, for which £1,052,536,700 capital stock of funded debt was created, carrying £35,301,392 annual interest, or a mean rate of about 5 per cent. per annum. The actual result of all these sinking fund operations, therefore, was, that the total amount of £330,050,455 was raised at 5 per cent. to pay off a debt carrying 4½ per cent. The difference in these two rates amounted, upon the total capital sum of £330,050,455, to £1,627,765 per annum, which may be set down as the increased annual charge of our funded debt, and a real loss to the public from this deceptive sinking fund system; without taking into account the expenses of the management of the sinking fund, and the increased amount of capital of debt consequent upon the practice of borrowing on less advantageous terms for larger sums than were required to meet the actual public expenditure." — I have described somewhat at length the English sinking fund, because the principles which governed its formation were early adopted in this country, under the leadership of Alexander Hamilton. In December, 1782, he introduced into the congress of the confederation the following resolution. "Whereas, It is essential to justice and to the preservation of public credit, that whenever a nation is obliged, by the exigencies of public affairs, to contract a debt, proper funds should be established, not only for paying the annual value or interest of the same, but for discharging the principal within a reasonable period, by which a nation may avoid the evils of an excessive accumulation of debt; therefore, Resolved, That whenever the net product of any funds, recommended by congress and granted by the states, for funding the debt already contracted, or for procuring further loans for the support of the war, shall exceed the sum requisite for paying

the interest of the whole amount of the national debt, which these states may owe at the termination of the present war, the surplus of such grants shall form a *sinking fund*, and be inviolably appropriated to the payment of the principal of the said debt, and shall on no account be diverted to any other purpose." Thus, four years before Mr. Pitt accepted the plan of Dr. Price, and ten years before he laid down the sound rules of finance embodied in the English act of 1792, the two important principles, that with the creation of a debt measures should be taken to insure its extinguishment, and that debt reduction is efficient only when made with surplus revenue, were clearly enunciated by Mr. Hamilton in the congress of the confederation. Circumstances, however, which chiefly arose from the weakness of the confederation, prevented any attempt to put into practice this resolution, and in the disordered condition of the finances little could be done before the return of peace. Even then the jealousy among the states prevented action, and it was not until the constitution was adopted and the national government formed, that a settlement of the debt question could be looked for. In his report on public credit, Hamilton proposed to apply the revenues arising from the postal service to the purposes of a sinking fund, and he again lays down as a vital principle the necessity of such a fund. "Persuaded, as the secretary is, that the proper funding of the present debt will render it a national blessing; yet he is so far from acceding to the position, in the latitude in which it is sometimes laid down, that 'public debts are public benefits,' a position inviting to prodigality, and liable to dangerous abuse, that he ardently wishes to see it incorporated, as a fundamental maxim, in the system of public credit in the United States, that the creation of debt should always be accompanied with the means of extinguishment. This he regards as the true secret for rendering public credit immortal. And he presumes that it is difficult to conceive a situation in which there may not be an adherence to the maxim." He recommended, as commissioners to administer this fund, the vice-president of the United States, the speaker of the house of representatives, the chief justice, secretary of the treasury and the attorney general. His propositions respecting the postal revenues were not accepted; but congress appropriated to the sinking fund the surplus revenues of the current year, and authorized the president to borrow \$2,000,000 with which to purchase stock at its then low value. There was a considerable surplus revenue in 1790, which was applied to debt reduction, and in 1791 the sinking fund had already reached the sum of \$1,000,000. The act of Aug. 12, 1790, which constituted this fund, provided, 1, that the surplus of the duties on imports and tonnage to the end of the year 1790 should be applied to the purchase of the debt of the United States, at its market price, if not exceeding par or true value thereof—said purchases to be made openly, and with due regard to the equal benefit of the several states; and 2, that,

in addition to this fund, the president should be authorized to borrow any sum or sums, not exceeding \$2,000,000, at an interest not exceeding 5 per cent., to be applied to purchases of public debt; provided that, out of the interest of the debt to be purchased, there should be appropriated, annually, a sum not exceeding 8 per cent. of the sums borrowed, toward paying the interest and reimbursing the principal of these sums. It will be seen that the compound interest scheme, which was so eagerly taken up in England, was not embodied in the plan of 1790, which was little more than a direct appropriation of surplus revenue to debt reduction. In 1792, however, an important change was introduced, and a permanent sinking fund was established, to be composed, 1, of the interest of the public debt, purchased, redeemed, or paid into the treasury, in satisfaction of any debt or demand; and 2, of the surplus, if any, which should remain of moneys appropriated for paying the interest of the public debt, after paying that interest. This fund was to be applied, first, to purchases of the debt, till the annual amount of the fund shall be equal to 2 per centum of the whole amount of the outstanding funded stock, bearing a present interest of 6 per centum; second, to the redemption of that stock; and lastly, to purchases of any unredeemed residue of the public debt. To January, 1795, the purchases of stock had amounted to \$2,268,022. — The operations of this and of subsequent sinking funds are fully described in Elliot's "The Funding System of the United States" (28th Congress, 1st Session, Exec. Doc.) The principles so clearly laid down by Alexander Hamilton have been generally applied in this country both with respect to national and to local indebtedness, but the manner of constituting the sinking fund has varied greatly according to circumstances. In every instance, however, the main object was to provide for the extinction of the debt, and, by setting aside a stated sum which was to be inviolably applied to this purpose, to maintain confidence in the credit of the state or borrowing power. Whatever errors, either in the composition of the fund or in its administration, have been made, it has come to be recognized that debt can be canceled only when a state's income exceeds its expenditure. The surplus may with profit be applied to debt reduction. Some of the state constitutions specify the number of years in which a debt is to be redeemed. For example, that of Illinois says: "Any county, city, school district, or other municipal corporation, incurring any indebtedness as aforesaid, shall, before or at the time of doing so, provide for the collection of a direct annual tax sufficient to pay the interest on such debt, as it falls due, and also to pay and discharge the principal thereof within twenty years from the time of contracting the same." (Constitution, 1870, Art. IX., § 12.) This would practically involve the maintenance of a sinking fund. The constitutions of other states are more particular. Thus, that of Pennsylvania (1873) recites, that, "to provide for the payment of the present

state debt, and any additional debt contracted as aforesaid, the general assembly shall continue and maintain the sinking fund, sufficient to pay the accruing interest on such debt, and annually to reduce the principal thereof by a sum not less than \$250,000; the said sinking fund shall consist of the proceeds of the sales of the public works, or any part thereof, and of the income or proceeds of the sales of any stocks owned by the commonwealth, together with other funds and resources that may be designated by law, and shall be increased from time to time by assigning to it any part of the taxes or other revenues of the state not required for the ordinary and current expenses of government; and, unless in case of war, invasion or insurrection, no part of the said sinking fund shall be used or applied otherwise than in the extinguishment of the public debt. The moneys of the state, over and above the necessary reserve, shall be used in the payment of the debt of the state, either directly or through the sinking fund, and the moneys of the sinking fund shall never be invested in or loaned upon the security of anything, except the bonds of the United States or of this state." (Art. IX., §§ 11, 12.) And again. "Every city shall create a sinking fund, which shall be inviolably pledged for the payment of its funded debt." (Art. XV., § 3.)—In addition to the writings mentioned in the course of the article, the following may be consulted: M'Culloch, *Treatise on the Principles and Practical Influence of Taxation and the Funding System*; *Reports of the Secretary of the Treasury*; *American State Papers*, *Finance*; *State Constitutions*; and *Congressional Debates*.

WORTHINGTON C. FORD.

SINTOOISM. (See SHINTŌ.)

SLAVERY is the right of property of one man in another man, in his family, in his posterity, and in the products of his labor. — There is no injustice more revolting than slavery, and yet there is no fact so widespread in history. Hence slavery is as old as war, in which it had its origin. Both slavery and war are inexplicable in the eyes of philosophy, if we do not admit, with Christianity, an immemorial perturbation among the members of the human family. — In antiquity the system of labor was everywhere slavery. It was found in Rome, in Greece, in Egypt, in Assyria, in Gaul, among the Germans, and, it is said, even among the Scythians; it was recruited by war, by voluntary sale, by captivity for debt, and then by inheritance. It was not everywhere cruel, and in patriarchal life it was scarcely distinguishable from domestic service; in some countries, however, it approached the service of beasts of burden; the brutal insensibility with which Aristotle and Varro spoke of slaves is revolting; and the manner in which they were treated by the laws is even more so. These men, who were of the same race, who had the same intellect, and the same color as their owners, were declared incapable of holding property, of appealing to the law, of de-

fending themselves; in a word, of demeaning themselves like men in any of the circumstances of life. Only the law of the Hebrew people tempered servitude by humanity. Doubtless, we might quote certain words of Euripides or of Terence, of Epictetus or of Seneca, colored with a more tender pity and evincing some heart; we find also both in Greek and Roman laws, on the monuments, and in the inscriptions and epitaphs which our contemporaries have so carefully studied; we find, I say, in these the proof that the granting of freedom to slaves, in individual cases, was frequent, and that it was inspired, especially at the moment of death, by religious motives. But the brutal fact of slavery is incontestable. The evil outweighed the good in an enormous measure; servitude remained from century to century, from country to country, during all antiquity, the universal fact, and the legitimacy of servitude the universal doctrine. — To the rare and barren protests of a few noble souls, Christianity finally added the power of its mighty voice. The brotherhood of men, the dignity of labor, the absolute duty of perfection: with these three principles, clothed with the authority of God himself, the human race entered a new phase, commenced the great battle of good against evil, and, little by little, forced back the scourges which, in the past, had reigned with undivided supremacy. Servitude was destined to be among the vanquished, but it was not without a long and grievous combat, which, at the present time, is not entirely terminated. — The learned labors of M. Edouard Biot and M. Janoski warrant the affirmation that servitude had almost entirely disappeared in Christian Europe from the tenth to the thirteenth century; but it is only too well known that after the discovery of the new world, the sixteenth and seventeenth centuries witnessed the re-establishment of this odious institution in all the colonial possessions of the nations of Europe. What do I say? The most Christian kings of France, Spain and England did not blush to place their signature at the bottom of treaties intended to assure to them the monopoly of the sale and transportation of millions of human beings. An entire continent, Africa, became like a mine to be worked, charged with furnishing the other continents with the living merchandise, called in diplomatic acts a *ton of negroes*, just as we say a ton of charcoal. — To the nineteenth century belongs the honor of waging against servitude a war which is not yet ended, but which has been distinguished, however, by remarkable victories. The revolution is complete as far as ideas are concerned. Morality spoke first, and all the sciences, little by little, came to agree with it. Philosophy gives to all slaves a soul equal to our own, which Aristotle, perhaps, refused to them. Physiology declares blacks and whites, despite important differences, to be members of the same family. History no longer discovers between slave owners and slaves the trace of any legitimate conquest. The law does not recognize any validity of a pretended

contract which has no title, the object of which is illicit, and one of the parties to which is not a free agent, and the other party to which is without good faith. Ethnology lifts to the dignity of a beautiful law the radical difference which places in the first rank the races which labor, like the European, and in the last rank the races who make others work for them, like the Turks. Political economy affirms the superiority of free labor to forced labor, and it condemns everything which deprives man of the family. Politics and charity, from different points of view, accept the same conclusion: charity, more tender, detests slavery because it oppresses the inferior race; politics, more lofty, condemns it, above all, because it corrupts the superior race. Thus the revolution above referred to, complete in the order of ideas, is far from being complete in the order of facts. — At the beginning of the present century England possessed nearly 800,000 slaves, scattered among nineteen colonies, to wit: more than 300,000 in Jamaica, 80,000 in the Barbadoes, 80,000 in Guiana, more than 60,000 in Mauritius, and the rest in the little colonies of Trinidad, Grenada, Antigua, St. Vincent, etc. France, in her colonies of the Antilles, Bourbon, Guiana and Senegal, had 250,000 slaves. There were 27,000 in the little colonies of Denmark, and about 600 in the island of St. Bartholomew, belonging to Sweden. Holland, which knew how to avoid servile labor in Java, preserved more than 50,000 slaves at Surinam and Curaçoa. But these figures are trifling, compared to the number of the enslaved population of the Spanish and Portuguese colonies, which amounted to at least 600,000 slaves; of Brazil, which is more than 2,000,000; and of the United States, which, before the American civil war, had 4,000,000 slaves. — France was the first to give the signal for the liberation of slaves, a liberation which unfortunately was sudden, violent, and did not last. In 1790-91 the constituent assembly, after much hesitation, admitted *free* people of color in the colonies to the rights of citizenship. The whites resisted, and when the convention tried to have the decree executed, the conflict between the blacks and whites led to the massacres which have been so falsely attributed to the emancipation of the slaves, proclaimed only at the end of 1793, and confirmed by the decree of Feb. 4, 1794, by which the convention decreed with enthusiasm the abolition of slavery in all French colonies. The result of the maritime wars was, to the colonies, disorder or conquest. At the same time, in the mother country, a reaction, aided by glory, carried men beyond the necessities of order. The year 1802, which witnessed the concordat, the life consulate, the peace of Amiens, the legion of honor, and the university, witnessed also the restoration of slavery and even the slave trade by the law of the 30th floreal, year X. — Commenced with more wisdom, and conducted with more perseverance, the movement of emancipation in England naturally triumphed more promptly than in France. In 1102 a coun-

cil held in the city of London, under the presidency of St. Anselm, forbade the slave trade. In 1763 an odious treaty assured to England, on the other hand, the monopoly of this traffic. In 1773 a generous Christian, William Wilberforce, first wrote against this public scandal. In 1780 Thos. Clarkson proposed its abolition to parliament, and in 1787 Wilberforce renewed the proposition, which, after having been seven times presented and seven times rejected, finally triumphed in 1806, and became, at the congress of Vienna, a solemn engagement of all the European powers (Declaration of Feb. 4, 1815), which was followed by laws promulgated by each of these nations. May 15, 1823, Mr. Buxton proposed the abolition of slavery in all the English colonies. After long hesitation, the act of abolition presented in 1833, in the name of the government, by Lord Stanley, was promulgated Aug. 28, 1833. This memorable law, which devoted £500,000,000 to the ransom of 800,000 men, did not, however, accord them liberty until after an apprenticeship, which was to last from Aug. 1, 1834, to Aug. 1, 1840; but this uncertain system could not be maintained. Lord Brougham proposed its abolition in 1838, and the colonial legislatures spontaneously decreed complete emancipation in the years 1838 and 1839. — At the same time, 1838, M. Passy proposed to the French chambers a bill with the same end in view, and in 1840 a commission was charged, under the presidency of the duke de Broglie, to prepare the way for the abolition of slavery in the French colonies. At the same time, also, 1839, Pope Gregory XVI. published a bull, condemning slavery and the slave trade. The report of M. de Broglie is celebrated; we may call it a judgment by a court of last resort, which, for the most elevated, decisive and practical reasons, condemned slavery forever. However, the sentence was not executed on account of the hesitation of the government and the resistance of the colonies. Slavery was not abolished in the colonies of France until after the revolution of February, by the decree of March 4, 1848, which M. Schoelcher had the honor of proposing. — The result of emancipation in the French colonies was the liberation of the slaves in the Danish colonies, proclaimed July 3, 1848. Sweden had set the example of liberation as early as 1846. — We here give a résumé of the economic and moral results of emancipation in the colonies of England and in those of France. Before emancipation, the colonies of the West Indies produced 3,640,000 quintals of sugar. These figures had sunk during the apprenticeship to 3,480,000 quintals, and after the liberation to 2,600,000. In 1848 the production was 3,795,311 quintals; in 1852, 3,376,000; and in 1858, 3,499,171. The emancipation of the slaves was followed by a diminution in production and an increase in prices, but also in wages; the result of commercial freedom was an increase in production and a diminution in prices, but also in wages. Twenty years after these two great trials the old figures were reached, the net cost was diminished, and if certain isolated

colonies suffer still while others prosper, there is no one in England who could have foreseen that two such radical experiments would not be followed by more disastrous and more prolonged consequences. — Let us dwell a little further on the colonies of France. Despite a triple trial, the emancipation of the slaves, competition in the mother country and a radical revolution, the general movement of affairs of the French colonies was not lowered beyond one-half, while it was lowered more than a quarter so far as all the business transactions of France during the first period of five years were concerned; after another five years, the figures prior to emancipation were very slightly surpassed at Guadaloupe, nearly half at Guiana, more than a quarter at Martinique, and more than a half at Réunion. — If we look only at production, after 1854, the figures prior to 1848 were surpassed, even for sugar, excepting at Guiana, which was transformed into a colony of consumption. The increase is in slow progress at Guadaloupe, important at Martinique, and extraordinary at Réunion. Wages are very little higher, the price of sale and renting of lands has increased, credit is more easy, thanks to the banks; new resources of credit and laws which permit the importation of cereals, rice, and also of machinery, arrive opportunely with the reduction of the customs duties; the price of sale is higher, the movement of ships has increased one-third, at the same time that the material and methods of manufacture have been changed. To the honor of liberty and that of the colonists, be it said, that, since emancipation, they have courageously made up their minds what to do; they have ceased to sigh, and begun to act. At Réunion tools have been changed, methods of processes improved, and the revenue from colonist settlements doubled; there is no hesitation in hiring a laborer for five years at double the price received at London for the importation of 6,000 coolies; those who bought with colonist settlements in 1848 have realized enormous fortunes, progress has followed wealth, and the general exposition of agriculture in 1862 showed sugar from Réunion which did not need to be refined. In the Antilles people are no longer contented with cursing the indigenous sugar refineries; they imitate them; central refineries have been established where, in 1874, the produce from sugar cane rose from 5 to 13 per cent., and there is hope of still further improvement; machinery and manuring were introduced, drainage has been tried, patents are taken out, landed credit is demanded, agricultural credit is used, free trade is called for; in a word, those routine and ruinous traditions which are the sad accompaniments of slavery are being departed from; and an endeavor is being made to realize these first four conditions of all economic progress: the perfecting of processes, abundance of hands, facility for credit, and the widening of the market. — As far as the moral order is concerned, all the results of the English experiment may be summed up in the words of Lord Stanley, in 1842, which were substantially as follows:

There has been progress in industrious habits, improvement in the social and religious system, and development in individuals of those qualities of heart and mind which are more necessary to happiness than the material goods of life. The negroes are happy and contented, they devote themselves to labor, they have bettered their way of living, increased their well-being, and, while crime has diminished, moral habits have become better. The number of marriages has increased. Under the influence of the ministers of religion, education has become more widespread. In short, the result of the great experiment of emancipation tried upon the whole of the population of the West Indies has surpassed the most ardent hopes. — In the French colonies, 40,000 marriages, 20,000 legitimate children, 30,000 acknowledged children, the population resuming a regular course and increase, the churches filled, the schools attended; at Guadaloupe and Martinique, 20,000 adults at the night schools; at Réunion, 23 societies of mutual aid among the freedmen, crimes against the person diminished (at least until the arrival of immigrants), justice and the clergy improved, peace maintained with garrisons less strong than before 1848: such are the gifts presented to French colonial society by the emancipation of its slaves. — It would be too long to show in detail, year by year, the economic and moral results of emancipation, since they became complicated by reason of the effect of political events and attempts at commercial liberty in France. Let it suffice to affirm that civilization has gained much, that wealth has lost little, that its losses have been repaired and more than repaired, at least in all the colonies in which the new régime has been accepted in good faith; finally, that the call of a million men to liberty, in distant lands, did not cause the tenth part of the trouble occasioned in the more civilized nations of Europe by the least important political question. — European nations quickly understood that the slave trade would never be completely abolished unless slavery itself was suppressed. Unfortunately, the United States of America did not understand this as quickly. The illustrious founders of the Union, fearing a dissolution of it at the very moment of its formation, and hoping, that to suppress the evil it would be sufficient to dry up its source, limited themselves to inserting in the constitution that the slave trade should be prohibited, beginning with the year 1808. As far as slavery was concerned, they had the weakness not even to mention its name, leaving to each state the task of ridding itself of the institution of slavery, which, at that period, was very little developed. In Washington's time, there were scarcely 700,000 slaves within the whole extent of the United States. Washington freed his own slaves by will, and we know from his correspondence with Lafayette that he busied himself with plans of emancipation. Many of the northern states successively freed their slaves; but the progress of the cultivation of cotton, the cession of Louisiana, the purchase of Florida and the conquest of Texas

had not been foreseen. Sixty years after Washington's time, the American republic had advanced with giant steps, slavery had grown with it, and the southern states contained 4,000,000 of enslaved blacks. A fact so enormous, so abnormal, produced in the bosom of the Union a profound perturbation. Not only did honor and morality suffer therefrom, but a terrible division took place between the north, which controlled the commerce, the shipping and the tariff of the Union, and the south, which, previous to the American civil war, controlled politics, the congress, and the laws of the Union. Without relating the long and lamentable history of this conflict, without speaking of the fugitive slave law, of the territorial question, of the debates on the right of search, of the projects for an invasion of Cuba, finally of all the electoral struggles for the presidency, let us recall that the question of slavery had become in 1856, and again in 1860, the sole stumbling block of the general elections. In 1856 the south triumphed for the last time in the person of Mr. Buchanan; in 1860 the north bore away the victory in the person of Abraham Lincoln, and the southern states immediately revolted, and declared war. This formidable war had the character of a war of independence; the north fought for the constitution, the south to obtain its autonomy. But for what purpose did the south thus wish to separate itself from a glorious nation? In order to perpetuate, maintain and extend slavery, and to have no more uneasiness as to the fate of that institution which its publicists dared to call the best system of labor. The north was led by circumstances to strike at the very root of the war, by attacking slavery. In its session of 1862, congress successively adopted: 1st, emancipation in the District of Columbia; 2d, the recognition of the republics of Hayti and Liberia; 3d, the measures proposed by the president for gradual emancipation in the states and immediate emancipation in the rebel states, beginning Jan. 1, 1863. We know that the defeat of the south assured the definitive abolition of slavery in the United States. Slavery having disappeared in North America, its foundations were necessarily shaken in South America. The republics separated from Spain have abolished it. Holland delivered its American colonies from slavery by a law of Aug. 8, 1862, and a law of December, 1871, paved the way for its suppression in Brazil. — This rapid review is confined to Christian countries. In Mohammedan and pagan countries, slavery exists almost everywhere; here more patriarchal, there more barbarous; maintained in the bosom of Africa by perpetual wars and a pitiless traffic. A Mohammedan sovereign, the bey of Tunis, however, abolished slavery in his states, even before France, in 1847; but the scourge of slavery will evidently never disappear from pagan nations, except from contact with, and the example of, Christian nations. We may hope that the nineteenth century will see servitude disappear; this would be its principal glory. The condition precedent to the

disappearance of slavery is the persevering accord of all opinions, of all creeds, of all nations, that it should be abolished, and this accord is now an accomplished fact. (See SLAVERY, in U. S. History.) AUGUSTIN COCHIN.

SLAVERY (IN U. S. HISTORY). It may be laid down as a fundamental proposition, that negro slavery in the colonies never existed or was originally established by law, but that it rested wholly on custom. The dictum, so often quoted, that slavery, being a breach of natural right, can be valid only by positive law, is not true: it is rather true that slavery, where it existed, being the creature of custom, required positive law to abolish or control it. In Great Britain, in 1772, custom had made slavery so odious that the Sommersett case justly held that positive law was necessary for the establishment of slavery there in any form; but the exact contrary of this rule, of course, held good in commonwealths where custom made slavery not odious, but legal. In these cases the laws which were passed in regard to slavery were only declaratory of a custom already established, and can not be said to have established slavery. The whole slavery struggle is therefore the history of a custom at first universal in the colonies, then peacefully circumscribed by the rise of a moral feeling opposed to it, but suddenly so fortified in its remaining territory by the rise of an enormous material interest as to make the final struggle one of force. In outlining the history of negro slavery in the United States, it seems advisable to make the following subdivisions: 1, the introduction of slavery, and its increase, 2, its internal policy; 3, the slave trade, foreign and domestic; 4 the suffrage clause and the "slave power"; and 5, slavery in the territories, including new states. The final abolition of slavery in each state, in the territories, and in the nation, is treated elsewhere. (See ABOLITION) — I. INTRODUCTION OF SLAVERY, AND ITS INCREASE. When English colonization in North America began, Indian and negro slavery was already firmly established in the neighboring Spanish colonies; and from these, particularly from the West Indies, negro slavery was naturally and unconsciously introduced into the English colonies, the Barbadoes being the stepping-stone for most of them. Nevertheless, the first authentic case of introduction was from an entirely different source. In August, 1619, a Dutch man-of-war, temporarily in Virginia, landed fourteen negro slaves in exchange for provisions. This is the only colony in which a first case can be found. Everywhere else we find slavery, when first casually mentioned, an institution so long established as to have lost its novelty. In each of them there are three points to be noted: the first mention of slavery, its first regulation by law, and the establishment, by custom or positive law, of the civil law rule, *partus sequitur ventrem*, instead of the common law rule, *partus sequitur patrem*. The latter rule, making children take the condition of the father, was the natural rule for

English colonists, would have made negro slavery far more tolerable, and would have established a constant agent for its ultimate extinction, since any connection between a slave father and a free mother would have been comparatively rare. The former rule, that the children should take the condition of the mother, which was everywhere adopted by custom from the beginning, not only relieved the system from check, but even gave it an added horror, of which the variations in color among the inferior race are mute but indelible certificates. In summarizing the introduction of slavery into the original thirteen states, we will begin at Mason and Dixon's line, going first southward, and then northward; its introduction into the new states and territories comes under the fifth subdivision. — In Virginia the acts passed were at first for the mere regulation of servants, the legal distinction being between servants for a term of years (white immigrants under indentures), and servants for life (slaves). Dec. 14, 1662, the civil law rule, *partus sequitur ventrem*, was adopted by statute. Oct. 3, 1670, servants not Christians, imported by shipping, were declared slaves for their lives. Slavery was thus fully legalized in the colony. — In Maryland slaves are first mentioned ("slaves only excepted") in a proposed law of 1638. In 1663 the civil law rule was fully adopted by a provision that "negroes or other slaves," then in the province or thereafter imported, should serve *durante vita*, "and their children also." — In Delaware the Swedes at first prohibited slavery, but it was introduced by the Dutch. It was in existence probably in 1636; but its first legal recognition was in 1721, in an act providing for the trial of "negro and mulatto slaves" by two justices and six freeholders. With this exception the system rested wholly on custom in Delaware. — In Carolina, under the first union of the two provinces, the Locke constitution (see NORTH CAROLINA) provided practically for white slavery: the "leetmen," or tenants of ten acres, were to be fixed to the soil under the jurisdiction of their lord without appeal; and the children of leetmen were to be leetmen, "and so to all generations." This provision, like most of the others, was never respected or obeyed. The 110th article provided that every freeman should have "absolute power and authority over his negro slaves of what opinion or religion soever." This met with more respect, and became the fundamental law of North Carolina without anything further than statutes for police regulation. — In South Carolina the first slavery legislation, an act of Feb. 7, 1690, "for the better ordering of slaves," took place before the separation. Slaves are said to have been introduced by Gov. Yeamans about 1670. June 7, 1712, slavery was formally legalized by an act declaring all negroes and Indians, theretofore sold or thereafter to be sold, and their children, "slaves to all intents and purposes." The civil law rule was made law May 10, 1740. The police regulations of this colony were filled with cruel provisions, such as the gelding of a male slave who

should run away for the fourth time; and yet an act was passed in 1704, and re-enacted in 1708, for enlisting and arming negro troops. — In Georgia slavery was prohibited at the establishment of the colony, in 1732. In 1749, after repeated petitions from the colonists, the trustees obtained from parliament the repeal of the prohibition. In 1755 the legislature passed an act regulating the conduct of slaves; and in 1765 and subsequent years the laws of South Carolina were re-enacted by Georgia. — In Pennsylvania slavery is first heard of in 1688, when Francis Daniel Pastorius drew up a memorial against the practice for the Germantown Quakers. It was not until 1696 that the Quaker yearly meeting was prepared to act favorably on the memorial. In 1700 the legislature forbade the selling of slaves out of the province without their consent. The other slavery legislation of the colony consisted of efforts, more or less successful, to check or abolish the slave trade; but, as soon as independence was fairly attained, arrangements were made for gradual abolition. So late as 1795, however, the state supreme court decided that slavery was not inconsistent with the state constitution. — In New Jersey slavery was introduced by the Dutch, but was not recognized by law until the "concessions" of 1664 (see NEW JERSEY), in which the word "slaves" occurs. In East Jersey slaves were given trial by jury in 1694; and in West Jersey the word "slave" was omitted from the laws. Acts for regulating the conduct of slaves began with the junction of the province with New York, in 1702; but these were never harsh, and the condition of the slave was more tolerable than in any other colony where the system was really established. — In New York slavery came in with the Dutch at an uncertain period, the Dutch West India company supplying the slaves. So early as 1628 the inhabitants were made nervous by the mutinous behavior of some of the slaves, but there was no legal recognition of slavery until 1665, when the duke of York's laws forbade "slavery of Christians," thus by implication allowing slavery of heathens. Full recognition was given by a proviso in the naturalization act of 1683, that it should not operate to free those held as slaves, and by an act of 1706, to allow baptism of slaves without freeing them. — In Connecticut slavery was never directly established by statute, and the time of its introduction is uncertain. In 1680 the governor informed the board of trade, that, "as for blacks, there come sometimes three or four in a year from Barbadoes, and they are sold usually at the rate of £22 apiece." They were considered as servants, rather than as chattels, could sue their masters for ill treatment or deprivation of property, and the only legal recognition of slavery was in such police regulations as that of 1690, to check the wandering and running away of "purchased negro servants." — Rhode Island passed the first act for the abolition of slavery in our history, May 19, 1652. In order to check "the common course practiced among Englishmen to buy negroes (sic)," the act freed all

slaves brought into the province after ten years' service. Unfortunately, the act was never obeyed; custom was too strong for statute law, and existed without law until the final abolition. The only legal recognition of the system was in a series of acts, beginning Jan. 4, 1703, to control the wandering of Indian and negro slaves and servants, and another, beginning in April, 1708, in which the slave trade was indirectly legalized by being taxed. — In Massachusetts a negro is mentioned in 1633 as an estray, "conducted to his master." In 1636 a Salem ship began the importation of negro slaves from the West Indies, and thereafter Pequot slaves were constantly exchanged for Barbadoes negroes. In 1641 the fundamental laws forbade slavery, with the following cautious proviso: "unless it be lawful captives taken in just wars [Pequots], and such strangers as willingly sell themselves [probably indentured white immigrants] or are sold to us [negroes]." The explanations inserted will show that this was the first legal recognition of slavery in any colony. Under it slavery grew slowly, and the rule of *partus sequitur ventrem* was established by custom and court decisions. Public sentiment, after the year 1700, was slowly developed against the system. In December, 1766, a jury gave a negro woman £4 damages against her master for restraining her of her liberty. John Adams notes at the time that this was the first case of the kind he had known, though he heard that there had been many. In 1768 another case was decided for the master, and thereafter the decisions of juries varied to every point of the compass for twenty years; but it is known that many of the cases in which the slaves were successful were gained by connivance of the masters, in order to relieve themselves of the care of aged or infirm slaves. John Quincy Adams gives 1787 as the year in which the state supreme court finally decided, that, under the constitution of 1780, a man could not be sold in Massachusetts. — In New Hampshire there were but two legal recognitions of slavery, an act of 1714 to regulate the conduct of "Indian, negro and mulatto servants and slaves"; and another in 1718 to regulate the conduct of masters. There were but few slaves in the colony, and slavery had but a nominal existence. — Vermont never recognized slavery. (See ABOLITION, I.) — From all the cases it will be seen that slavery was the creature of custom. The only exceptions are a peculiar provision in the law of Maryland (1663) and Pennsylvania (1725-6) making the children of free-born mothers and slave fathers slaves to their father's master until the age of thirty; and the laws in a few states re-enslaving freedmen who refused or neglected to leave the state. This latter provision was the law of Virginia from 1705, and was put into the state constitution in 1850; and laws fully equivalent were passed during their state existence by North Carolina, South Carolina, Georgia, Alabama, Mississippi and Louisiana. In the white heat of the anti-slavery struggle, laws were passed by Virginia in 1856, by Louisiana in 1859, and by Maryland

in 1860, providing for the voluntary enslavement of free negroes; but these were exceptional. Milder provisions, to the same general effect, to punish by fine or sale the coming or remaining of free negroes in the state, were inserted in the constitution of Missouri in 1820, of Texas in 1836 (as a republic), of Florida in 1838, of Kentucky in 1850, of Indiana in 1851, and of Oregon in 1857. (See the states named.) The most troublesome to the northern states were the regulations of the seaboard slave states, under which negro seamen of northern vessels were frequently imprisoned, and sometimes sold. In 1844 Massachusetts sent Samuel Hoar to Charleston to bring an amicable suit there for the purpose of testing the constitutionality of the South Carolina act. He was received in a very unfriendly fashion. The legislature passed resolutions requesting the governor to expel him from the state, and an act making any such mission a high misdemeanor, punishable by fine and banishment. Finally, on receiving unequivocal assurances of personal violence if he remained, Mr. Hoar left Charleston without fulfilling his mission. — However strongly custom may have established negro slavery in the colonies, it has been suggested that the validity of the system was at least made doubtful by the *Sommersett* case in England. In that country, in 1677, the courts held negro slaves to be property, as "being usually bought and sold among merchants as merchandise, and also being infidels." In 1750 custom had so far changed that the law was again in doubt. In 1771 Charles Stewart, of Boston, took his slave James *Sommersett* to London, where the latter fell sick, and was sent adrift by his master. Stewart, afterward finding *Sommersett* recovered, reclaimed him and put him on a ship in the Thames, bound for Jamaica. Lord Mansfield issued a writ of *habeas corpus*, and decided, June 22, 1772, that the master could not compel his slave to leave England, whose laws did not recognize "so high an act of dominion." If the colonies, by charter and otherwise, were forbidden to pass laws contrary to the laws of England, and if the laws of England did not recognize slavery, was slavery legal in the colonies? It must be remembered that the *Sommersett* decision was not that the laws of England forbade slavery, but that there was no law in England establishing slavery. There was no attempt to make an English custom override an American custom, and we can not draw any attack on the American system of slavery out of the *Sommersett* case. — The colonies, then, began their forcible struggle against the mother country with a system of negro slavery, recognized everywhere by law, moribund in the north, but full of vigor in the south. In the north, where there was a general consciousness that slavery was doomed, the slaves were generally regarded as servants for life, as persons whose personality was under suspension. In the south they were regularly regarded by the law and by private opinion as things, as chattels, with "no rights or privileges but such as those who held the power and the government

might choose to grant them," with all the consequences arising from the fact that they had not come to America voluntarily, as persons, but involuntarily, as property. In so far the Dred Scott decision correctly stated the feeling of our forefathers. But the feeling was in great measure a consequence of the unfortunate adoption of the rule *partus sequitur ventrem*: a race to which the rule was applied could be no other than animal, and a people among whom the rule prevailed could never be emancipated from the feeling. For this reason the revolutionary congress made no attempt to interfere with slavery, except in regard to the slave trade, to be referred to hereafter. The state of war itself did little real harm to the system. In Virginia, Nov. 7, 1775, Lord Dunmore proclaimed freedom to all slaves who would fight for the king, and negro soldiers were enlisted by Massachusetts, Connecticut, Rhode Island, New York, Pennsylvania, Maryland, Virginia and North Carolina. South Carolina refused to follow the recommendation of congress, in 1779, to enlist 3,000 negro troops. A return of the continental army, Aug. 24, 1778, shows 755 negro soldiers, not including the New Hampshire, Rhode Island, Connecticut or New York troops. At the end of the war Rhode Island, New York and Virginia freed their negro soldiers, but the system remained as before. The treaty of peace bound the British not to carry away any "negroes or other property of the American inhabitants"; and this collocation of terms is repeated in the treaty of Ghent in 1814. All through the period of the confederation, slavery received no detriment, except in the action of individual states (see ABOLITION, I.), and in its exclusion from the northwest territory, to be referred to hereafter. The states and the nation began their course under the constitution with the same general system as before, but with three modifications: the apportionment of representation to three-fifths of the slaves; the power of congress to prohibit the slave trade after 1808; and the fugitive slave clause. The first of these made the system of slavery itself a political factor, represented in the government; the third offered a tempting and dangerous weapon to use against an opposing section; and the second was the death warrant of the whole system in the double event of the acquisition of foreign territory and the development of antagonistic sections. They are therefore treated in special subdivisions. — Until this time the difference in the slave systems of the north and of the south had been a difference of degree rather than of kind. The basis and the general laws were nominally the same everywhere; and there was a general agreement that the system was evil in itself, and that it was desirable to rid the country of it by gradual abolition. But, from the beginning, the masterful white race had found, in the colder north, that it was easier to do work for itself than to compel work from the black race, and, in the warmer south, that it was easier to compel work from the black race than to do the work for itself. In both sections

the ruling race followed naturally the line of least resistance, and negro slavery increased in the south, and decreased in the north. The process may be seen in the number of slaves in the colonies north and south of Mason and Dixon's line, as estimated by the royal governors in 1715, as estimated by congress in 1775, and as ascertained by the first census, in 1790, as follows. *North*, (1715) 10,900, (1775) 46,102, (1790) 40,370; *South*, (1715) 47,950, (1775) 455,000, (1790) 657,527. Before 1790 the two sections had begun to show the contrasting results of pushing, self-interested free labor on the one hand, and shiftless, unwilling slave labor on the other. Gouverneur Morris, in the convention of 1787, thus spoke of slavery at the time: "It was the curse of Heaven on the states where it prevailed. Travel through the whole continent, and you behold the prospect continually varying with the appearance and disappearance of slavery. The moment you leave the eastern states and enter New York, the effects of the institution become visible. Passing through the Jerseys, and entering Pennsylvania, every criterion of superior improvement witnesses the change. Proceed southwardly, and every step you take through the great regions of slaves presents a desert, increasing with the increasing proportion of these wretched beings." Nor was the assertion denied by the southerners who heard it. George Mason, of Virginia, said: "Slavery discourages arts and manufactures. The poor despise labor when performed by slaves. They prevent the emigration of whites, who really enrich and strengthen a country. They produce the most pernicious effect on manners. Every master of slaves is born a petty tyrant. They bring the judgment of Heaven on a country. As nations can not be rewarded or punished in the next world, they must be in this. By an inevitable chain of causes and effects Providence punishes national sins by national calamities." And Jefferson, in the same year, after detailing the evils of slavery, added, "Indeed, I tremble for my country when I reflect that God is just, and that his justice can not sleep forever." But this substantial agreement in sentiment was very soon to be broken by an event which entirely altered the paths of the two sections. — Few influences have so colored the history of the United States and of negro slavery as the inventions of 1775-93 in England and America. In 1775 Crompton's invention of the mule jenny superseded Hargreaves' spinning machine; in 1783 Watt's steam engine was adapted to the spinning and carding of cotton at Manchester; in 1785 cylinder printing of cottons was invented; and in 1786-8 the use of acid in bleaching was begun. All the machinery of the cotton manufacture was thus standing ready for material. Very little had thus far come from the United States, for a slave could clean but five or six pounds a day for market. In 1784 an American ship which brought eight bags of cotton to Liverpool was seized on the ground that so much of the article could not be the produce of the United States; and Jay's treaty (see that title) at

first consented that no cotton should be exported from America. In 1793 Eli Whitney, of Connecticut, then residing in Georgia, changed the history of the country by his invention of the saw-gin, by which one slave could cleanse 1,000 pounds of cotton from its seeds in a day. He was robbed of his invention, which the excited planters instantly appropriated; and slavery ceased to be a passive, patriarchal institution, and became a means of gain, to be upheld and extended by its beneficiaries. The export of cotton, which had fallen from 189,316 pounds in 1791 to 138,328 in 1792, rose to 487,600 in 1793, to 1,601,760 in 1794, to 6,276,300 in 1795, and to 38,118,041 in 1804. Within five years after Whitney's invention cotton had displaced indigo as the great southern staple, and the slave states had become the cotton field of the world. In 1859 the export was 1,386,468,562 pounds, valued at \$161,434,923, and the next largest export (tobacco) was valued at but \$21,074,038. Was it wonderful that southerners should say and believe that "cotton is king," and that secession could never be attacked by blockade, since the great commercial nations, even the free states themselves, would not thus allow themselves to be deprived of the raw material of manufacture? The reader may judge the reasonableness of the belief, and the magnitude of the temptations to English intervention, by the value of the English imports of cotton from the United States and elsewhere, 1861-3, and the coincident rise in price: imports from the United States, (1861) \$132,851,995, (1862) \$6,106,385, (1863) \$2,300,000; from other countries, (1861) \$65,034,990, (1862) \$148,358,840, (1863) \$213,700,000; price per lb., (1861) 7 cents, (1862) 13½ cents, (1863) 27½ cents. From a purely commercial and agricultural venture the cotton culture had taken a different aspect. Those who controlled it felt very much the same importance as a man might feel who had gained control of the magazine of a man of war, and could threaten to blow up the whole ship if he should be interfered with in any way. — This development of the culture of cotton was pregnant with consequences to both sections. In the north, manufactures and commerce were developed, and the remnants of slavery slid to extinction down a steeper and smoother descent. In the south, the price of slaves was steadily increasing, and the increased profit thus indicated was steadily stamping labor itself as slavery. It is not in financial matters alone that bad money drives out good: wherever slave labor was extended, it tended constantly to expel free labor from the market. Immigration shunned slave soil as if by instinct, and it was not long before the whole population of the slave states was divided into three great classes: the rich whites, who did no work; the poor whites, who knew not how to work; and the slaves, who only worked when compelled to work. The results on the economical development of the country may easily be imagined. No one was under any special incentive to work, to invent, or

to surpass his neighbors; slaves, the only working class, could not be trusted to engage in any labor requiring care or thought; success in anything higher than the culture of cotton, tobacco or sugar, meant the inevitable freedom of the laborer; and long before 1850 "southern shiftlessness" had become chronic, hopeless and proverbial, even in the south. The reader who wishes for details will find them (from the census of 1850) in von Holst's third volume, or in Sumner's speech of June, 1860, as cited below; and an instructive description of affairs in 1860 is in Olmstead's two volumes. — Even on the culture of the soil the influence of the slave system was for evil. Only free labor can get large profits from a small surface, and the unwilling and unintelligent labor of slaves required so much larger area for its exercise that in 1850 there were to the square mile only 18.93 inhabitants in the southern states to 45.8 in the northern states. Slavery, like Tacitus' Germans, demanded empty acres all around it. In 1860 the acreage of improved to unimproved lands in Virginia was 11,437,821 to 19,679,215; in North Carolina, 6,517,824 to 17,245,685; in South Carolina, 4,572,060 to 11,623,859; and in Georgia, 8,062,758 to 18,587,732. The older slave states have been selected; in the new slave states the comparison is equally or more unfavorable. In the old free state of New York the comparison stood 14,358,403 improved to 6,616,555 unimproved; in the new free state of Illinois, 13,096,374 to 7,815,615. Of the free states, all but California, Iowa, Maine, Michigan, Minnesota, Oregon and Wisconsin had more improved than unimproved land in farms; of the slave states, only Delaware and Maryland. The comparison of the price of lands is still more unfavorable to slavery, varying in such near neighbors as Pennsylvania and Virginia from \$25 per acre in the former to \$8 per acre in the latter. The average value of northern farms in 1860 was \$29 an acre; of southern farms, \$9.80. This constant necessity for elbow room for slave labor was the ground reason for its constant effort to stretch out after new territory. A planter's policy was to take up as much land as possible, scratch the surface until his slaves could or would extract no more from it, and then search for virgin soil; for it was cheaper to pass the Mississippi, or invade Texas, than to cultivate a worn-out farm with slave labor. Scientific agriculture, and the revivification of so-called worn-out farms, were never attempted until the overthrow of slavery; and, since they have begun, we hear no more of the need for new territory for cotton. — The influence of slavery upon the section in which it existed was particularly evil in regard to the possibilities of warfare. Not only did it throttle commerce, manufactures, literature, art, everything which goes to make a people independent of the rest of the world: its influence in checking the natural increase of fighting men is plainly perceptible in the decennial census tables. Even when there is an apparent equality of numbers between the two sections, the equality is delusive,

so long as the southern scale is partly filled with a population not only non-combatant but actually to be distrusted as possibly hostile. For this reason, in the following table, taking separately the states which were free and slave in 1860, the population of the free states is given first, then the population of the slave states (excluding slaves), and finally the slaves.

	1790.	1800.	1810.	1820.
North.....	1,968,040	2,684,616	3,758,910	5,152,372
South.....	1,303,647	1,764,211	2,317,048	2,966,989
Slaves.....	657,527	857,105	1,163,854	1,518,990
	1830.	1840.	1850.	1860.
North.....	7,006,399	9,733,922	13,589,488	19,128,418
South.....	3,842,843	4,848,107	6,459,946	8,361,848
Slaves.....	2,005,469	2,486,326	3,204,051	3,953,524

Whatever causes may be assigned to explain the growing disproportion of free population and fighting men of the two sections, it is evident that the slave states were worse fitted at the end of each successive period for a forcible struggle with the free states, and that the sceptre was departing from the south. — It is not proposed in this article to touch on the moral aspect of slavery, or the absurd Biblical arguments for and against it. the rigid application of the *partus sequitur ventrem* rule, combined with the material interests of the cotton monopoly, will absolutely distinguish negro slavery in the United States from every system that has preceded it. We may summarize the economical evils of the system, in those points which no one can dispute, in a few words. It paralyzed invention and commerce; it prevented manufactures and the general introduction of railroads, steam machinery, or improved agricultural implements; it degraded labor by white as well as by black men; it stunted all the energies of the people, and deprived them of those physical comforts which were regarded elsewhere as almost necessities; it dwarfed the military ability of the people, at the same time that it increased the military ambition of the ruling class, and kept the poor whites so ignorant that to them their state was a universe, its will sovereign, and its power irresistible. Every year increased the pile of explosives in the southern territory, and yet the force of events compelled slavery to grow more aggressive as it grew really weaker for war. That a people so situated, with no resources of their own and with little power to draw from without, should have waged the final war as they did, is almost enough to hide in the glory of their defeat the evil thing that went down with them. The enormous strides of the southern states from 1870 until 1880 show what the same people can do under free labor, and nearly all southern writers are agreed that the south was the greatest gainer by the overthrow of slavery. President Haygood, of Georgia, in a thanksgiving sermon of 1880,

says: "For one illustration, take the home life of our people. There is ten times the comfort there was twenty years ago. Travel through your own country—and it is rather below than above the average — by any public or private road. Compare the old and the new houses. Those built recently are better in every way than those built before the war. I do not speak of an occasional mansion that in the old times lifted itself proudly among a score of cabins, but of the thousands of decent farm houses and comely cottages that have been built in the last ten years. I know scores whose new barns are better than their old residences. Our people have better furniture. Good mattresses have largely driven out the old-time feathers. Cook stoves, sewing machines, with all such comforts and conveniences, may be seen in a dozen homes to-day where you could hardly have found them in one in 1860. Lamps, that make reading agreeable, have driven out the tallow dip, by whose glimmering no eyes could long read and continue to see. Better taste asserts itself: the new houses are painted; they have not only glass, but blinds. There is more comfort inside. There are luxuries where once there were not conveniences. Carpets are getting to be common among the middle classes. There are parlor organs, pianos and pictures where we never saw them before. And so on, to the end of a long chapter. There are more people at work in the south to-day than were ever at work before; and they are raising not only more cotton, but more of everything else. And no wonder, for the farming of to-day is better than the farming of the old days, first, in better culture, second, in the ever-increasing tendency to break up the great plantations into small farms. Our present system is more than restoring what the old system destroyed." — II. THE SYSTEM INTERNALLY. The Louisiana civil code (Art. 35) thus defines a slave: "One who is in the power of a master to whom he belongs. The master may sell him, dispose of his person, his industry and his labor; he can do nothing, possess nothing, nor acquire anything but what must belong to his master." This comprehensive definition will show the status of the slave and the rights of the master sufficiently to obviate the necessity of any full statement of the slave laws of the states. For these the reader is referred to the authorities cited below. As slavery rested on custom, its regulation was uniformly by statute, the constitution usually ignoring it, and leaving it wholly in the power of the legislature. Slavery was never mentioned in the state constitutions of Delaware, Maryland (until 1837), Virginia (until 1850), North Carolina (except a mere mention of slaves in 1835), South Carolina (except a qualification of negroes for membership in the legislature in 1790), or Louisiana. In the new states slavery was legalized by that provision of their constitutions which forbade the legislature to emancipate slaves without consent of their owners, or to prevent immigrants from bringing their slaves into the state: such provisions were

inserted by Kentucky in 1792, Georgia in 1798, Mississippi in 1817, Alabama in 1819, Missouri in 1820, Tennessee in 1834, Arkansas in 1836, Maryland in 1837, Florida in 1838, Texas in 1836 and 1845, and Virginia in 1850; and these continued in force until the final abolition of slavery. Trial by jury for crimes above the grade of petit larceny was secured to the slave by the constitutions of Kentucky in 1799, Mississippi in 1817, Alabama in 1819, Missouri in 1820, and Texas in 1845, and by various statutes in Georgia, Tennessee, North Carolina and Maryland, but was denied in any case in South Carolina, Virginia and Louisiana. There were also provisions in most of the states for the punishment of the willful and deliberate murder of a slave. The benefit of both these provisions, however, was largely nullified by the universal rules of law that a negro's testimony could not be received against a white man, and that the killing of a slave who should resist "lawful authority" was justifiable homicide. As slavery grew more extensive the necessity for repressive legislation to act upon the slaves became more pressing, and the slave codes more severe, until every white person felt himself to be a part of a military force guarding a dangerous array of prisoners. Education of slaves was strictly forbidden, though this provision was frequently evaded or disobeyed in individual cases. The pass system was in full vigor everywhere, and even the younger girls of the master race did not hesitate to stop a strange negro on the road, examine his pass, or order him to a particular house for examination. It was a strange society, always on the alert, always with its hand on the sword, and cruel and evil things were done in it. The burning of negroes as a punishment for heinous offenses was not an uncommon thing, nor was it by any means the most shocking of the crimes in the punishment of which George Mason's prophetic words of 1787 were rigidly fulfilled. Many of the evils had a reflex influence upon the men of the dominant race; but the women, shielded from personal contact with most of the evil, and trained from childhood in the daily exercise of the heroic virtues, developed an unusual force of character, to which much of the stubborn endurance of the war was due, and even more of the sudden rejuvenation of the south after the war.—*Black Codes, or Black Laws.* These penal laws of the slave states had a very direct influence upon the legislation of several of the free states, particularly of those to which there had been a large southern migration. Ohio, in 1803, forbade negroes to settle in the state without recording a certificate of their freedom; in 1807 passed an act denying to negroes the privilege of testifying in cases in which a white man was interested on either side; and followed this up by excluding them from the public schools, and requiring them to give bonds for their good behavior while residing in the state. In 1849 these "black laws" were repealed as a part of the bargain between the democrats and free-soilers. (See OHIO.) The legislation of Illinois in 1819, 1827 and 1853, imitated

that of Ohio, and in 1851 Indiana inserted similar provisions in her state constitution, which the state courts, in 1866, held to be void, as repugnant to the constitution of the United States. The same provisions were adopted by Iowa in 1851 by statute, and were made a part of the state constitution of Oregon in 1857. Wherever the state constitutions prescribed conditions of admission to the militia, as in Indiana in 1816, Illinois in 1818, Iowa in 1846, Michigan in 1850, Ohio in 1851, and Kansas in 1859, negroes were excluded; and in the states where the composition of the militia was left to the legislature the exclusion was as fully attained by statute. As a general rule, most of this legislation was swept away as rapidly as the republican party obtained complete control of each state, after 1856.—*Insurrections.* No slave race has organized so few insurrections as the negro race in the United States. This can hardly be due to the natural cowardice of the race, for its members have made very good soldiers when well organized; nor to the exceptional gentleness of the system, for it was one of increasing severity; nor wholly to the affection of the negroes for their masters, for the great plantation system, under which there could be little affection on either side, had been fairly established in 1860, and yet there was no insurrection throughout the rebellion. It is encouraging to believe that the race, by long contact with the white race, has imbibed something of that respect for law which has always characterized the latter, so that the negroes, however enterprising when backed by the forms of law, patiently submitted to legal servitude. It is certain that revolt, during their history as slaves, was regularly individual, and that most of it was only revolt by legal construction. In 1710 a negro insurrection is said to have been planned in Virginia, but it was balked by one of the conspirators, who revealed the plot, and was rewarded by emancipation. In 1740 a local insurrection broke out in South Carolina, but it was stamped out instantly by the militia. In New York a negro plot was unearthed in February and March, 1741, and as a consequence of the intense popular excitement a number of negroes and whites were hung, and several negroes burned, but the whole story of the "conspiracy" seems now of the flimsiest possible construction. In 1820 Denmark Vesey, a St. Domingo mulatto, organized a negro insurrection in Charleston. It was revealed, Vesey and thirty-four others were hung, and a like number were sold out of the state. In August, 1831, the most formidable of all the insurrections broke out in Southampton county, near Norfolk, Virginia, led by Nat Turner. He believed that he had been instructed by Heaven, three years before, to rebel, the sign being an eclipse of the sun in February, 1831, but, oppressed by a sense of the greatness of the task, he fell sick, and did not begin until August. With fifty associates he then began a massacre of the whites, sparing neither age nor sex. The insurrection was at once suppressed, and Turner, after several weeks' concealment, was

captured and executed in November. The total loss of life was sixty-one whites and over a hundred negroes. The Seminole war in Florida partook very much of the character of a negro insurrection. While Florida was under Spanish rule, very many fugitive slaves had taken refuge there and intermarried with the Indians; and the desire of reclaiming them was the secret of many of the Indian difficulties of that region. In 1816 American troops blew up the "negro fort" on the Apalachicola, which was the headquarters of the fugitives. On the annexation of Florida (see ANNEXATIONS, II.), slave hunting increased in eagerness, and the fugitives were pursued into the everglades. In 1833 the Seminoles had about 200 slaves of their own and 1,200 fugitives. One of the latter, the wife of Osceola, was seized while trading at Fort King, and her enraged husband at once began open war. It was conducted with inhuman cruelty on both sides, the most prominent example being the massacre of Major Dade's command, Dec. 28, 1835. The American commanders hardly ever made any secret of the great object of the war, the recapture of the fugitives; and, as the Seminoles refused to make any treaty in which the fugitives were not included, the war was long and expensive. In 1845 a treaty was arranged for the removal of both Seminoles and fugitives beyond the Mississippi, but the claimants pursued the latter with every form of legal attack, secured some of them, and, in 1852, obtained payment from congress for the remainder. The Harper's Ferry insurrection (see BROWN, JOHN) closed the list of negro revolts. — III. THE SYSTEM EXTERNALLY; THE SLAVE TRADE. 1. *Foreign Slave Trade.* It has long been a general belief that the colonies, before the revolution, were anxious to prohibit the slave trade, but were prevented by the crown's instructions to the governors to veto any such laws; and the Virginia declaration of June 29, 1776, denounces the king for "prompting our negroes to rise in arms among us, those very negroes whom, by an inhuman use of his negative, he had refused us permission to exclude by law." The case is complete enough against the crown. From the time of Hawkins' slaving cruise in 1562 the British government was an active partner in the slave trade. By the treaty of Utrecht, in 1713, it secured for one of its monopolies the slave trade from Africa to the West Indies; in 1750 it beneficently threw open the trade to all its subjects; and its consistent policy is well stated in the official declaration of the earl of Dartmouth in 1775, that "the colonies must not be allowed to check or discourage in any degree a traffic so beneficial to the nation." But it is not so easy to clear the skirts of the colonies. The assertion of their desire to suppress the trade rests on the passage of a great number of acts laying duties upon it: the titles of twenty-four of these acts in Virginia are given in Judge Tucker's Appendix to Blackstone. But almost invariably these acts were passed for revenue only, and the Virginia act of 1752 notices

in its preamble that the duty had been found "no ways burdensome to the traders." It was not until the opening of the revolution that any honest effort was made to suppress the trade, except in Pennsylvania, where bills to abolish the slave trade were passed in 1712, 1714 and 1717, and vetoed. The Massachusetts general court passed a bill to prohibit the slave trade, March 7, 1774, and another, June 16 following; but both were vetoed. It was prohibited further by Rhode Island in June, 1774; by Connecticut in October, 1774; and by the non-importation covenant of the continental congress, Oct. 24, 1774, as follows: "We will neither import nor purchase any slave imported after the first day of December next, after which time we will wholly discontinue the slave trade, and will neither be concerned in it ourselves, nor will we hire our vessels, nor sell our commodities or manufactures to those who are concerned in it." This covenant, ratified by the states, north and south, checked the trade for the time. No further attempt was made by congress to interfere with the trade, and the ratification of the articles of confederation in 1781 gave the states the power to regulate this and all other species of commerce. — In the formation of the constitution the question of the regulation of the slave trade offered a great difficulty. The three southern states demanded its continuance, alleging that Virginia and Maryland desired to prohibit it only to secure a domestic market for their own surplus slaves. The matter was compromised (see COMPROMISES, III.) by allowing congress to prohibit it after 1808. In the meantime the act of March 22, 1794, prohibited the carrying of slaves by American citizens from one foreign country to another; the act of May 10, 1800, allowed United States war vessels to seize ships engaged in such trade, and the act of Feb. 28, 1803, prohibited the introduction of slaves into states which had forbidden the slave trade by law. Virginia had done so by statute in 1778 and 1785, Georgia by constitutional provision in 1798, South Carolina by statute in 1787 (repealed in 1803), and North Carolina by statute in 1798. Finally, congress, by act of March 2, 1807, prohibited the importation of slaves altogether after the close of the year; the acts of April 20, 1818, and March 3, 1819, authorized the president to send cruisers to the coast of Africa to stop the trade; and the act of May 15, 1820, declared the foreign slave trade to be piracy. It can not, however, be truly said that the slave trade was abolished: it never really ceased before 1865. The census of 1870 assigns Africa as the birth-place of nearly 2,000 negroes, and it is impossible even to estimate the number illegally imported from 1808 until 1865. The sixth section of the act of March 2, 1807, allowed negroes confiscated under the act to be disposed of as the legislature of the state might direct; and southern legislatures promptly directed the sale of the confiscated negroes. This absurd section, which introduced slaves into the south, while punishing the importer, was repealed March 3, 1819, and the con-

fiscated negroes were ordered to be returned to Africa. The claim of British naval officers on the African coast to visit and search vessels flying the American flag, but suspected of being slavers, was steadily resisted by the American government, and led to an infinite variety of diplomatic difficulties and correspondence, which the reader will find detailed in William Beach Lawrence's volume, cited below. It was finally compromised by articles eight and nine of the Webster-Ashburton treaty, Aug. 9, 1842, by which the two governments agreed to maintain independent squadrons on the African coast, to act in conjunction. Difficult as this made the slave trade, it by no means suppressed it; and, as the price of negroes in the south rose higher, importations increased, and so did the difficulties of obtaining convictions from southern juries. The most notorious case was that of the Georgia yacht *Wanderer*, in December, 1858, but it was not the only one. According to the "Evening Post," of New York city, 85 vessels were fitted out from that port for the slave trade during eighteen months of 1859-60, the names of the vessels being given; and another newspaper of the same city estimated the cargoes introduced by these New York vessels alone at from 30,000 to 60,000 negroes annually. Said a Georgia delegate in the Charleston convention of 1860: "If any of you northern democrats will go home with me to my plantation I will show you some darkies that I bought in Virginia, some in Delaware, some in Florida, and I will also show you the pure African, the noblest Roman of them all. I represent the African slave trade interest of my section." In 1858 an ingenious attempt was made to evade the law. A Charleston vessel applied for a clearance to the African coast "for the purpose of taking on board African emigrants, in accordance with the United States passenger laws." Howell Cobb, secretary of the treasury, refused to give the clearance. — As we approach the year 1860 we find growing apprehensions of the reopening of the foreign slave trade. It must be remembered that congress was only permitted not directed, to abolish the trade after 1808, and that a simple repeal of the law of 1807 would have made it as legal as any other branch of commerce. The inherent weakness of the system of slavery, which grew weaker as it widened, imperatively demanded the repeal. To retain political power it was necessary to introduce the custom of slavery into the new territories in order to prepare them to be slave states. For this the domestic supply would not suffice; and Alex. H. Stephens, in his farewell speech to his constituents, July 2, 1859, says that his object is "to bring clearly to your mind the great truth that without an increase of African slaves from abroad, you may not expect or look for many more slave states." The repeal of the law of 1807, and the revival of the foreign slave trade, were advocated by the southern commercial convention in 1858 and 1859, by De Bow's "Review," and by a great and growing number of leading men and newspapers. It was even taking

the aspect of a new phase of a distinct southern political creed, an effort to repeal that which was a standing condemnation of slaveholding and slaveholders. Before anything definite could be attempted, secession intervened. The constitution of the confederate states forbade the foreign slave trade, and "required" congress to pass such laws as should effectually prevent the same. How long this prohibition would have endured, if independence had been achieved, can not be conjectured, but it is certain that a slaveholding government would have found far more difficulty in enforcing such a prohibition than the government of the United States had found. — 2. *The Domestic Slave Trade*. Even barring secession and rebellion, negro slavery had always a possible danger in the undoubted power of congress to regulate commerce "between the states." Should this power ever find a majority in congress ready to apply it in an unfriendly spirit to the sale of slaves from state to state, and thus to coop up each body of slaves in its own territory, the system would be injured in a vital point. For this reason the ninth section of the act of 1807 allowed the transfer of slaves from point to point along the coast in vessels of not more than forty tons burden. After the abolition of slavery in the British colonies, American coasting vessels with slaves on board would occasionally be forced by stress of weather into British West India ports, when the authorities at once liberated the slaves. Diplomatic complications followed, of course; but the British government steadily refused to pay for the slaves liberated, except in cases which had occurred before the abolition of slavery in the colonies. (See CREOLE CASE, and the authorities there cited for the other cases.) The domestic slave trade by land was never interfered with until the abolition of slavery, except by the unavoidable operations of war during the rebellion. A bill was introduced by Sumner in 1864 to prohibit it, but it came to nothing. A bill to repeal the sections of the act of 1807 permitting the coastwise slave trade was added as a rider to an appropriation bill, and became law July 2, 1864. — IV. THE SUFFRAGE CLAUSE AND THE "SLAVE POWER." The constitution (see COMPROMISES, I.) gave to the states in which slavery existed legal representation in the lower house of congress for three-fifths of their slaves. In this provision there was innate an influence which was as potent on the political aspect of the slave system as the cotton culture was upon its material aspect. It must be remembered, that, in spite of the number of slaves in the south, slave owning was not at all general in that section. In 1850 the white population of the south was 6,459,946, and De Bow, superintendent of the census, and a pro-slavery southerner, gives the number of slaveholders as only 347,525, classified as follows: holders of 1 slave, 68,820; 2 to 5 slaves, 105,683; 6 to 10 slaves, 80,765; 11 to 20 slaves, 54,595; 21 to 50 slaves, 29,733; 51 to 100 slaves, 6,196; 101 to 200 slaves, 1,479; 201 to 300 slaves, 187; 301 to 500 slaves, 56; 501 to 1,000 slaves, 9; over 1,000 slaves,

2. But even this statement, De Bow admits, has an element of deceptiveness, for most of the small holders were not slave owners, but slave hirers; and he estimates the actual number of slave owners at 186,551. In 1850, 90 of the 234 members of the house of representatives were apportioned to the slaveholding states. If we omit from their population three-fifths of the number of their slaves in 1850, they would have been entitled in round numbers to but 70 representatives. The other 20 members represented only the 186,551 slave owners, and the loosest examination of the majorities by which bills passed the house of representatives during the anti-slavery conflict will show that the introduction of these 20 votes was usually the decisive factor down to 1855. This consequence was apparent from an early date. The repeal of the suffrage clause was demanded in 1814 (see CONVENTION, HARTFORD); and the demand grew still stronger after 1833, and never failed to excite the hottest wrath of southern members. Perhaps the occasion which roused the most intense feeling was the presentation by John Quincy Adams in congress, Dec. 21, 1843, of a formal proposal from the democratic legislature of Massachusetts to amend the constitution by repealing the three-fifths clause. In congress it was denounced unsparingly, and refused the privilege of printing, and out of congress the fervor of denunciation was unreportable. — But the direct operation of the three-fifths clause was far less than its indirect influence. It must be remembered that the 200,000 slave owners necessarily included in their ranks almost all the governors, judges, legislators, and leading men of the slave states, and their senators and representatives also, since the purchase of one or more slaves was the first step of any man who began to acquire wealth; and that all these men were united by a common purpose, the protection of property, which was superior in its every-day operation to almost any other claim. Practically, then, the 200,000 slave owners, recruited from time to time by new accessions, formed a dominant class; and the ninety representatives and thirty senators (in 1850) not only represented them, but were selected from their number. Such a political force as this had never before appeared in American politics: the utmost conceivable evils of the influence of corporations must pale their fires before it; and it is no wonder, that, as it rose gloomier and more threatening upon the southern sky, the instinctive political sense of the people gave it the name of the "slave power." In the nature of things this power could not be conservative: it must be aggressive, for the interest represented by it demanded extension to obtain profit; and yet, as it grew wider, it grew weaker, and needed still warmer support. The general, double-acting rule was: the more slaves, the more territory; the more territory, the more slaves. It was not in human nature for the men who made up the slave power to resist an influence so constant, so natural, so silent and so powerful, and the vicious twist given by it to the whole southern

policy grew stronger yearly. No influence, even that of honor, could resist its undermining or escape being argued away. It was progressively successful in transplanting the custom of slavery beyond the Mississippi, in swinging the whole force of the nation upon Mexico for the acquisition of new slave territory, and in violating the condition precedent on which it had obtained the admission of Missouri as a slave state; and it was partially prepared in 1861 to shock the conscience of civilization by reopening the foreign slave trade, to whose suppression the good faith of the nation was pledged. But, before this last effort could be made, its time had come. The internal defects of the combined cotton-slave system could not remain stationary. Nothing is more certain than that, from 1850 to 1860, the number of slave owners was diminishing, particularly in the gulf states, the plantations were growing larger, the cotton culture was becoming less and less patriarchal and more and more of a business, and the slave power itself was growing more compact, grasping and reckless. It might have been that, without secession, this concentrating process would have gone on until the non-slaveholding whites of the south would have united against it; but that possibility was never tried. In 1860 the rising anti-slavery tide of the north and west came into flat collision with the rising tide of the slave power, and equilibrium was at last restored by violence. — It was not alone the inherent grasping nature of the slave power which affronted the non-slaveholding states and helped to bring about the final catastrophe. It is no reflection upon southern legislators of the present to say that the slaveholding member of congress until 1861 was in general an exceedingly unpleasant personage. His faults of thought, feeling, expression and manner, were long ago explained by Jefferson. "If a parent had no other motive, either in his own philanthropy or in his self-love, for restraining the intemperance of passion toward his slave, it should always be a sufficient one that his child is present. But generally it is not sufficient. The parent storms, the child looks on, catches the lineaments of wrath, puts on the same airs in the circle of smaller slaves, gives a loose rein to his worst passions, and thus nursed, educated and daily exercised in tyranny, can not but be stamped by it with odious peculiarities." However unjust it may be in theory to wage a political crusade against bad manners, it is as certain as anything can be that the political union of the free states in 1860 was largely brought about by the "odious peculiarities" of slaveholding members of congress in debate. Their boisterous violence, their willingness to take liberties of language, contrasted with their unwillingness to allow the same liberty to opponents, their disposition to supplement discussion with actual violence or threats of it, the indescribable and merciless assumption of an acknowledged superiority, made the debates of 1850-60 a shameful record, and are still remembered by their old opponents, with a certain sore-

ness, as "plantation manners." It was bad enough that a senator should be clubbed into unconsciousness for words spoken in debate (see Brooks, P. S.); it was, if anything, worse that his first speech on his return to the senate should be answered by a South Carolina senator with the remark that "we are not inclined again to send forth the recipient of punishment howling through the world, yelping fresh cries of slander and malice." Southern writers will never fully understand the election of 1860 until they come to study, in the light of the new training, the debates which preceded it. — A power so situated, in a constantly weakening minority in the nation, and yet supreme in influence in its own states, was necessarily particularist in theory. Where it ruled, the forefathers had said state sovereignty and meant state rights, while their descendants said state rights and meant state sovereignty. (See that title.) And the development of the great cotton interest made state sovereignty even worse than it was by nature: instead of the jarring and comparatively innocuous demands of state sovereignty, it banded together a number of states by a common controlling interest, and evoked the deadly peril of sectional sovereignty. (See NULLIFICATION, SECESSION.) State rights could never have caused a blow; even state sovereignty would have died a harmless and natural death; but slavery and sectional state sovereignty each so acted and reacted upon the evil points of the other that the combined tumor was at last beyond reach of anything but the knife. But, during its existence, slavery never hesitated upon occasion to drop state sovereignty for the time, and use the nation and the national idea as political forces for its advancement; and yet it never did so, except in the case of the acquisition of Florida, without injuring itself. In its infancy it acquired the territory west of the Mississippi (see ANNEXATIONS, I.) by a process which was only defensible on the ground that the powers of the government were given by a nation, and not by sovereign states; and out of this territory grew its subsequent difficulties. (See COMPROMISES, IV.; KANSAS NEBRASKA BILL.) It flung the nation upon Mexico, and the disputes over the territory thus acquired first put the anti-slavery sentiment into political shape. It forced the passage of a fugitive slave act fatally adverse to state sovereignty and state rights in compensation for the admission of California as a state (see COMPROMISES, V.; FUGITIVE SLAVE LAWS), an act whose operation made its moving power the object not only of dread but of abhorrence in the free states. Finally, by transferring theoretical state sovereignty into practical secession, it compelled such an extensive showing of national power that the effects will be felt for generations to come. — V. SLAVERY IN TERRITORIES AND NEW STATES. It is certain that slavery in the original states was founded on custom only, and the same foundation, if any, must be found for slavery in territories and new states. The modern states of Kentucky and Tennessee, for example,

were never colonies or territories of their parent states: they were integral parts of Virginia and North Carolina, and the custom of slavery was established at Nashville or Harrodsburgh on just the same basis as at Beaufort or Richmond. When their separation from the parent states took place, the custom of slavery remained, and they entered the Union as slave states. Granting that no opposition to slavery was felt by the nation at large, the same process might have been repeated anywhere, and custom, unopposed, might have made any territory slave soil, and brought it into the Union as a slave state. It is, therefore, impossible to admit fully the dogma, so popular and useful in the anti-slavery conflict, that the national territory was free soil without any statutory enactment. It might be free, and it might be slave, according to custom. In the cases of Kentucky, Tennessee, Mississippi and Alabama, the cessions of their territory were accepted by the United States from Virginia, North Carolina, South Carolina and Georgia, under a pledge not to interfere with the existing custom of slavery. The rights of all these states to the territory which they professed to cede, like the rights of New York, Connecticut and Massachusetts to the northwestern territory, were exceedingly doubtful (see TERRITORIES, I.); nevertheless, the pledge was honorably fulfilled. — The slaveholding states always denied that any act of congress could prohibit the custom of slavery in a territory. But this is as impossible of acceptance as the free soil dogma above stated. The territories were certainly not without law. Their inhabitants were not the law-making power, for then there would have been no distinction between territories and states. On any other subject than slavery, no one, in court or congress, denied that congress was the law-maker for the territories. But slavery was only a custom; and, while no one denies that a custom is valid until abrogated by statute, this has been the only case in which it has been seriously asserted that any custom is above and beyond abrogation by statute. So evident was this in 1787 that the ordinance of that year (see ORDINANCE of 1787) abolished slavery in the territory northwest of the Ohio, in whose case no restraining pledge had been given. The articles of confederation, which were then in force, gave congress no power to so prohibit slavery, or, indeed, to hold or govern territory at all. The whole act was so obviously a consequence of the national power to hold and govern its own territory, and was so plain a parallel to the proposal to similarly prohibit slavery in the Mexican annexations (see WILMOT PROVISIO), that southern writers have endeavored to avoid it in two ways: 1. They assert that the ordinance was merely an expression of the will of the several states, a new article of confederation, so to speak. This is impossible. The state vote on the ordinance of 1787 was indeed unanimous, but this fact has no bearing on the matter, for the ordinance of 1784, which covered much the same ground (excepting the

prohibition of slavery), was not adopted by unanimous vote, South Carolina voting in the negative, and yet its validity was never impeached on that account. Further, the articles of confederation were to be amended by state legislatures only: however we may admit the power of a national convention to override them, we can hardly acknowledge the power of congress itself to amend them. 2. Judge Taney, in the Dred Scott decision, holds that the ordinance of 1787 "had become inoperative and a nullity upon the adoption of the constitution." If this was so, and if it was true, as the same decision holds, that the power of congress to "make all needful rules and regulations" for the territory of the United States was intended to be confined to the territory then owned by the United States, and not to be extended to territory subsequently acquired, the fugitive slave law of 1850 was in a large degree unconstitutional. It was based on the fugitive slave clause of the constitution: but this only allowed the reclamation of slaves from one *state* to another *state*. (See FUGITIVE SLAVE LAWS.) During the territorial existence of the northwest the ground was covered by this proviso to the prohibition of slavery by the ordinance of 1787: "provided always that any person escaping into the same, from whom labor or service is lawfully claimed in any one of the original states, such fugitive may be lawfully reclaimed and conveyed to the person claiming his or her labor or service as aforesaid." If the power to make "rules and regulations" for the territories only applied to the territory owned in 1789, and was intended to supply the place of the fugitive slave clause in the superseded ordinance of 1787, it follows that the fugitive slave law of 1793 exhausted the constitutional powers of congress to provide for the reclamation of fugitive slaves to a territory. All the trans-Mississippi territory was subsequently acquired; and, if the Dred Scott decision was correct, the fugitive slave law of 1850 was unconstitutional in providing for the reclamation of fugitive slaves from it. The consequence must have been that the trans-Mississippi territories, whether slavery were allowed or prohibited in them, would have been a sort of Alsatia, a safe refuge for fugitive slaves; and slavery would have been at a greater disadvantage than under the ordinance of 1787. —The custom of slavery was already in existence in Louisiana and Florida at the time of their annexation, but the responsibility for its enlargement is directly upon congress. The act of March 26, 1804, provided that no slaves should be introduced into the territory, *except* "by a citizen of the United States, removing into said territory for actual settlement, and being at the time of such removal *bona fide* owner of such slave or slaves"; and the act of March 30, 1822, while forbidding the importation of slaves from without the United States, by implication allowed the domestic slave trade. Both acts confirmed the laws then in force in the territories, and not inconsistent with the acts; and as the territorial laws recognized slavery, it con-

tinued in force, and Louisiana and Florida entered the Union as slave states. Upon the admission of Louisiana as a state, the continuance of the custom of slavery in the rest of the purchase was practically provided for by the sixteenth section of the act of June 4, 1812, continuing the territorial laws of Louisiana in the new territory of Missouri. Again, when the new territory of "Arkansaw" was created by the act of March 2, 1819, a similar provision continued in the new territory the laws of Missouri, which recognized slavery. The consequences of this long *laches*, this omission of congress to prohibit the custom of slavery, which had been recognized by French, Spanish and territorial law, had now become apparent in the application of Missouri for admission as a slave state, and the tardy attempt in congress to attack the evil raised a political storm. On the one hand, since the new state had not the ability to compel a recognition of its existence, its recognition was clearly a matter of favor, on which congress could impose such conditions as it should consider needful. On the other, it was hardly just that congress should permit the existence of even an evil custom during its own responsibility for government, and only undertake to abolish it at the instant of giving the state professed self-government. The settlement of the case is elsewhere given (see COMPROMISES, IV.); it resulted in the abolition of slavery in the rest of the Louisiana purchase, above 36° 30' north latitude, and the admission of Missouri as a slave state. As there was no abolition of the custom of slavery in the territory of Arkansas, we must consider the custom left still in existence there. On the application of Arkansas for admission as a slave state in 1836, there were some symptoms of a renewal of the Missouri struggle; but John Quincy Adams and other anti-slavery men agreed that the admission of Arkansas was fairly nominated in the Missouri bond, and the state was admitted. At the same session an increase in the area of Missouri (see that state) made a considerable addition to the slave soil of the United States. Here the extension of slavery stopped, with the exception of the admission of Florida and Texas as slave states in 1845. (See ANNEXATIONS, III.) The area of Texas had been free soil under the decree of Guerrero, the Mexican dictator, in 1829, afterward ratified by the Mexican congress; and slavery is not recognized in the constitution of the Mexican state of Coahuila and Texas, or in the provisional Texas constitutions of 1833 and 1835. But American settlers had brought their slaves with them, and fairly introduced the custom of slavery; and the constitution of 1836 formally declared all persons of color slaves for life, if they had been in that condition before their emigration to Texas, and were then held in bondage. Thus, though the state was not in the Union as yet, was the only instance of the professed establishment of slavery by the organic law of an American state, unless we are to take the Massachusetts code of 1641 as the first. The basis of the system is clearly expressed in a

section of the Kentucky constitution of 1850, as follows: "The right of property is before and higher than any constitutional sanction; and the right of the owner of a slave to such slave and its increase is the same and as inviolable as the right of the owner of any property whatever." It was no more necessary, then, to declare a constitutional right of property in the case of slaves than in the case of horses. In both cases the legislature was to accept and defend the right without question. A slave state was regularly declared such, at its admission, only by the provision forbidding the legislature to emancipate slaves without consent of owners, or to forbid the domestic slave trade. — As slavery reached the limits of its state extension in 1845, it only remains necessary to recur to its attacks upon the territories. Here the customary basis of slavery makes manifest the weakness of the claims for its extension after 1845. It is one thing to acknowledge the validity of a recognized and unopposed territorial custom in Louisiana, Missouri and Arkansas: it is a very different thing to admit, as pro-slavery advocates required, that the custom could not be abolished by statute, or prohibited where it did not exist. Nevertheless, in this respect, the compromise of 1850 (see COMPROMISES, V.) gave the slave states all they then asked. It refrained from prohibiting the custom, and gave the territorial legislature a general right of legislation, subject, of course, to the veto power of congress. But this last was now a meaningless form: it was impossible to obtain the passage of an act by congress and the president, annulling a territorial law recognizing slavery. Congress practically gave loose reins to the territorial legislatures, and they took advantage of it. New Mexico (then including Arizona) passed an act in 1851 recognizing peonage, or white slavery, and another in 1859 recognizing negro slavery; and Utah (then including Nevada) passed an act in 1852 maintaining the right of slaveholding immigrants to the services of their slaves. None of these acts was annulled until 1862. (See WILMOT PROVISIO.) The Kansas-Nebraska bill (see that title) in 1854 went a step further. It took off the Missouri prohibition of 1820, and allowed the introduction of the custom into all the territories. It is at least doubtful, leaving out the good faith of the repeal, whether a custom could properly be introduced in that way; but the climax of doubtfulness was reached when the Kansas struggle showed that the custom had no chance of practical introduction in that territory. The pro-slavery claim (see DRED SCOTT CASE; DEMOCRATIC PARTY, V.; COMPROMISES, VI.) was then advanced that both congress and the territorial legislatures were bound to defend slavery in the territories. If negro slavery was based on custom, and not on organic law, this claim was certainly a novelty in jurisprudence. We can easily understand the recognition or the prohibition of a custom by statute, but the establishment of a custom by statute is beyond conception. Yet this is the sum of the southern demand, when divested

of verbiage and reduced to its real essence; and secession was based on the refusal of the demand. — For the political influence of slavery, see DEMOCRATIC PARTY, WHIG PARTY, AMERICAN PARTY, REPUBLICAN PARTY. ALEXANDER JOHNSTON.

SMITH, Adam. The name of Adam Smith is the greatest in political economy. He has had the singular fortune to stamp his impress ineffaceably on the intellectual world as well as on the world of facts. Adam Smith is not only the acknowledged founder of economic science, but the authority appealed to, and who inspired Sir Robert Peel and Huskisson, those dauntless ministers of his ideas. His life, wholly devoted to study and thought, passed away modestly and peacefully. The information we possess regarding him is small. We shall endeavor more especially, within the limited space allowed us, to bring into relief the facts calculated to make known the character of the man and to explain the works of the thinker. — The little village of Kirkaldy, in Fifeshire, in Scotland, had the honor of being the birthplace of Adam Smith, who was born there, on June 5, 1723. His father, who was comptroller of the customs, had died several months before Adam Smith was born. His mother watched over his childhood, and she more than once had cause to fear for his life; for his constitution was frail and sickly. When he was only three years old, he was playing before his uncle's house, when a band of gypsies passing by kidnaped him. The alarm was given; his uncle gathered his friends together, overtook the kidnapers in a neighboring wood, and rescued his nephew. — From the school in Kirkaldy, in which he received his early education, Adam Smith went, in 1737, to the university of Glasgow. He there attended the lectures on moral philosophy of the illustrious head of the Scotch school, Hutcheson, whose teaching made a decided impression upon the mind of Adam Smith. He appreciated the solid and practical worth of it, and all his writings show that he adopted its exalted spiritualism, its solid common sense and its strong morality. He always retained a filial feeling for Hutcheson, and never spoke of him but with the expression of the sincerest admiration and the deepest gratitude. — Intended by his family for the church, Adam Smith was admitted to Balliol college, at Oxford. The future philosopher at first applied himself, with marked preference, to the study of mathematics and of the physical sciences. He knew not only the theory of these sciences, but had devoted much time to their history. These successive endeavors of the human intellect in the search of truth had a charm which delighted his investigating mind. From the sciences he passed to literature, and, after a stay of seven years, he read with equal facility the Latin, Greek, French and Italian poets. He frequently exercised himself in

translating from the French, with a view to his improvement in the art of writing. He regarded this exercise as eminently calculated to perfect one's style. — After completing his studies at Oxford, he returned to Kirkaldy. Determined to give up the ministry, he decided to live with his mother, in the peace which she alone could bring him, and to limit his ambition to the uncertain hope of obtaining one of those modest offices to which literary talent then led in Scotland. In 1748 he began to put his projects into execution, by opening at Edinburgh, where he came to establish himself, a public course of rhetoric and belles lettres. These lectures attracted a large number of hearers, and in a short time gave him substantial fame; for in 1751 he was appointed to the chair of logic in the university of Glasgow, and the following year to that of moral philosophy, left vacant by the death of Thomas Craigie, the successor of Hutcheson. He filled this chair for thirteen years, and always looked upon this period of his life as the most useful to his fellow-men as well as the happiest to himself. The brilliancy of his reputation gathered around him a crowd of students eager to hear him. The subjects of his course became the fashionable study; and his opinions the principal object of the discussions which entertained literary societies. Certain inflections of the professor's voice even, and certain favorite expressions of his, became matters of imitation. The talents of Mr. Smith, said one of his hearers, appeared nowhere to so great advantage as in the exercise of his duties as professor. In delivering his lectures he relied almost entirely upon his readiness in extemporizing. His style, though lacking, it is true, in grace, was clear, and free from affectation, and as he was seen to be interested in his subject, he never failed to interest his hearers. Each discourse consisted commonly in distinct propositions, which he made it his study successively to prove and explain. These propositions, stated in general terms, had often, from the very extent of their subject, an appearance of paradox. In his endeavors to develop them, it was not unusual to see him at first appear as if embarrassed and not thoroughly master of his subject, and even speaking with a kind of hesitation. But as he went on, the subject seemed to grow before him; his manner became warm and animated, and his expressions easy and flowing. In delicate points susceptible of controversy, you would have recognized without difficulty that he secretly entertained the thought of some opposition to his opinions, and that he consequently felt obliged to maintain them with the greater energy and vehemence. The abundance and the variety of his explanations and illustrations threw light upon his subject, as he handled it. — He divided his course into four parts; the first three included natural theology and moral philosophy, and particularly the moral principles which relate to justice. In the first part of his course he examined the various political regulations which are not founded upon the principle of justice, but upon

that of expediency, and the object of which was to increase the wealth, power and prosperity of the state. From this point of view he considered the political institutions relating to commerce, to finance, and to ecclesiastical and military establishments. What he taught upon these various subjects forms the substance of the work since published under the title "An Inquiry into the Nature and Causes of the Wealth of Nations." This exact evidence proves, that, since 1753, although this part of his course was limited to the consideration of economic legislation, Adam Smith had formed an opinion on the fundamental questions of political economy. It is impossible to determine wherein the opinions of the professor of moral philosophy differed from those of the author of the "Wealth of Nations," since nothing remains to us of his teaching but this indication of one of his disciples. However, Adam Smith only followed the example of his master whom he revered, in introducing the consideration of economical order into his course of moral philosophy, and it is perhaps to the single chapter of the "Manual of Moral Philosophy" of Hutcheson, in which he treats of value, of exchange, etc., that we owe the "Wealth of Nations."—From this period also his friendship with Hume, who had just published the second part of his "Essays" (1752), dates. In the nine discourses on political economy contained in this work, Hume, in attacking the erroneous theories of the mercantile system and of protective duties, determined the true principles of the nature of wealth, the profit of capital, and the solidarity of interests. This friendship, precious to both of them, kept up by their daily relations, to which Adam Smith brought profound convictions and an ardent love of humanity, and his friend a cold and jesting skepticism, which took away nothing from the sincerity of his affection, this friendship, which is a eulogy for both of them in this age of irritable vanity and literary jealousies, lasted until the end of Hume's life, and it is permissible to believe that the author of the "Essays" exercised an influence over his friend favorable to the direction of his thoughts toward political economy. This we know certainly, that the principal merchants of Edinburgh, then a very commercial town, shared Smith's views in the matter of customs, and that he himself drew from their conversation on the subject that knowledge of facts which characterizes his great work.—Half a century later, the most illustrious propagator of his doctrines, J. B. Say, crossed over to Glasgow. I wished to see, he wrote, the place which was the cradle of sound doctrines in political economy. I was conducted to a long, narrow room, where everything still remained as in Smith's time. An arm chair of old black eather towered between two of the windows, and I confess that I could not seat myself in it without very strong emotion mingled with respect. It is my inmost conviction that sound ideas of political economy will change the face of the world; now, can a

man look coolly at the source of a great river? Remarkable coincidence! At the same period at which, in his Glasgow attic, Smith was uttering his first principles on political economy; under the chateau of Versailles, the same ideas were germinating in the head of Quesnay, and prompting his articles in the *Encyclopedie* (1756).—It was after he had been for seven years professor of moral philosophy at Glasgow, that Adam Smith published his "Theory of the Moral Sentiments." The fundamental principle of this theory is, that the actions of others are the only source of our moral perceptions. The judgments which we pass as to the morality of our own acts, are but a personal application of the judgments which we pass on the acts of our fellow-men. It is this moral approbation which Smith calls *fellow-feeling*. In the first part of his book he explains how we learn to judge of the conduct of others; in the second, how, in applying this judgment to ourselves, we rise to the idea of a duty to be performed. "Smith is in the right," well says M. Cousin, "when he develops the charms of sympathy, when he urges us to have ceaselessly before our eyes the conditions upon which others sympathize with us, and bestow upon us all that is sweetest to the human heart, to wit, the approbation and good will of our fellow-men. Smith's mistake is to have believed, or to have appeared to believe, that fellow-feeling is itself the good. The two differ in principle; and it is of consequence that this difference should be made manifest, firstly, for the truth's sake, then for the sake of virtue itself; for virtue is impaired at its very foundation, if it pursues an end not its own; and it is all over with virtue, if, when by reason of a going astray of opinion, it comes to be wanting in fellow-feeling, and it is no longer able to maintain itself by its own power, and to be sufficient unto itself." For, indeed, sympathy or fellow-feeling, a noble and entirely personal feeling, are only a result of our organization; and Adam Smith, by assigning it the first place as the source of human actions, sacrificed to it the principle itself of which it is only the sign, conscience itself, that rule which subsists invariably and sovereignly obligatory above the caprices of the imagination and of the heart, and above the force of circumstances.—Singular inconsistency of the spirit of system; it is the philosopher of sympathy, the too exclusive defender of the sentiments of benevolence and commiseration, whom the opponents of political economy have accused of selfishness and of implacable hardness to the misery of his fellow-men! If these blind traducers of economic doctrine did not recall that the economist of Glasgow had written and proved that those who feed, clothe and lodge the entire body of the nation, should have a large enough share in the product of their work to be sufficiently fed, lodged and clothed, they should at least have been careful that their attacks were directed against the philosopher who had made sympathy the only motive of our actions and the law of duty.—Toward the end of 1763

the wish to visit the continent, and the liberal offers which were made him, determined Smith to accompany the young duke of Buccleugh in the travels which he contemplated undertaking. He sent to the rector of the university of Glasgow his resignation of the office he had filled for thirteen years. Universal regret was felt, and the university recorded its thought upon the register, and said that "the university could not refrain from expressing its sincere regret at the removal of Dr. Smith, whose distinguished virtues and amiable qualities had won for him the esteem and affection of his colleagues, and who had honored the university by his genius and the extent of his knowledge. His elegant and ingenious 'Theory of the Moral Sentiments' had won for him the esteem of men of taste and letters all over Europe. His happy talent of throwing light upon the most abstract subjects, his assiduity in communicating useful knowledge, and the exactness in discharging the duties of his position, which characterized him as a professor, were for the young men intrusted to his care a source of enjoyment as well as of sound instruction." Smith and the duke of Buccleugh embarked for the continent in March, 1764. After a stay of ten or twelve days at Paris, they took up their residence at Toulouse, which had just witnessed the execution of the unfortunate Calus. They spent eighteen months here in the society of the principal members of the parliament of that city. From Toulouse they proceeded toward Geneva, crossing by a circuitous route through the southern provinces of France; after a sojourn of two months in this city they returned to Paris. This was in December, 1765, and they remained there until October of the following year. — Smith had long been familiar with French literature. He was acquainted with the works of J. J. Rousseau, and from a letter of Hume's we learn that he had read Helvetius' *l'Esprit*, and Voltaire's *Condide*. Furnished with letters of introduction from Hume, the Scotch philosopher met with the most flattering reception from Aembert, Helvetius, Marmontel and Madame Riccoboni. He was admitted to the society of the Duchesse d'Anville, and became especially intimate with a son of the Duc de La Rochefoucauld. This noble and generous mind began later a translation of the "Theory of the Moral Sentiments," which he did not finish, and the grateful philosopher, who had in his first edition associated the name of the author of the *Maximes* with that of Mandeville, took care to drop from the second his criticism on the grandfather of his friend. — The physiocratic school was at this time in all the ardor of the strife against the partisans of the mercantile and restrictive system. It had been for several years in possession of the doctrine which made it what it was; for in 1758 Quesnay had published his *Tableau économique*, printed at Versailles, under the eye of the king. The very year in which Smith left England, Le Trosne, then king's advocate at Orleans, publicly professed the master's principles in a discourse on the decadence of

the magistracy; and during his sojourn in Paris, the *Ephémérides du Citoyen*, for the purpose of opposing the principles of Quesnay, and the *Journal de l'agriculture, du commerce et des finances*, under the direction of Dupont de Nemours, to defend them, were established. At this same time one of the most enlightened economists, Abeille, published a pamphlet on exclusive privileges in matters of commerce, which was very favorably received. Thus Smith was witness, during his stay in Paris, of the contest of economical systems. Unfortunately, no details of this period of his life, so interesting in the history of science, have come down to us. We learn from Dugald Stewart that he took pleasure in conversing with Turgot, and that he corresponded with Quesnay, but nothing further. Dupont de Nemours is more explicit, and represents him as having been his condisciple at Quesnay's. "Dupont de Nemours," says J. B. Say, "told me that he often met Adam Smith in that society, perhaps the most respectable in Europe, and that he was there regarded as a judicious and simple man, but as one who had not yet shown what he was capable of." What is beyond all doubt, is the profound esteem which Smith always preserved for the ingenious and thoughtful founder of the physiocratic school. He intended to dedicate his great work to him, and only the death of Quesnay (1774) prevented the realization of this noble thought. It is certain that Turgot conceived a high opinion of his ability, and Condorcet relates, that, after his retirement from the ministry, he kept up a correspondence with Smith. These two great minds, the beauty of whose characters vied with the loftiness of their intellect, were worthy to understand each other, but there remains no trace of this interchange of letters. The papers left by Turgot have revealed none; those of Adam Smith were destroyed before his death by his own order, and his most intimate friends never had any knowledge of this correspondence. — It is, nevertheless, difficult to suppose, that, during the nine months which he spent in Paris, in society where economical topics were the order of the day, the conversation of so many men in whom he recognized great learning and distinguished ability, and of whom he declared that their doctrine approached the nearest to the truth, should have been without influence on the formation of his principles. But to what extent it is impossible, in the absence of any written document, to determine. Must we infer, as have some, from the solicitous and minute care taken by Smith shortly before his death to have his manuscripts—among which were the lectures delivered at Glasgow on economic subjects—destroyed, that he had an especial interest in leaving nothing from which the succession of his ideas could be conjectured? This is a pure hypothesis, as well as a most improbable one, and does nothing but complicate a problem, the solution of which it is impossible to give. — Back in England in October, 1766, Smith returned to Kirkcaldy, where he lived for ten years near his mother, and in the

society of some of the friends of his childhood. His friend Hume, then librarian of the faculty of advocates at Edinburgh, strove several times, but in vain, to draw him away from his solitude. "I want to know what you have done," Hume wrote to Smith, in 1769, "and I intend to exact a strict account from you of the use you are making of your time in your retreat." Four years later, he added: "I will not accept the excuse of your health, which I regard only as a subterfuge invented by indolence and love of solitude. In truth, if you continue to listen to those two little evil advisers, you will end by breaking completely with society, to the detriment of both the parties interested." — It was from this stubborn meditation of six years that the great work came which was to immortalize his name. The "Inquiry into the Nature and Causes of the Wealth of Nations," which he had begun to write in 1771, and which appeared in March, 1776, disclosed the secret of his long retreat. A month afterward Hume congratulated him in the following glowing terms: "My dear Mr. Smith, your work has afforded me the greatest pleasure; and in reading it, I emerged from a state of painful anxiety. It is a work, the expectation of which kept in such suspense yourself, your friends and the public, that I trembled to see it appear; but at last I am relieved. Not that—reflecting how much attention this reading exacts, and how little disposed the public is to bestow such—I must not still distrust for some time the first breath of popular favor; but there are in it depth, solidity, subtle penetration, and a multitude of curious facts: such merits should, sooner or later, fix the attention of public opinion. If you were here, at my fireside, I should contest some of your principles. But this and a hundred other things can be discussed only in conversation. I hope that it will be soon, for the state of my health is very bad, and will not admit of a very long delay." These sad presentiments were not long in being realized. Four months later, Hume was no more; Smith felt his death keenly, and has left us, in the touching account which he gave of his friend's death, and in the merited eulogy of his character, the trace of his bitter regrets. — Hume simply anticipated the judgment of posterity, which, in its admiration, has associated the name of Smith with those of Grotius and Montesquieu. Smith indeed gave to economic science the character of certitude, which these two great men had impressed upon international law and political science. He placed it upon a basis which the progress of the human mind may perhaps enlarge, but never displace. The great principle which is the starting point of all economic phenomena, he lays down in the beginning of his work: The annual labor of every nation is the fund which originally supplies it with all the necessaries and conveniences of life which it annually consumes, and which consist always either in the immediate produce of that labor or in what is purchased with that produce of other nations. These words contained a revolution in the order of economic ideas.

Breaking with the opinions generally received in his own age, he at the same time separated himself from the partisans of the mercantile system, who made all wealth consist in the precious metals, and from the physiocrats, who regarded the soil as the only source of it. Instead of gold and silver, and the fertility of the land, what does he place at the summit of his science? Man, of whom labor is the manifestation; man with his productive powers, the potency of which is immeasurably increased by the division of employments and the accumulation of capital. The classes of producers who had been regarded by the physiocrats as tributaries of landed property, raised by him to the rank in which their services class them in society, are henceforth respectable and useful by the same title as the others. He invites all, under the rule of the law of labor, to the exploitation of the material world, to the enrichment of individuals and nations, to the fusion of interests, and in subjecting them to the same obligations toward the state, he claims for them liberty in the choice of their work, in the movement of capital and the circulation of products. — In this framework, in the order which he assigns to them in it, and in a series of searching and concise arguments, his ingenious and profound analyses of the division of labor, the price of goods, the power of saving and the action of capital, credit, banks and duties, range themselves. These different elements of economic science, several of which had already been successfully studied by Locke, Hume, Verri and Turgot, had new light thrown on them by Smith, a light which is diffused over all the parts of the subject of which he treats. Everything is treated with the supreme composure of superior reason and immutable good sense, which, carried thus far, amounts to genius. No contemporary passion disturbed the serenity of his judgment. The principles which he teaches are not a weapon in his hand, but only the generalized expression of facts conscientiously observed. One thing alone inspired him with an indignation which he could scarcely restrain; the spirit of monopoly. — No one before Smith had shown with more clearness and foresight the advantages of economic liberty, from the point of view of the conciliation of individual and general interest. But the honor of having extolled the principle of liberty, and of having established it upon its true basis, belongs to the physiocratic school. Smith, in his "Wealth of Nations," faithful in this to the ideas which he had indicated in his course of moral philosophy, considers liberty as necessary to the complete development of the productive forces, and justifies it by economic usefulness and *expediency*. Quesnay and Turgot demand it as a right, and present it to us as the expression of justice. In fact, liberty, from the economic point of view, is a right, because it has its source in more freedom, and ends in personal responsibility and positive duties; it is just, because it alone is able to insure to man the remuneration which is really due to his efforts, and to the goods, as a consequence, the

price which belongs to them. In the eyes of the physiocrats, liberty is not only the most favorable manner of making an equitable division of the fruits of labor and the most powerful stimulant to man's activity, but the manifestation of his conscience, the sign of his right, and the source of his duties. Notwithstanding the deviations into which they have allowed themselves to be drawn by a vicious method rather than by an error of principle, notwithstanding their adventurous incursions into the domain of natural law, it will be the everlasting honor of these worthy heirs to the Cartesian tradition, to have given as a foundation to political economy the grand principles of property, liberty, and individual and collective responsibility, with which all economic questions are necessarily connected. Smith regarded man as a being exclusively productive; and just as in his system of moral philosophy he did not rise to the superior idea of the good, of which sympathy, or *fellow-feeling*, is but the result, so in political economy he did not ascend to the idea of the just, that is to say, to the first data upon which the economic life of man and of society rests. — The fault has been found, and justly, with the "Wealth of Nations," of a lack of proper arrangement of the various parts, which prevents the whole of the doctrine from being clearly discerned from the beginning: questions of the greatest importance are often treated there incidentally and *à propos* of questions which should have been presented only as secondary ones. Thus the author's ideas on the price of things are intercalated in a dissertation on the value of the precious metals during the last four centuries; his notions on money in the chapter on the treaty of commerce; his principles of commercial liberty in the examination of the mercantile system. But if this great work offends by a lack of method, it none the less remains the finest monument raised to political economy. What a treasury of true ideas, of ingenious and profound observations, does it not offer us! It is by drawing inspiration from the thoughts of the master that his successors have accomplished all the progress which has since marked the advance of economic knowledge. It was by declaring themselves as his disciples that Malthus, by his theory of population, J. B. Say, by that of outlets, and M. Dunoyer, by his valuable studies on productive services, enlarged the domain of science; and the commercial policy of England, which will one day be that of all nations, was inaugurated under his auspices, and triumphed by the help of his arguments. — Smith passed the two years which followed the publication of the "Wealth of Nations" in London, in the society of the most distinguished men of England, and in frequent intercourse with Gibbon, Burke and Pulteney. In 1778, having been appointed, through the influence of the duke of Buccleugh, commissioner of customs in Scotland, he returned to Edinburgh. It was in this city that the last twelve years of his life glided away. The leisure allowed him by the business of his office was employed to a great extent in the

revision of his works, the successive editions of which he superintended with great attention. He had, it is said, the intention of publishing a critical examination of *l'Esprit des lois*. This study was undoubtedly connected with a treatise on civil and political law which he had undertaken to write. The death of his mother, whom he lost in 1784, and, four years later, that of a cousin of whom he was very fond, were the cause of a grief from which he never wholly recovered. In 1787 the university of Glasgow conferred the title of rector upon him, an honor which he appreciated very highly. From that time his strength gradually failed. When he felt the first attack of the painful malady which was to carry him to the grave, he ordered all his papers to be destroyed. "I intended to have done more," said he to his friends, "and there are materials in my papers which I might have turned to account; but that is out of the question now." His resolution with regard to this had long been taken, as a letter addressed to Hume in 1773 shows. In the month of July, 1790, after severe suffering, borne with courageous resignation, this great man was taken away from science and the world. — His character was at once affectionate and reserved, frank and lively, and his habits of a simplicity from which he never deviated at any period of his life. His generous and impetuous soul, under an outwardly cold appearance, rose to enthusiasm, when there was question of the great interests of humanity. He spoke little, and when he was forced into his trenchments, his speech was embarrassed, and his expositions assumed, without his knowledge, a dogmatic form which gave them the semblance of a lesson. This manner of expressing himself was a result of the habit contracted in his public courses on the science, and not of pretension, which was far from his mind, for never was there any one whose modesty was more easily alarmed than his. He was profoundly versed in the philosophic knowledge of the human heart and mind; but he lacked penetration in his judgment of individuals. The studious and retired life which he had led had familiarized him but little with the character and passions of men. His memory was prodigious, but very far from being a ready one. If Adam Smith did not share the brilliant qualities which fell to the lot of several of his contemporaries, he at least had, in the highest degree, that penetrating exactness and firmness of opinion which are perhaps more useful to the progress of the human mind, and which at the same time confer glory on their possessor.* M. MONJEAN.

* While he occupied his chair at Glasgow, Smith was in the habit of giving certain lectures on the elements of political economy, as it was understood in his time, *i. e.*, upon those artificial regulations and restraints of civil society which statesmen conceive to be necessary or expedient. Here he was accustomed to draw those inferences in favor of a policy of freedom which he afterward expanded into his celebrated work. Neither he, nor, indeed, any one else, had ever elaborated at this time the laws under which the production of wealth is effectually secured. — The modern science of political economy has been developed from a host of nega-

SMUGGLING. The offense of importing prohibited articles, or of defrauding the revenue by the introduction of articles into consumption, without paying the duties chargeable upon them. It may be committed indifferently either upon the excise or customs revenue. — *Origin and Prevention of*

tive inductions. Statesmen, misled by the selfish misrepresentations of reputed experts, have from time to time controlled and misdirected trade in the fancied interests of trade. They have attempted to be wiser than nature. They have seen that order and government have been necessary to the well-being of society, and that confusion and mischief are the invariable result of un instructed self-interest. But, forgetting that the business of government is to check aggression only, and to secure every man a fair field for the exercise of his own labor, they have unconsciously aided aggression, curtailed liberty, and narrowed the field in which labor could exercise itself. There is of course a border, for the occupation of which the advocates of liberty and control constantly contend. The wisdom of government in the days of Adam Smith, and frequently enough in our own time, is to extend the area of government, and, with it, to assert the just control of an administration over the innocent acts of individuals. Such a line of action on the part of a government may be adopted with the best possible intentions, as Smith shows in the ninth chapter of his fourth book, where he sketches the policy of Colbert. Such a policy found its earliest and most complete refutation in the reasonings which are contained in the "Wealth of Nations." * * It has been objected to Adam Smith and Hume, that they did not foresee the French revolution, intimately as they were acquainted with the state of France. But the objection is shallow. What is called political prophecy is often mere guess work, which no wise man will seriously indulge in. The easiest way in which weak men think they can gain a reputation is by sinister predictions of political events. No one can anticipate the conservative forces of society, no one can gather enough information to make a safe induction as to the resistance which may be made to change, or, indeed, as to the forces which will compel change. But there is such a thing as political prescience. It is not difficult to discover the inevitable consequences induced by certain kinds of political action. This faculty Smith possessed in the highest degree, in a far higher degree than Hume, whose sagacity and acuteness he admired so much. Of this prescience his great work is the most noteworthy illustration. No person has ever pointed out with more exactness the effects of a mistaken commercial policy, the invariable reaction from a course of legislation which does not commend itself to the moral sense of a nation, and the mischievous consequences which ensue when a public law gives its sanction to private selfishness. * * The range of the subjects treated in Smith's work is very wide. Social history and the politics of commerce occupy his attention as much as mere abstract reasonings. His educational theories have been generally accepted. His rules of taxation are classical. His vindication of free trade is complete. His criticism of the great company has been the basis of the latest legislation on the Indian empire. His conception of the mutual relations in which nations stand, is as comprehensive as it is generous. It should not be forgotten that Smith did not propose to himself the discovery of a scheme which should make any one country wealthy or prosperous at the expense of the rest of mankind, but how the wealth of nations should be developed. He rose far above the peddling maxim, that the gain of one people is the loss of another. Hence his work is international, and has formed an effective protest against those shams of a sordid self-interest which masks itself under the name of patriotism. — Among economists, Smith possesses the inductive mind in the highest degree. His work not only displays a wealth of varied reading, but is full of facts. Considering, too, how exact was the statistical data on which he could in his time rely, his sagacity is remarkable. No example of this quality seems to me more striking than his inference that the precarious occupants in the ancient manor must have passed through a métayer tenancy before they reached the independence of the fifteenth-century yeoman, as described by Fortescue. Such was actually the fact, as I have been able to discover from a very large

Smuggling. This crime, which occupies so prominent a place in the criminal legislation of all modern states, is wholly the result of vicious commercial and financial legislation. It is the fruit either of prohibitions of importation, or of oppressively high duties. It does not originate in any depravity inherent in man; but in the folly and ignorance of legislators. A prohibition against importing a commodity does not take away the taste for it; and the imposition of a high duty on any article

investigation of farm accounts during the epoch referred to by Smith. But, in fact, to be scientific, political economy must be constantly inductive. Half, and more than half, of the fallacies into which persons who have handled this subject have fallen, are the direct outcome of purely abstract speculation. In consequence, though he was the progenitor of the science, and necessarily left it incomplete, Smith is far more frequently in the right than his critics are. Almost every blemish in his work (some few inaccuracies of expression excepted, which arise from a somewhat loose use of terms,) is due to his exaggerated sympathy with the economic theories of his French friends and teachers. It is to this influence that we can trace his errors as to the nature and causes of value, and whatever is defective in his exposition of rent. Even here, however, he seems to me to be much more in the right than Ricardo, who accounts for the origin of rent on grounds which have absolutely no warrant in fact. His most adverse critics have, however, united with his warmest admirers in his vindication of private liberty against the interference of government; that is, in his advocacy of what are called free trade principles. To the modern reader, who recognizes the vast services which the merchants and manufacturers of Great Britain have done for such principles as Smith advocated, the language which the author uses about the mercantile classes seems singularly harsh and bitter. "The passionate confidence of interested falsehood"; "the policy of a "great empire" being guided by the policy of "shopkeepers"; "impertinent badges of slavery, imposed by the groundless jealousy of merchants and manufacturers"; "illiberal and oppressive monopolies"; "the mean and malignant expedients of the mercantile system," and similarly pungent comments on the machinations of the trading classes a century ago, are expressions of active animosity against interests which Smith must have thought hostile to the public good. But, at that time, the leading merchants deserved little sympathy from any person who considered this public good as the paramount object of economy and legislation. Their intrigues had prevented the establishment of bonded warehouses. The mercantile classes drove Walpole into the war of the right of search. The real or reputed interests of the same order precipitated and prolonged the seven-years war. The costs of that war, and the sustentation of the East India company, whose conquests had made it bankrupt, led to the uprising of the American colonists, and the war of independence. The merchants who stimulated, and the nabobs and planters who continued, these costly struggles, were no doubt powerful in "Change alley. They were, moreover, ready to make the highest biddings for rotten boroughs. But they were detested by the people, and especially by those freeholders in whom, as Smith thought, the strength and hope of the nation resided. Macaulay has given, in a few words, a statement of how public opinion estimated these people, in his "Life of Lord Clive," the greatest of the race. — The most energetic attack, however, which Smith made on any institution of his time, was that on the East India company. To us the company is a thing of the past. In Smith's day it was the most brilliant phenomenon that the world had ever witnessed. A very few years had created the Indian empire; had changed a few timid and servile traders into a force of heroes, by whom successes had been achieved more amazing than those of Cortez and Pizarro. In the face of this extraordinary prestige, which affected the whole western world, the author of the "Wealth of Nations" dissected the pretensions of the great company, showed that it failed as a trader, and failed as a ruler; and proved that its government was mischievous to its subjects, and its monopoly a wrong upon the English people. — THOROLD ROGERS.

occasions a universal desire to escape or evade its payment. Hence the rise and occupation of the smuggler. The risk of being detected in the clandestine introduction of commodities under any system of fiscal regulations may be always valued at a certain average rate; and whenever the duties exceed this rate, smuggling immediately takes place. Now, there are plainly but two ways of checking this practice: either the temptation to smuggle must be diminished by lowering the duties, or the difficulties in the way of smuggling must be increased. The first is obviously the more natural and efficient method of effecting the object in view; but the second has been most generally resorted to even in cases where the duties were quite excessive. Governments have almost uniformly consulted the persons employed in the collection of the revenue with respect to the best mode of rendering taxes effectual; though it is clear that the interests, prejudices and peculiar habits of such persons utterly disqualify them from forming a sound opinion on such a subject. They can not recommend a reduction of duties as a means of repressing smuggling and increasing revenue, without acknowledging their own incapacity to detect and defeat illicit practices; and the result has been, that, instead of ascribing the prevalence of smuggling to its true causes, the officers of customs and excise have almost universally ascribed it to some defect in the laws, or in the mode of administering them, and have proposed repressing it by new regulations, and by increasing the number and severity of the penalties affecting the smuggler. As might have been expected, these attempts have, in the great majority of cases, proved signally unsuccessful. And it has been invariably found, that no vigilance on the part of the revenue officers, and no severity of punishment, can prevent the smuggling of such commodities as are either prohibited or loaded with oppressive duties. The smuggler is generally a popular character; and whatever the law may declare on the subject, it is ludicrous to expect that the bulk of society should ever be brought to think that those who furnish them with cheap brandy, geneva, tobacco, etc., are guilty of any very heinous offense. "To pretend," says Adam Smith, "to have any scruple about buying smuggled goods, though a manifest encouragement to the violation of the revenue laws, and to the perjury which almost always attends it, would, in most countries, be regarded as one of those pedantic pieces of hypocrisy, which, instead of gaining credit with anybody, serve only to expose the person who affects to practice them to the suspicion of being a greater knave than most of his neighbors. By this indulgence of the public the smuggler is often encouraged to continue a trade which he is thus taught to consider as, in some measure, innocent; and when the severity of the revenue laws is ready to fall upon him, he is frequently disposed to defend with violence what he has been accustomed to regard as his just property; and, from being at first rather imprudent than

criminal, he at last too often becomes one of the most determined violaters of the laws of society." ("Wealth of Nations," p. 406.) To create by means of high duties an overwhelming temptation to indulge in crime, and then to punish men for indulging in it, is a proceeding completely subversive of every principle of justice. It revolts the natural feelings of the people; and teaches them to feel an interest in the worst characters—for such smugglers generally are—to espouse their cause, and avenge their wrongs. — A punishment which is not proportioned to the offense, and which does not carry the sanction of public opinion along with it, can never be productive of any good effect. The true way to put down smuggling is to render it unprofitable; to diminish the temptation to engage in it; and this is not to be done by surrounding the coasts with cordons of troops, by the multiplication of oaths and penalties, and making the country the theatre of ferocious and bloody contests in the field, and of perjury and chicanery in the courts of law; but by repealing prohibitions, and reducing duties, so that their collection may be enforced with a moderate degree of vigilance; and that the forfeiture of the article may be a sufficient penalty upon the smuggler. It is in this way, and in this way only, that we must seek for an effectual check to illicit trafficking. Whenever the profits of the fair trader become nearly equal to those of the smuggler, the latter is forced to abandon his hazardous profession. But so long as prohibitions or oppressively high duties are kept up, or, which is in fact the same thing, so long as *high bounties* are held out to encourage the adventurous, the needy and the profligate to enter on this career, we may be assured that armies of excise and customs officers, backed by the utmost severity of the revenue laws, will be insufficient to hinder them. — It would be useless to enter in this place into any lengthened details to prove the truth of these statements. Unluckily, the entire financial and commercial history of all countries abounds with instances in point, many of which must be familiar to every reader. The prohibition of foreign products, or the imposition of heavy duties on foreign or native products, does not take away the taste for them. On the contrary, it would seem as if the desire to obtain prohibited or over-taxed articles acquired new strength from the obstacles opposed to its gratification.

Per damna, per cædes, ab ipso
Ducit opes antimumque ferro.

The prohibition of foreign silks which existed in England previously to 1826 did not hinder their importation in immense quantities. The vigilance and integrity of the custom house officers were no match for the ingenuity, daring and *douceurs* of the smugglers. And at the very moment when the most strenuous efforts were made to effect their exclusion, the silks of France and Hindostan were openly displayed in Almack's, in the drawing rooms of St. James', and in the

house of commons, in mockery of the impotent legislation by which it was attempted to shut them out. There is, in truth, great room for doubting whether the substitution of an ad valorem duty for the whole system of prohibition was at first productive of any material increase in the imports of foreign silks. The repeal of the prohibition was a most judicious measure; but the duty being unfortunately fixed at too high a limit, it gave an overwhelming stimulus to smuggling. Before the abolition of the duty on silks, the expense of their clandestine importation from France was roughly estimated at about 15 per cent. ad valorem; and as the duty on silks, down to 1845, was double that amount, or 30 per cent., we need not wonder that it was estimated, by well-informed parties, that from a third to a half of the total quantity of imported silks escaped the duty. Indeed, every one is aware that their clandestine importation was carried on, to a great extent, within the port of London, and in the custom house itself, by the corruption and connivance of the officers. And this, we may be assured, was not a solitary instance. The corruption of the officers, is, in truth, an inevitable consequence of the over-tax system. — The enormous duties that were imposed in England previously to 1823 on home-made Scotch and Irish spirits, produced an extent of smuggling and demoralization of which it is not easy for those who have not attended to such matters to form an idea. At present, however, the duties in that country on tobacco, brandy and hollands, but especially the first, are the great incentives to smuggling. The preventive water-guard is kept at a great expense for little other purpose than to hinder the clandestine importation of these articles. But notwithstanding its efforts, considerable quantities of them find their way into the country without being subjected to any duty. And how should it be otherwise? The price of tobacco in the contiguous continental ports may, on an average, be taken at from 8d. to 10d. per lb.; and as the duty on tobacco is from 3s. 6d. to 5s. per lb., need we be surprised to learn, that, allowing for the expenses of smuggling, if one cargo out of three be safely landed, the business is as profitable as it is adventurous and exciting? “But it is not so much by the introduction of tobacco from abroad as by its admixture or adulteration with other articles, that the contraband dealers endeavor to defeat the duty.” It may, however, be right to state that it must not be imagined that the mere diminution of an oppressive duty on any article will put down the smuggling to which the duty may have given rise. The diminution may not be sufficiently great; and if so, it will have but little influence. — These considerations show the degree of weight which should be attached to the statements of those who endeavor to excuse or apologize for exorbitant duties by showing that they have sometimes been reduced without any material increase taking place in the consumption of the articles on which they are laid, or any material diminution of smug-

gling. In exemplification of this it has been stated that though the duty on tobacco was reduced in England in 1825 from 4s. to 3s. per lb., the consumption was not increased in anything like the same proportion; and that, notwithstanding the rapid growth of population, a period of ten years elapsed before the tobacco revenue rose to its former level. But no one acquainted with the facts could have anticipated any other result. Taking the cost of tobacco on an average at 6d. per lb. (which is beyond the mark), the duty previously to and since the reduction has been respectively 800 and 600 per cent. ad valorem. And it is needless to say that the least of these duties holds out an overwhelming temptation to smuggling and fraud. The truth is, that the reduction of duty in 1825 was an ill-advised measure; and there is perhaps no great reason to conclude that the further reduction of the present duty of 9s. per lb. to 2s. would be much wiser, or that, while it sacrificed revenue, it would be at all sufficient to suppress illicit practices. It is idle, therefore, by referring to instances of this sort, to endeavor to make it be believed that an adequate diminution of taxation is not followed by a corresponding increase of consumption. Had the duty on coffee, instead of being reduced in England in 1808 from 1s. 8d. per lb. to 7d., been reduced to only 1s. 3d. (the proportion in which the tobacco duty was reduced), the effect would have been all but imperceptible; and instead of the consumption being immediately increased from about 1,000,000 lbs. to 9,000,000 lbs., the presumption is, it would not have been increased to 1,500,000 lbs. In taxation, as in everything else, unless the means be adequate to the desired ends the result will be nothing. If you offer a premium of eight to one on smuggling, do you imagine you will abate the nuisance you have called into existence by reducing the premium to six to one or four to one? It will be found in every case in which a reduction of duty is not followed by a more than corresponding increase of consumption, that the article continues to be overtaxed, or that the duty left upon it either exceeds the cost of smuggling or places it beyond the reach of those who might otherwise become its consumers. We are bold to say that no instance can be found in the financial history of any country of an adequate reduction of the duty on an over-taxed article not being followed by a cessation of smuggling and a great increase of consumption. J. R. McCULLOCH.

SOCIALISM AND SOCIALISTS. It is with these words as with all others which express, at a given date, a definite situation, but which, in the long run, either because facts or the state of men's minds has changed, are transformed, and no longer convey their original meaning.* Hence, to

* “The assailants of the principle of individual property,” says John Stuart Mill (“Principles,” book ii., § 2), “may be divided into two classes: those whose scheme implies absolute equality in the distribution of the physical means of life and enjoyment, and those who admit inequality, but grounded

fix their meaning, at their true date, is essential. An analysis of such meaning may be reduced to this: In every human society, whether it advances or retrogrades, modifications more or less profound are always going on, modifications which are more or less perceptible, and which, with or without the knowledge of such society, act upon its economy. Apparently such a society remains the same; but in reality it is daily affected by changes of which it becomes entirely conscious only after time has fixed them in the habits and customs of the people, and marked them by its sanction. This is the course of civilizations which are being perfected or which are declining. The honor of a generation is to add something to the inheritance it has received, and to transmit it improved to the generation which comes after it. To employ what has been acquired as an instrument of new acquisition, to advance from the verified to the unknown: such is the idea of progress as it presents itself to well-ordered minds. But such is not the idea of the socialists. In their eyes the situation given is a false one, and the process too simple. Reforms in detail do not seem to them worthy of attention. They have plans of their own, the first condition of which is to make a *tabula rasa* of everything that exists, to cast aside existing laws, manners, customs, and all the guarantees of person and property. It seems to them that we have lived thus far under the empire of a misconception which it is urgent should cease; our globe, according to them, is an anticipated hell, and our civilization a coarse outline only. What is the remedy? There is only one—to try the treatment of which the socialists hold the secret. That treatment varies according to the sect. There are socialists with mild remedies, and socialists with violent remedies; the only difficulty is in the choice. But with all their differences, there is one point on which they agree—the formal condemnation of human societies as they are at present constituted, and the necessity of erecting on their ruins an order of things more conformable to the instincts of man and to his destiny here below. In exchange for our real world, the socialists offer us worlds of the fancy.

on some principle or supposed principle of justice or general expediency, and not like so many of the existing social inequalities, dependent on accident alone. At the head of the first class, as the earliest of those belonging to the present generation, must be placed Mr. Owen and his followers. M. Louis Blanc and M. Cabet have more recently become conspicuous as apostles of similar doctrines (though the former advocates equality of distribution only as a transition to a still higher standard of justice, that all should work according to their capacity, and receive according to their wants).—The characteristic name for this economical system is 'communism,' a word of continental origin, only of late introduced into this country. The word 'socialism,' which originated among the English economists, and was assumed by them as a name to designate their own doctrine, is now, on the continent, employed in a larger sense: not necessarily implying communism, or the entire abolition of private property, but applicable to any system which requires that the land and the instruments of production should be the property, not of individuals, but of communities, or associations, or of the government.—It is in this latter sense, evidently, that M. Reybaud uses the word "socialism" in this article.—Ed.

This is their distinguishing trait, and one which makes of them a family apart. — In this pursuit they have had so many precursors that to enumerate them would be to write the history of the adventures of the human mind. At one time, we have philosophers engaging in that chase in solitary speculations; and at another, sects, trying in abortive essays to realize their dreams; now, a whole population stakes in that chase its existence and repose; here, we find the idea of mysticism prevailing, and curbing instinct to the profit of a system; there, instinct gets the upper hand and breaks therein which all regular government puts on it: everywhere we witness an effort to destroy the old mould, and to obtain a new one. Revolts and factions beget one another while copying one another. First we find Plato with the most captious of models. He invented an imaginary community, which Sir Thomas More reproduced in his *Utopia*. In both cases, goods were to be in common, and the fruits of labor distributed by means of arbitrary combinations. Campanella went farther. With Plato he admits promiscuity; but, bolder than Plato, he regulates its exercise. Morelli, not content with recommending a community, would force it on men. He establishes for labor a species of obligatory conscription, and condemns to perpetual imprisonment the partisans of property, under pretext of their dangerous dementia. Babœuf treats them as conspirators, and spares them as little as Morelli. For the sake of good example, he expels them from among men when he does not deliver them to the executioner. Willingly or by force, he would have all distinctions of class and all appropriation of goods disappear. He would tolerate only one costume, one table, one ordinary. The great centres of population trouble him, and, with a stroke of his pen, he suppresses them. Luxury has its birth in cities, and of luxury he will have nothing. Homes should be as uniform as possible, in order not to excite jealousy by comparison. There should be like care for the education of all citizens. The state takes possession of them, and abandons them only at death. It makes laborers and workmen out of them. Useful services, and not acts which serve for pleasure, are demanded of them. What is not communicable to all, he says, in his imperative language, must be severely retrenched. The science of government, he says, is to suppress whatever may act as an obstacle, and the best régime is that which is so contrived as to meet with no opposers. It is not difficult to see what advance the idea of the community had now made. With Plato it was only an idyl; with Babœuf it is a yoke of iron; from an ingenuous dream and one far from being ironical, we pass to the dreariest and most degrading servitude; Plato confines himself to advice, Babœuf would act with living force; Plato admits categories, Babœuf endures none of any kind; he takes the lowest level, and wishes to reduce everything to it. This contrast is intelligible: Plato remains in the imaginary, Babœuf enters the real; with a view to the end,

he thinks of the means, and fearing defeat, determines on the most energetic means. — Examples of a common régime were no more wanting in antiquity than the speculations in which such a common régime was offered in perspective. The conventual organization, with its exploitation of mortmain and vows of renunciation, was nothing else. But those who submitted to it were out of the world, not in the world; they lived for heaven rather than for the earth. As much may be said of the Essenes, whose life was almost that of monks. The Moravians preserve more affinity with regular society; their community is neither as narrow nor as exclusive as that of the Jewish sect; they admit of marriage and of the intermingling of the sexes, while the Essenes preserved the strictest celibacy; they recognize private property side by side with collective labor, while the Essenes had nothing of their own. In the Paraguay missions, likewise, the community partook of a mixed character; each Indian had his field and his flock; only a separate domain, the Possession of God, was reserved for cultivation in common, and its produce was intended to meet the expenses for the support of the infirm, for the purposes of worship, and the payment of the tribute sent each year to the king of Spain. Moreover, in these various modes of grouping, there was neither revolt nor formal protest. They were combinations suggested at one time by a particular creed, at another by expediency of a local character. In the case of the Indians of Paraguay, their community was a beginning of civilization; in that of the Moravians and Essenes, as well as in that of the monks and anchorites, it was a means of sanctification. Under these conditions all government is easy; its point of departure is the spirit of discipline and the suppression of the instincts. From these partial communities to a general community the distance is a great one—the distance between the exception and the rule, between a special state of men's minds and the dispositions which animate the other members of the human family. Such cases must be noted, but there is no conclusion to be drawn from them. — The community of goods has had less offensive apostles, like the Jacques in France and the Lollards in England. The former did not confine their pretensions within the walls of a monastery or the limits of a nation's territory. They had pretensions to empire, and they disguised projects of partition and spoliation under the mask of political rights. Neither did the Anabaptists admit that they entertained similar pretensions. Their religious schism was only a pretext to lead the populace to an assault on property. What a sad memory the Anabaptists have left! They filled with their crimes and their names two full centuries of the history of Germany. Münzer was their first corypheus; he invited the poor to the partition of the spoils of the rich; Mathias, in turn, ordered the sacking of the houses of the bourgeoisie; John of Leyden proclaimed polygamy a law of the state, and was the first to conform to that law by marry-

ing seventeen women. The execution of such bandits did not suffice to extirpate their sect, and after they had disappeared, the ruins with which the land was strewn showed what is engendered, in popular interpretation, by the utopia of the community, and what vestiges it leaves after it. Socialism has no more formidable formula; and, in the end, it is the only one which is susceptible of application. All other formulæ escape the intelligence of the crowd because of their subtlety; this one is as clear as it is powerful. To take from those who have, in order to give to those who have not, is a concise and intelligible proposition, to reduce all positions and fortunes to a level, is one not less so. Both find in the heart of man a bad passion, which answers to them. When they are heard, passion leaves the vague to enter the world of realities; it knows what it wants, and whither it goes. There is no longer a mere anathema falling in a vacuum, but a campaign to be undertaken against society, with the booty in prospect — We have now cast a rapid glance at the men and the sects which, in the past, may be considered as the equivalents of socialism and socialists. With those who in our day are so named, the spirit is the same; only their procedure is different.* The

* Among the forms of socialism, German writers on political economy mention what they call *staatssozialismus*, or state socialism, understanding by the term "that system which would have economic relations regulated as far as possible by the state, and which would substitute state help for self-help." Prince Bismarck has shown a decided leaning to this form of socialism. The French have the expression *socialisme d'état*, which is the exact equivalent of *staatssozialismus*, or state socialism. That such a form of socialism has been finding favor with large classes of the people in recent times can not be doubted. Hence it has been not inappropriately styled by Professor Fawcett, "modern socialism;" and much of what he says on its growth and probable consequences in certain countries of Europe is true as to its growth and consequences in the United States, but of course not to the same extent as in Europe. He writes: "It is each day becoming more evident that in every European country an increasing number of the laboring population are giving an enthusiastic adherence to certain social and economic principles, which, if carried into effect, will introduce even more fundamental changes than those brought about by the first French revolution. Never, perhaps, was there a time when it was more important to dispassionately consider the ideas, the wants and the aspirations of the workmen who are engaged in this movement, which may be described under the general title of modern socialism. Without such dispassionate consideration, there is certain to arise, instead of a kindly and intelligent sympathy, the rancorous enmity of bitter class prejudice. Those who are prepared to show this sympathy may have some chance of directing to purposes of inestimable good this new movement, which, if met with blind and unreasoning opposition, will at last gradually gather so much strength as to pass beyond control; Europe may then find herself involved in a terrible war of classes. It has been repeatedly shown that the friends of revolutionary changes derive their motive power from the bigoted opponents of progress, and from the stubborn upholders of unwise laws and unjust privileges. It might as well be supposed that the railway engine would move if it were deprived of steam, that wheat could grow without soil, or that man could live without food, as to imagine that a revolutionary propagandism could be maintained if it were not kept alive by the recollection of some wrong inflicted, and by the continuance of some grievance unredressed. It is perfectly vain to expect that there will not be threatenings of coming convulsions so long as the social and economic condition of great masses of the people remains what it is at the present

feeling of bitterness against established civilizations is at least as great, and if there be not as much violence in act, it is because moral force has resisted in time. We must add, that, in the case of almost all, the visions of the brain have been tempered by upright intentions. This is true of

time. England is constantly being glorified as the wealthiest of all nations. From every platform in the kingdom orators delight to parade the well-known statistics about our vast and growing commerce. Each quarterly return from the board of trade shows an augmentation of exports and imports. In spite, however, of all these evidences of accumulating wealth, the majority of our people have a severe struggle for existence, and no inconsiderable minority live in abject misery and in degrading poverty. The more wealthy the nation is admitted to be, the more perilous does it become, and the more ominous of future trouble, that one out of twenty of the nation should be a pauper; that to a great proportion of our laboring classes a life of incessant toil yields no other result than an old age of dependent mendicancy; that millions are so entirely uneducated as to be cut off from every intellectual enjoyment; that in many rural districts houses are established far more comfortably than laborers are housed; and that in our largest and wealthiest cities the poor are so crowded and huddled together, that in a countless number of instances all the members of a family herd together in a single room. Can any one who reflects on such facts be surprised that a wide-spread spirit of unrest and dissatisfaction is abroad? Ought it not to be regarded as almost incredible that a social structure resting on such a basis should have stood so long? But it may be said that if things are not as rapidly improving as can be desired, they are certainly not getting worse. Why then, it is urged, should there be this new outburst of discontent? No new laws vexatious to the industrial classes have been imposed; many, on the contrary, have been repealed; taxation is not more burdensome, and duties on many of the necessities of life which added greatly to their cost have been remitted. May it not, therefore, be fairly concluded that things will gradually improve; that the present dissatisfaction is unreasonable, and that the demands of those who are so discontented with society as it is now constituted should be simply met by undeviating resistance? As there is only too much reason to fear that many will assume this attitude of resistance, it is important to give the most emphatic warning as to the consequences which the adoption of such a policy may involve. As it is so frequently supposed that the movement in favor of organic social and economic changes has no solid foundation in reason or in justice, and that it is rather a temporary aberration of certain unsettled and mischievous people who love revolution for revolution's sake, it becomes important, in the first instance, to attempt to discover whether this is a true interpretation of the sentiments now widely prevalent among the industrial classes. — As previously remarked, it no doubt, at first sight, appears somewhat difficult to account for the fact that this desire for change should have grown up with the repeal of many unjust laws, with the remission of many burdensome taxes, with a great stimulus in the productive industry of the country, and with the more wide-spread desire among those who are in comfortable circumstances to be good, kind and charitable to the poor. But does not the fact that all these circumstances have been in operation without producing any more marked effect upon the general well-being of the people, suggest an explanation of the phenomenon which we are seeking to elucidate? Scarcely any other result can be expected than that there should arise a feeling of angry disappointment, unreasoning distrust and unjust suspicion when favorable agencies like those just mentioned are contrasted with such facts as those previously enumerated, which are only too truly typical of the social and economic condition of the country. For a long time the people were led to believe that the elevation of their class would be secured by bringing into operation various favorable material agencies. At one period it was supposed that the application of steam to manufactures, and the improvement of locomotion by the introduction of railways, would so stimulate production as to bring to the laborer an age of golden plenty. At another time it was confidently stated that by

Robert Owen, who was the first to open the way. In Owen, there were two men, the man of fact and the man of an idea; the one superior, the other mediocre. A manufacturer in New York, he had the opportunity to found, aided by a benevolence without limit and by the sole power of

the abolition of protection the markets of the world would be thrown open to us, and the supplies of cheap food thus procured would yield an increased store of comfort to every humble home. In one respect these predictions have been fulfilled, in another respect they have been cruelly falsified. Production has been stimulated beyond the expectations of the most sanguine, and supplies of food have been obtained from even the most distant countries in much greater quantities than could have been anticipated. Still, however, so far as the laborer is concerned, the age of golden plenty seems as remote as ever, and in the humble homes of the poor a not less constant war has to be waged against penury and want. From the bitter disappointment thus engendered, there has not unnaturally arisen a feeling of deep distrust of the fundamental principles on which society is based. A wide-spread opinion has grown up that it is no use relying upon the old remedies and the old nostrums. Resort must be had to far more radical changes; the very foundations on which our social system rests must be altered. This feeling of unrest, this desire to do away with the existing order of things, is sure to arise when the mass of the people become dissatisfied with their condition. On many previous occasions they had more reason than now to attribute their misfortunes to political causes. Unjust and vexatious taxation, combined with a reckless expenditure of a profligate and corrupt court, at length accumulated such misery upon the French people that an irresistible movement arose to sweep away every established institution. The first French revolution ought not consequently to be regarded as an uprising to substitute a republican for a monarchical form of government. The people, driven to a frenzy of despair by physical suffering, were not in a frame of mind calmly to reason upon well-devised schemes of relief. They wished to see everything changed, and they consequently waged an unremitting war with the existing state of things. Again, the revolutionary movement in 1848, although it caused the fall of so many dynasties, was not so much a political as a social and economic movement. The dissatisfaction which prevailed at this period was not mainly due either to unjust laws or vexatious taxation. It was the manifestation of an intense desire fundamentally to change the principles from which the vast industrial system of the present time has been developed. *Competition and the separation of capital from labor may be regarded as the most prominent characteristics of modern industry.* It might, therefore, have been almost foreseen that these characteristics would be singled out for special reprobation, when the general condition of the industrial classes became unsatisfactory, and the great mass of the people in every country felt that they had to bear an undue amount of suffering, the hardest toil yielding to them a most inadequate share of comfort and enjoyment. There consequently arose a determination to substitute for the industrial system then existing one from which not only competition would be absent, but one in which capital and labor would be united, instead of being separated by the rivalry of hostile interests. The industrial ideas which were thus sought to be carried into practical effect may be described under the general name of socialism or communism. The very mention of these words will no doubt to many minds suggest much that is ominous of danger, and much which is opposed to the well-being of society. Prejudice, however unfounded, often spreads so fast that it becomes most formidable to combat. To many, socialism and communism are supposed to be synonymous with confiscation and spoliation. A socialist exists vaguely in the minds of the comfortable classes as a sort of abandoned creature who wishes to live by robbing other people of their property, and who desires to see general pillage introduced. *In the present state of mankind, socialism would do nothing to increase the well-being of the people, and the socialistic schemes which have been propounded would inevitably end in disastrous failure. But, although this may be fully proved, yet nothing can be*

example, one of the most flourishing industrial colonies that have ever been known. The basis of his system was the thought, borrowed from J. J. Rousseau and Bentham, that the practice of virtue has enough in it to fully indemnify those who devote themselves to it. So far the idea is a

more unjust than to throw aspersions upon the character of socialists, and to misinterpret their motives. They no doubt have been mistaken enthusiasts, but it is impossible to deny that their motives have been pure and their aims lofty. They have been animated by a desire which must have been felt by all who are not depraved by selfishness, to lighten poverty, to alleviate human suffering, and to diffuse more general happiness among mankind. The injustice which is so generally done to socialists will be perhaps more clearly perceived when attention is directed to the origin of the socialistic sentiment. — It has been often remarked that the more a country advances in wealth, the wider and deeper seems to be the gulf between the rich and the poor. Not only is this shown by the fact that the augmentation in the number of the very wealthy is not accompanied either by a corresponding decrease in the number of the very poor, or by a proportionate diminution of their sufferings; but the separation between classes seems to become intensified in other ways. The time was when those who were engaged in any industry, master, foreman and workmen, dwelt near to each other, and between them there were often intimate personal relations, which have now completely passed away. Although the introduction of steam and the application of various mechanical inventions have completely revolutionized the conditions on which industry is carried on, yet there has probably been a not less marked change in the social and industrial life of the country. The supplanting of hand-loom weaving and pillow-lace making by vast manufactories filled with complicated and costly machinery, does not represent a greater change than that which is indicated by a comparison between the present mode of life of men of business and that which was adopted by them formerly. The merchant and the manufacturer used to reside close to where the daily work of their lives was carried on. Now, however, each year a greater distance separates the homes of the master and his workmen. Many who have accumulated princely fortunes seldom go within miles of the homes of any of their workmen. All these considerations show that the relations between employers and employed have gradually lost their personal character, and have become more and more commercial. This being the case, there can, of course, be little friendship or comradeship; there is too little of that personal sympathy which often arises among those who are fellow-workers at a common object; but, on the contrary, labor being bought and sold in the same way as any commodity of commerce, the only feelings between employers and employed are too often those which exist between the buyers and sellers of merchandise. It must not, however, be supposed that the present has thus been contrasted with the past with the object of implying that there has been no improvement, nor must it be imagined that it would be desirable to restore a state of things which would in many respects be incompatible and incongruous with the requirements of modern times. But being perfectly ready to admit that there has been progress, yet this should not cause us to lose sight of those drawbacks associated with commercial development, which make the present in some of its aspects compare unfavorably with the past. It is, of course, far more prudent carefully to consider these drawbacks with the view of reaching the causes which produce them; for if this can not be done, if commercial progress is always to be presented to the mass of the people in no other aspect than that in which they now see it, there will certainly arise not only dissatisfaction, but a desire to effect organic changes in the constitution of society. Some idea may be formed of the extent to which discontent must be engendered, when every workman must be constantly reminded of the fact, that, while numbers are unable to obtain a sufficiency of the necessaries of life, others have so much superfluous wealth that they are able to squander it in useless and mischievous luxuries, and never devote themselves to one hour's useful employment. The more the distance widens between the rich and the poor, the more

correct one, and no kind of success was wanting to the man who put the principle in practice; the error consisted in presuming, that, applied to humanity as a whole, it would succeed, as it had succeeded in a manufacturing centre. The great human family can not be governed as a small flock

the belief is certain to gain ground that there is something radically wrong in the laws which regulate the distribution of wealth. It can not be wise and just, it is plausibly said, that the produce which the earth yields should be so apportioned among its inhabitants that, whereas many have far more than they need, others have to endure the bitter pangs of want. It is urged that if there was more equality in this distribution, there would be enough for all; if superfluities were taken away from the rich, and given to the poor, all would then enjoy adequate comfort. Those who are influenced by such ideas as these are at once, by natural sequence, led to the conclusion that the circumstances which produce inequalities in wealth are chiefly responsible for all the social and economic evils under which a nation suffers. It is consequently proposed that society should be regulated on principles which would, as far as possible, prevent inequalities in wealth. A feeling thus arises in favor of either abolishing, or greatly curtailing the rights of private property. Various schemes have, from time to time, been propounded with the object of giving effect to these ideas. Those who would not shrink from applying what they conceive to be a complete remedy, propose that society should be reconstituted on an entirely communistic model; associations being established in which there should be no private property, the wealth produced being the joint property of the community. Others suggest less thorough remedies, and propose, that, after a due maintenance has been guaranteed to all the members, any surplus which may remain might be appropriated as private property. St. Simon and Fourier in France, and Robert Owen in England, have identified their names with these communistic experiments. It is scarcely necessary to remark that all such attempts have hitherto failed to obtain any practical success. In fact, it is not too much to say that in the present state of mankind failure is inevitable. Men are not yet sufficiently advanced to work with as much zeal for the good of others as for their own advantage. Those who are industrious will not long remain content if they see that a considerable portion of the fruits of their labor is devoted to the support of those who are as well able to work as themselves, but who are so indolent and improvident that they rely upon others for their maintenance. It must, however, be remembered that such men as St. Simon, Fourier and Owen never proposed the confiscation of other people's property. They always contemplated that their communistic societies should legitimately acquire the land and other property upon which they first commenced operations. Robert Owen, in fact, purchased an estate in Hampshire for a considerable sum of money, upon which he attempted to give practical effect to his socialistic ideas. Although these schemes have completely failed, yet failure has done little to weaken the sentiment which gave them birth. The ideas from which they have originated have not been and probably will not be ever extinguished. Each fruitless endeavor to carry them out not only stimulates a fresh development, but also causes them to assume another form. Unlike the socialists of former days, those who are at the present time under the influence of the socialistic sentiment are beginning to place their chief reliance upon state intervention. They seem to think that if individual efforts have been unable to achieve success, this provides the most cogent argument in favor of an appeal to the state. This is the reason which induces me to ascribe such grave importance to modern socialism. There was no cause to feel alarm or misgiving as long as socialism simply caused certain experiments to be tried by enthusiasts, against whom no other charge could be brought than that they showed too much zeal in their efforts to improve society. Even their failure did something to benefit mankind. It can scarcely be doubted that in these first socialistic schemes were sown the germs of a social and economic movement which has already effected great good, and which promises more for the future than any other agency

is governed. It was not long before Robert Owen perceived this. He himself, by exaggerating it, had changed the nature of his method for the worse. From a paternal administration he was imperceptibly led to the abandonment of all social restraint. He not only ended in the community,

yet brought into operation. It is well known that some of those who were the most strongly imbued with the teaching and doctrines of Robert Owen were the founders, and afterward the managers of our most prosperous co-operative institutions. Co-operation is as yet only in its infancy; it has hitherto been generally applied to the distribution of wealth, but rarely to its production. Enough, however, has been seen of its effects to justify a confident belief that its general adaptation to industrial undertakings would probably mark the greatest advance ever yet made in human improvement. Labor and capital, instead of being hostile interests, will be united, and by this union an incalculable stimulus will be given to production. * * *—Until quite recently there was one most marked and important difference between the continental and the English workman. The former placed his chief reliance on the state, whereas it was the aim of the latter to free himself as much as possible from government control. One of the first uses which the French workmen made of their success in the revolution of 1848, was to compel the government to establish national workshops, and to advance loans to co-operative associations. One of the first things which the English workmen did, when they obtained political power by the reform bill of 1867, was to call upon parliament to repeal all the laws which interfered with the formation of voluntary trade combinations. The continental workman was constantly looking to the state as he would to a powerful friend or benefactor to aid and reward him. The attitude of the English workman has, until recently, been one rather of hostility toward the state. His habit has been to claim freedom from government control, so that he might have a free and open field for the exercise of his energies. This difference, however, between English and continental laborers is becoming less marked. It can scarcely have escaped notice that during the last two or three years English workmen have with much greater frequency asked for government assistance; and the demands for state intervention are constantly enlarging. There are many circumstances which have contributed to bring about this change. In the first place, it is probable, as previously indicated, that the growing tendency shown by so many of our artisans to rely upon the state may be traced to the false hopes excited, some years since, by those who taught the people to believe that the great end to be striven after was a larger production of wealth. This augmented production of wealth has taken place, and when it is found to be unaccompanied by the predicted improvement in the condition of the poor, there is naturally aroused keen disappointment, and there is diffused through the industrial classes a general feeling of distrust. They get into just that frame of mind which causes them to give a ready acceptance to any doctrines differing from those by which they suppose they have been deceived. The opinions in favor of state intervention so current among continental workmen now consequently find a more ready acceptance in this country; these opinions are, in fact, transplanted to our shores under such favorable circumstances that, for a time at least, they seem to have taken root among us. * * *—Fully, however, admitting that among those who hold these opinions are still to be found some of our ablest artisans, yet it can scarcely be denied by any who observe the signs of the times that, so far as England is concerned, the demands for state assistance are each year assuming more formidable proportions. This will be sufficiently shown by enumerating some of the many things which the state is, with increasing urgency, asked to supply for the people. It is now, for instance, often said that the government should pay the passage-money of emigrants; should furnish work at good wages for the unemployed; and should secure for laborers comfortable houses and wholesome food at a reasonable rate. Such proposals as these represent the opinions of those who may by comparison be regarded as moderate in their demands. * * *—In one respect this growing tendency to rely upon the state is fraught with greater

but he took from the community the only guarantee it possessed, the responsibility of the individual. If we believe him, man, having come accidentally into this world, and being the plaything of accidental circumstances through life, could not, without injustice, be declared responsible for his acts. Fatality alone determined good and evil; with the individual, there could be neither merit nor demerit. Why, then, punishment or reward? It was better to let man and society follow their bent, removing all the circumstances which might lead to evil, and increasing those which might lead to good. So much for this world; and, as to the other, why trouble one's self about it? It escapes our means of knowledge; it is an enigma which no one has been able to solve. Such was Owen's conclusion. Never was negation more absolute stated with greater candor. During fifty years he presented it to rebellious human societies as their only means of salvation; in colonies, in plans, in publications, in voluntary subscriptions, he spent a vast amount of money, without his personal sacrifices being able to make his desolating maxims advance a serious step. They wounded men's souls at too many points to be able to make any great ravages. The inventor of them lived long enough to assist at the obsequies of his doctrine. — The doctrines of Saint-Simon permitted more consideration to be

danger to England than to many other countries. This is not an appropriate place to discuss the advantages and disadvantages of government by party. There is, however, one aspect in which party government may be viewed, as having a very direct bearing upon the subject we are now considering. The two great political sections who contend for place and power have a constant temptation held out to them to bid against each other for popular support. [May not the same be said of political parties in the United States?] When therefore, it is perceived that any particular set of opinions has obtained a great hold upon the masses, place and power will seem to be the lot of the political party which promises to do most to give effect to these opinions. Under the pressure of this temptation, it may, consequently, any day happen that statesmen will accept doctrines and pursue a policy against which, if their judgment was unbiased, they would be the first to protest. This is a peril which hangs over this country, and recent events have shown that I am not conjuring up an imaginary vision of coming danger. During the last year [this was written in the early part of 1872] direct encouragement has been given to some of the most mischievous and alarming features of modern socialism by one who is, and by another who has been, a responsible minister of state. The budget of 1871 was framed in accordance with some of the financial principles of the international association; and no member of this organization ever made more reckless promises to the proletariat than did Sir John Pakington, when, as president of the social science association, he told the workmen, in his address at Leeds, that parliament ought to secure for them comfortable homes and wholesome food at reasonable prices. A few months before Sir John Pakington enunciated these mischievous doctrines, the people had been virtually told by the chancellor of the exchequer, that if they make some demand, the granting of which involves additional expenditure, the majority shall avoid contributing a single shilling toward the outlay, and shall be enabled to throw the whole burden upon the payers of income tax. Under such fostering care it is not surprising that there is rapidly growing up in this country an abnormal development of that new form of socialism, the cardinal principle of which is that all social improvements must be effected by state agency, and must also be carried out by public money." — HENRY FAWCETT.

paid them; the basis of his system was a purely sacerdotal government. No more division between the temporal power and the spiritual; the time had come to confound them. Instead of a pope and an emperor, men were to have a *father*, who would unite the functions of both, and govern in the *forum internum* and the *forum externum*, in things spiritual as well as temporal. This would cease, between the body and the spirit, a struggle which has lasted from the beginning of the world, and which has maintained disorder in the world. A natural hierarchy would follow on this change. Society would be divided into three classes: savans, artists, and those engaged in industrial pursuits; and the chiefs of these three classes would be the greatest savans, the greatest artists, and the greatest workers in the industrial world. These latter would need no investiture but that of the consciousness of their force. They would not be chosen; they would install themselves in their own position. The human family would know them by their works. Moreover, the new bond of society would be, under this régime, not fear, but affection; and the most loving, placing themselves above others, would necessarily impart their tone to all others. The chain of positions being thus formed, everything would follow in the most natural manner imaginable; each one would take rank in proportion to his capacity, and each capacity would be served in proportion to its works. Thenceforth humanity was to be only one family, and the earth to constitute only one great farm, the fruits of which were to be divided in proportion to rank and services. Such was the Saint-Simonian law, and it added, on the condition of woman and the relation of the sexes, certain not over-edifying precepts summed up in the expressive words, rehabilitation of the flesh. We know in what this strange morality ended, so far as the principal disciples of Saint-Simon are concerned. Its public profession cost them a suit in the courts and a sentence. Their religion did not survive this scandal, and was dispersed to the music of hisses. Everything considered, it was not worth the noise made about it. A political papacy invested with discretionary powers, with the sovereign disposal of the lot and rank of individuals in society, preaching the reign of the senses under the lying cover of the equality of the sexes, was not a system, and did not advocate a doctrine, which could long resist the revolt of men's consciences and the decrees of public opinion. — The same fate was reserved, after a longer defense, for the doctrine of Charles Fourier. Substantially it had the same foundation; but the mode of procedure of Fourierism was different. Fourierism, like Saint-Simonism, wished to substitute a world of the fancy for the real world, and an artificial order for the course of things. Fourier started out with the idea, that from the earliest ages to our own time the passions have been the source of so many evils only because they have been unskillfully suppressed. God, according to Fourier, can not have made anything

essentially bad or essentially useless. If the passions, in their actual play, are the source of many disorders, it is not with the passions themselves that we must find fault, but with the medium in which they move, a human medium, and therefore susceptible of modification. "Attractions," says Fourier, "are proportional to destinies," which means that it would be all gain for men to yield to their inclinations. Hence they must be satisfied in an association freely agreed to, and in which all the instincts of man may have room for the fullest play. These formulas of association are the ingenious part of Fourier's work. The association is in groups, which end in series, and these in phalanxes. The group is the cell of the human hive; it is composed of seven or nine persons; it has a centre and wings, and a harmony which results as much from its identities as from its contrasts. The series comprise from twenty-four to thirty-two groups. The phalanx is Fourier's commune; consisting of 1,800 souls, it lives in a palace which he calls the phalanstery, divided in such a manner as to procure the greatest possible number of pleasures, while avoiding all the prejudices which result from the arrangement of actual households. As to property, it does not incorporate itself in individuals; it is collective. Its value circulates only under the form of coupons, and becomes susceptible of appropriation; products are divided among the three direct agents of production: capital, talent and labor. Let us add, that in Fourier's system no repugnance attaches to this labor; it is attended by a love for it, taste and buoyancy; it is done in short sessions, in holiday clothes, with passion and spirit; the task is taken up or dropped at will, and varied so as to produce neither monotony nor weariness. Nor is this all; to these wonders of earth Fourier adds the joys of a heaven of his own. He has his own cosmogony and his own transmigration of souls; he walks his system through the spheres, and requires of our planets the most singular services. The whole of Fourier's system may be summed up thus: a universal government, a perfect world adorned by a perfect society. Beyond this, imagination can not soar. In this land of vertigo, nothing is to be found but glare. Again, we have a world to be made over, a civilization to be reconstructed, man and humanity to be renewed in a confused amalgam of the marvelous and the real. — Here stops the series of socialists at first hand; after them come the plagiarists, and, first of all, Cabet. Like Campanella and Sir Thomas More, Cabet has given us, in his "Icarie," an imaginary community, which unites all perfections in itself, and which found, in the streets of Paris, more than one partisan whom time has disabused. When it became a question to pass from ideas to acts, he perished in the attempt, and learned what becomes of dreams when brought to wrestle with realities. And so it was with Louis Blanc. In the silence of his study he had imagined an administrative workshop which would cure industry of the leprosy of competition. He

would have the state become entrepreneur (see **ENTREPRENEUR**) and universal producer; he would have it carry out, at the expense of, the public treasury, an experiment in relation to the economy of manual labor. In the workshops which were to be established, the workmen were to share in the profits of exploitation, and these workshops, of different kinds, were to be associated among themselves in such a way that the profits of some might serve to cover, if need were, the losses of others.* Nothing could be more ingenious on paper; each of these workshops would become a type and a model; free industry would be forced, under pain of death, to draw inspiration from them, and this idea of the absorption and destruction of free industry was discoverable in the spirit of the project. Private activity was destined to disappear before official activity. We know what these specious plans became in the execution of them: by forced deviation the administrative workshop became the national workshop (see **ATELIERS NATIONAUX**), with an elective head, and a minimum of wages, two features borrowed from the combination of Louis Blanc. A false idea led to applications still more false, so false that the author of the idea vehemently and justly repudiated them. Proudhon was no happier. Is it proper to rank Proudhon among socialists? No one battled them more fiercely than he; he produced the evidence of their contradictions, the emptiness of their plans, and the poverty of their doctrines; he left nothing standing, neither their arguments nor their combinations; and he warned against them even to the point of invective. But if he was brutal toward the community, he was no less so toward property; and he remains a socialist spite of himself. From the core of what he denies we need only disengage what he affirms, to become convinced of this. Thus, he sacrifices the idea of property to I know not what species of imaginary possession floating *in vacuo*. And so, after an at-random dissertation on the determination of value, he arrives at imagining a general and uniform tariff for it, both for labor and products, by measuring the price of these latter by the number of hours employed in producing them! Lastly, as a consequence, he proposes to replace money made of gold and silver, by orders payable in kind, in such a manner as to return from gold and silver money to barter, and to deprive capital of one of its most evident powers, the power to produce interest. On all these points Proudhon remains on the staff of the socialistic legion which he so maltreated. To the same staff belongs also Pierre Leroux, as he appeared with a plan of human society in his hand. He admits the family, fatherland and property only on certain conditions. He finds that the fatherland has the drawback of recognizing a chief or head; the family, of recognizing a father and children; and the institu-

tion of property, of recognizing rich and poor. Pure despotism! It is all a question of finding a combination in which the family, the fatherland and property shall be such that man may develop in them without being oppressed by them; in other words, that the family should not produce an heir, that the fatherland should have no subjects, and property no proprietor. Such is the problem, such the solution: if to it we add a little of theurgy and metempsychosis, we shall have all the baggage of Leroux, so far as things serious are concerned. — We have reached the end of those systems, and may judge in what they agree, and in what they differ. Under the names we have mentioned, there now remain but the men for whom socialism was a tool or a pedestal, and the political parties who took up the standard of socialism without seeking to define it. Socialism, indeed, has had its day; many were attracted by it as men are attracted by novelty; then the crowd mixed with it with the obscure feeling that it would find its advantage in it, and that in the absence of conviction they should adhere to it from pure calculation. And how could the crowd defend itself against socialism? It was promised higher wages in return for less labor, a quarry to hunt in a society in dissolution, the leveling of conditions, the humiliation of the higher classes, and a general division of private fortunes among all. Is it to be wondered at that such vertigo was contagious, and that it became in some countries, for an instant, an object of alarm? Yet socialism did not deserve so much honor. As a theory, it could not stand examination; as a fact, it was not able to succeed under any circumstances or at any point. The name of Owen is connected with the failures of New Harmony and Orbistan; that of Cabet, with the Nauvoo failure in the state of Illinois; with Fourier's, a series of discomfitures which followed on the heels of each other at Condé-sur-Vesgres, Citeaux, in the valley of the Sig, and in America. From the ideas of Louis Blanc, there proceeded only the *ateliers nationaux* (national workshops), the paternity of which he excepted to; of the boldness and rashness of Proudhon, all that remains is the memory of the *bank of exchange* or *bank of the people*, made famous by the most untoward catastrophe. The history of contemporary socialism is but one continual abortion. The principal actors on its stage have disappeared from the scene, and left their places to a few confidants who stammer out their parts. All that socialism and socialists have done is reduced to a few plans of association, to a few commonplaces which are only the weakened echo of their first timorous ideas, to a few formulas whose meaning time changes, and which have become fixed in language as problems or bugbears. — Thus, all these chimeras gradually depart into the regions of oblivion. It may be that the same vertigo will appear again under other forms and another name; our globe is the seat of an eternal revolt and of an eternal wail. But then as now, unless the hour of an irrevocable decline has struck for humanity, the result of

* This is almost the system extolled by the famous German agitator, Ferdinand Lassalle. What is said lower of Proudhon applies to some extent to Karl Marx.

such errors can not be doubtful. True, these errors are covered with a mask—the love of the people, the interest of the suffering, the feeling of human perfectibility, the advance of generations to a better state and one less full of shocking inequalities. But behind this mask we find a more living physiognomy. That living physiognomy is the truth of things, whether the inventors of systems be conscious of it or not. Behind the truth of things the public conscience always retreated and always will retreat. This, to its honor, we must hope. The question is of a war to the knife against established civilizations, to the profit of imaginary civilizations; it is a question of destruction for the sole purpose of building up again; it is a question of giddily abandoning ourselves to systems which, scarcely fledged, give battle to one another, and which die out in the shock of rivalry and the weakness of isolation. It would seem, indeed, that socialists supposed that society, such as it exists, is only so much stage scenery which might be made to disappear at the wave of a wand. And what is proposed in its place? Servitude in all its forms. Take all these systems; they have one feature in common, which is to stifle, by their artificial forms, the taste for and the use of liberty. They condemn human activity to carry a yoke of iron. Here man is enticed into a world of fancy, and there he is condemned to devote himself to others without the merit of that devotion being allowed him. He can no longer dispose of the fruits of his labor, nor regulate the employment of his hands or his brain. The state takes possession of his entire person, of his goods, of the products he creates, and determines the portion of them which he shall receive back. Under the régime of socialism the individual disappears, and is absorbed by a collective being. He ceases to be a body or a soul, and becomes a piece of mechanism. Slavery does not more completely than socialism destroy the personality of man. (Compare *ATELIERS NATIONAUX, COMMUNISM, FOURIERISM, PROPERTY.*)

LOUIS REYBAUD.

SOCIAL CONTRACT. Is society a human institution? or, is it of natural institution? These are the two questions which must be solved in order to form a clear and exact idea of the rights and duties of man in the civil and political order. Of course I here suppose that man is a free being, for every system that denies human freedom thereby denies the possibility of a binding moral law. I suppose it to be admitted, also, that there is an order of the universe, for otherwise creation would be unintelligible, and the destiny of man an enigma; that this order is so imperative that every reasonable creature should respect it and accomplish it in himself and out of himself, which gives his rights and duties the sanction of natural law. *Non scripta lex, sed nata.* I suppose, finally, that the conception of the ideas of liberty, order and harmony, however high they may be, and precisely perhaps because they are high, are not

the final term of human intelligence; that these ideas cause him to take one more step and lift him to the very substance of universal order, to God who gave to each being its constitution and its end. — If I am met by a refusal to admit these hypotheses as the bases of my investigation, I declare myself powerless, I will not say to solve, but even to discuss, the problem placed before me, for, as a man can not walk on the ground without a point of support, neither can the intelligence move if the very bases of all reason are lacking it. I affirm, therefore, the existence of two laws: one natural, or divine; the other positive, or human; the former immutable, the second variable; from this distinction flows the solution of the problem of man and society. — God, when creating man, gave him a nature proper to himself. By reason of this nature relations are established between him and his fellows which bind them together and form of them a whole, which is the *social state*. Society is, therefore, the aggregate of the different beings bound together by the relations which spring from their respective natures, and which constitute the law of order. Hence the obligation of every reasonable and free being to regulate his conduct in conformity with these relations. This is what Montesquieu has so well expressed in the following definition, which is a flash of genius: “Laws are the necessary relations which spring from the nature of things.” And he indicates by the following phrase what he understands by *necessary relations*: “Before there were intelligent beings, such beings were possible; they had, therefore, relations, and, consequently, possible laws.” In fact, a thing to which laws could not be given would not be a possible thing. Then Montesquieu adds: “God made these laws, because they have a relation to his wisdom and his power.” Hence the consequence that when man was created, he was created for society, which was a necessary, fundamental law of his nature; for he was not created alone, he found himself face to face with a being similar to himself, and directly of these two beings there was one of them who owed something to the other, and another to whom something was due. Thence arose immediately between these two beings the right and duty which followed from their respective natures, which last, being equal and identical, necessarily engender equal rights and duties. — I therefore most energetically deny the social contract in so far as it is affirmed to be a pact entered into at the origin of human society to establish its laws. It was nature, or rather Providence, that willed the establishment of society; it was the wants of man which afterward made the laws after the notions of a superior law, which speaks to the heart of all men, the divine imprint of which is found everywhere the same. “*Nec erit,*” says Cicero, “*alia lex Romæ, alia Athenis, alia nunc, alia post-hac, sed et omnes gentes et omni tempore una lex et sempiterna et immortalis continebit.*” If this law sometimes varies among different nations, it always retains that which is of its essence. **BURKE**

expressed the same idea when he said that there are in nature sources of justice from which civil laws flow like so many streamlets; and that just as waters take the tint and the taste of the soils through which they run, civil laws vary with the regions and the governments of different countries, although they all proceed from the same source. — The hypothesis of an anti-social state, and of an organization of society according to an agreement entered into, is a system in contradiction with the nature and destiny of man; it would logically imply the right to break the contract, for the benefit of the contracting parties, should it become inconvenient or burdensome to them, and to leave the bosom of society to return to the state of nature, which would be the negation of the sacred and eternal idea of order toward which all free and reasonable creatures inevitably gravitate, and also the negation of an obligatory law anterior and superior to the wills or caprices of man. — Hobbes was the first modern philosopher who professed the doctrine of a state of nature anterior to the social state; man left this state of nature only because it was a state of war; whence the celebrated axiom, "War is the state of nature." But what is society in such a system? It is the creation of a force great enough to substitute peace for war. Peace, therefore, being the end of society, it follows that there are two modes of the formation, or two possible origins, of society. The first is the contract by which a collection of men, or of families, agree to constitute a force superior to individual forces, a force capable of crushing them out and thus of establishing peace at any price. The second mode is to lose no time in collecting the votes of persons interested in putting an end to the state of war, to enter into this so necessary contract. It is sufficient that a man, by force or artifice, succeed in establishing his power over a collection of men, and be able to maintain it, in order to establish straightway the social bond. The right of the stronger establishes this bond as completely as a contract. And this latter method is even the better form of society; for power concentrated in a single hand, affords more guarantees of strength and durability, and is consequently more perfect; its mission being to crush out all individual forces by all possible means, and to maintain the state of peace by the destruction of the state of war which is found in the existence of individual forces; hence the more unlimited power is, the better it is. From this it follows that all limitation is contrary to the end of power and of society, and that, whatever the despot may wish, it is the duty of his subjects to obey, and they have no right to resist. Such, in a few words, is the celebrated system of Hobbes. — Admitting that men are really what Hobbes pretends they are, that is, famished wolves which devour each other—*homo homini lupus*—it might be maintained against him that the contract which binds them together, whether based on consent or on force, could have no possible existence. The laws would be merely heavy chains, and the sole

aspiration of each and every individual would be to break them, to escape from his cage and rush on the chief chosen or imposed on him, who would soon and necessarily succumb to numbers. Whatever be the opinion held concerning the original nature of man, it is evident that the consequences which Hobbes draws from his premises are open to discussion, since, starting from the same point, J. J. Rousseau arrives at opposite conclusions. — Rousseau considers the state of nature as the ideal of man, and the social state as a contract state. Nature, therefore, "took little care to bring men together by mutual wants; she did little to pave the way for society; she put little of her own into all that men have done." Nevertheless, Rousseau acknowledges that the social state was an advance on the state of nature; he admits, that, instead of destroying natural equality, the fundamental pact, on the contrary, substituted a moral and legitimate equality for whatever inequality nature might have placed among men, and that, it being possible for them to be unequal in force or in genius, they all become equal by convention and of right. Thus the contract was entered into to the improvement of the lot of humanity. Not that the law of nature is not superior to positive law, for it comes from God. "Whatever is good and conformable to order is such by the nature of things and independently of human conventions. All justice comes from God, he alone is its source; but if we knew how to receive it from so exalted a source we would need neither government nor law. Doubtless there is a universal justice emanating from reason alone; but this justice, to be admitted by us, must be reciprocal. To look at things from a human point of view, in default of a natural sanction, the laws of justice are powerless among men. * * Therefore conventions and laws are necessary to unite rights to duties, and restore justice to its object." — We now perceive the profound difference between the system of Rousseau and that of Hobbes. Rousseau elevates man; Hobbes degrades him. The former leads to liberty; the latter to despotism. Applied to governments, the philosophy of Hobbes creates in the bosom of political society the domination of a single will. Around this will are grouped the instruments of obedient and blind forces, which it moves as it pleases. The general will must become an immense holocaust; the caprice of a single man must lead and govern all. It is the image under which we may represent Satan, that rebel angel, seeking eternally to combat against light, that is to say, liberty. Such a system would be the greatest degradation of humanity, a really infernal work from which Christ has saved the world. It is useless for Hobbes to say that power, such as he conceived it, is alone capable of ending the state of war which is at the foundation of society. The society which he depicts is not a hive of men, but a den of wild beasts. The despot whom Hobbes places at the summit of his edifice, far from giving energy to the sentiments which constitute the dignity of the human

race, would seek, on the contrary, to stifle them. Liberty! he would dread its smallest spark; for everything must be a piece of mechanism, the motive power of which is held by one. The condition of the subject is to obey; the right of commanding belongs to the despot alone; the man who deliberates is from that very fact a rebel. The certain effect of the arts and sciences is to elevate man's immortal soul, and to give it noble aspirations; the despot is careful to prevent the growth of these aspirations; he therefore paralyzes public education. Under this régime equality is an unknown word; favor is everything, merit nothing. Security does not exist. Everything belongs to the sovereign master—person and property. This want of security destroys all culture, all emulation, all industry. The object being to inspire terror, the severity of penalties bears no proportion to the crimes committed. No; this strong power, which Hobbes praises, can never found a prosperous and peaceful society, for despotism is not a creative but a destructive force. — Strange contradiction between two philosophers, two thinkers of rare power! While Hobbes deduces from the social contract which he imagines the despotic type, Rousseau infers from it the democratic type. Reason, good sense, if we were obliged to admit this pretended contract, would evidently be on the side of the French philosopher as against the English philosopher; for it is difficult to suppose that men would come together, to agree on a social state which, instead of making them free citizens, would turn them into slaves. Rousseau imagines a people who give themselves laws, in which they realize all their powers as an artist of genius does in his domain. Tendencies are free in it, objects free, actions free. Proportions are perfectly expressed in that empire. Each organ is a complete whole, which preserves its integrity in the sphere in which it moves. It has its specific force in accordance with which it exercises the functions entrusted to it, though it still obeys a general law, from which, in the aggregate, there results a simple and magnificent harmony. Such is the ideal of Rousseau as opposed to that of Hobbes. — Why have Hobbes and Rousseau, in starting from the same point, arrived at results so different? Because both constructed a work, not of reason, but of imagination. Instead of constructing this marvelous product called *society* from the immutable elements of humanity, they constructed it of the changing elements of history. Hobbes lived at the time of the great English revolution. Chance, and perhaps his character, threw him into the party of absolute right. He saw the head of a prince he loved fall under the rage of factions. The sight of the revolution and of its excesses stirred his soul. He thought he beheld the dissolution of society, because he witnessed the birth of a new order of things. He concluded from this that a power strong and able to command the waves was necessary in order to curb the popular flood. Rousseau had under his eyes the exact opposite of this. He

had seen royalty abusing its power, oppressing peoples, living by the sweat of the people's brow, exhibiting every species of immorality and scandal. Right, everywhere ignored, needed an avenger. Rousseau became this avenger, and thereby lost his country. Hobbes and Rousseau started from a false principle; they ignored the rules of natural law, and they expiated their error by the low estimation into which their doctrines have fallen in the eyes of posterity. Instead of going astray in the regions of the imagination in order to find the origin of society, it would be much simpler to say, with a modern philosopher: "The society of beavers is formed by virtue of the laws of the nature of beavers; the society of men is formed by virtue of the laws of human nature; to reach the true idea of the formation of human society, we must therefore start with a true idea of human nature; all light is there; beyond that, there is nothing but hypotheses and contradictions." Let us therefore seek that light. — The right considered in its root and its ultimate reason can be found neither in the world of sense nor in the sphere of experience and of history. Right in itself is eternal; it is independent of manners and customs, of religions and climates. Owing to this independence it must extend its sceptre over all the earth, without distinctions of epochs or races. Thus is explained the sovereign power of law. From the fact that law exists, it follows that there is a being to whom it applies, and that that being is a man, that is to say, a moral being, with reason and freedom, and not a brute outside the bounds of reason and of liberty. Now, the sphere of the application of law or right is society. Society, then, is contemporary with man. Why did man institute this power, this product? It was not alone from the point of view of his security. The right to security originates the moment that a certain number of men have taken possession of a corner of the earth, and are confronted by the same wants and dangers. Side by side with the ideal of right and law, there is the ideal of duty. A society has of necessity, from its birth, moral rules which precede positive law, and which may be summed up as follows: Law or right, like duty, spring from conscience, and consequently whatever wounds the conscience is neither a right nor a duty. Freedom, as a source of action, is the foundation of right and duty, that is to say, of morality. The circle of rights and duties is as broad as that of the necessary relations which may bind together free beings. Society having an object, each one of its members should divest himself of the rights the personal and independent exercise of which would hinder society from attaining this object. He should accept all the duties which society imposes on him for the attaining of this object; for there would be no society, properly speaking, where there was no constraining power to compel co-operation to attain the final object of society. — Considered from this point of view, society is as eternal as right, as conscience. History shows us great catastro-

phes, nations and races which have been swallowed up in the abyss of time; the earth also shows us on every side traces of great physical revolutions, which have ravaged, transformed and renewed it; in like manner the present division of nations bears witness to great political perturbations, which at different times so profoundly influenced the destinies of nations; we everywhere tread on ruins and funeral couches. But did society itself ever perish? Did not its living and sacred image always escape destruction? When Troy, abandoned to the flames, was about to become a pile of ashes, Eneas fled, bearing with sadness into exile the venerated images which represented immortal society, and approaching a new land, he cried out: "Italiam! Italiam!" then, placing his precious relics on a fruitful soil, he founded Rome, the future heiress of the world. Civilizations are thus superimposed one upon another, are amalgamated together, are made or unmade, advance or recede; but society, and an ever better society, rises always up amid the ruins of extinct civilizations, because society is above civilization itself. — If society were the result of a contract, it might be dissolved by withdrawing the consent which formed it. Otherwise there would be an implied contradiction. Do we not see then what an upheaval would result from such a state of affairs? Do we not see the perturbation that would be caused in the scale of rights and duties? Do we not see that binding moral law would disappear from the world, and that the social force would disappear before individual force? If men who had learned all the advantages of social life, renounced it at once, and retired into forests and deserts, these men would obey the caprices of a disordered imagination and the inspirations of wandering reason, but we could not admit that they acted in virtue of a right. The state of society is therefore an impulse of the moral nature of man, and not the impulse of his intelligence; it is spontaneous, and not the result of deliberation. It comes from above, not from below; it is not of man, but of God, who, in creating man intelligent, also created the earth to satisfy the wants of his intelligent creature, and who distributed among the countries different products, in order to oblige men to exchange the different kinds of wealth of the countries they inhabit, in such a way that they might be forced to labor for each other, and that, from the selfish efforts of a single man, the good of all should necessarily flow, as the system of the universe results from the force of attraction.

EUGÈNE PAIGNON.

SOCIAL SCIENCE. Society is ruled by natural laws, like the human body and every living organism. The laws of an organism determine the relations between its different parts, between its members and organs; social laws should establish, therefore, the nature of the relations which exist between men, as well as their causes and their effects; and social science should co-ordinate

these laws in a systematic manner. — Social science must not be confounded with political science. The latter has to do with the relations between states, between governments and subjects, and between citizens; while social science takes cognizance only of men, to the exclusion of the external bond which is called the state. — Now, of what nature are the relations among men? They answer evidently to our needs, which are of two kinds, material and moral. Thus, on the one hand, they answer to the necessity of food, clothing, shelter and defense; and, on the other hand, to man's desire for instruction, and, in general, to a whole series of faculties and passions, which draw men together and put them in contact. — Society is composed of individuals, and everything that contributes to their preservation helps the preservation of society. But although man is a "sociable animal" or a "political animal" we can, strictly speaking, conceive of the absence of all human society. Many savages live in an isolated manner, in couples or in very small families; they have only material wants to satisfy. But of society may it be said that it "does not live by bread alone," for it is principally the moral wants of men which create and maintain its bonds. In a word, material wants preserve the individual, and moral wants society; to the former correspond the egotistical sentiments, to the latter the affective sentiments, abnegation and self-control. The egotistical sentiments and the affective sentiments (or the faculty of self-sacrifice) are capable of attaining an equal degree of strength. Before the existence of society the affective sentiments acted in a scarcely perceptible manner; later, with the development of civilization, their strength gradually increased, and the more intense they became, the more the bonds of society were strengthened. It even happened at times that these sentiments, or some of them, degenerated into destructive passions, and produced evils great in extent and intensity. — We have already suggested, that, in our opinion, the affective sentiments are the first cause of abnegation, self-control and sacrifice; paternal and maternal love, filial piety, patriotism, military honor, *esprit de corps*, furnish numerous examples of this. Abnegation, once disengaged or isolated from the sheaf of human sentiments, develops, and is not slow to offer a counter-weight to every act of egotism. This counter-weight is not always sufficient, far from it; but it is rarely entirely powerless. Its effect is often aided by numerous circumstances, which we can not enumerate here, but it becomes completely of no avail when it consists only of a word, that is to say, when the abnegation is not founded upon a want of our nature. — Thence comes, also, the inanity of those new social systems, hatched in the brain of a man who pretends to foresee everything, to measure everything, and to assign to everything its relative importance; in other words, in the brain of a man who wishes to reorganize society according to the ideas of his own idiosyncrasy. For if society is really governed by natural laws, and it would be

absurd to doubt it, arbitrariness could have no power over it; to influence it, one would have to begin by submitting himself to those laws which he can control only by making use of their power. — There is a science which concerns itself with the means of satisfying our material wants; there is another which has to do with our moral wants; the one is political economy, the other moral science; it is, therefore, the union of the two which constitutes *social science*. An endeavor has been made to establish the relations which exist between political economy and morality by seeking, among economic propositions, those which resemble certain precepts of morality. For example, political economy and morality show, each from its own point of view, the utility of labor and saving; by the aid of comparisons of this nature, it has been easy to show the morality of economic principles. It seems to us that here a wrong road has been followed. The sciences are not moral or immoral; they state laws. Has it ever been examined whether mathematics or chemistry has any relation with morality or with religion? Such preoccupations might lead some ardent believer to excommunicate the earth because it allows itself to revolve about the sun! The sciences have no relation with religion, nor with morality, and a science which studies what may be called the base side of nature or of man, is no less noble than any other. Must we despise the physician because he is occupied solely with disease? Or must we despise the judge because he has to do only with criminals? And supposing that the economist studies the selfish sentiments of man, it does not follow that he is selfish himself. Turgot, Adam Smith and J. Stuart Mill were generous men. The man who studies toxicology is not a poisoner. Man is more or less selfish, according to his temperament or his education. Moreover, we must not speak too ill of selfishness kept within the bounds of justice, of the love of self, since it is a *universal sentiment*, *INDISPENSABLE to the preservation of our species*. The economist proves that our wants make us work, and this, not because morality recommends it, but because the satisfaction of these wants is an imperative necessity of our nature. Man must eat or die. The economist, in investigating the laws of labor, permits us to render it more productive and less arduous. The economist establishes also the action of supply and demand. Has he created this action? Does he approve it? No more than the natural philosopher created or approves of the rain. Does one approve or disapprove of a natural law? Would you disapprove of the horse, because he walks on four legs, or of the bird because it flies, or of the fish because it swims? Such is their law, and whether it pleases you or displeases you, you can do nothing to change it. Besides, we create nothing; we ascertain facts, and in our relations with these animals, we take into account the established facts, and act accordingly. In the same way, the economist has not created the law of supply and demand, a law which we consider as

the most characteristic and strongest expression of selfishness. What is supply and demand, if not a sentiment which can be formulated thus: you need my superfluous goods, well, you shall pay for them, and the more dearly in proportion as your need is the more intense, so long as you are able to give me an equivalent for them? This sentiment is so general that we find it quite simple that the price of an article should rise in proportion to its relative rarity. We are convinced that this action of supply and demand, which is so cruel, renders, upon the whole, great services to society. Are not arsenic, belladonna and many other poisons of service? But were the action of supply and demand an evil without compensation, we ought to study it, and the economist will have deserved well of humanity for having thoroughly examined its mechanism. — It would be then the task of the moralist to derive advantage from the truths discovered by the economist. He would inculcate on man his precepts protective of society; he would teach him abnegation and self-control. He would say to him: Without doubt your wheat is in great demand, and you can obtain such and such a price for it; but think also of the evil you will produce by using your right in its entire fullness. The moralist will be able to call to his aid every other honest sentiment, capable of counterbalancing selfishness, and in primitive times men did not fail to appeal to the religious sentiment. The conclusion must not be drawn from this division of labor, this partition of powers, that the moralist is above the economist; it suffices to recall the fable once related to the Roman people on the Aventine hill. Morality, even religion itself, may be pushed beyond the limits which healthy reason approves; they may become passionate and fanatical at the expense of very high material interests, and for the good of humanity, the two branches of social science should exercise a perfectly equal influence, and thus establish that equilibrium which is the sign of health. — Many publicists cultivate both sciences together, and combine political economy and morality; we are glad to be able to state this, but all do not succeed equally well in this combination of studies. MAURICE BLOCK.

SOCIETY. "Man," says Aristotle in the beginning of his "Politics," "is a social being." This definition is in some sort the point of departure of political science. It destroys at once all the false hypotheses which make society a mere convention. It has been truly said that such a convention presupposes the existence of a state of society in some form, in order that men might be able to come to an understanding with one another. Besides, the state of isolation is impossible. Man would not be able to exist in such a state. The child could not live without the food and care furnished by its mother, the woman could not dispense with the protection and labor of the man. Language, the bond of all society, is born with society and of society, and helps to maintain and extend it. The definition of man as a social

being rests, therefore, on his most imperious wants, on his most instinctive sympathies and on his most invincible inclinations. Adam Smith rightly remarks that man is the only being who makes exchanges. Society, from a certain point of view, is merely a series of exchanges, a perpetual communication of material and moral benefits which men hold with each other. To complete the definition, or, rather, to give it all the clearness and truth which it should receive, we must add, that if man is born a social being, he unceasingly becomes more social. The family, the tribe, the nation, with its vast developments, mark the different periods of society. A moment comes when the division of mankind into nations gives place to a sentiment which expresses sociability in its highest degree; this sentiment is the sentiment of humanity. Man, far from being a wolf to man, *homo homini lupus*, according to the gloomy definition of Hobbes—adopted by all who see in society an artificial and conventional fact—sees in man a being worthy of his respect and his love, an equal, a brother. Religion and philosophy, by paths which are sometimes different and sometimes identical, lead to this sublime result, while interest, properly understood, enjoins it on us to be useful to others in view of reciprocity. — Society implies associates. We can not, therefore, flatter ourselves that we know the object of society without knowing first the nature of the beings which are its elements. Society itself is but the medium and the means which these beings make use of to develop themselves. What are these individuals? Are they simple units endowed with a vegetative or an animal life, and obeying the laws of fatality? No. they are moral persons, that is to say, free, responsible, whose destiny it is to develop and perfect themselves and rise to the conception and practice of the true and the good; having, in one word, besides material life, a moral and intellectual life. The special character of man, in this world, is to be at once the most social and the most personal of all beings. Is it the person which shall be sacrificed to society, or society which shall aid in the development of the individual? It would be absurd to suppose that the diminution of that which constitutes our dignity, our value, our very being, should be the object or the result of the association of our efforts, labors and mutual assistance. In truth, the only object of society is to give value to the individual. By society the individual must become more enlightened, more powerful and more moral; society in turn will be worth only what those who compose it are worth. — Respect for every right, the practice of every duty, the cultivation of every faculty, the development of human nature: such is the object of society. Society is essentially favorable to the growth, as it is absolutely necessary to the exercise and the guarantee, of all our legitimate inclinations. Thus, by it the family is ordered, property protected and increased, the capital necessary to civilization and material life increased, perpetuated

and transmitted. The object of institutions of the civil and political order is to assure this regular development of each and all. But it is important to remember that the state alone is not charged with the attainment of this object. The better part of human nature escapes the state. Religion is no more an affair of state than philosophy. And so with industry and commerce, as well as all the institutions intended to favor saving and to distribute wealth properly. In like manner the various means of instruction and education at the command of the individual and the family, do not depend upon the state. The state protects them, the law guarantees or regulates their exercise, but all these things have a proper and independent life of their own. Otherwise society would go contrary to its object. It would be no longer established to favor but to suppress individual development. Instead of being the putting in common of liberties respecting and aiding one another, it would be slavery organized, either by a powerful majority or a dominating minority. — Political societies, in so far as they are collective beings, reflect and reproduce everything to be found in the nature of the individuals who compose them; only they reflect and reproduce it on a large scale, which has given rise to the saying that society is merely a big individual. It is true that this has been said of the state also, with truth in some respects, but still with much less truth, for all that enters into society is far from entering the state, as we have already seen. Nothing prevents and everything commands us to consider society as a living whole. There are in society collective rights and collective duties. It has the right to be guaranteed, and the duty of repressing evil and assisting the individual. This it does sometimes through the state, and sometimes by means of free associations. In like manner there is in society, as in the individual, an instinct of preservation and an instinct of progress. The one is attached to tradition, which is of a nature to serve society eternally, or simply to everything which has served it long. The instinct of progress walks in advance of all innovations, welcomes everything favorable to the ulterior development of the human mind and of society; it embraces the future in its views and its hopes, as the instinct of preservation adheres to the past and loves to keep itself within the limits of the present. These two instincts, almost always at war, are both necessary. They are completed, tempered and maintained by each other. From their collisions terrible crises result, the more to be feared, since, if one is devoted to routine, the other easily gives itself to adventure. But in spite of, and sometimes by means of, these crises themselves, humanity advances, launching itself toward the future, resting on the past, and making a starting point for useful progress and dangerous innovations at the cost of more than one laborious work of groping and painful experience. This progress of societies, demonstrated by the philosophy of history, a theory which was framed by a number of writers,

notably by Turgot and Condorcet, in the last century, is scarcely denied in our day, although the scope and extent of that progress are continually in dispute. Who doubts in our day that modern society excels the societies of antiquity in justice and humanity, as well as in material development? Property more secure, better distributed, resting on labor as a foundation; the family purified, slavery and serfdom abolished; penalties more humane and more just; well-being increased; the sciences developed; the power of right above brute force: are not these certain results given by historical observation? The amount of evil, whether it be free or fatal, diminishes, no matter how enduring and wide-spread it may be; the amount of good increases: such is the visible revelation of Providence in history. Have we not here the most striking justification of society, the most incontestable proof of its necessity and its benefits? (See CIVILIZATION, SOCIAL SCIENCE, SOCIALISM.)

HENRI BAUDRILLART.

SOUTH CAROLINA, one of the thirteen original states of the American Union. — **BOUNDARIES.** The triangular shape of the state, and its natural boundary by the Atlantic on the east, leave but two boundaries to be fixed, on the north and on the west. The former was tacitly fixed about 1698, and more formally in 1732 (see NORTH CAROLINA), and was run by the two states in 1764, 1772 and 1813. The latter led to a boundary suit between Georgia and South Carolina before the congress of the confederation, which was settled in 1787 by a cession to Georgia of South Carolina's claims west of the Savannah and the Tugaloo branch of it. The latter state then proceeded to cede to the United States her "other" claims west of a north and south line from the head of the Tugaloo, but this, as it proved, was a distance of but twelve miles. (See TERRITORIES.) — **CONSTITUTIONS.** The constitutional history of the colony is bound up with that of North Carolina until about 1700. In 1719 the people revolted against the proprietors, and established a temporary government of their own; and, in accordance with their wish, South Carolina became a royal colony until the revolution. The crown appointed the governor; the governor appointed the upper house, or council, and retained a veto power; and the people elected the lower house. The opening years of the revolution were marked by constant conflicts between the governor, Sir William Campbell, and the legislature, so that the legislature was almost constantly prorogued. July 6, 1774, the first popular convention met, and chose delegates to congress; and, Jan. 11, 1775, a provincial congress met, which practically assumed the powers of government. March 26, 1776, it adopted the first constitution of the state. The lower house, or general assembly, was to be chosen by the people annually, in fixed apportionments to each parish; it was to choose the upper house, or council of thirteen members; and the two were to

choose the president [governor] and vice president. The congress made itself the first lower house. Two peculiar provisions are that the president was to have no power to make war, peace or treaties, without the consent of the legislature; and that "the resolutions of the continental congress, now of force in this colony, shall so continue until altered or revoked by them." (See STATE SOVEREIGNTY) — March 17, 1778, an act of the legislature put a new constitution in force after Nov. 29. It ordained that "the style of this country" should be the state of South Carolina; gave the governor a term of two years, and forbade his re-election; changed the names of the houses to senate and house of representatives, and made them both chosen by the people; left out the section as to national supremacy; and established freedom of incorporation to all societies "professing the Christian Protestant religion." — June 3, 1790, a more elaborate constitution was framed by a popular convention, without popular ratification. It omitted the treaty clause; made the right of suffrage dependent on a freehold of £50 or a tax of three shillings; recognized slavery by requiring for representatives a qualification of £150, or 500 acres and ten negroes; and omitted all religious restrictions. It was amended in 1808, 1810, 1816, 1820, 1828, 1834, 1856, and 1861, the first, the great compromise described hereafter, being the only important change — A new constitution was formed by a convention Sept. 13-27, 1865, without popular ratification. Its main changes were that it gave the governor a term of four years, and made him eligible by popular vote; gave the right of suffrage to free white males over twenty-one, on two years' residence; forbade slavery, "slaves in South Carolina having been emancipated by the action of the United States authorities"; and forbade the legislature to inflict punishment of any kind for participation in the rebellion. — The reconstruction convention at Charleston, Jan. 14 - March 17, 1868, framed a new constitution, which was ratified by popular vote, April 14-16. It declared that all men were free and equal; that their paramount allegiance was due to the United States; that the state should forever remain in the Union, and resist with its whole power every attempt to dissolve it; and that all classes of citizens should enjoy equally all common, public, legal and political privileges. The compromise of 1808 (hereafter detailed) was omitted, and the legislature was to be chosen according to population, the house for two years, the senate for four. Every male over twenty-one was given the right of suffrage, except that no one prohibited from holding office by the 14th amendment was to vote or hold office until his disabilities were removed. Debt contracted in aid of rebellion was repudiated. Presidential electors were to be chosen by the people, though the federal constitution directs them to be chosen in such manner as the legislature may direct. — **GOVERNORS:** John Rutledge, 1776-8; Rawlins Lowndes, 1778-9; John Rutledge, 1779-82; John Matthews,

1782-3; Benjamin Guerard, 1783-5; William Moultrie, 1785-7; Thomas Pinckney, 1787-9; Charles Pinckney, 1789-92; Arnoldus Vanderhorst, 1792-4; William Moultrie, 1794-6; Charles Pinckney, 1796-8; Edward Rutledge, 1798-1800; John Drayton, 1800-2; James B. Richardson, 1802-4; Paul Hamilton, 1804-6; Charles Pinckney, 1806-8; John Drayton, 1808-10, Henry Middleton, 1810-12; Joseph Allston, 1812-14; David R. Williams, 1814-16; Andrew Pickens, 1816-18; John Geddes, 1818-20; Thomas Bennett, 1820-22; John L. Wilson, 1822-4; Richard I. Manning, 1824-6, John Taylor, 1826-8; Stephen D. Miller, 1828-30; James Hamilton, 1830-32; Robert Y. Hayne, 1832-4; George M'Duffie, 1834-6; Pierce M. Butler, 1836-8, Patrick Noble, 1838-40; John P. Richardson, 1840-42; James H. Hammond, 1842-4; William Aiken, 1844-6; David Johnson, 1846-8; W. B. Seabrook, 1848-50; John H. Means, 1850-52; John L. Manning, 1852-4; James H. Adams, 1854-6; R. F. W. Allston, 1856-8; William H. Gist, 1858-60; Francis W. Pickens, 1860-2; M. L. Bonham, 1862-4; A. G. Magrath, 1864-5; Benj. F. Perry, provisional, 1865; James L. Orr, 1865-8; Robert K. Scott, 1868-72; Franklin J. Moses, 1872-5; Daniel H. Chamberlain, 1875-7; Wade Hampton, 1877-9; William D. Simpson, 1879-81; Johnson Hagood, 1881-3; Hugh S. Thompson, 1883-5. — The state is popularly known as the "palmetto state," from a local dwarf palm, the most northern variety of the order. It has always been a favorite emblem for state flags, etc. The capital of the state is Columbia. — **POLITICAL HISTORY.** For a long time South Carolina was divided into two quite distinct geographical and political divisions by the line across the middle of the state formed by the falls of the great rivers. The lower, coast or cotton country, from the falls to the seaboard, was the original colony, settled mainly by English Episcopalians, with a considerable percentage of French Huguenots; the upper country, from the falls to the mountains, was settled mainly by immigrants from the states to the northward, with a considerable percentage of Scotch and Scotch-Irish immigrants. But a more essential difference was in the distribution of the slave population. From the beginning it fell more heavily toward the coast. In 1840, of the 196,222 slaves in the state, 129,814 were in the lower country, and 66,408 in the upper country; and, of the 267,360 whites, 150,994 were in the upper country, and 116,366 in the lower country. The segregation of interests, in its final development, may be seen in the following table of white and slave population, compiled from the census of 1860. Class A is the tier of districts or counties impinging directly on the sea, and including the sea-island cotton district; class B is the tier next to the preceding; and class C is the extreme northern tier; the intermediate districts are more evenly balanced, and are not considered. In all three classes the districts are arranged in order, from west to east, to the North Carolina boundary.

CLASS A.		White.	Slave.
1.	Beaufort	6,714	32,530
2.	Colleton	9,255	32,307
3.	Charleston	29,136	37,280
4.	Georgetown	3,013	18,109
5.	Horry	5,564	2,359
CLASS B			
1.	Barnwell	12,702	17,401
2.	Orangeburgh	8,108	16,583
3.	Clarendon	4,378	8,566
4.	Williamsburgh	5,187	10,259
5.	Sumter	6,857	16,682
6.	Darlington	8,421	11,877
7.	Marion	11,007	9,951
CLASS C			
1.	Pickens	15,335	4,195
2.	Anderson	14,286	8,125
3.	Greenville	14,631	7,049
4.	Spartanburgh	18,537	8,240
5.	Union	8,670	10,801
6.	York	11,329	9,964

Geological reasons account for the few variations from the general rule in the table. The upper country, on the democratic principle, had the power to tax, and the lower country the property liable to taxation. The compromise by which the two were reconciled is altogether the most interesting feature in the history of the state before 1860. — Before the revolution the upper country had comparatively little intercourse with the lower country, and hardly any political power. During the revolution it was one of the strongholds of the tory party of the state, and political power was carefully conserved by the lower country. This design will explain the first constitutions of the state, in which the number of delegates in the lower house was so apportioned to the districts as to give control to the lower country; and the choice of other state officers was given to the legislature. As soon, however, as state politics settled down into orderly development, it became evident that no such unilateral arrangement could be permanent. The tendency to the formation of a white democracy, in which the property of the lower country would be at the mercy of the population of the upper country, was so strong, and created so much angry feeling, that, in 1807, a compromise was agreed upon, and, in 1808, it was ratified as a part of the constitution. Its provisions will be found in Calhoun's works, as cited below. In brief, it fixed the number of members of the lower house at 124, 62 representing white population, and 62 taxation. Every ten years the white population and the taxes paid for ten years past were to be ascertained; and each district was to be entitled, for the next ten years, to one representative for each sixty-second part of either the total white population, or the total amount of taxes paid. In this way any undue exercise of taxing power by the upper country would remedy itself; for it would, for the next ten years, increase the representation of the districts on which undue taxes should be levied. To whatever the result is to be ascribed, to this compromise or to the increase of slaveholding influence, it is certain, that,

from 1808 until the overthrow of this compromise by the reconstruction constitution of 1868, there were really no separate parties in the state, and no bitterness of party conflict. — The formation of the federalist and anti-federalist party division in 1787-8 brought about a curious contradiction to previous history. Many of the leaders of the lower country, who had been ardent whigs during the revolution, had been educated in England, retained no abiding animosity to that country, and, as they represented commercial interests, were federalists by nature, even though the policy of their party might lead to friendship with Great Britain. On the contrary, the spirit of local independence, and a general opposition to the lower country, made the rest of the state as warmly anti-federalist. The division is plainly shown in the vote in the legislature on calling a convention to consider the constitution in 1788. Of the twenty-nine districts or parishes in the state, only five were divided: the parishes on the coast were as generally unanimous in favor of calling the convention as the parishes in the upper country were unanimous against it. The convention was only called at last by a vote of 76 to 75. In the convention the constitution was ratified, May 23, 1788, by a vote of 149 to 73. The division in the vote was not so striking as in the convention, seventeen parishes or districts being now divided; but the line of division was still very perceptible. — For some years after the adoption of the constitution the federalists retained a general control of the state, due rather to their wealth and ability than to their numbers. They gave three great leaders to the national federal party: Charles Cotesworth Pinckney (see his name); and William Smith and Robert G. Harper, two of the ablest congressional debaters of their party. When the legislature came to choose electors in 1792, they obtained the second votes of seven of the state's eight electors for John Adams. Before another presidential election the opposition had fairly taken form, and in 1796 the eight electors voted for Jefferson and Thomas Pinckney. In 1800, when the battle between federalists and democrats had become general and defined, the popularity of Charles C. Pinckney in his own state gave him the federalist support for vice-president. (See CAUCUS, CONGRESSIONAL.) The democrats in the legislature offered to compromise by choosing electors pledged to Jefferson and Pinckney, and this, as it afterward proved, would have made Pinckney vice-president, instead of Burr. An indiscreet letter, written by Adams, and censuring Pinckney's public conduct, had recently come to light, and would have been a fair excuse to an ordinary politician for abandoning Adams. But Pinckney rejected the compromise, and stood by his colleague; and both fell together. The legislature chose electors, who voted for Jefferson and Burr; and this was the deciding state. — From this time the state, in national politics, was a unit, its small federalist element disappearing after its first great defeat. In state politics the only element of discord was

removed by the compromise of 1808. For half a century the political history of the state is an absolute blank, with the single exception of the nullification contest. (See NULLIFICATION.) In that struggle the nullification leaders were Calhoun, Senator Hayne, Gov. Hamilton, Preston (afterward senator), McDuffie and Hammond (afterward governors), and Rhett. The "Union party" was led by Poinsett, Huger, Petigru, Legaré, Grimké, Drayton, Memminger, and others; but it must be remembered that the Union party generally by no means denied the right to secede, only the right to disobey the laws of the Union, while remaining in the Union. And, further, the opposition of nullifiers, like Calhoun and Preston, to the Jackson school of national democratic leaders, was a reason for their being often classed as whigs until 1843-4. (See WHIG PARTY, II.) In fact, men of all parties in the state were generally ultra democrats, secessionists in ultimate theory, and differing in practice only. — After the termination of the nullification struggle the state remained in political repose until 1860. For ten years before that date she was ready to secede at any time upon a promise of support by one or more other states. In 1860, having secured the desired assurances, the state seceded, and became one of the confederate states. (See SECESSION, CONFEDERATE STATES.) With a voting population of 47,000 in 1860, she furnished 60,000 soldiers to the confederate armies, and at the close of the rebellion was well nigh exhausted. The marks of the exhaustion are still visible in the census of 1870, in which the state shows a slight decrease of white population since 1860, in spite of five years' recuperation. Alabama is the only other seceding state which shows the same indication. — In May, 1865, some feeble efforts at self assertion by the state government were suppressed by the federal authorities, and Benj. F. Perry was appointed provisional governor, June 30. Under his guidance the convention of 1865, which rescinded the ordinance of secession, was held, a constitution adopted, and a governor and legislature elected. The new legislature met Oct. 25, and the new governor was inaugurated Nov. 29. The state government ratified the 13th amendment, and a code of laws permitting and regulating apprenticeship of laborers until the age of twenty-one in males and eighteen in females, and specifying the rights and duties of employers and employed. At the following session of the legislature an effort was made to remove the dislike of the negroes to the "black code" by the passage of a bill giving all civil rights, to sue and be sued, etc., to the freedmen; but the 14th amendment was rejected. — Under the reconstruction act (see RECONSTRUCTION), Maj. Gen. D. E. Sickles was appointed military governor March 11, 1867. He was removed Aug. 26, and was succeeded by Maj. Gen. E. R. S. Canby. The registration showed 78,982 colored and 46,346 white voters. A convention was ordered by overwhelming votes, the state constitution of 1868 was adopted, and the state was readmitted, June 25. The new state

officers had all been nominated by the convention which framed the constitution, sitting as a republican nominating convention. Four of them, Gov. Scott, the state treasurer, N. G. Parker, the comptroller general, J. J. Neagle, and the attorney general, D. H. Chamberlain, were northern men, or "carpet-baggers"; the secretary of state, F. L. Cardozo, was a native freedman; and the adjutant general, F. J. Moses, was a native white. One of them, Moses, has since been imprisoned in New York for theft; all of them, with the exception of their ablest member, Chamberlain, seem to have been personally and shamelessly dishonest. The legislature, composed mainly of freedmen, without property, education, political experience, or sense of responsibility, was probably the most openly corrupt legislative body that ever held sessions in the United States. Details of its proceedings would be tedious and useless; they can be most easily reached in Pike's work, cited below. One instance will be sufficient: the state debt was officially reported in 1868 at \$5,407,306.27; in 1872 at \$17,557,000; and in 1873 at \$20,333,901.10. In 1871 a legislative investigating committee reported that the state officers had over-issued bonds and defrauded the state to the amount of \$6,314,000; but the legislature, by a large majority, refused to impeach them. One defaulting official defied a legislative committee to indict him, unless the legislature should first pass a bill to enlarge the penitentiary, since he intended to take at least half of them thither with him. — Ku-klux outrages in the state seem to have fairly begun in 1870, though they were alleged to have taken place previously. In 1871 they had become a prominent feature in elections (see *KU-KLUX KLAN*), but were unsuccessful in their object of suppressing the negro vote. In 1874 came the first sign of defeat for the dominant party: a part of it refused to support the regular nominations, and the nominations of this faction were supported by the democrats, and defeated by a much smaller majority than usual. In 1876 came the final struggle between property and population for the control of the state. From the beginning it was marked by hardly suppressed disorder. Massacres of negroes took place at several points, in one of which, at Hamburg, July 9, the assaulting party of whites was led by a negro justice of the peace. Nov. 21, the returning board declared the republican presidential electors successful by an average vote of 91,672 to 90,856; most of the republican candidates for state offices successful by very similar votes; and no party majority in the lower house of the legislature, owing to the board's refusal to give any certificates for Edgefield and Laurens counties, where fraud and violence were charged. In the senate there was a small but undisputed republican majority. On the meeting of the legislature, which was to canvass the votes for governor, Gov. Chamberlain used federal troops to exclude the Edgefield and Laurens members from the state house. Thereupon they, with the other democratic members, sixty-four in all, formed one house, and the fifty-

nine republican members another. Dec. 5, the senate and the republicans declared Chamberlain elected, casting out the vote of the two counties above named; a week later the democratic house, with part of the senate, declared Wade Hampton elected. Hampton obtained the office in April following. (See *INSURRECTION*, II.)— Since 1877 there has been practically no republican opposition in state elections, nor, generally, in congressional elections. In 1882 one republican congressman was seated after a contest. In the presidential election of 1880, 58,071 republican to 112,312 democratic votes were cast. In the legislature of 1882 the republicans have but two senators out of thirty-four, and five representatives out of 124. How long this state of affairs can last is a difficult question. One answer to it may perhaps be the restoration in some form, by common consent, of the venerable compromise of 1808, which was abrogated in 1868. The effort to exclude property representation altogether has resulted in the entire exclusion of the popular majority from power: an equitable division of power between the two might possibly solve the problem. — The roll of South Carolina names which have reached exceptional distinction in American politics is very large. The most distinguished are those of Calhoun and C. C. Pinckney. (See their names.) Others are as follows, democrats unless otherwise specified: William Aiken, governor 1844-6, congressman 1851-7; R. W. Barnwell, congressman 1829-33; United States senator 1850-51, and a member of the confederate states senate 1862-5; M. L. Bonham, congressman 1857-60, brigadier general in the confederate army, confederate congressman 1861-2, and governor 1862-4; Preston S. Brooks (see his name); Ædanus Burke, state judge and chancellor 1778-1802, and congressman 1789-91 (see *CINCINNATI*); Armistead Burt, congressman 1843-53; Andrew P. Butler, state judge 1835-46, and United States senator 1846-57; M. C. Butler, major general in the confederate army, and United States senator 1877-87; Langdon Cheves, congressman 1811-15 (see *DEMOCRATIC PARTY*, III.), and president of the bank of the United States in 1819; William Drayton, congressman 1825-33; William Henry Drayton, state judge and chief justice 1771-7, and author of a widely circulated whig charge to a grand jury in April, 1776; Christopher Gadsden, a revolutionary leader, delegate to the stamp act congress in 1765, and to the continental congress 1774-6; John Gaillard, United States senator 1805-26, and president of the senate 1814-19 and 1820-25; James Hamilton, congressman 1823-9, and governor 1830-32 (see *NULLIFICATION*); James H. Hammond, congressman 1835-6, governor 1842-4, United States senator 1857-60, and an ultra pro-slavery author and debater; Wade Hampton, governor 1876-9, and United States senator 1879-85; R. G. Harper, federalist congressman 1795-1801 (see *MARYLAND*); Robert Y. Hayne, attorney general 1818-22, United States senator 1823-32, and governor 1832-4 (see *NULLIFICATION*); Ralph Izard, commissioner to

Tuscany 1777-9, delegate to congress 1781-3, and United States senator 1789-95; Lawrence M. Keitt, congressman 1853-60 (see Brooks, P. S.), killed at Cold Harbor in 1864; Henry Laurens, delegate to congress 1777-80, minister to Holland 1780-81, and one of the negotiators in 1782-3; Hugh S. Legaré, attorney general 1830-32, chargé at Brussels 1832-6, congressman 1837-9, and attorney general under Tyler; William Lowndes, congressman 1811-22 (see DEMOCRATIC PARTY, III); George M'Duffie, congressman 1821-34, governor 1834-6, and United States senator 1843-6; John McQueen, congressman 1849-60, and confederate congressman 1862-4; Charles G. Memminger, confederate secretary of the treasury, 1861-4; Arthur Middleton, delegate to congress 1776-8 and 1781-3; Henry Middleton (son of the preceding), governor 1810-12, congressman 1815-19, and minister to Russia 1820-30; James L. Orr, congressman 1849-59, confederate senator 1862-5, governor (republican) 1865-8, and minister to Russia 1872-3; Francis W. Pickens, congressman 1834-43, minister to Russia 1858-60, and governor 1860-62; Charles Pinckney, delegate to congress 1777-8 and 1784-7, and to the convention of 1787, governor 1789-92, 1796-8 and 1806-8, United States senator 1797-1801, minister to Spain 1803-5, and congressman 1819-21 (see ELECTORS); Joel R. Poinsett, congressman 1821-5, minister to Mexico 1825-9, and secretary of war under Van Buren; Wm. C. Preston, United States senator 1833-42, president of the college of South Carolina, and an eloquent speaker; Robert Barnwell Rhett (name changed in 1837 from Smith to Rhett, to obtain a legacy), congressman 1837-49, U. S. senator 1851-2, and a leader in secession; Edward Rutledge, delegate to congress 1774-7, and governor 1798-1800; John Rutledge, delegate to congress 1774-7 and 1782-3, governor 1776-8 and 1779-82, justice of the U. S. supreme court 1789-91, and appointed chief justice in 1795, but not confirmed by the senate because of his intemperate opposition to Jay's treaty; William Smith, federalist congressman 1789-97, and minister to Portugal 1797-1801; Thomas Sumter, a famous partisan leader in the revolution, congressman 1789-93 and 1797-1801, and United States senator 1801-10; Waddy Thompson, congressman 1835-41, and minister to Mexico 1842-4; and James L. Trenholm, confederate secretary of the treasury 1864-5. — See authorities under NORTH CAROLINA, GEORGIA, NULLIFICATION, SECESSION, RECONSTRUCTION; 2 Poore's *Federal and State Constitutions*; Lawson's *History of Carolina* (to 1714); 2 Force's *Tracts*; Carroll's *Historical Collections of South Carolina* (to 1776); Gibbs' *Documentary History of the Revolution, chiefly in South Carolina* (1764-82); Drayton's *Memoirs of the Revolution, as relating to South Carolina* (1821); Rivers' *Early History of South Carolina*; Ramsay's *History of South Carolina*; Chase's *Life of Lowndes*; 6 Calhoun's *Works*, 254; 1 Olmstead's *Cotton Kingdom*, 206; Simms' *History of South Carolina* (continued to 1860); Pike's *The Prostrate State* (1873).

ALEXANDER JOHNSTON.

SOUTHERN CONFEDERACY. (See CONFEDERATE STATES.)

SOVEREIGNTY. I. *The Idea of Sovereignty.* The state is the embodiment and personification of the power of the people. The power of the people in its highest dignity and greatest force is sovereignty. — The word sovereignty originated in France, and the idea of sovereignty was for the first time developed by French science. Bodin raised it to the dignity of the fundamental idea of public or constitutional law. Since his time the word sovereignty and the idea have exercised a great influence on the entire development of the constitution of modern states as well as on politics. — During the middle ages the expression *souveraineté* (*suprema potestas*) was used in a still wider sense. Every board or authority competent to give a final decision, so that an appeal to a higher authority was impossible after such decision, was called a sovereign board. The highest courts of justice were called *cours souveraines*. Thus there were a great number of sovereign offices and corporations within the state. But gradually this name ceased to be given to mere offices and positions in the different branches of the administration, and it was finally given only to the highest power in the state, the power which controlled the whole. Hence the idea of sovereignty came to have a higher meaning, and to signify the concentrated fullness of political power or of the power of the state. The definition of the term sovereignty was controlled completely by the centralizing tendency of French politics, beginning with the sixteenth century, and by the struggle of the French kings for absolute power. Bodin had explained sovereignty as absolute, perpetual political power (*puissance absolue et perpétuelle d'une république*). Sovereignty was subsequently understood in this absolute sense. Not only Louis XIV., who called himself the state, but even the Jacobin convention of the French republic of 1793, attributed omnipotent political power to itself, as Louis had to himself. Both were wrong in doing so. The modern representative state knows nothing of absolute political power; and absolute independence does not exist anywhere on earth. Neither political freedom, nor the rights of the other organs and component parts of the state, are compatible with such unlimited sovereignty; and whenever men have sought to exercise it, history has condemned such usurpation. The state itself, as a whole, does not possess such omnipotence; for even the state is limited externally by the right of other states, and internally by its own nature, by the rights of its members, and those of the individuals within the state. — The characteristics of sovereignty are: 1. The independence of the power of the state of all *superordinated* political or state authority. Even this independence is to be understood as relative, and not as absolute. International law, which binds all states together by common rights, is no more in conflict with the sovereignty of states

than is constitutional law, which limits the exercise of the power of the state within the boundaries of the state. This renders it possible for certain territorial states to be still considered sovereign states, although in essential things, as for instance, in their foreign policy, etc., they are dependent on the greater aggregate state. 2. The highest political or state dignity, or what the ancient political language of Rome understood by the term *majestas*. 3. The plenitude of political or state power in contradistinction to mere partial authority. Sovereignty is not the sum of separate special rights, but the political aggregate right; it is a central idea with an energy similar to that of property in private law. 4. Further, the sovereign power is, by virtue of its nature, the supreme power in the state. Hence it follows, that no other political power within the state can be superordinated to it. The French *seigneurs* of the middle ages ceased to be sovereign when they were again compelled to subordinate themselves to their liege lord, the king, in all the essential relations of political independence and rank. The German electoral princes, after the fourteenth century, were able to claim sovereignty in their territories, because they really possessed, in their own right, the supreme political authority within the same. 5. The state being an organized body, the *unity* of sovereignty is accordingly a requisite of its well-being. The *partition* of sovereignty leads in its consequences to the paralysis or dissolution of the state, and hence is not compatible with the health of the state.—II. *State Sovereignty (Popular Sovereignty) and Regent Sovereignty.* To whom does sovereignty belong? The different political parties are inclined to answer this question in an entirely different sense, and science also has to remove many kinds of obstacles, and to overcome many prejudices, before it can succeed in reaching a simple and true solution of the question.—1. A widely spread opinion, particularly since the time of Rousseau and the French revolution, answers: To the people; and declares itself in favor of the principle of the so-called sovereignty of the people. But we must first inquire, What does this opinion understand by the "people"? By the "people" some understand simply the sum total of the individuals who find themselves brought together in the state; that is, they, in thought, resolve the state into its elements, and attribute the highest power to the inorganic mass, or the majority of these individuals. This extremely radical opinion is manifestly in contradiction with the existence of the state, which is the foundation of sovereignty. Hence it is not compatible with the constitution of any state, not even with absolute democracy, of which it pretends to be the foundation; for even in an absolute democracy it is the regular assembly of the people, and not the atomized multitude, that exercises the state power.—2. Still others understand by "people" the collective, equal citizens of the state, who, assembled in commonalties, give expression to their will; that is, they under-

stand by people the sovereignty of the *demos*, in democracy. When limited to this form of the state, the principle of popular sovereignty, thus understood, has certainly some sense and truth in it; it is then literally synonymous with democracy. But even in the case of representative democracy the principle loses its application in great part, because in the regular action of the state the supreme power is not exercised directly by the citizens, but indirectly by their representatives. The principle is entirely incompatible with all other forms of the state on which it makes the strange claim that the head of the state should place himself on an equality with the meanest citizen, and that those governing, being the minority, should subordinate themselves to the governed, or the majority. In the body politic this principle assigns to the feet the place of the head, and to the head the place of the feet.—3. It sometimes happens that the two opinions are not sharply distinguished from one another, but that they fade one into the other. The one is anarchical, the other absolute-democratic. Their defenders, however, maintain the universal validity of both. Yet the danger of this theory consists precisely in the fact, that its recognition presupposes and demands in principle the complete overthrow of all other forms of the state, with the sole exception of direct democracy, and the transformation of the former into the latter.—This opinion, accordingly, has been advocated by decidedly antagonistic parties, but still (if indeed consciously) only by those who were dissatisfied with the existing political organization or government, and strove to undermine and overthrow it. Hence it became a terrific weapon of destruction in the hand of the French revolution. Even the national assembly, in its declaration of war of April 20, 1792, officially proclaimed Rousseau's theory: "The French nation has undoubtedly declared, that sovereignty belongs only to the people, who, limited in the exercise of its highest will by the rights of succeeding generations, can not confer any irrevocable power; the nation frankly acknowledges, that no tradition, no legal decree, no declaration, no contract, can subject the society of men to any authority in such a manner that the nation should no longer have the right of revoking such power. Every people has alone the power to give itself its laws, and the inalienable right of changing its laws. This right, in its fullest extent, belongs either to no one or to all." The subsequent convention disclosed the further consequences of this principle after the destruction of the monarchy. But even in our own days we have heard the proclamation of the same principle at the Paris Hôtel de Ville.—In February, 1848, the constitutional monarchy was abolished, the republic proclaimed, and the dictatorship of an improvised government appointed by a similar sovereign act of the excited Parisian population. In an official declaration drawn up by Lamartine himself, we read: "Every Frenchman who has reached the age of manhood is a citizen of the state, and every citizen is a voter."

Every voter is a sovereign. The law is equal, and is absolute for all. No citizen can say to another: You are sovereign to a greater extent than I; consider well your power; be prepared to exercise it; and be worthy of taking possession of your lordship."—4. The endeavors of certain French statesmen to oppose to this ruinous idea of the sovereignty of the people (an idea which either destroys all constitutional and public law, in order to give a foundation to the majesty of the state, or which transforms all states into democracies) the idea of a sovereignty of reason and justice, were indeed well meant, but they did not prove satisfactory. By appealing to either reason or justice they thought they could do away with the abuse which the people might make of its sovereignty. This notion, however, overlooks the fact that the right belongs only to the person, but sovereignty only to a political personality, by which it must be exercised according to the principles of reason and justice. To the error which recognizes in absolute democracy the only fundamental form of the state, we thus find opposed here another error, the error of idiocracy, with its well-meant intention of guiding the majority of the people by the supremacy of an idea. But this contradiction remains without result, because the power of personality is stronger than any fiction.—5. Another opinion calls the *nation*, considered as a unit, and as capable of organization, even if it be not yet organized or only insufficiently organized, with its instincts, its language and its social differences, the *people*, and ascribes to the *nation* the right to change the form of the *state* at its pleasure. A *nation* has a tendency to constitute itself into a *people*, and hence into a state (see NATIONALITIES, PRINCIPLE OF); and therefore we must admit that the germs of sovereignty lie in the nation, and that the nation has a tendency to develop sovereignty out of them; but that it shall develop sovereignty is only a possibility. (See NATION.) Popular sovereignty, in this sense, or, more correctly, national sovereignty, is accordingly an unripe, undeveloped, ante-state idea, which had to await the actual growth of states in order to become realized in a state form.—6. But in a political sense we may and even must understand by *people*, the ordered aggregate of head and members which we recognize as the living soul of the personality of the state. In so far as the state appears as a person, independence, the highest honor, the plenitude of power, supreme authority, and unity, that is, sovereignty, undoubtedly belong to it. The state as a person is sovereign. Hence this sovereignty is called the sovereignty of the state. Sovereignty does not exist before the state, nor outside the state, nor above the state; it is the power and majesty of the state itself. It is the right of the whole; and as certainly as the whole is more powerful than any part of that whole, just as certainly is the sovereignty of the whole state superior to the sovereignty of a single member within the state. If, through the strife of parties, language had not

been distorted, it would seem perfectly legitimate to call state sovereignty, as here defined, the sovereignty of the people, understanding by "people," not a loose multitude of individuals, but the politically organized whole, in which the head holds the highest position and has the highest duty to perform, and in which every individual fills the place and performs the task best suited to his nature. In this sense French publicists have called this sovereignty *souveraineté de la nation*. But nowadays this designation would be liable to the most deplorable misunderstandings, and for this reason we have preferred the unequivocal expression state sovereignty. This state sovereignty manifests itself both externally and internally; externally as the self-dependence and independence of every single state in respect to every other single state, and in relation of the secular power to the church; internally it manifests itself as the legislative power of the whole body of the people. In this sense the English are wont to ascribe sovereignty to their parliament, at the head of which is the king, and which represents the whole people. Yet this is not a peculiarity of English constitutional law, but a fundamental view of the constitutions of modern representative states in general, a view which does, indeed, regard the prince as the head, and for that very reason as a member of the *people*, and which ascribes the highest actual exercise of sovereignty, legislation, not to the head alone, but to the head in connection with the representative body, in other words, to the whole body of the state. The patrimonial doctrine of the state, which regards the state as the property of the prince, and hence attributes sovereignty only to the prince, and the absolutist doctrine of the state, which identifies the state with the prince, and thus looks upon state sovereignty as princely sovereignty, alike ignore the important principle that all the power of the prince is essentially only the concentrated and condensed power of the people, and that the people and the state continue a legal entity despite the downfall of princes and the extinction of dynasties.—7. Besides this sovereignty dwelling in the whole body of the state or of the people, there is also within the state a sovereignty of the head of the state, to wit, the sovereignty of the ruler, or, because it is most apparent in monarchy, what is called the sovereignty of the prince. In relation to all other single members of the organism of the state, and in relation to individual citizens of the state, the supreme head of the nation possesses the highest power and occupies the highest position—a power and position which properly belong to him. Thus, in English constitutional law, the king is in a special manner styled sovereign. Thus, too, in every monarchical state, sovereignty is ascribed to the monarch as such. There is, however, no contradiction between state sovereignty and the sovereignty of the prince, above referred to. Sovereignty is not divided, from the fact that one-half is given to the people, and the other to the prince. Their relation is not that of two jealous powers, struggling for supremacy. In both there is unity

and plenitude of power; but it is manifest that the *whole*, in which the *head*, in accordance with its highest position in the body politic, is included, is superordinated even to the head considered in itself alone and apart from the whole. The whole people (the state) makes the law, but within its limits the head of the state moves with complete freedom in the exercise of the supreme power that belongs to him. State sovereignty is chiefly the sovereignty of the law; the sovereignty of the prince is chiefly that of government. Where the former is at rest, the latter is active. A real conflict can not easily take place between them; a conflict between them at all points is, in principle, not possible; for such a conflict would be the conflict of the supreme head considered in itself alone with the supreme head in connection with the remaining members of the state; that is, it would suppose a conflict of the same person with himself. While thus there is no conceivable peace between the democratic sovereignty of the people and the sovereignty of the prince, and while the one must necessarily subjugate and abolish the other, there exists between the sovereignty of the state and the sovereignty of the prince the same harmony that exists between the whole man and his head. — III. *What the Sovereignty of the State includes.* 1. The people, politically organized, the state, has first of all, a right to the recognition of, and respect for, its dignity and supremacy; or, as the Romans termed it, respect for its *majesty*. Hence every serious injury to the honor, power and even to the established order of the Roman state, was considered by the Romans as a *crimen læsæ majestatis*. — 2. The independence of the state of foreign states is, further, a necessary quality and effect of its sovereignty. When a state is compelled to acknowledge the political superordination of another state it loses its sovereignty, and submits itself to the sovereignty of the latter. Still, all subordination of a state does not completely destroy its sovereignty, because the dependence which that subordination implies is not an absolute one, and because its original independence and self-dependence reappear in many circumstances. In composite states, confederations, federal states and kingdoms, the individual states, although in certain respects subordinated to the whole, still, as states, possess a relative sovereignty, limited, not as to its content, but as to its extent. Thus in Switzerland they speak of cantonal sovereignty when reference is had to the affairs of the confederation. Similarly in the United States and in the German Empire we must distinguish between the sovereignty of the aggregate state (union, empire) and that of the states belonging to the confederation. We can, however, speak of the relative sovereignty of individual states subordinated to an aggregate state (confederation or empire) only where the individual state is itself organized as a state, that is, where it has all the essential organs of a

state (legislative bodies, governments, etc.,) and a state life peculiar to itself; but we can not speak of such relative sovereignty of the individual state subordinated to an aggregate state when it has to the whole the relation of a mere part of that whole, the relation of a province, for instance. As in all that is relative, there is here, too, a scarcely perceptible transition from the one thing to another. Externally the sovereignty of the state in our time is ordinarily represented by the head of the state, not by the legislative body, but this rather from motives of expediency than from juristic reasons. — 3. At home, sovereignty finds its chief expression in the right of the people independently to determine the forms of its political existence, and, in case of need, to change them. What can not be conceded to a part of the people, to the mere majority of the people without the government, undoubtedly belongs to the aggregate people in its political organization. The individual subject should not oppose the ordinances of the people, even when his political rights are injured by such ordinances: for if the state is to preserve its unity, its cohesion and order, the individual, in the domain of public law, must subordinate himself to the highest power in the state. — It certainly is not a matter of indifference, in passing a moral or legal judgment on the change, whether it takes place by the way of reform or of revolution. Reform supposes, first, that the change is introduced by the organism empowered by the constitution to make it, and hence, that in constitutional representative states, it is introduced by the legislative body representing the whole nation; that is, that it is made formally conformable to law. Second, that even in the transformation of the law the spirit of the law is respected; and hence, that the law which it is proposed to change or repeal, should be set aside only to the extent that it has become obsolete or unsuitable, and that new law should be allowed to come into force only in so far as it seems to be mature and to have its foundation in the new circumstances of the people's life. If either the form of the constitution is disregarded, or if the principle of right be violated in the change, such an act is not reform, but revolution. The right of reform is a necessary expression of the vital energy of the state. To contest this right, is to deny the development of the people, and to cause revolution. — But the radical doctrine of the state also maintains the right of the people to revolution. The idea of public law, however, opposes this assumption; for revolution is either a violent breach of the existing constitution of the state, or else a violation of the principles of legal right. For this reason revolutions, as a rule, are not legal acts, although they may be powerful natural phenomena which change public law. When the unchained natural forces which are passionately excited in the nation produce and determine a revolution, the regular efficiency of public law is disturbed. In the face of events of this kind, public law is powerless. It is unable to draw the revolution within the sphere of its norms

and laws. One of the greatest tasks of politics is to guide a revolution which has broken out into the regular paths of reform and political order. If the law was too weak to prevent, or reform too slow to anticipate, revolution, neither the one nor the other, nor both together, can now control it. Hence we can speak only by way of exception of a right of revolution, and only in the sense of a right of self-defense of the people, to save its existence, or to realize its necessary development, when the avenues of reform have been closed. The constitution is, after all, only the external organization of the people. If by the constitution the state incurs the danger of ruin, or if by it the life of the people has been paralyzed, or the vital interests of public well-being have been endangered, the principle of self-defense should be applied. "Necessity knows no law."—4. State sovereignty embraces the power of making the necessary laws. The legislative power, in the narrower sense of the term, like the constitutive power, flows from the sovereignty of the state, and is at the same time its regular revelation.—5. But further still, on the sovereignty of the state, in principle, rest all other powers of the state, for which reason the constitution and legislation limit and regulate all other expressions of sovereignty.—6. *Irresponsibility*. From the higher point of view, there really exists no irresponsibility of men in regard to their doings or omissions. In fact, the eternal judgment of God of this world excludes the idea of the irresponsibility even of nations. Even on earth, in the destinies and sufferings of peoples, this responsibility is not unfrequently painfully felt. But it is impossible within a state to establish a tribunal before which the whole people, or its representatives, as holders of the supreme power of the state, can be called to account. If this were attempted, the state itself would to that extent at least be subject to this tribunal, and thus a member would be placed higher than the body, the part above the whole. But if a state, in the execution of its sovereignty, should be responsible to another state, its sovereignty on that account would be a limited one, and subordinate to the higher sovereignty of the judging state. Only by the further development of international law, or by a higher political organization of the world, before which individual sovereign states would have to bow, as to an aggregate empire, could the political responsibility of individual states be organized. It may be reserved for the future to realize this idea. At present it is only an idea.—7. All particular state powers, on the contrary, are responsible to the sovereignty of the state.—IV. The second kind of sovereignty, the sovereignty which belongs only to the head of the state, is recognized in modern public law only in monarchy. Only the monarch, not the president of a republic, although the latter exercises rights of sovereignty, has, according to modern public law, a personal claim to be regarded as sovereign.* J. C. BLUNTSCHLI.

SOVEREIGNTY (IN U. S. HISTORY). (See POPULAR SOVEREIGNTY.)

SPAIN. This country, which occupies the greater portion of the Iberian peninsula, and includes the Balearic isles and the Canaries, ex-

Armstrong & Co., 1878), "are applicable to persons and to states; moreover, from the intimate connection between the state as a political organism and the territory where the laws prevail, the territory itself may be called a sovereignty, or the expression may be explained in the last case with greater reason as denoting something held in sovereignty, a province or district which is not dependent. The first notion in the word was that of being above or higher than others in power and jurisdiction. Thus, the sovereign ruler is above all other officers or magistrates, and above all the individuals belonging to the people. The quality of sovereignty, however, does not necessarily imply unlimited power or unchecked power; much less undelegated power. It can be used of all kingly and imperial power, from that of a chief officer of state who is absolute, to the king who can do nothing without a legislative assembly. It has not, however, if we do not err, ever been applied to the head of a democratic state whose office ceases after a term of years. For the most part, when used at present, it is either of dignity, denoting the superior person in the state or nation, or else it is used of a ruler who can control the policy of a nation toward other nations in matters of diplomacy. Thus, the king or queen of England, although having, in matter of fact, an exceedingly limited power, is called sovereign, to denote the dignity of the office as above all others in the kingdom, or as having constitutionally the power to control foreign relations, a power unchecked in theory, yet practically not expressing the sovereign's personal will.—The abstract conception of sovereignty is thus unfolded by Mr. John Austin in the sixth of his lectures on 'The Province of Jurisprudence,' (i., p. 226, ed. 3): 'If a determinate human superior, not in the habit of obedience to a like superior, receive *habitual obedience* from the *bulk* of a given society, that determinate superior is sovereign in that society, and the society (including the superior) is a society political and independent. To that determinate superior the other members of the society are *subject*; or on that determinate superior the other members of the society are *dependent*. The mutual relation which subsists between that superior and them may be styled the relation of sovereign and subject, or the relation of sovereignty and subjection.' This definition looks at fact simply, and has nothing whatever to do with right. The *habitual* obedience would seem to be absolute, but persons called sovereigns at the present day have no right to require habitual obedience except within a very narrow sphere. *Subjection* is now used, if used at all in politics, of relations that are not personal, the term being retained while the feudal notion has left it. And again, few, I presume, of the subjects of the sovereign of Great Britain would allow to themselves be called dependents on the sovereign.—But what is the sovereignty of a state? and how does it comport with the sovereignty of a ruler? In the intercourse of nations, certain states have a position of entire independence of others, and can perform all those acts which it is possible for any state to perform in this particular sphere. These same states have also entire power of self-government, that is, of independence upon all other states as far as their own territory and citizens not living abroad are concerned. No foreign power or law can have control except by convention. This power of independent action in external and internal relations constitutes complete sovereignty. This definition of sovereign states would be inconsistent with the claim of sovereignty which has been set up in this country by communities called states, and in the treaty of 1783 with Great Britain called sovereign states; which, however, never made a treaty separately with foreign nations, never belonged in their separate capacity to the community of nations, and are incapacitated by the constitution from performing any international act; and which, moreover, by the same constitution, are precluded from doing many things within their own territory and in the exercise of state power, which sovereign states do and must do. This use of the word *sovereignty*, and, indeed, the use of the word *state*, shows the poverty of political language, but has helped on far

* "The words sovereign and sovereignty," says Theodore D. Woolsey ("Political Science," etc., New York, Scribner,

tends over 507,036 square kilometres, and contained, according to the census of 1860, 15,658,000 inhabitants. Spain had perhaps sixteen millions in 1873 — The last general enumeration of the population took place on Dec. 31, 1877, the returns showing that at that date the kingdom, including the Balearic and Canary islands ("Baleares" and "Canárias," each considered a province), and the small strip of territory in North Africa, facing Gibraltar, had a total population of 16,625,860, comprising 8,134,659 males and 8,491,201 females. — The vast majority of the inhabitants of Spain are natives of the country, the aliens being less numerous than in any other state of Europe. According to the census returns of Dec. 31, 1877, there were at that date only 26,834 resident foreigners, the mass of them in four provinces, namely, Barcelona, Cadiz, Gerona and Madrid. The number in the province of Barcelona was 4,392, comprising 2,490 males and 1,902 females; while in the province of Cadiz the number was 3,321, comprising 1,866 males and 1,455 females. — The progress of population did not amount to more than 75 per cent. in the course of the last hundred years. In 1768 the population was calculated to number 9,307,800 souls; in 1789 it had risen to 10,061,480; and in 1797 it exceeded 12,000,000 souls. In 1820 it had fallen to 11,000,000, but in 1823 it had again risen to 12,000,000, and in 1828 to 13,698,029. At a census taken in 1846 the population was found to be 12,168,774, and it was 16,301,851 at the census of 1860. Finally, at the census of 1877 the population amounted, as before shown, to 16,625,860, being an increase of 324,009 in the course of seventeen years, or at the rate of about $\frac{1}{2}$ per cent. per annum. The present density of population is considerably less than half that of Italy, and less than one-third that of The Netherlands. — There were, at the census of Dec. 31, 1877, fourteen towns in Spain

greater evils than that of supplying false premises for syllogisms ending in secession. — Is the sovereignty of the state a term emanating from the sovereignty of the ruler? or is the ruler properly called a sovereign only as representing the state? The state stands for an untold amount of good to be secured to present and future generations by a just and wise government, at the head of which the ruler is placed. He is a means for a great permanent end; he dies, and some one else succeeds to him, and not by his will, for the most part, but by the law of the state. He disobeys the law, and seeks to overturn it; another is substituted for him, and all things go on, it may be, better than before. All this shows that the ultimate power in theory rests with the state or the people constituting it, and that the prince is a delegate or deputed sovereign. Thus of course touches the source of his power, and the object for which it is granted. The power itself may be absolute, and the grant may have been made in remote ages. The prince is a vicar of God, just as receivers of tribute are 'God's ministers, attending continually upon this very thing.' But he is such because the state and its authority are from God, and because he fulfills the end for which the helm of state is intrusted to him. If some democrats of the French school have talked of cashiering kings, the grossness of taste, and want of reverence for old dignities, were the result of an ill use of sovereign power. If the French kings had felt that they were created to minister rather than to be ministered unto, that their power, called sovereign, was delegated to them, the outrages of an extreme reaction against their sway might have been spared to the world."

with a population of over 50,000. The following is a list of these towns, with the number of their inhabitants:

Madrid	897,690	Granada	76,106
Barcelona	249,108	Cartagena	75,906
Valencia	143,856	Cadiz	65,028
Sevilla	133,938	Xeres de la Frontera	64,533
Malaga	115,882	Palma	58,234
Murcia	91,805	Lorca	62,934
Zaragoza	84,575	Valladolid	52,206

— Nearly 46 per cent. of the whole surface of the kingdom is still uncultivated. The soil is subdivided among a very large number of proprietors. Of 3,426,083 recorded assessments to the property tax, there are 624,920 properties which pay from 1 to 10 reals; 511,666 from 10 to 20 reals; 642,377 from 20 to 40 reals; 788,184, from 40 to 100 reals; 416,546, from 100 to 200 reals; 165,202, from 200 to 500 reals; while the rest, to the number of 279,188, are larger estates, charged from 500 to 10,000 reals and upward. The subdivision of the soil is partly the work of recent years, for in 1800 the number of farms amounted only to 677,520, in the hands of 273,760 proprietors and 403,760 farmers. — I. *Constitution.* At the end of the last century there was left no tradition of the ancient cortes of Castile, Aragon, Valentia and Catalonia, which were so powerful during the middle ages. The only vestiges of them which remained did not go beyond the empty ceremony in which an oath was taken to the prince of the Asturias. — The war of independence roused the Spanish nation, which had been accustomed to absolute monarchy, from its slumber. Deprived of its kings, the necessities of the time obliged it to appoint a regency, which, in order to gain more prestige and a greater authority, convoked the cortes. The deputies, assembled at Cadiz, dictated the constitution of 1812, which was the origin of representative government in Spain. — It would be vain to look on their work as the restoration of Spain's ancient liberties, which now belong exclusively to history. Nothing will be found in it but an echo of the ideas proclaimed by the French revolution of 1789. The spirit which reigns in it is the spirit of democracy, as is shown, beyond a doubt, by the establishment of a single chamber and the suspensive veto. — Once on the throne again, Ferdinand VII. re-established the ancient régime pure and simple. A military insurrection in 1820 restored a breath of life to the liberal system, which in 1823 fell a second time under the influence of internal dissensions, aided by the intervention of France on behalf of absolute monarchy, on which Europe looked complacently. — It was easy to foresee, that, with the death of Ferdinand, an inevitable change would take place in the form of government. Isabella II. succeeded him, at the age of three years, under the guardianship of her mother, Maria Christina, of Naples. The infante Don Carlos, brother of the king, and representative of the party opposed to all reform, considered himself injured in his rights, and the quarrel which ensued made it necessary to strengthen the new legitimist order by the sup-

port of liberal opinions. Still, there was no thought of restoring the constitution of 1812; it was believed that the people could be satisfied with something less; and in 1834 the royal statute was promulgated and a charter granted, establishing two chambers, the one of the *grandees* of the nation (*estamento próceres*), the other of its representatives (*estamento de procuradores*), to whom was conceded not the initiative in the drawing up of bills, but the simple power of deliberating on those which might be presented to them by the ministers, together with an altogether derisive right of petition. — While war desolated Spain, disorder was increased by the manœuvres of the more or less ardent partisans of political progress. In 1836, an insurrection having broken out at Granja, María Christina was forced to sign a decree restoring the constitution of Cadiz until such time as the nation, represented in the cortes, should reject it or frame one in harmony with the wants of the time. In 1837 the constituent chambers were assembled, and drew up a constitution very similar to that at present in force in Belgium. Later, the moderate party, having obtained power, undertook to correct, according to its doctrines, the work of the progressive party, and formed, with the assistance of the ordinary cortes, the constitution of 1845, which, with certain amendments (1857), is the constitution that continued in force until 1868, and which has a great resemblance to the French *charte*, amended in 1830. X. Y.

— *Spain, after the Revolution of 1868.* In September, 1868, a revolution put an end to the dynasty of the Bourbons. The revolutionary juntas undertook, first of all, to secure public order, a necessity imposed on every well-organized society. It was besides necessary, for the organization and concentration of power, to establish the unity of the government, and to call on men experienced in the management of public business to take the initiative in this task. The revolutionary junta of Madrid, therefore, delegated its powers to Gen. Serrano, duke de la Torre, whom it intrusted with the formation of a provisional government. He did this by raising to the first places in the state those men who had labored for the triumph of the revolution by the sword, by their words or their acts. The provisional government convoked constituent cortes. The people hastened to the polls; universal suffrage was for Spain an accomplished fact. It was necessary, to give a legal character to the general acts of the provisional government, to establish a political constitution different from those of 1812, 1837 and 1845, and to bring it into harmony with the new wants of the nation, and the political interests of popular parties. The cortes, in a number of sessions, some of which have remained memorable, finished the task which they had undertaken, and transformed the provisional government into an executive power. — The constitution of 1869 was the cause of great progress in political institutions. The

first title provided for individual liberty, the inviolability of a man's domicile, and the secrecy of letters, unless in case of offenses punishable by law. It also accorded the right of assembling and of association for all purposes not contrary to public morals. Every Spaniard, by its terms, acquired the right of expressing his ideas and opinions freely by speech, or through the press. The right of petition was recognized as belonging to all citizens except to the army. The nation pledged itself to maintain the Catholic religion and its ministers. The free practice of every other religion, in public or private, within the bounds prescribed by the general rules of morality and law, was guaranteed to all foreigners living in Spain. This provision applies to Spaniards professing a religion different from the Catholic. — That constitution guaranteed liberty of the press, and abolished its preliminary censure, etc. It allowed any one to found schools without the permission of the authorities. An important provision is that abolishing the requirement of a special permission to summon before the ordinary tribunals, public officials for any kind of misdemeanor. In case of a clear and evident violation of the provisions of the constitution, the official can not shield himself against responsibility by alleging an order emanating from his superiors. — Every Spaniard is obliged to take up arms in defense of his country whenever called upon to do so by law; to contribute to the expenses of the state in proportion to his means; in return he may aspire to every office and public employment, according to his merit and capacity. — Constitutional guarantees can not be suspended in the whole or in any part of the kingdom unless by law and for a given time, in extraordinary circumstances, and when demanded by public safety. Except in those extreme cases in which public safety might be endangered, the government has neither the right to exile nor to transport a Spanish citizen, nor to remove him farther than 250 kilometres from his domicile. — It is provided that every association, which, by its object or by the means which it employs, imperils the security of the state, shall be dissolved by law. — The constitution recognizes three public powers: the *legislative* power, the *executive* power and the *judicial* power. Sovereignty resides essentially in the nation, from which all powers emanate. The cortes make the laws; the king sanctions and promulgates them. The cortes are composed of two legislative assemblies, the senate and the congress (chamber of deputies), equal in power, except that the popular chamber has the priority in all discussions relative to taxation, public credit and recruiting. Congress is renewed every three years, and one-fourth of the senate during the same period. The cortes must remain in session at least four months each year, not including the time spent in organizing. They must be convoked before Feb. 1. Senators and deputies can not be arrested nor called before the courts during the time in which the cortes are in session, without the permission of the legislative

body of which they form a part, except in case they are taken *flagrante delicto*. The cortes have the right to appoint or to discharge, at will, the members of the court of accounts of the kingdom. In the case in which, in accordance with the vote of the congress, there is occasion to impeach a minister or a ministry, the senate constitutes itself a court of justice. In this case the chamber of deputies chooses a commission intrusted with conducting the impeachment. This commission and the members impeached may challenge one-third of the senators called to sit in judgment; the latter can not be chosen except from senators who have entered on their duties before the impeachment of the ministers. — Deputies are elected by universal suffrage. Every Spaniard aged twenty-five years, not having been sentenced for any crime, is a voter, and eligible to office. Election in two degrees is resorted to in the case of senators: they are nominated by commissioners chosen by universal suffrage, and by the members of the *deputations* or provincial assemblies. — King Amadeus, son of the King of Italy (duke of Aosta), was elected by 195 votes in the session of Nov. 19, 1869, and on Feb. 2 following he made his solemn entry into Madrid. The same day the regent of the kingdom resigned his powers into the hands of the assembly, and the king took the oath of fidelity to the constitution before the president, Don Manuel Ruiz Zorilla. The cortes pronounced their own dissolution in their capacity of constituent cortes.

F. H.

— *Republic of 1874*. The reign of King Amadeus lasted only until Feb. 10, 1873. A royal message explained the reason of the abdication. On Feb. 11 of the same year the cortes accepted the abdication, by 256 votes against 32, and proclaimed the republic. A deputation accompanied the king and his family to the frontiers.

M. B.

— *Restoration of the Monarchy in 1874, and present Constitution*. At the beginning of 1874 the republic was set aside by Serrano's regency. In the meantime the uprising in favor of Don Carlos had assumed greater dimensions. A dislike for the latter, and a desire for quiet and an orderly state of things, rendered the return of the younger branch of the Bourbons to the throne possible. Alfonso XII., son of Queen Isabella, and her husband, Francis de Assisi, was proclaimed king Dec. 30, 1874, and he succeeded in again restoring the monarchy to an orderly state. — The present constitution of Spain, drawn up by the government, and laid before a *cortes constituyentes*, elected for its ratification March 27, 1876, was proclaimed June 30, 1876. It consists of seventy-nine articles or clauses. The first of them enacts that Spain shall be a constitutional monarchy, the executive authority resting in the king, and the power to make the laws "in the cortes with the king." The cortes are composed of a senate and congress, equal in authority. There are three

classes of senators: first, senators by their own right, or *senadores de derecho propio*; secondly, 100 life senators, nominated by the crown; and thirdly, 130 senators, elected by the corporations of state, and by the largest payers of contributions. Senators in their own right are the sons, if any, of the king and of the immediate heir to the throne, who have attained their majority; grandees, who are so in their own right, and who can prove an annual *renta* of 60,000 pesetas, or £2,400, captains general of the army; admirals of the navy; the patriarch of the Indies and the archbishops; the presidents of the council of state, of the supreme tribunal, and of the tribunal of *cuentas del reino*. The elective senators must be renewed by one-half every five years, and by totality every time the king dissolves that part of the cortes. The congress is formed by deputies "named in the electoral juntas in the form the law determines," in the proportion of one to every 50,000 souls of the population. By a royal decree issued Aug. 8, 1878, the island of Cuba received the privilege of sending deputies to the cortes, in the proportion of one to every 40,000 *free* inhabitants, paying 125 pesetas, annually, in taxes. Members of congress must be twenty-five years of age; they are re-eligible indefinitely, the elections being for five years. The deputies can not take state office, pensions and salaries; but the ministers are exempted from this law. Both congress and senate meet every year. The king has the power of convoking, suspending or dissolving them; but in the latter case a new cortes must sit within three months. The king appoints the president and vice-president of the senate from members of the senate only. The king and each of the legislative chambers can take the initiative in the laws. — The constitution of June 30, 1876, further enacts that the king is inviolable, but his ministers are responsible, and that all his decrees must be countersigned by one of them. The cortes must approve his marriage before he can contract it, and the king can not marry any one excluded by law from the succession to the crown. Should the lines of the legitimate descendants of Alfonso XII. become extinct, the succession shall be in this order: first to his sisters; next to his aunt, and her legitimate descendants; and next to his uncles, the brothers of Ferdinando VII., "unless they have been excluded." If all the lines become extinct, "the nation will elect its monarch." — The executive power is vested, under the king, in a council of ministers of nine members. F. M.

— II. *Administrative Organization*. The administration has been entirely remodeled since 1868: centralization has given place to *self-government*. The government, the provincial assemblies and the municipalities (*ayuntamientos*) constitute the three degrees of the administration. The government, in conjunction with the cortes, administers and executes the laws. The provincial assemblies have within their jurisdiction benevolent institutions, prisons, education, roads, canals; they have

the initiative in all projects of public utility within their respective boundaries. The municipalities, with their *juntas of associates*, have within their jurisdiction the tribunals of the justices of the peace, the colleges and free universities, and the levying of taxes; and are really sovereigns within the limits fixed by the law. — The constitution of 1869 has defined these limits by regulating the laws creating these different bodies, according to the following principles. 1, the government and management of the local affairs of the province by local provincial corporations; 2, publicity of the sessions of each corporation; 3, the publication of budgets, financial management, and the most important decisions; 4, interference by the king, or, in default of the king, by the cortes, to prevent the provincial and municipal assemblies from exceeding their powers, to the prejudice of general and permanent interests; 5, verification of their resources arising from taxation, to prevent the provinces and the municipalities from coming into opposition with the financial system of the state. — Municipal assemblies, elected by universal suffrage, and whose councilors elect the *alcalde*, previously appointed by the governors or the king, may establish hospitals, almshouses, lying-in-hospitals and colleges, and regulate everything capable of contributing to the scientific, industrial and progressive movement of the locality. — The provincial assemblies form a species of congress. Provinces, whose population does not exceed 150,000 inhabitants, have twenty-five deputies, and one more for each 10,000, up to 300,000; those which reach this figure have forty deputies, and an additional one for every 25,000 inhabitants; those which have 500,000 inhabitants have forty-eight deputies, and an additional one for every 50,000 inhabitants. Permanent provincial commissions are chosen from these assemblies, and renewed every year. Provincial assemblies hold two sessions, one in the month of April, and the other in November, to regulate and discuss the budget, to balance the preceding budget, and to perform all acts within their competence. The permanent commission has charge of the execution of the decisions of the assembly, decides urgent questions which may arise in the interval of the sessions, on condition that these decisions shall be submitted to the approval of the provincial assembly at its earliest meeting. The provincial assemblies, as well as the municipal councils, can exercise their functions only within the precise limits assigned them by the laws. The wants of each province, not within the exclusive jurisdiction of the state, are regulated by the provincial assemblies. Those which are special to each municipality are within the jurisdiction of the municipal councils. — Political questions are forbidden to the two assemblies. Consequently, the government has a representative in each province, the *civil governor*, to prevent the municipal and provincial assemblies from exceeding their powers. This functionary, essentially political, and liable to be removed by the government, super-

vises, in its name, the execution of the laws, and presides over the provincial assemblies. He has power to suspend their decisions, rendering, at the same time, an account of his acts to the government, which, on the advice of the council of state, confirms or rejects his decrees of suspension. The civil governor has, within his sphere of action, political affairs, the public safety, the postal service and telegraphs, economic establishments (agricultural, industrial, commercial and others), custom house guards for the prevention of fraud, the civil guard for the protection of persons, and the inspectors charged with the maintenance of public order. We thus see that in the civil order no functionary has so much power and responsibility as the governor. — There are in Spain 9,361 municipal districts, with an equal number of councils. There are as many provincial assemblies as provinces, with the exception of the Basque provinces, which, in virtue of their *fueros* (franchises), have a general authority that is renewed every three years. These *fueros* were confirmed in 1839, at first by the general-in-chief, Baldomero Espartero, prince of Vergara, afterward by the national cortes. They (the *fueros*, or franchises) consist in the exemption from personal tax, from the tobacco monopoly and from stamped paper. They compensate for the exemption from customs by a voluntary gift of three millions of reals each year, for everything which these provinces import or export without being subject to governmental inspection. — Navarre also possesses franchises (*fueros*) which were limited by the law of Aug. 16, 1841 since that year this province is subject, like others, to a direct tax. — One of the most important privileges enjoyed by the Basque provinces is the exemption from military service. But, when the country has to carry on a national war, they are obliged to furnish a division, armed and equipped at their own expense, to defend the honor of the Spanish flag, which they did in the African war and the Cuban expedition. — Public education, in so far as it relates not only to elementary instruction but to middle-class schools, is placed entirely in charge of the municipal councils and the provincial assemblies. It is true that the law requires conditions of fitness for the masters and professors, but it is the assemblies which pay them. The state reserves to itself the universities, the high schools and special schools, without prejudice to establishments of the same kind, founded to compete with those of the state, by virtue of freedom of instruction. The clergy maintain seminaries for the instruction of young men intended for the priesthood. — III. *Judicial Organization*. The judicial organization corresponds to the requirements of civil and criminal justice. Its tribunals are classified as follows: 1, municipal tribunals, or justices of the peace; 2, tribunals of the first resort; 3, courts of appeal; 4, supreme court (court of cassation). Justices of the peace are intrusted with all registers of the civil state and of marriages. Formerly, marriage was exclusively canonical, and could only be contracted before the priest of

the parish and witnesses. The proclamation of civil liberty has authorized civil marriage contracted before the municipal officer, leaving to Catholic couples the right of converting the civil contract into a sacrament at the church. Disputes of voluntary jurisdiction are brought in the first instance before justices of the peace, whose duty it is to conciliate the litigants. No case can be brought before the tribunals without having been submitted previously to the tribunal of conciliation. Judges of courts of first resort decide all civil and criminal questions, concerning which they pronounce decisions, supported by reasons and considerations. *Audiences* are courts of appeal, before which are brought the decisions and sentences of the lower tribunals, and which have to pronounce opinions in criminal cases. The supreme court of justice, or court of cassation, decides questions of jurisdiction, appeals in cassation, and abuses of power; and fixes the common law of the land by its decisions, published in the official journal of the government. There are fifteen *audiencias* (courts of appeal), 548 tribunals of the first resort, and as many of justices of the peace as there are districts administered by *alcades*. — Individual rights being incompatible with the policy of prevention, it was necessary to replace the latter by the repressive system, which can only be properly exercised by tribunals to insure all the certainty and publicity which the legal proceedings and the judicial decisions require. The organic law of the tribunals, voted by the constituent cortes, in establishing a new system, the system of the municipal tribunals, courts of investigation, courts of apportionment, courts of appeal, and the supreme court, separated the magistracy of the bench from that of the public prosecutor, by conferring permanence of tenure on the former. The progress of juridical science and the organization of justice in other countries rendered this classification and this distinction between magisterial functions necessary. Every judicial sentence must be pronounced in open court. Trial by jury exists in Spain. — The court of accounts, whose members are chosen by the cortes, is charged with auditing the accounts of the state, the provinces and municipal districts, when the amount reaches a given sum. This court is placed under the supervision and inspection of the two legislative assemblies, and no deputy or senator can be a member of it. Jurisdiction in case of disputes between the administration and private persons, formerly belonged to the provincial councils and the council of state; it belongs now to the authority of the *audiencias*, and to the fourth chamber of the supreme court of justice. — The army is subject to a special jurisdiction for offenses and misdemeanors committed by the accused in their military capacity. Jurisdiction belongs, according to the case, either to a council of war, or to the supreme council. — The tribunal of the *rota* takes cognizance of all ecclesiastical or religious cases which concern Catholics or ministers of worship. — IV.

Ecclesiastical Organization. The ecclesiastical organization consists of the papal nuncio, who is not only the representative of the holy see, but also president of the tribunal of the *rota*; the archbishop and bishops, chapters and parishes. The archbishops of Spain are nine in number. The archbishop of Toledo is considered primate of the church. The transmarine provinces have two archbishops, one at Santiago de Cuba (Havana), and the other at Manilla (Philippine islands). The peninsula has forty-four suffragan bishops, Cuba two, Porto Rico one, and the Philippines four. Ecclesiastical administration is the only one which does not correspond to the civil divisions of the country; it has retained its ancient boundaries. Certain provinces contain three or four bishops; on the other hand, there are provinces which form parts of several bishoprics, and certain bishoprics have parishes in four, five and even eight different provinces. The number of parishes is 19,397 in Spain, and 603 in the transmarine provinces; altogether, 20,000 parishes. According to the new concordat, eight bishoprics were suppressed, and two created, one at Madrid, the other at Ciudad-Real. — The budget of public worship amounts to about fifty millions of francs. The cortes, with the view of reconciling the interests of the treasury with the wants of the church, decided that the municipalities and the provincial deputations should bear a part of the expenditures for worship and the salaries of clergymen; the state contributed its share by an annual subsidy of thirty millions of francs. The ecclesiastical expenditures in each parish are not to exceed 2 fr. 50 cent. for each inhabitant. When this sum is exceeded, the state pays the difference. — The chapters are organized in the following manner: a dean, four canons in office, a greater or less number of canons freely elected by the crown, the pope or the prelates, and, finally, beneficed canons appointed in each cathedral according to the needs of worship. The seminaries for the higher education of the clergy are supported by the chapters. There are religious corporations in Spain devoted exclusively to civil education; such are the *Escolapian* Fathers. — The clergy enjoy the same political rights as other citizens. Priests may express their ideas freely, by speech or through the press, may take part in all associations, and vote in the electoral colleges. If guilty of any misdemeanor, they are tried in accordance with the provisions of the penal code; offenses against canonical rules are tried by prelates. The state does not interfere in affairs of the church, except when they are of a nature to affect public tranquillity and with a view to the legitimate defense of national institutions. The constituent cortes of 1869 subjected ecclesiastics to the oath which is considered a condition preliminary to the payment of the salaries assigned them as public functionaries. The clergy not wishing, in the great majority of cases, to submit to this formality, the payment of these ecclesiastical salaries was suspended. According to the terms of the new law on the clergy and worship,

the oath of allegiance to the fundamental law of the kingdom was declared necessary.

FAUSTINO HERNANDO.

— V. *Public Charity.* From remote ages numerous institutions, established and maintained by Christian charity, existed in the peninsula. In the thirteenth century the knights of the order of St. James had hospitals for the pilgrims visiting the apostle-patron of Spain, and the first monks dispensed a generous hospitality. Later, alms and rich legacies furnished the means of founding great hospitals, which the bishops supported so freely with their revenues that these revenues could be considered as savings banks for the poor. At present, charity is regulated in Spain by the law of June 20, 1849, supplemented by general regulation. Charity is considered as public when it is supported by the revenues of the state or the product of taxation, and as private when it is carried on exclusively at the expense of foundations. — Public establishments are classed as general, departmental and communal. General establishments are those for the insane, deaf mutes, the blind, and the incurable. The law puts hospitals, houses of refuge, lying-in hospitals and foundling hospitals in charge of the departments; and small hospitals, provisional almshouses, ambulances, domiciliary aid and asylums in charge of the communes. According to the law of June 20, 1849, the state is obliged to support at least two hospitals for the blind, two for deaf mutes, and eighteen for incurables and the infirm old. — The general direction of public charity belongs to the ministry of the interior (*de gubernacion*); it is exercised through the agency of the governors (prefects) and councils of provincial and communal charity. At Madrid there is a central general council. The departmental and local councils supervise the administration of hospitals, public as well as private, and report violations of the law to the governors. It is their duty to audit the annual accounts and budgets, and provide for deficits in case of necessity. — Private as well as public charitable institutions are subject to such visits as the president of the central council or the governor may prescribe. They are obliged to report their economic condition, and all papers and documents which concern their administration.

* The national church of Spain is the Roman Catholic, and the whole population of the kingdom, with the exception of about 60,000 persons, adhere to the same faith. According to article twelve of the constitution of 1876, a restricted liberty of worship is allowed to Protestants; but it has to be entirely in private, all public announcements of the same being strictly forbidden. The constitution likewise enacts that "the nation binds itself to maintain the worship and ministers of the Roman Catholic religion." Resolutions of former legislative bodies, not repealed in the constitution of 1876, settled that the clergy of the established church are to be maintained by the state. According to official returns laid before the cortes in July, 1876, the number of places of worship and schools of Spanish Protestants were as follows: fifty-three places of worship; ninety schools, with 2,500 enrolled members, and 8,000 attendants at service on Sundays at the various chapels; 8,000 children. The poorest receive Protestant education. — F. M.

Bishops have also the right of visiting institutions of charity in their dioceses, and of reporting such observations to the governors or to the central council as these visits suggest to them. — The functions of the committees of administration and of the councils of supervision of charitable institutions are performed gratuitously, except those of the secretary. There are also committees of ladies for foundling hospitals and lying-in hospitals, and brotherhoods for the assistance of the poor. — The resources of institutions of charity consist of the revenues from their property; and when these are sold, of the interest on state bonds, as well as alms, gifts, legacies, collections and grants voted in the general budgets, departmental as well as communal. The government has the right to create or suppress institutions of charity, but only after having taken the advice of the committee of supervision of the department, of the central council and the council of state. There is reason to believe that the sum employed by private charity greatly exceeds the total of public charity. COUNT DE RIPALDA.

— VI. *Public Instruction.* Spain attracted attention in the middle ages, by her love for the sciences, and the success with which they were cultivated in her ancient universities. Salamanca was, with Paris, Oxford and Boulogne, one of the great lights of Christian civilization. Universities constituted, in Spain, a species of scientific and literary municipalities, as the guilds did industrial and commercial municipalities. Kings founded some, endowed others, protected all, recompensing with a liberal hand their masters and doctors, and placing them by honorable privileges in the same rank with the nobility. In consequence of the powerful influence of the court of Rome and the eclat and great honor and profit attaching to ecclesiastical studies, instruction had fallen into the hands of the clergy, and, in the collation of academic grades, the pontifical authority was on a level with that of the king. At the period of the political regeneration of Spain, the government undertook the secularization of studies, by opening the universities to modern sciences, and appointing lay professors. The bishops, nevertheless, retained an indirect right of interference, as guardians of the purity of the faith and of good morals — There are three grades of instruction: primary, intermediate, and academic instruction. The first is supported mainly by the *ayuntamientos* (municipalities), which are obliged to support one or more schools for boys and girls, in proportion to their population and resources. Every agglomeration of persons, consisting of more than 500 souls, must have a school for boys completely organized, and a school for girls. Those which do not reach this number are grouped together to form a district, provided with an elementary school. The government devotes a certain sum each year to aid poor municipalities. The law declares as "civilly obligatory" the *moral duty* of parents, guardians and trustees to give

their children or their wards primary instruction from the age of six to nine years, charging the *alcades* or mayors to see to this. Ordinarily instruction is paid for; it is gratuitous only for the children of parents too poor to pay the small fee charged. No one may perform the duties of teacher without having obtained a diploma given by the government on receiving specific guarantees of capacity and morality; this applies also to private schools. The law favors the establishment of asylums (*parrulos*) and institutions for the blind, and for deaf mutes. — In 1867 there were about 22,000 public schools (including 1,021 schools for adults and 282 asylums), with more than 1,200,000 pupils; and 4,218 private schools, with 198,943 pupils. Of these 1,400,000 pupils, there were 850,000 boys and more than 550,000 girls. In 1872 Spain had, for primary instruction, 24,144 public and 4,188 private schools, forming a total of 28,332, attended by 1,425,339 pupils of both sexes, about 9.1 per cent. of the inhabitants. — Intermediate instruction is given in institutes founded in each capital of a province, and in every other city which has obtained the authorization of the central power to establish such an institution. These cities must have shown the convenience and feasibility of founding such an institute, and that they have satisfied the laws relating to primary instruction. There are also institutes founded and directed by private persons, according to the laws and regulations of the state, for this degree of instruction. The following figures are official. The number of students in the sixty-five colleges and institutes were: in 1865-6, 10,164; 1866-7, 6,688; 1867-8, 6,385; in private institutions, during the same years: 13,576, 18,335, 18,903 pupils; home instruction was enjoyed by 2,695, 1,936, 3,410 pupils. Secondary instruction has forty-six official and a great number of free establishments, with 20,000 students. — Academic studies are pursued in the universities under the immediate direction of the deans and rectors appointed by the head of the state. There are ten universities in Spain—an excessive number, difficult to reduce, because each finds certain good means of self-defense, either in its past glories, or its distance from every other literary centre; in the number of people who surround and frequent them, or in the wishes of the cities in which they are situated, and which consider them as property belonging to them and which can not be removed without injustice. Each of the universities has a number of faculties; that of Madrid, in the centre of the country, the first in Spain in dignity and splendor, has them all; it alone is able to continue or extend studies which qualify one for the degree of doctor. University studies are pursued only in state institutions. The whole number of students was, in 1866, 16,545; in 1867, only 12,104; in 1868, 12,269. In 1872, 12,269 students received matriculation in the universities of the state. — There are, besides, higher and professional studies. To the first belong the schools of bridges and roads, of mines, agriculture, industry, fine arts, diplo-

macy and the *notariado*. To the second, those of commerce, navigation, veterinary art, overseers (*maestros de obras*), mechanics (*aparejadores*) and surveyors; and, finally, there are normal schools. — Such is a picture of public instruction in Spain, according to the law of Sept. 9, 1857. It is completed by the protection and subsidies given to the academies, libraries, archives and museums, as a means of promoting the progress of science. The government supports the ten universities and other institutions of public utility; the provinces and municipalities contribute 1,500,000 reals to the maintenance of the archives and libraries, and to the development of higher and professional education. The sixty-three subsidized institutions of secondary education cost 7,560,000 reals. The income from academic dues amounts to 1,260,000 reals, the rents to 900,000, and the deficits covered by the provinces and municipalities to 5,400,000 reals. The treasury spends two millions of reals in subsidies to provincial institutions and special schools, as well as for archives and libraries.*

MANUEL COLMEIRO.

— VII. *Finances*. The constitution of 1869 provided, that, in the ten days following the opening of the cortes, which takes place Feb. 1 of each year, the budgets of receipts and expenditures shall be presented, and that in no case, and under no pretext, shall any payment be made, unless authorized by law, and ordered by the minister of finance. All the laws relative to public receipts and expenditures are considered as forming a part of the budget, and are published under the same heading. All the discussions to which it gives rise, and, in general, all the questions in which the interests of tax payers are involved, must be first laid before the chamber of deputies, and, in case of disagreement between it and the senate, the opinion of the chamber prevails. — As it may happen that the cortes can not always discuss and approve the budget and authorize the collection of taxes, either on account of the numerical insufficiency of the deputies present, or in consequence of the closing of the legislative session, or for any other cause dependent on circumstances, the coun-

* It was found, at the general census of 1860, that of the total population of the kingdom, there were 2,414,015 men and 715,906 women able to read and write; 316,537 men and 389,211 women able to read, but not to write; and that all the rest, upward of 5,000,000 men and 6,800,000 women, could neither read nor write. At the preceding census, of 1846, the total number of persons of both sexes, able to write, was found to be no more than 1,221,001, while the total number able to read was only 1,898,288, or considerably less than one-fifth of the population. — In 1878 there were stated to be 29,600 schools in Spain for primary education, with 1,611,000 pupils. Middle-class education is given in fifty-eight public colleges, by 757 professors, to 13,881 pupils. In first-class education the most remarkable feature is the large number of law students, namely, 3,755 in 1859-60, divided among ten faculties. There were, at that date, ten faculties of literature and philosophy, with 224 students; seven faculties of sciences, with 141; four faculties of pharmacy, with 544; seven faculties of medicine, with 1,718; and six faculties of theology, with 339 students—in all, 6,181 students. The expenditure for public education by the government amounted, on the average of the last years, to rather less than £250,000. — F. M.

stituent cortes have decided, that, if deputies and senators, having met together at the place appointed by the constitution, neglect to vote the taxes, the receipts and expenditures shall be made in accordance with the conditions established by the budget of the preceding year — This provision has been criticised. Many think that it destroys the constitutional principle, according to which no one is obliged to pay a tax not voted by the cortes, or the collection of which does not take place according to the forms prescribed by law. "According to the same principle, every public functionary, who seeks to exact or exacts payment of a tax not regularly authorized, is liable to the punishment provided for illegal exactions." There are also persons who consider this provision contrary to the rights of legislative power. But on examining the question dispassionately, it is clear that this article is simply a complement of the fundamental law, and is applicable only in cases, really very rare, in which the cortes could not or would not vote the taxes and authorize their payment. In other words, it is a law dictated by foresight, a conditional law, to meet cases in which the article of the constitution in question can not be carried out. It is in no way opposed to the prerogatives of the cortes, its action is to avoid continuing political parties in power indefinitely; it establishes merely a common rule for the administration, the government and the country, so that these three moral powers may always continue living and active. The administration makes its action felt in all parts of the social body, the government supervises all, and the country pursues its labors, trusting confidently in the public powers. — But to return to the budget. Each ministry fixes the budget of the expenditures of its own department, and presents it to the minister of finances, who alone has authority to lay it before the cortes, accompanied by a statement of the receipts, that is to say, the means of meeting all obligations. The budget is divided into two parts: the *ordinary* and the *extraordinary*. The first includes the expenditures and receipts which have a permanent character, though their amount may be variable. The second includes the transient or temporary receipts and expenditures. They are both divided into chapters, comprising all accounts of the same nature, and then divided into as many headings as are necessary for the determination of all details. As regards the budget, there are general and constant rules, sanctioned by time and by the laws: 1, the government can neither suppress nor modify the receipts voted by parliament, nor decree new ones; 2, it can not apply funds to any other use than that determined by the law; 3, the budget extends over one year, from July 1 to June 30, inclusive; accounts remain open for the following six months, for final settlement, for the collection of outstanding sums, and the expenditures voted for the said year; 4, in case it is necessary to incur expenditure for which the legislature has provided no credit, or when the sum granted is insufficient, the government must, in the former case, ask the

cortes for an extraordinary credit, and, in the latter, an additional credit, stating the means of covering it; 5, if the cortes are not in session, and if the expenditure for which a credit has not been voted has a character of urgency, the government may authorize it, on its own responsibility, either by transferring a credit from one chapter to another in the section to which the expenditure belongs, after having first informed the financial section of the council of state of its action, and deliberated upon it in the council of ministers, or by an extraordinary or a supplementary credit, covered (the council of state consenting) by the fund of the floating debt of the treasury; 6, the government is obliged to lay before the cortes, during the first month of the session, a bill approving the credits made during their absence; 7, every head of a department, and every functionary, to whatever class he may belong, is responsible to the treasury for every amount paid beyond the credit granted; 8, payments are made every month, after the approval of the council of ministers. Besides these financial rules recommended by legislation, there are others whose utility has been recognized in recent years, and which have at present the force of law. They are the following: 1, in each law relating to the finances, the sum which the floating debt of the treasury should reach during the year must be indicated in precise manner—it constitutes, ordinarily, the third of the general budget; 2, the government should transmit to the court of accounts all the documents drawn up for the purpose of procuring funds, so that if the court discovers any illegality in them, it may report such irregularity immediately to the cortes; 3, the same court has to examine the grant or grants of credit, and give its opinion on their legality. The ministers are responsible, and are subject to criminal prosecution for any collection of money not authorized by the cortes. Each minister orders the expenditures of his own department; but the orders for payment are made by the minister of finance, except so far as concerns the expenditures of the ministry of war and marine, considered as military bodies. These two ministries are responsible for all payments unduly made, unless the ministry of finance declares them valid. No court can issue a writ of attachment or an execution on funds of the state, either capital or interest. Every sum due by the state, recognized and audited, the payment of which is not demanded for five years, is confiscated to the benefit of the treasury.

RUIZ GOMEZ.

— There have been no accounts of the actual public revenue and expenditure of the kingdom published since the year 1870-71, but only budget estimates. These differ, as will be seen from the subjoined tabular statement, giving the budget estimates of five financial periods, to an extent such as to allow not even an approximate judgment of the real receipts and disbursements. There are, indeed, accounts of public revenue and expenditure published monthly; but the public

accounts have not been approved by parliament since 1865-7; and the *tribunal de cuentas* has not audited the accounts later than 1868-9. According to official returns, the following were the estimated revenue and expenditure for the financial years 1877-82:

YEARS.	Revenue.	Expenditure
	Pesetas.	Pesetas.
1877-8.....	736,000,000	735,750,000
1878-9.....	750,630,302	753,177,865
1879-80.....	778,478,988	806,590,940
1880-81.....	791,650,792	836,651,193
1881-2.....	783,000,000	782,650,000

— The following are the budget estimates for the year ending June 30, 1883:

REVENUE.	
	Pesetas.
Direct taxes.....	230,979,000
Indirect taxes.....	164,409,000
Customs.....	113,458,000
Stamps and excise.....	221,585,000
Revenue from national property.....	28,860,225
Various.....	21,706,000
Total.....	782,997,225
EXPENDITURE.	
	Pesetas.
Civil list.....	9,800,000
Cortes.....	1,859,250
Public debt.....	223,023,056
Indemnities and pensions.....	47,750,065
Ministry of president of council.....	1,101,600
Ministry of foreign affairs.....	3,590,900
Ministry of justice.....	51,625,675
Ministry of war.....	126,272,700
Ministry of marine.....	36,127,300
Ministry of interior.....	45,369,000
Ministry of public works.....	90,117,400
Ministry of finance.....	20,581,925
State monopolies.....	124,957,875
Various.....	522,520
Total.....	782,639,250

— The minister of finance declared, in presenting the budget for 1871-2, that the state was "on the verge of bankruptcy," from which it could be saved only "by the most strenuous exertions, devoted both to raise the revenue, by the imposition of new taxes and otherwise, and to depress the expenditure to the lowest possible point." The latter recommendation has in recent years become difficult of execution, on account of the large expenditure connected with the civil war. In the budget for 1870-71 the cost of the war department was estimated at £4,730,321, while it was set down in 1874-5 at £9,840,000, being about one-half of the total revenue which it was expected would be raised. But the army expenditure fell again to under five millions in the budget of 1877-8, and remained the same in the budgets of 1878-82. Although in 1881-2 the budget estimate of the revenue was £31,320,000, and the expenditure \$31,306,000, still, as in previous years, there was a large deficit, and in October, 1881, the minister of finance spoke in strong terms of the mismanagement of his predecessors, and proposed a new basis of financial administration, by which to rectify past deficiencies and secure a surplus in the

future. He proposed, as seen above, a budget for 1882-3, with a revenue of 782,997,225 pesetas, and an expenditure of 782,639,250 pesetas. Efforts were made again, in preparing the budget for 1883-4, to adopt extraordinary means to increase the revenue, but without satisfactory results. — The large and constantly increasing annual deficits, dating from the reign of Queen Isabel, were covered, partly by loans, partly by extraordinary taxation (such as "exemptions from military service," figuring in the budget of 1874-5), and partly by the sale of national property, formerly belonging to churches, convents and monasteries. — The following is a statement of the Spanish debt on Sept. 1, 1881:

	Pesetas.
5 per cent. consolidated, due to United States.....	3,000,000
3 " consolidated, due to Denmark.....	3,250,000
1 " external debt.....	4,092,894,000
1 " internal debt.....	3,245,160,194
1 " bonds inscribed in favor of corporations.....	20,784,433
1 " bonds inscribed in favor of clergy.....	14,332,005
2 " bonds for public works.....	21,578,000
2 " subventions to railways.....	614,409,000
Old debts convertible into internal 3 per cents.....	204,088,175
2 per cent. external redeemable debt.....	254,402,000
2 " internal redeemable debt.....	471,647,821
1 " bills.....	170,326
Arrears.....	9,567,895
3 per cent. securities of guarantees.....	2,685,486,250
Total.....	12,503,327,576

— In a report of the government of the king Alfonso XII., dated July, 1875, it was stated that none of the national creditors could hope to be satisfied "without having recourse to credit operations at an enormous rate of interest, which in a short time doubles the original debt." By a complicated process of conversion, arranged in 1881-2, the various classes of Spanish debt are to be converted into "new 4 per cents," whereby the actual capital will probably be reduced to £338,000,000, bearing an annual charge of £9,500,000, equal to about 11s. per head of the population. In addition to this, the state has incurred obligations in respect to the island of Cuba, estimated at over £10,000,000. F. M.

— VIII. *Army and Navy.* The Spanish army was composed, in 1874, of 70,000 infantry, 13,000 cavalry, 3,000 engineers, 14,000 artillery; besides 40,000 infantry of the reserve, 12,000 custom house employés, 12,000 police and 3,000 militia of the Canary islands. In these figures are not included the 23,000 to 24,000 men of all arms then garrisoned in Cuba, the 3,400 at Port Rico, and the 11,000 of the Philippine islands. — The law of February, 1873, on the reorganization of the army abolished conscription by lot, and replaced it by voluntary recruitment. The recruitment takes place in the capitals of the provinces, in proportions to be fixed annually by a special law of the cortes. The voluntary recruit must not be less than nineteen nor more than forty years of age. The duration of service is two years for a new recruit, and one in case of re-enlistment, with a chance for the recruit of remaining for life in the

active army, and enjoying the benefit of promotion in the order of merit and seniority. Voluntary recruits receive pay amounting to one *piécette* (1 franc) per day, payable weekly. The reserve (which remains at home) comprises all young men who, on the first of January of each year, shall have completed their twentieth year. The government may mobilize the reserve forces within the limits of the province to which they respectively belong, by a simple decree of the government; it may also mobilize them in their respective military districts, by decree, when the cortes are not in session; but in this case the government must inform the assembly as soon as it resumes its labors. In all other cases mobilization can take place only by virtue of a law. — The requirement of a certain stature, as a condition for military service, is abolished in the regular army; it is only necessary to show that the recruit is sufficiently strong and robust in health to form a part of the military force. Voluntary recruits for the active army are exempt from the reserve. The term of service in the reserve is three years. The first year is spent in the ranks, to receive military instruction. During the other two years, young men enrolled in the reserve may be called to active service, in case of war, in which contingency a law of the cortes is necessary. Young men of seventeen years may also be admitted into the reserve, if their physical constitution permits them to enter the service. — Instruction is given to soldiers of the infantry, artillery and engineers, by the officers of the corps; but the cavalry must pass through training institutions. In each corps there are schools for soldiers, non-commissioned officers, and officers, in which they are instructed in their own duties and in those of the grade immediately above them. In the infantry *cadets* are admitted, whom an officer instructs in the branches necessary to pass the examination as sub-lieutenants. The places of sub-lieutenant not filled by non-commissioned officers and cadets, are reserved for the graduates of the infantry college at Toledo. These graduates, admitted at the age of fourteen or fifteen years, remain, after examination, three years at school, then enter the regiments, where they pass successively, in the course of six months, through all the inferior grades, before they are appointed sub-lieutenants. A similar college exists at Valladolid for the cavalry; the graduates follow the same course to become cornets. The artillery has its college at Segovia, the students (who lodge there as in the preceding two) remain four years, at the end of which time they become attendants of the *school of application*, from which, after two years, they issue as lieutenants of the corps. The school of engineering is at Guadalajara. Applicants for admission must be from sixteen to twenty-five years of age, and pass an examination to enter as day scholars, according to their merit, either in the preparatory course, or in that of the first year. After the course of the second year, those not already occupying that rank are made sub-lieutenants; after

four years they obtain the grade of lieutenant. For the staff school, situated at Madrid, the conditions are nearly the same as for the school of engineering. At the end of four years the lieutenants pass into the infantry, then into the cavalry, in order to familiarize themselves during fifteen months with all the details and accounts; they visit the different military establishments during six months, before receiving their final appointment. There is also a college at Madrid for aspirants to employment in military administration; the course there lasts four years. — *Justice* is administered, in the case of soldiers, by military councils of war, presided over by commanders of corps, or the local governor, according to circumstances, and composed of six members. The sentence is laid before the captain general, who, aided by his auditor, affirms or reverses it; in the latter case it is referred to the supreme tribunal of the army and navy. In the case of officers, the council is composed of general officers, and presided over by the captain general, assisted by the auditor, who does not, however, take part in the deliberations. The head of the state decides in the last resort, on the advice of the supreme tribunal. The sentence may be carried into immediate execution, and without appeal, if it does not involve loss of employment or life; nevertheless, it is always submitted to the approval of the chief of the state. Offenses and ordinary misdemeanors are judged by the captain general, assisted by his auditor; the case is then presented to the king. Directors general may order investigations against officers; they then present the case to the king, who decides, with the advice of the supreme tribunal. The artillery, engineers and the military administration have special tribunals. Besides the auditor and the procurator connected with the chief towns of the district, the military governors are obliged to consult an assessor.* — The navy consisted, according to official returns, of the following vessels afloat and under construction, in 1882:

	First Class :	Guns.
5	ironclad frigates.....	60
12	screw frigates.....	228
2	paddle steamers.....	9
Second Class :		
5	paddle steamers.....	12
11	screw steamers.....	39
2	screw transports.....	4

* The army of Spain, reorganized in 1868, after the model of that of France, was modified as to its organization by subsequent laws in 1877, 1878 and 1882. Under the new military law, the armed forces of the kingdom consist: 1, of a permanent army; 2, of a first or active reserve; and 3, of a second or sedentary reserve. All Spaniards past the age of twenty are liable to be drawn for the permanent army, in which they have to serve three years; they then pass for three years into the first or active reserve, and then for six years into the second reserve. Any one may purchase exemption from service by a payment of about \$300. — The strength of the permanent army of the peninsula for 1882-3 was put down at 94,810 men; while for Cuba the number was 26,570; Porto Rico, 3,318; and the Philippines, 10,035. Of the infantry there are 140 battalions, and of the cavalry twenty-four regiments; six regiments of artillery, and ten battalions of pioneers. The civic guard consists of fifteen regiments, with 780 officers and 14,756 men.

	Guns.
Third Class :	
1 ironclad monitor.....	3
2 floating batteries.....	5
19 screw steamers.....	35
26 screw gunboats.....	26
1 paddle gunboat.....	1
7 paddle steamers.....	14
1 screw transport.....	2
4 pilot sailing vessels.....	..
Unclassified :	
1 steamer.....	2
2 cadet corvettes.....	40
29 small screw gunboats.....	37
2 torpedo boats.....	..
132 Vessels.	Total guns..... 517
Total horse power of engines, 26,067.	

—The navy of Spain was manned, in 1879, by 14,000 sailors, and 7,033 marines, and commanded by one admiral, seven vice and rear admirals, and 644 commissioned officers of various grades. The navy, like the army, is recruited by conscription, naval districts for this purpose being formed along the coast, among the seafaring population. The number inscribed on these naval conscription lists of men between eighteen and thirty years was reported to be 72,000 at the end of June, 1875. — IX. *Resources, Trade and Industry.* Agriculture is the most important branch of activity in Spain, where there is reason to believe that, of 100 inhabitants, 75 cultivate the soil. The land cultivated comprises 1,150,200 hectares of irrigated land and 25,393,637 hectares not irrigated. The Basque provinces and Navarre refuse all information on this subject. It results from these figures, and from those which may be assigned to the wooded country, that there still remain about ten million hectares upon which human industry has not yet been exercised. — The total imports and exports of Spain were as follows, in each of the five years 1877–81 :

YEARS.	Imports.		Exports.	
	Pescetas.	Pescetas.	Pescetas.	Pescetas.
1877.....	538,350,000	515,900,000	429,300,000	544,300,000
1878.....	397,800,000	429,300,000	503,900,000	544,300,000
1879.....	443,300,000	503,900,000	544,300,000	591,300,000
1880.....	473,500,000	544,300,000	591,300,000	
1881.....	496,400,000	591,300,000		

Among the importing countries, Great Britain and France stand first; but in exports, the former holds the first rank. — The merchant navy of the kingdom consisted, on Jan. 1, 1881, of 2,236 vessels, of a total burden of 560,125 tons, comprising 347 steamers, of 233,686 tons. At the commencement of 1860 there were 6,715 vessels, of 449,436 tons burden, and at the commencement of 1868 the number of vessels had fallen to 4,840, and the total tonnage to 367,790, showing a decrease in the eight years of 1,975 vessels, of an aggregate burden of 81,696 tons. There was an increase in tonnage, it will be seen from the preceding figures, of 192,355 tons, in the thirteen years from 1868 to 1881. — The length of railways in Spain, on Jan. 1, 1880, was 6,550 kilometres, or 4,067 English miles; and 2,000 kilometres, or 1,242 English miles, were in course of construction. The whole of the Spanish railways belong to private com-

panies, but nearly all have obtained guarantees, or subventions, from the government. During the reign of Alfonso alone 2,000 miles of new lines have been opened, and 3,000 more were in course of construction in 1882. — The postoffice carried 85,210,000 letters and post cards in the year 1878. There were 2,592 postoffices on Jan. 1, 1879. — The length of lines of state telegraphs of Spain, on Jan. 1, 1880, was 16,124 kilometres, or 10,070 English miles, and the length of wire 40,405 kilometres, or 25,150 English miles. In the year 1880 the total number of telegraph messages was 2,222,429; one-fourth of the whole number being international, and one-fifth of the remaining number administrative, dispatches. — X. *Colonies.* The colonial possessions of Spain, formerly embracing nearly the whole of America, are reduced at present to Cuba, Porto Rico and the Philippine islands, with scattered settlements in the Atlantic and Indian archipelagos, a small strip of territory in northern Africa, and another strip claimed on the west coast of Morocco. The total area of these possessions is 164,926 English square miles. The total population, according to returns mostly for 1877–80, numbered 6,399,347. These returns state the area and population of the various possessions as follows :

COLONIAL POSSESSIONS.	Area.	Population
	Eng. Sq Miles.	
1. Possessions in America :		
Cuba.....	43,220	1,424,619
Porto Rico.....	3,550	754,313
Total in America.....	46,770	2,178,932
2. Possessions in Asia :		
Philippine islands.....	114,326	6,300,000
Caroline islands and Palao.....	560	36,000
Marvan islands.....	420	8,665
Total in Asia.....	115,306	6,344,665
3. Possessions in Africa :		
Fernando Po, Annabon, Coresco, Elobey, San Juan.....	850	35,000
Total possessions.....	162,926	8,558,597

The population of Cuba, at the census of Dec. 31, 1877, was distributed as follows. Whites, 764,164; free negroes, 344,050; negro slaves, 227,902; and Chinese, 58,400. The number of slaves from 1870 to 1877 decreased by 136,000. But the total number of inhabitants also decreased by 20,500 during the same period. — Spain is the only European state which still permits the existence of slavery in its colonies. A bill for the abolition of slavery in Porto Rico was passed by the national assembly on March 23, 1873, while a bill for the gradual abolition of slavery in Cuba was laid before the cortes in November, 1879, supported by the government. The bill provides, that, on the promulgation of the law embodying it, all slaves from fifty-five and upward shall become free; that slaves from fifty to fifty-five shall be liberated on Sept. 17, 1880; from forty-five to fifty, in September, 1882; from forty to forty-five, in 1884; from thirty-five to forty, in 1886; and from thirty to

thirty-five in 1868. Those under thirty shall be emancipated in 1890. From 1880 a sum of 100,000 piastres was to be annually set apart in the Cuban budget for defraying the expense of the emancipation of the slaves, the price to be paid to the owners being fixed at 350 piastres for each slave. — Cuba is divided into three provinces, the southeast and central being the richest and most populous, containing twenty-two cities and towns, and 204 villages and hamlets. — BIBLIOGRAPHY. SPEAKER. (See PARLIAMENTARY LAW.)

SPEAKERS. (See CONGRESS, SESSIONS OF.)

SPECULATION, in some form or other, has existed under every commercial system; but the forms under which it is now largely conducted, and the enormous extent of the speculative transactions, are peculiar to the present age. It is with the discussion of these forms—their character, their development, and their more immediate effects—that this article is concerned. (For the more wide-reaching effects of the speculative spirit upon credit, business and production, see articles on COMMERCIAL CRISES, and on OVER-PRODUCTION.) — Until the present century the chief field for speculative operations was furnished by the difference of price of the same commodity in different places. Mercantile profits were made by buying in a cheap market and selling in a dear one; and with the imperfect means of communicating intelligence, and the slow and generally hazardous means of transportation, such speculations often involved great risks and offered the chance of correspondingly high profits. But the modern development of the postoffice, of steam transportation, and especially of the telegraph, changed all this. Abundance in one market, and scarcity in another, was no longer possible except on a limited scale or through artificial obstructions. The telegraph gives notice of the unequal-

ity in its first beginnings; and, long before it can reach an extreme, cargoes have been diverted from the full market to the empty one. Indications which once could be seized only by men of exceptional position and sagacity, are now the common property of the whole business public. — But the opportunities for men of exceptional position and sagacity have been extended in another direction more than they have been curtailed here. The state of the markets at distant places may be known to every one; but it is still only the few that can foresee their state at distant times. The information that has set narrow limits to speculation in place has furnished the necessary basis to an infinitely more important and wide-reaching speculation in time. The difference in price between New York and Chicago, apart from temporary disturbing causes, can never be greater than the cost of carriage (in its widest sense) between the two places, because we have in the one place telegraphic information concerning the markets of the other. If we had the same certain knowledge of prices at future times, the prices of goods to-day and a month hence could not differ by more than the cost of holding those goods for that length of time. It is, of course, impossible to have such knowledge; and the few who have the power to foresee or to manipulate the course of the market are enabled to turn these price variations to their own account. Before the invention of the telegraph, such dealing in futures would have been a blind game of chance, now, there is just such a combination of indications and uncertainties as to give scope to business talent of the highest order. Here lies the explanation of what is peculiar in the speculation of the present day. — In a healthy state of business these variations in price are not very large or rapid; often not large or rapid enough to make speculative dealings pay the interest of the capital required. But such a state of things is almost always disturbed by a sudden rise in the price of certain classes of goods, or perhaps by a general rise of prices. A sudden increase in the demand or decrease in the supply of a particular article will produce the former result; inflation of the currency, increased production of the precious metals, or, sooner or later, the unrestricted extension of business credits, will produce the latter. The holder of goods of the classes affected sees himself nominally the richer for every day that goes by, and with this apparent increase of wealth comes a desire on the part of every one to hold more goods and stocks, even if they have to borrow money to do so. This shows itself, not merely in the operations of the stock and produce exchanges, but in business speculations of every kind; most of all, perhaps, in the extension of speculative production, which lies outside the scope of the present article. This holding for a rise is the form of speculation which presents most attractions for the general public; and a speculative mania is often developed which can only end in a crisis. This mania may attach itself to particular

lines of investment, as to tulips in Holland in 1634-8, to South sea bubbles in England in 1720, to manufactures in 1815 and 1825, to the English railways in 1846, or the American railways (among other things) in 1871-3. Often it may be more general in connection with the indiscriminate extension of credit, as in the years preceding 1837 and 1857; or, worse yet, in connection with currency inflation, as seen in France at the time of John Law's bank, 1718-20, in the assignats of the French revolution, or in our own recent experiences; where every exporter or importer, and indirectly, every business man, is obliged to be involved against his will in speculation on gold. — In such speculative periods, with unsettled and generally advancing prices, the more prudent business men are thus obliged to have recourse to contracts for future delivery of goods at definite prices. The builder can not safely make a contract for a fixed sum unless he knows what his materials will cost a few months hence. The cotton manufacturer can not arrange his basis of production and scale of prices unless he knows what his raw material will cost him from time to time. If a planter or cotton factor agrees to deliver him his material from time to time at determinate prices, the manufacturer knows where he is likely to stand. Here is a transaction, speculative in form as far as concerns the broker, but in reality a defense against the evils of speculation. The manufacturer knows what he can probably afford to pay, the producer knows for what he can probably afford to sell. Of the unavoidable risk, each party takes the part concerning which he can best judge, and against which he can best protect himself. This is an exceptionally favorable case. The majority of those who sell "short," *i. e.*, who engage to deliver goods which they do not hold, rely not so much upon sources of supply which they represent, as upon their judgment concerning the future movements of the market. Yet even in this case their influence may be healthful, and their work legitimate. It has been said that the general public is fond of speculating for a rise. Now, a man of special training, and special sources of information, can often see clearly where the general public is mistaken, and by selling short at the high prices, and obtaining the means of meeting his obligations at the lower ones, may take advantage of the public mistakes, and at the same time render a service to the market in steadying prices. As transactions of this kind multiply, it is inevitable that they should fall more and more into the hands of brokers, and that these brokers should organize exchanges for the purpose of more easily dealing with one another. These last are of modern growth. The germ of the New York stock exchange seems to have existed at the close of the last century, but its regular organization dates from 1817. The Chicago produce exchange is scarcely thirty years old. These means of communication have greatly facilitated *bona fide* transactions; but, with their growth, gambling transactions have grown up about them to such an ex-

tent as often to hide the *bona fide* transactions from view. — The first step in this direction has been the habit of dealing upon margins; that is, of not making full payment at the time of the first engagement, but of depositing a sufficient sum to insure the broker against loss by change in the price. It is hard to draw the line where such transactions lose their *bona fide* character; the deposit of a margin may simply be a convenient and perfectly legitimate way of extending business credit. But where the marginal idea is carried through the transaction, and settlement is effected, not by an actual delivery and payment, but by a payment of the difference in price at the two periods, with no delivery at all, we have a complete departure from the original character of the transaction. It is now nothing more than a wager on the change of price of the stocks or goods in question, somewhat cloaked under the forms of legitimate business. In the next stage of speculation, by "puts," "calls," and "spreads," even these forms are cast aside. In the first of these a man buys of a broker, for a small consideration, the right to deliver a certain quantity of stock at a specified price within a specified time; in the second, he buys the right to receive it; in the third, he buys for a considerably larger price the right of delivering or receiving as he may choose. They are thus, even in form, simply wagers on the price movement. — We have spoken of the outside public as generally speculating for a rise, and the more practiced operators for a fall. Of course there are numerous exceptions to the latter; and it is precisely these exceptions, when they take the shape of corners, that make the most impression upon the public mind. In its principles a corner does not differ from any other monopoly. An individual or a ring who once secure the whole or nearly the whole marketable stock of a commodity, have, of course, the power to fix the price as long as that state of things continues. But in the case of ordinary attempts at monopoly the buyers have usually the advantage of being able to diminish their consumption for the time being, and to wait for the advent of competing sources of supply. But the bear, who has sold short, has neither of these advantages. He must deliver a fixed quantity, and must do it within a fixed time. He has no choice but to do that or fail; and the operator who can control the supply of a stock in the market for a comparatively short time can charge any one who has sold that stock short any price up to what will drive him to absolute failure. Just as it is the public fondness for speculating for a rise that makes it possible and profitable for the street to sell futures, so it is the readiness of the street to sell futures that makes it possible and profitable for large operators to engineer a corner. — In spite of the strong impression that they make upon the public imagination, successful corners in stocks are by no means so common as is generally supposed. The important ones in New York have been the Morris canal corner of 1835, the Harlem corners of 1863 and 1864,

Prairie du Chien of 1865, North-Western of 1867, and Hannibal & St. Joseph of 1881. Even in these it is not always certain that the bulls make the profits they appear to. For the time being they extort enormous sums; but after the settlement they find themselves holders of masses of stocks, which they have usually bought somewhat above its normal figures; and the price at which they can ultimately dispose of this stock is an important element in the question of their success. But it is extremely difficult to carry a stock corner forward to its completion. The Michigan Southern corner of 1865—apparently a very safe operation, since the cornerer was buying property which he really wanted—was broken by an issue of construction stock. So also in an attempt to corner Milwaukee & St. Paul, and so twice in the history of Erie. The substitution of preferred for common stock has had the same effect. A still commoner source of failure, which it is impossible to guard against, is the treachery of individual members of a cornering pool. — Corners in produce are a growth of the most recent years; yet they already exceed stock corners in frequency, and still more in economic importance. It is but a short time since writers regarded corners in a commodity like wheat as almost an impossibility; so varied are the sources of supply, so apparently impossible is it for one man to control them. But these writers had not foreseen the development of short sales and paper contracts which should make a temporary control of a particular market so thoroughly effective toward securing this end. The extent to which speculative sales of produce have grown is almost inconceivable. The statistician of the New York produce exchange testified that nine-tenths of its dealings were purely speculative. The same fact is more strikingly brought out by a comparison of the quantities of produce actually brought to New York in 1882 with those nominally sold.

PRODUCE.	Sales.	Receipts.
Wheat..... bushels	647,147,000	44,736,000
Corn..... "	443,091,000	76,399,000
Oats..... "	150,524,000	15,905,000
Cotton..... bales	30,049,000	600,000
Petroleum..... barrels	1,524,887,000	10,500,000

As compared with 1881 the increase in these speculative sales is probably more than one-third, while the actual quantity of products delivered has, on the whole, diminished. In fact, flour seems to be the only produce of first-rate importance which still maintains its non-speculative character. The pretended sales of wheat for 1882, as our table shows, were more than fourteen times the quantity received. The sales of cotton were five times the entire crop, fifty times the whole quantity received in New York, and two hundred times the actual deliveries in the New York market. In the oil business it has been even worse. The recorded sales in November alone amounted to nine times the entire stock in the country, or to

135 times the production for the month. (For a fuller exhibit of these facts, see "Public," Jan. 4, 1883.) In Chicago matters are almost the same—three thousand millions of sales on less than four hundred millions of produce in 1882. In Liverpool they are no better, in spite of more apparent compliance with the forms of delivery. A single consignment of a hundred bales of cotton has nominally changed hands one hundred and fifty times before sale for *bona fide* consumption. When the whole amount available for the year's use in Europe and America has been less than 7,000,000 bales, the year's contracts for future delivery have amounted to 80,000,000 bales. Thus Liverpool has been the centre of cotton corners in the latter half of successive years beginning in 1879, and seriously disturbing legitimate business. Meantime we have had in America (usually centring in Chicago), the wheat corners of 1879, 1881 and 1882, the pork corner of 1879 and 1880, and more or less successful attempts at many others, scarcely less wide-reaching than these in their effects. — The attempts to meet these evils by legislation have had little success. Legislative inquiries, like that of the New York committee on corners, have proved abortive; enactments like those of Illinois in 1874 have been inoperative. Only to a limited extent have the courts been able or willing to interfere, by making it impossible for speculators to sue on their contracts. It was indeed held, in a few English cases in the early part of the century, that a contract of sale for future delivery of what a person does not now hold, was void; but in the business developments and necessities of the time it was of course impossible to maintain that doctrine. It is now held, that such a contract is valid if, at the time it was made, either party intended it should be fulfilled. In order that the court should regard it as a gambling contract, it must be proved that neither party regarded it as more than a wager on price variations. But practically the courts do not do much even within these narrow limits. Unless they are supported by the public opinion of the boards of trade and similar organizations, it is in the power of these last to inflict upon any dealer who may have recourse to the courts, penalties in the way of loss of business facilities for which he can obtain no adequate compensation. Add to this, that the courts, as in a recent case in Illinois, have often shown unwillingness to enter upon the consideration of matters of this kind, and we see how inadequate are the legal defenses against the present state of things. — The difficulty of dealing with the evils of the system is enhanced by popular ignorance as to just what the evils are, and where they really lie; and by a popular prejudice, too often embodied in legislation, against operations which are sometimes necessary, sometimes beneficial, and at the worst only indirectly responsible for the evils which have grown up in connection with them. Of such mistaken legislation a striking instance was offered in the year 1864, when speculation in gold was forbidden.

The law, under the pressure of public sentiment at that time, was obeyed; but its results were the very reverse of what the public had anticipated. The event proved that gold speculation had been a means of steadying the market; without it, gold rose 100 per cent. in two weeks, and then dropped 50 per cent. at the hurried repeal of the prohibition. What the speculators did for the gold market was again seen in 1866, when they attempted to keep the necessary stock of gold in the country in view of the increasing European demand; but the treasury department, with less foresight, exerted itself to counteract the rise in the gold premium which these speculators seemed to be producing. It succeeded at the time, but at the cost of a greater subsequent rise, which these speculations would have largely enabled us to avoid. So of the cotton speculators of 1868, who seeing the mistake of public judgment, bought up the cotton which we were exporting to Liverpool at a very low figure, and, a few months later, sold at a high figure to the manufacturers, who would otherwise have had to reimport. They made fortunes by so doing, and thus excited public prejudice; but the American public was in every way better off for their operations. The planter obtained a higher price than he could otherwise have done, the manufacturer paid a lower price; the expense of double transportation was saved; the speculative difference of price remained in American hands instead of going to Liverpool; and the chief mistake made by the speculators, in point of serving public interest, was in not carrying their operations still further. ("N. Y. Nation," vol. vii., p. 85.)—That is a typical case. If a speculator is simply aiming to forestall the movement of the market, and not to manipulate it, he undoubtedly confers a public benefit in so far as he is himself successful; and so great a public benefit that no one need grudge him his profit. His work tends to steady prices, to diminish the difference between producers' and consumers' prices in a rising market, to break the shock of a falling market. But it is almost impossible for a speculator to resist the temptation to manipulate as well as forestall price changes; and when he succeeds in so doing, he increases just those evils which he would otherwise diminish. If he works on a small scale, it may be by the circulation of false rumors or the show of false appearances, perhaps even by securing false management of the property; if he works on a large scale, it may be by securing a corner.—Corners in stocks can hardly be a direct source of evil to the general public. With produce corners it is different. The investor can easily do without a particular stock; he may be glad to take advantage of the high price to sell it. But the consumer can not even for a short time do without his food; and a corner in wheat or pork may become a serious matter to him. A speculative monopoly of this kind is probably no worse than any other monopoly. Permanent monopoly of coal or oil may work more lasting injury than a temporary

corner in wheat. The former settles things on a wrong basis. The latter unsettles things from their right basis. By preventing regular transportation, it prevents cheap transportation; by preventing regular export, it spoils our foreign market. How far it actually disturbs the prices paid by consumers remains an open question. Witnesses before the New York committee, apparently well informed and candid, differed directly on this point. The Liverpool cotton corners are estimated to have temporarily raised the prices paid by manufacturers more than 10 per cent. An able article by H. D. Lloyd in the "North American Review" for August, 1883, shows how, in recent corners, flour, a non-speculative article, has varied more than 50 per cent., in sympathy with the variations of wheat. It is not probable that this affects the consumer quite as badly as would at first sight appear; the quantities sold at the highest price are probably comparatively small, and the shock is so slowly distributed among the middlemen that before it reaches the mass of consumers the reaction has already begun. With our present incomplete statistics of retail sales, we must reserve judgment on this point. The gist of the matter is, not that a corner is worse than any other kind of monopoly; not necessarily that it is as bad as any other kind of monopoly; but that, under the present system, men will undertake a corner who could not undertake any other kind of monopoly. If there are ten times as many contracts on a small wheat supply, operators can afford to make ten times the effort to control that supply. If those contracts must be fulfilled within a limited time, the operator has only to control the supply for that time. A system of short sales makes such a temporary monopoly possible. Each additional speculative contract is so much addition to its possible profits.—Besides the articles already referred to, see *International Review*, vol. ii., p. 818; *Bankers' Magazine* (N. Y.), vol. xxxvi., p. 308; *Nineteenth Century*, vol. x., p. 532.

ARTHUR T. HADLEY.

SPOILS SYSTEM, The. This phrase designates a theory of politics and a use of official authority—more especially that of appointment and removal—according to which the merits of candidates and the general welfare are subordinated to the selfish interests of individuals, factions or parties. The range of this subordination is very great. It extends all the way from the case of a party which, honestly holding none but its followers to be fit for a clerkship, selects the best of them, but bars the gates of office against all others down to the faction leaders, who, excluding all but their own henchmen, corruptly make promotions for money, and promise places for votes; all the way from the great officer who, hardly conscious of wrong, accepts for the party the offerings of his subordinates, down to the official robber who mercilessly demands the places or the money of those serving under him; all the way from the head of a bureau or a department who requests

more clerks, that they may work for his party, or serve as waiters or coachmen in his own family, down to the legislators who vote appropriations in aid of their re-election, and city aldermen who bribe electors by corrupt contracts, and conciliate thieves, gamblers and grog-shop keepers by winking at their offenses. — It is doubtless vain to expect that in politics there will ever be such unselfish regard for merit and duty as to exclude every shade of that system, and perhaps there will always be various questions as to the moral aspects of which honest men will disagree. The limits of the spoils system in its practical application at any time can not, therefore, be precisely stated; nor can we any more precisely state where the merit system begins.* But it is, nevertheless, a great advantage to have convenient phrases, which, like *the spoils system*, and *the merit system*, distinctly mark those extreme and incompatible theories and methods in politics and administration of which the people readily take notice for approval or rebuke. In reference to these systems, all officers and politicians may be readily and usefully classified. Which system does a great politician or officer defend or practice? must always be an important question. — The phrase "spoils system" appears to have had its origin in a speech made in January, 1832, by Mr. Marcy, of New York, in the senate of the United States, in which (in speaking of the politicians of his day, and especially of New York politicians) he said, "When they are contending for victory, they avow the intention of enjoying the fruits of it. If they are defeated, they expect to retire from office. If they are successful, they claim, as matter of right, the advantages of success. *They see nothing wrong in the rule that to the victor belong the spoils of the enemy.*" (Gale & Seaton's Congressional Debates, vol. viii., part 1, p. 1325.) — The system of the pirate and the highwayman, thus defended, had been for some years growing in and poisoning our politics. It was only this open and shameless avowal of it which was original with Mr. Marcy. In the article on TERM AND TENURE OF OFFICE some facts are given tending to show that the earliest practice according to that system was in New York. It was not unnatural that the first unblushing avowal of it, at Washington, should be made by a senator from that state. Among the maxims of Col. Burr for the guidance of politicians, one of the most prominent was, that the people at elections were to be managed by the same rules of discipline as the soldiers of an army; that a few leaders were to think for the masses, and that the latter were to obey implicitly their leaders. * * He had, there-

fore, great confidence in the *machinery of a party*," etc. (Statesman's Manual, vol. ii., p. 1139.) New York has never lost the art, so aptly and early taught by Burr, of making and running party machines. Jenkins, in his "History of Parties in New York," (p. 227), tells us, that "before 1820 the spoils system had been so far matured in that state, that Gov. Clinton, in that year, complained in a message 'of an organized and disciplined corps of federal officers interfering in state elections.'" Mr. Hammond, in his "Political History of New York," and speaking of its early politics, declares, "that party spirit had raged in this more than in any other state of the Union." Mr. Van Buren's relation to the system appears in the article last cited. The unparalleled abuses in past years at the New York postoffice and custom house, and the municipal, judicial and other corruptions associated with the names of Barnard, McCunn, Tweed and Fisk, at the city of New York, have made the consequences of a long and general toleration of that system a part of our familiar history. But it is due to New York to add, that, during the past decade, her citizens have done more than those of any other state to arrest such abuses and to substitute a "merit system" for a "spoils system," both in her own administration and in that of the federal government. — The politicians and the office seekers readily comprehended the spirit and opportunities of the new system which Marcy announced. The era had not long been closed, even among the enlightened nations, during which the hope of plunder and spoils from captured ships and cities had been regarded as essential alike for securing enlistments and for achieving victories on sea or land. Intense and vindictive partisans, accustomed to treat their political opponents as both personal and public enemies, adopted with equal facility the reasoning of Marcy and the war code of pillage and spoils. Either in the heat of victory or the hope of gain, they forgot or disregarded the fact, that the places, the salaries, the promotions, the profitable contracts which they sought, did not belong to the party they had conquered, but to the people, of which they were only a part. A new force, compounded in about equal proportions of corruption and savagery, was soon made potential, alike in the battle fields of politics, in the methods of elections, and in the processes of administration. The proclamation of the spoils system in the senate greatly shocked the better minds of both parties, and alarmed the country at large. Nevertheless the theory of the system (of which "rotation in office," in order to increase the spoils, was an important part) was, even by men in high places, largely and rapidly accepted. In the debate in the senate in 1835, upon the bill for repealing the four years term of office act of 1820, Senator Shepley of Maine, and Senator Hill of New Hampshire, defended that kind of rotation which requires no fault in an officer to justify a call for his removal, and Wright of New York, following Jackson's first message, declared such rotation "to be a car-

* The phrase "merit system" was first used in Eaton's "Civil Service in Great Britain," and it is sufficiently defined by saying that it is everywhere the very opposite of the spoils system, in both theory and method. The merit of a candidate, the merit of a bill or the merit of a policy are equally the basis of all just claim for support. A system which everywhere, in politics and official life, holds merit to be a decisive test, must everywhere recognize the public interests as paramount. Such a system is as thoroughly democratic and republican as it is thoroughly just.

dinal republican principle." But, on the other hand, Webster, Clay and Calhoun, Ewing, Southard and White, and others, denounced the new system as false in theory and demoralizing, corrupt and despotic in tendency. — The abuse of the power of removal, for the double purpose of weakening and wreaking revenge upon the opposite party (or "punishing enemies," in the phrase of the spoils system war code), and of rewarding party workers and personal friends (or of "making and dividing spoils," according to the theory of that code), was the part of the spoils system which was first fully developed. It was not in New York alone that the greed for offices, the hate of political opponents, the fierce partisanship, and the corrupt selfishness and demagogism from which that abuse springs, had affected the administration, even before Marcy's declaration. If there was space for tracing their first manifestations, we should find Washington much annoyed by them, and in every subsequent administration marks of their presence, if not evidences of their pernicious influence. They gave Jefferson much trouble, and tested the sturdy independence of the younger Adams. But it was Jackson who first adopted a fundamental article of the spoils system code, by making the doctrine of "rotation in office" a cardinal principle of his policy at the beginning of his administration. The significance and the disastrous effects of that doctrine, as illustrating the true character of the system which Marcy justified, is sufficiently explained in the article on REMOVALS. — If we consider the spoils system in the details of its practical methods and evil effects, they will be found most developed along the great lines of public administration and party activity. In the articles on ASSESSMENTS (Political), CIVIL SERVICE REFORM, CONFIRMATIONS, JUDICIARY (Elective), PATRONAGE, PRIMARY ELECTIONS, PROMOTIONS, REMOVALS, and TERM AND TENURE OF OFFICE, the results of the system along those lines and much of its history are given. — It was for the purpose of arresting those abuses and substituting a merit system for a spoils system, that the civil service act, approved Jan. 16, 1883, was enacted by congress; and for the same purpose the legislature of New York passed a yet more stringent act on May 4 of the same year. Several sections of each of those acts are aimed against political assessments, and both of them direct that impartial tests of character and of attainment (mainly through competitive examinations) be substituted for official favor and political influence as a basis for entering the public service in non-elective offices. — But in one particular the New York law goes much further than the act of congress. It greatly enlarges the scope of the law against bribery, as it has stood in this country, following, however, in the wake of the bribery and office-brokerage laws long in force in Great Britain. The American bribery laws, of prior date, perhaps without exception, only prohibit the corrupt "use of money or any promise, contract," etc., for the "payment of

money," or for the "delivery or conveyance of anything of value." This leaves the corrupt promise or use of places, promotions, official influence for votes, speeches and work, etc., in aid of candidates and parties, as well as removals and official threats of removal for personal and party ends, untouched. These grave abuses, which are among the worst results of the spoils system theory of politics, are made penal by the fourteenth section of the New York law, as they long since were under British statutes. (See Eaton's "Civil Service in Great Britain," pp. 132 to 141.) — No more space can be given to the origin and growth of the spoils system in this country. But no one should infer that it is of American origin, or that it most naturally flourishes under republican institutions. The work last cited shows the origin of the system in the despotism, corruptions and favoritism of the English monarchy in feudal times, and traces its progress, until the suppression of all its worst features by the substitution in Great Britain of a merit system of the same character, in most particulars, as that which the statutes of congress and of New York aim to establish. There is not an abuse in our politics or administration, connected with the spoils system, which did not exist in a more aggravated form in England before our revolution. In precise form, some of the abuses attending confirmations by senates, could not exist in Great Britain, because such confirmations are there unknown; but a statute (49 Geo. III., chaps. 126, 218), far more stringent than any we have on the subject, enacted when our constitution had been but twelve years in force, contains penal clauses against the corrupt use of solicitations, recommendations, bargainings or negotiations for obtaining nominations, appointments or resignations, which might be usefully enacted here. It is also true that the forms of political assessments, as they exist with us, were not known under the old English spoils system. But it was because offices, grants, promotions, decorations and charters were both openly sold for money and corruptly bartered for political services and votes. If offices, after being sold there, were also liable to be annually taxed, as with us, at the will of a party, a great officer or a partisan committee, their value upon the original sale would have been greatly impaired. The British patronage monger preferred to get the full price on the original sale. Within the last half-century the British government has purchased back for itself, for a money price paid in hand, civil offices which had been merchandise for generations. It is hardly twelve years since commissions in the British army were freely bought and sold. And, to this day, the right to be a rector or parson in the church of England (subject to the approval of the bishop) is openly and extensively advertised for sale, and is publicly bought and sold for money. King James had helped to bring gerrymandering to perfection before Elbridge Gerry was born. We have added little to the art of coercing voters, or concealing, or lying about,

the false count of votes. Office-mongering and office-brokerage and patronage of every kind, a century ago, had definiteness and an importance in the penal law, the politics and the social life of Great Britain, which they have not yet attained in this country. — We have only to glance at the essential spirit and methods of a federal and aristocratic despotism, as compared with those of a spoils system according to the theory of Burr and Marcy, to see how naturally the latter grows out of the former. The king reaches the throne through birth and privilege, and not by merit. The lords hold their places by his favor. The aristocratic class, made up of the blood royal, the nobility, the state church officials, the high officers of the army and the navy, and the great land owners, are a part of the party forever in power. They make their political faith, the creed of the state church, and subserviency to their wishes, the tests for obtaining and continuing in office of whatever kind. What more natural, under such a government, than that all those who do not respond to these tests should not only be excluded from office, but be denied the privilege of voting? Not merely the political faith of that forever dominant party was for generations essential to holding office, but the acceptance of the articles of the state church as well, and, for a long time, the partaking of the sacrament according to its method, were absolute conditions of office holding. The office-holding noblemen, the bishops, and the king's lord lieutenants of counties, were the patronage mongers, place dispensers and election manipulators of their sections; and their cunning and precedents are adroit enough to be even yet worthy the study of senators, politicians and bosses who act on the theories of those feudal potentates and imitate their methods so far as our form of government will allow. — With us the party majority is the king of politics. Spoils-dispensing senators, representatives, governors and party leaders are with us the feudal lords of patronage. Our constitution allows no religious creed to be made a test for office. But, disregarding personal merit and common justice almost as absolutely as any feudal aristocracy ever did, the lords of our politics, in flagrant violation of the first principles of a republic and of the plain intent of the constitution, make the faith of the dominant party, its selfish interests and unmanly subserviency to themselves, the conditions of gaining and holding any of the tens of thousands of places where, in federal departments, in state bureaus and in city offices alike, political views are not in the least qualifications for official duty. — The leaders, under the old English spoils system, claimed the right and used the opportunity of exerting all the authority and resources of the government in their hands to keep their class and party in power and their opponents out of power. Patronage was a prerequisite of a great officer, to be used for himself and his party. Equally with the leaders of our spoils system, they repudiated all demands based on individual

merit which they thought inconsistent with the selfish interest of their class and party. They said, in the language of Marcy, We "claim as matter of right the advantages of success." We "see nothing wrong in the rule, that to the victor belong the spoils." Feudal leaders sold the offices in order to get money to be used for keeping themselves in power. Our spoils system leaders annually rob the humble officers under them of a part of their salaries for the same purpose. The use of money thus gained to buy the press, to corrupt the officers of election, and to bribe voters, has been the common offense of both. Each alike made its political creed the paramount qualification for an appointment, and claimed the right to use all official authority for propagating that creed. James II. and Andrew Jackson, Archbishop Laud and Senator Marcy, George III. and assessment-extortioner Hubbell agree in this, that the opinions of the dominant party, the favor of its leaders, and subservient work as they direct, are the supreme qualifications for clerks, janitors, office boys and scrub-women, and that each are bound to give time and money to keep those who oppress them in power. — That phase of the spoils system which consists in the usurpation of the appointing power of the executive, by the legislative department, has been, save in the matter of confirmations, almost identical in Great Britain and in this country. Executive patronage there was for generations as carefully apportioned among the members of parliament as plunder ever was among pirates, or spoils among soldiers. To avoid the intolerable nuisance of having members going the rounds of the departments, bullying and begging for their shares of patronage, a patronage secretary was provided, who kept accounts with each member, and doled out to him his share as regularly as soup is dispensed from a free eating house. — The greater interest of these facts does not consist merely in the historical analogies between the corrupt and partisan systems of the two countries, but in the further facts, rich in hope for us, that, in the elder country, where that system was founded on the throne, entrenched in feudal principles and class distinctions—where it was buttressed by the army on one side, and the state church on the other, and was, therefore, tenfold stronger than with us—it has been, through a steady effort of twenty-five years, overthrown and removed. In our efforts to overthrow such a system, we have but to contend for the fundamental principles of a republic while standing upon all the best precedents of its founders. It would not be a bad definition of a true republic to describe it as a government under which office is secured by merit to the exclusion of favoritism and influence, nor of a true aristocratic despotism, to define it to be a government under which favor and influence secure office, and merit is subordinated to birth and privilege. — There is another view of the subject which must not be overlooked. That can hardly be said to be a system in political affairs which is but a series of abuses. A system

implies an orderly method proceeding from some recognized theory. The theory of the spoils system may be readily outlined. — 1. In a merely superlative and ideal sense, a party may be (what Burke declared it to be) a body of persons agreeing together in the support of common principles, which they seek to carry into effect for the public good; but according to the only practical and sensible use of the word, a party is a highly organized body of politicians constantly engaged in selfish and warlike effort for capturing the government (or for keeping its enemies from capturing it), and for gaining honors, offices and profits for themselves. — 2. Politics is at once a game, a business and a series of campaigns; to be so conducted as to pay the leaders, the fighters and the workers. Profit enough must be got out of the administration to pay the expenses of capturing it and the cost of office seeking. — 3. The theory that a regard for great principles, love of country, and a sense of duty—analogueous to those sentiments which support the charities, the asylums and the churches of a nation—are the vital force of a party, is altogether chimerical. — 4. Patriotism, disinterested public opinion, and devotion to great principles as a duty, are suspicious and unreliable elements in politics; and, if they ever exist, they are yet generally but a cover for a hypocrite or a doctrinaire. They are indeed very dangerous to good party management and to favorite leaders. Selfishness, patronage and discipline are the great forces of politics. Absolute obedience, and the despotic rule of the majority, are the strength and salvation of a party. — 5. The honors, the offices, the public employments, the political assessments, the profitable contracts, the opportunities of levying illegal fees and political blackmail—these are the spoils, to be divided so as to be made most effective. — 6. Personal merit is not to be wholly ignored, nor public opinion needlessly affronted; but the wishes of the leaders must be accepted as the law of the party, and zeal and work for the party are qualifications for public service paramount to personal merit. The party politics of a door-tender, a cartman, a storekeeper, an office boy, a washwoman and a chimney sweep, are essential to their selection. When either gets an office, a debt to the party is incurred, for which fealty, work and assessments are due as long as the man or the woman holds it. — 7. The leaders must govern secretly and absolutely, after the precedent of the Albany regency, and according to the original semi-military code of Burr. To refuse obedience to them, or to bolt however bad a nomination, is treason to the party never to be forgiven. — 8. Custom houses and postoffices, under the spoils system, are not mere places for doing public work upon business principles by officers having business capacity, but are entrenched outposts of the party, to be manned by its valiant warriors, and to be barricaded against opponents; nor this alone, for these offices are also asylums for broken-down henchmen, sally-ports for carrying elections, and banks

of issue for raising assessments. — 9. The party leaders must hold the gates of the primaries as well as all the gates of office; they must fix the conditions upon which any member of the party can vote for a delegate or be allowed to receive a nomination. It is fatal to discipline to allow the primary meetings to be open to all those who are faithful to the principles of the party. The officers of primary organizations should be the compliant henchmen of the senators, governors and chieftains who run the postoffices and custom houses, and they must exact a pledge from all members to obey the leaders, to defend the platform of the majority, and to support every nomination, whether good or bad. To allow those ready to support the principles of a party to freely meet, and choose their own presiding officers, and select and send their own delegates to a convention, is fatal to spoils system management. — 10. Senators are the feudal lords of state politics, whose voice should be held supreme in selecting the federal officers to serve within these states; and if a president shall refuse to nominate a senator's favorite for a collector, the senator should resign, go home, and arouse his state against the president. From Burr to Marcy and Jackson, and from the latter to Tweed and Conkling, such has been the theory and the practice under the spoils system. — 11. Clerks, other small officers and laborers paid by the public, though bound to work for the government, are also bound, not only to work for the party, but to pay to it the partisan taxes it chooses to impose. They must not be allowed to serve the people equally and justly at all times, irrespective of political opinions and party interests, but, on pain of removal, must, as far as the criminal law will permit, make every official act bribe or coerce a vote, and bring dollars to the patronage monger or the party that gave them their places. — 12. All attempts, therefore, to compel the use of official authority only for public purposes, all attempts to put persons into the service merely because they are the most worthy, all attempts to put them in without the consent of the party managers or the member of congress of the state or district, all attempts to impartially test their fitness by examinations, all attempts to prevent great officials using patronage as a perquisite of themselves and their party, are utterly utopian and doctrinaire—gross invasions of the discretion of officials and of the rights of parties. When the infamous Judge Barnard, on his trial under impeachment, replied to a question about his use of judicial patronage—"I won this office, and its patronage is mine"—he rivaled Marcy in condensing the whole spirit of the spoils system. — With such authority and income, with resources for bribery and coercion so ample, a party, following able and unscrupulous leaders, may go a great way in defiance of public opinion. It has honors for the aspiring, authority for the ambitious, profits to bribe the mercenary, removals for overawing the timid, money to pay its own expenses, exclusions from the muster roll of party membership.

for intimidating those who threaten to say what they think, or expose what they know to be wrong. — But the course of events during the last few years has made it plain that the spoils system must everywhere very soon give place to a system under which merit must be the test of selections for appointments, and regard for the intents of the public, rather than those of the party, be made the rule of administration. The people are more and more clearly comprehending that parties must serve the people, and not ask the people to be the servants of a party. DORMAN B. EATON.

SQUATTER SOVEREIGNTY. (See POPULAR SOVEREIGNTY.)

STAMP ACT CONGRESS (IN U. S. HISTORY), a body of delegates from all the colonies, except New Hampshire, Virginia, North Carolina, and Georgia, which met at New York, Oct. 7, and finally adjourned Oct. 25, 1765. It differed from the continental congress, which succeeded it, in that it took no steps toward forcible resistance. (See REVOLUTION, II.) — The delegates from New York were named by the committee of correspondence; from Delaware and New Jersey, by informal action of the members of assembly; from the other colonies named, by formal action of the lower house of assembly. The action of the congress was confined to an address to the king, petitions to parliament, and a declaration of the rights and grievances of the colonies. The last named paper acknowledged "all due subordination" to parliament; but declared that the colonies could only be taxed by their own representatives in the colonial assemblies; that the colonists had the inherent right of trial by jury; that the stamp act, and other legislation to extend the jurisdiction of the admiralty court, without trial by jury, had "a manifest tendency to subvert the rights and liberties of the colonists"; and that parliamentary restrictions on colonial trade were burdensome. — The petition of congress was offered in the house of commons, Jan. 27, 1766. It was objected to, 1, as the act of an unconstitutional gathering, and 2, because of its denial of the right of parliamentary taxation. After some debate the order of the day was voted, and in this summary manner the first request of the united colonies for a hearing was passed over. — The proceedings of this congress are in Niles' *Principles and Acts of the Revolution*, 451, and in 2 Niles' *Register*, 337, 353; see also authorities under REVOLUTION.

ALEXANDER JOHNSTON.

STANDING ARMIES. (See ARMIES.)

STANDING ORDERS. (See PARLIAMENTARY LAW.)

STANTON, Edwin M., was born in Steubenville, O., Dec. 19, 1814, and died at Washington, D. C., Dec. 24, 1869. He was graduated at Kenyon College in 1833, was admitted to the bar

in 1836, and practiced at Cadiz, O., until 1839, then at Steubenville until 1847, at Pittsburgh, Penn., until 1857, and thereafter at Washington city. He had always been a democrat, and in December, 1860, he became attorney general under Buchanan. In January, 1862, he became secretary of war under Lincoln, and retained the place until 1868. In this position he showed a devouring energy and capacity for work, which considerably shortened his own life, as well as the war. As the conflict between the president and congress on reconstruction was developed, he took sides with the latter, and President Johnson's attempt to remove him led to the impeachment of the president. (See RECONSTRUCTION; TERM AND TENURE OF OFFICE; IMPEACHMENTS, VI.) When the impeachment failed, in May, 1868, Stanton resigned. In December, 1869, he was nominated and confirmed as justice of the supreme court, but died before entering office. A. J.

STATE, Department of. This is the oldest, and ranks by long established usage as the first, of the departments of the United States government. Founded by act of July 27, 1789 (1 Stat. at Large, p. 28), the department is presided over by a secretary of state, who is a member of the cabinet, and is sometimes (though erroneously) styled prime minister. The functions of the secretary of state embrace a great variety of responsible duties. He is the organ of the government in all communications of whatever nature with foreign governments. Such communications, although in form purporting to emanate from the president whenever important diplomatic matters are concerned, are always prepared at the department of state, and signed by the secretary, although they must first have the president's approval. The secretary conducts all correspondence with the ministers and consuls of the United States residing abroad; he has exclusive charge of negotiations concerning foreign affairs; he only, according to official etiquette, can communicate with the representatives of foreign powers residing in the United States, upon public affairs. He is the official organ of correspondence between the president and the governors of the various states in the Union. He has charge of all treaties which have been made, and conducts negotiations as to new treaties or modifications of old ones. All the laws of the United States are preserved in the archives of the state department as they come enrolled on parchment from congress, after being approved by the president. The secretary publishes the United States laws, resolutions, presidential proclamations, treaties, etc., properly edited, in annual volumes. The secretary of state is custodian of the great seal of the United States, and affixes the seal with his countersign to commissions or appointments to office in the higher grades, to executive proclamations, to warrants for pardon, extradition, etc. He records and issues passports to Americans traveling abroad. He makes annual report to congress (more recently made monthly) on the commercial

relations of the United States with foreign countries, based upon information gathered by our ministers and consuls abroad. A register of the department of state is issued annually, with full lists of consular and diplomatic agents, salaries, fees collected, regulations concerning precedence of diplomatic agents, etc. The department also publishes a volume of consular regulations, in frequently revised editions — The secretary of state is aided by a first assistant secretary, who becomes acting secretary in his absence, salary \$4,500; a second and third assistant secretary, salaries \$3,500 each, who are charged with correspondence with diplomatic and consular officers, and with such public business and correspondence as may be assigned to them by the secretary. The business of the department is distributed among seven bureaus: a diplomatic bureau, having charge of correspondence with American ministers residing abroad; a consular bureau, charged with the correspondence with the consulates of the United States; a bureau of indexes and archives, having charge of the mails, the registry and indexing of correspondence, and the preservation of the archives; a bureau of accounts, having the custody and disbursement of appropriations, care of funds and bonds, and of the building and property of the department; a bureau of rolls and library, having custody of the rolls, treaties and laws, with their promulgation, and the care of the library and public documents, as well as of the revolutionary archives; a bureau of statistics, charged with the preparation of the reports upon commercial relations; and a law bureau, for the examination of all claims, and of questions of law submitted by the secretary or his assistants. — This widely distributed business is performed by a force of sixty-two officers and clerks, besides fourteen messengers and laborers, drawing annual salaries to the amount of \$112,350 in 1884. The contingent and miscellaneous expenses of the department of state amounted to the very moderate sum of \$25,050 the same year. The department is located in the new and commodious granite building forming the south wing of the massive edifice known as the state, war and navy department building, erected in 1871–81. The department of state has had as its secretaries, from the beginning of the government, a series of statesmen distinguished in the political annals of the country. The following list exhibits the names, with the term of office occupied by each:

SECRETARIES OF STATE.

1. Thomas Jefferson.....	Sept. 26, 1789
2. Edmund Randolph.....	Jan. 2, 1794
3. Timothy Pickering.....	Dec. 10, 1795
4. John Marshall.....	May 13, 1800
5. James Madison.....	March 5, 1801
6. Robert Smith.....	March 8, 1809
7. James Monroe.....	April 2, 1811
8. John Quincy Adams.....	March 5, 1817
9. Henry Clay.....	March 7, 1825
10. Martin Van Buren.....	March 6, 1829
11. Edward Livingston.....	May 24, 1831
12. Louis McLane.....	May 29, 1833
13. John Forsyth.....	June 27, 1834
14. Daniel Webster.....	March 5, 1841
15. Hugh S. Legaré.....	May 9, 1843
16. Abel P. Upshur.....	July 24, 1843

17. John C. Calhoun.....	March 6, 1844
18. James Buchanan.....	March 6, 1845
19. John M. Clayton.....	March 7, 1849
Daniel Webster.....	July 22, 1850
20. Edward Everett.....	Nov. 6, 1852
21. William L. Marcy.....	March 7, 1853
22. Lewis Cass.....	March 6, 1857
23. Jeremiah S. Black.....	Dec. 17, 1860
24. William H. Seward.....	March 5, 1861
25. Elihu B. Washburne.....	March 5, 1869
26. Hamilton Fish.....	March 11, 1869
27. William M. Everts.....	March 12, 1877
28. James G. Blaine.....	March 5, 1881
29. Frederick T. Frelinghuysen.....	Dec. 12, 1881

A. R. SPOFFORD.

STATE RIGHTS. (See STATE SOVEREIGNTY, II.)

STATE SOVEREIGNTY (IN U. S. HISTORY), the theory of the relation of the states to the Union on which was based the right of secession. It held that all the rights and powers of sovereignty were vested in the thirteen states, or commonwealths, which originally formed the American Union; that the peoples of these commonwealths had authorized their state governments to form the confederation in 1777–81 and the constitution in 1787–9; that the peoples of the individual commonwealths thus formed a voluntary union, retaining to themselves the whole essence of sovereignty, but yielding to the new federal government certain of the insignia of government, previously held by the state governments; that the people of any state, by withdrawing from the federal government its grant of powers, *ipso facto* dissolved the only bond which united them in a continuously voluntary union with the other states; and that there is, and can be, no "sovereignty" in the people of *all* the states, considered as a nation, in internal affairs, and no insignia of sovereignty in foreign affairs, except what is granted to the federal government by the real sovereignties, the peoples of the individual commonwealths, or states. The above is the doctrine of state sovereignty pure and simple, as it includes the right of secession. There is a much more popular and far milder doctrine, of which Madison was the strongest supporter: it holds that the states were sovereign until the ratification of the constitution; and that they then ceased to be entirely sovereign, a government partly national and partly federal taking their place. A variety of the first theory was also upheld, particularly in 1861–5: it held that the states were still truly sovereign, but that their international responsibility and comity forbade them to secede even from a voluntary union on trivial grounds, and authorized the other states to war upon them and compel their return. — In considering the question it is as well to begin by examining the word sovereignty itself, though the examination must be brief. Mr. John Austin defines it thus: "If a determinate human superior, not in the habit of obedience to a like superior, receive habitual obedience from the bulk of a given society, that determinate superior is sovereign in that society, and the society (including the superior) is a society political and

independent. To that determinate superior the other members of the society are subject. * *

The mutual relation which subsists between that superior and them may be styled the relation of sovereign and subject, or the relation of sovereignty and subjection." This carefully guarded definition evidently implies that sovereignty resides in some small class, and it will settle the question of the sovereignty of the dukes of Burgundy in the middle ages, or of the princes of Servia in modern times. But its fundamental idea must be modified in the United States, where every governmental agency is supposed to be "in the habit of obedience" to the will of the people, expressed in written constitutions. The question for us must be, whether the people of the state, the commonwealth, or the people of the nation, has been habitually superior when it has seen fit to declare its will. This will show us whether the ultimate sovereignty, the absolute independence of action in domestic and foreign affairs, the uncontrolled power of decision in the last resort, is in the people of a state or in the national people. — No theory of the nature of the American Union can be suggested against which arguments from authority, from the declarations and opinions of leading men, legislative bodies and conventions, can not be levied in array. The feeling of the American people has always been so strongly individualistic, their conventions and legislatures have been so much inclined to put confidence in their own assertions without regard to opposing facts, and their public men have been so influenced in feeling and language by their environment, that it is not difficult to bring arguments from authority in support of every variety of theory. This series of articles, relying on the facts of our history, and practically disregarding authority, is founded in a belief opposed to all the theories above enumerated: that the Union is not "voluntary," in the sense implied in state sovereignty; that it has always been compelled by force of circumstances, common interests, and everything that goes to develop a national will and make up a nation; that the nation has existed, by its own will maintained by arms, since the first shot was fired at Lexington; that it has since continually asserted its existence with a steadily growing certainty of success; but that the expression and assertion of its existence is limited, according to its own will and the political instincts of the people, by the controlling necessity for preserving state lines, state government and "state rights," properly so called. (See CONGRESS, CONTINENTAL; DECLARATION OF INDEPENDENCE: NATION.) This article will therefore be confined to 1, the leading arguments for state sovereignty, as advanced by its supporters; 2, the historical arguments against it; and 3, "state rights."—1. The word "people" is the *z* of American political algebra. All parties agree in the assertion that sovereignty is inherent in the people, not in the government; and in so far the unanimity of belief is almost startling, considering the diversity of results

to which it has led. But the unanimity disappears as soon as we undertake to define "the people." Is it the people of all the states, of the nation, that is sovereign? Is it the people of each individual state that is sovereign? Jefferson Davis and his associates in 1861 held the latter view, and each, when the sovereign people of his state declared for secession, obeyed the behest of the only "people" known to him, even to the waging of war on the United States. The dominant party of the north and west held the former view, and justified the people of the nation, through its constituted agents, in suppressing rebellion by war. The democratic party of the north and west generally supported the war measures of the government, but did so on the ground of the third doctrine above mentioned, that the government was the agent of the non-seceding states in offsetting by war the unfriendly act of secession. If the doctrine of state sovereignty is correct, if each individual state is the only nation which its citizens can know, the southern states in 1860-61 undoubtedly exercised a constitutional and inalienable right in seceding, if they believed that the welfare of their citizens and their own preservation would be imperiled by remaining in the Union; and the suppression of the rebellion was a revolutionary transformation of a voluntary into an involuntary Union. And the argument of southern writers in favor of state sovereignty is, in general, as follows. — 1. They direct attention to the slow and steady growth of the states along the Atlantic coast, the nucleus of each being widely separated from the others, and none of them ever mingling with its neighbors or losing its own identity; to the fact that each had its distinct government, the king being the common executive; and they conclude, that, when the connection between the colonies and the king was "severed by rebellious swords, each colony became a living soul, and each necessarily possessed sovereign political will over its own territory and people." In support of this assertion their appeals are mainly to authority; and if this form of argument could be accepted as conclusive, the doctrine of state sovereignty would be very strong. The word "people," as used at the time, was almost invariably applied to the people of a state; and the people of all the states are loosely referred to as "the continent," "the generality," "America in general." When independence was finally declared, the instrument was carefully entitled "The unanimous declaration of the thirteen united (*sic*) States of America," showing that "thirteen independent wills became unanimous on the great occasion"; and in declaring the independence of "the States," these bodies are always referred to in the plural: "that as Free and Independent States they have full Power to levy War, conclude Peace, contract Alliances, Establish Commerce, and to do all other Acts and Things which Independent States may of right do." The idea may be indicated by the full title of Dr. Ramsay's "History of the Revolution of South Carolina

from a British Province to an Independent State." And the language of the constitutions adopted by the several states during the revolutionary period is even stronger in the same direction. "The people of this state, being by the providence of God free and independent, have the sole and exclusive right of governing themselves as a free, sovereign and independent state; * * That this republic is and shall forever be and remain a free, sovereign and independent state." (Connecticut act of 1776, establishing the charter as a constitution, preamble and article 1.) "The people of this commonwealth have the sole and exclusive right of governing themselves as a free, sovereign and independent state." (Massachusetts constitution of 1780, still in force, art. 4.) "This convention, therefore, in the name and by the authority of the good people of this state, doth ordain, determine and declare that no authority shall, on any pretense whatever, be exercised over the people or members of this state but such as shall be derived from and granted by them." (New York constitution of 1777, art. 1.) "That the style of this country (*sic*) be hereafter the state of South Carolina." (South Carolina constitution of 1778, art. 1.) When we add to such expressions as these the emphatic *caveat* of the second of the articles of confederation, "each state retains its sovereignty, freedom and independence," the whole makes up a formidable mass of contemporary testimony in favor of the "sovereignty" of the individual states; and it is re-enforced by the unconscious and ingenuous testimony given by the almost invariable language of men of the time in official and unofficial positions. And, finally, in the treaty of peace which closed the war, the high contracting parties joined in declaring, not that the United States as a nation was independent, but that the several states, naming them in order, were "free, sovereign and independent states."—But, after all, what is all this argument from authority worth more than the impotent protests of a drowning man in the midst of a resistless current? His declarations that he will not drown can hardly save him without the added exertion of swimming. If "sovereignty" could be maintained by resolutions alone, the argument from authority would be of weight; but neither is true. Reams of resolutions would be of little avail in maintaining the "sovereignty" of Ireland or Poland, unless the resolvers are ready to back their resolutions by physical force; and no such readiness was ever shown by the individual states. Massachusetts came nearest to it in the sudden levy of troops and siege of Boston which followed the fight at Lexington; but even Massachusetts, while fighting the enemy with one hand, was with the other beckoning to the nation for help, and her delegates, as soon as the continental congress met in the following month, successfully urged the adoption of her troops as a "continental army." In resolutions the states were prolific: when it came to war, the highest and most dread attribute of "sovereignty," all instinctively shrank back,

and pitted the true nation against a king, sovereign against sovereign. The mass of evidence above summarized goes just far enough to prove that the individual states were sovereignties *in posse*; and had any one of them ever ventured on the next essential step, and maintained its separate sovereignty by physical force, no sane man could have denied that it was at last a sovereignty *in esse*. But this last step has always been wanting, and, while that is the case, all is wanting. That states, thus covering like frightened chickens under their mother's wing, should have gone on calmly ignoring in words their mother's existence, and asserting by resolution the sovereignty which they dared not maintain by force, only shows the inability of even the wisest men to see clearly all the phases of contemporary history. That able men should still argue that a sovereignty *in posse* can be transformed into a sovereignty *in esse* by such a cheap and easy weapon as a resolution, only proves that prejudice is still frequently of stronger weight than obvious fact. That the nation should have quietly tolerated such open denials of its very existence, only proves the national indisposition to apply unnecessary force. An imperator or a czar must suppress the least impeachment of his sovereignty: the American republic will still calmly allow even an open denial of its existence—always provided that the denial is confined to theory.—But it must not be supposed that the argument from authority itself is so overwhelmingly in favor of state sovereignty as the summary above would imply. We may pass by the unofficial exhibitions of national spirit in revolutionary times, and still have a reserve force of authority to show the universal consciousness that the controlling, though always self-controlled, power was in the *national* people. Congress, in its declaration of July 6, 1775, says: "We exhibit to mankind the remarkable example of a people [not of thirteen peoples] attacked by unprovoked enemies." The same body formulates its proclamation of Dec. 6, 1775, thus: "We, therefore, in the name of the people of these United Colonies"; and thus begins its declaration of July 4, 1776: "When, in the course of human events, it becomes necessary *for one people* to dissolve the political bands which have connected them with another, and to assume among the powers of the earth the separate and equal station to which the laws of nature and of nature's God entitle them." This last step, this assumption of a separate and equal station among the powers of the earth, is the only means by which "sovereignty" can properly be asserted; and it never has been so asserted by a single state. The real national revolutionary nature of the declaration, and the subordinate part played by the states in it, are well stated in the address of congress to the people, Dec. 10, 1776: "It is well known to you, that, at the universal desire of the people, and with the hearty approbation of every province, the congress declared the United States free and independent." If we are to trust to authority, we

may cite the sweeping assertion of Charles Cotesworth Pinckney, Jan. 18, 1788: "The separate independence and individual sovereignty of the several states were never thought of by the enlightened band of patriots who framed the declaration of independence, the several states are not even mentioned by name in any part of it." And no man in the South Carolina legislature at that time said him nay when he denounced the claim, "that each state is separately and individually independent, as a species of political heresy." — Again, in its commission to its ambassadors to France, Oct. 23, 1776, congress remarks: "A trade upon equal terms, between the subjects of his most Christian majesty and the people of these states will be beneficial to *both nations*"; and the ultimate treaty of Feb. 6, 1778, refers regularly to "the *two parties*" or "the *two nations*." The treaties with the Netherlands, Sweden and Prussia, in 1783-5, use the same phrases. Nor did congress hesitate to bring the national *power* into plain view, when necessary. Dec. 4, 1775, it resolved that "in the present situation of affairs, it will be very dangerous to the liberties and welfare of America, if any colony should separately petition the king or either house of parliament." Dec. 29, 1775, it resolved that "the colonies of Virginia, Maryland and North Carolina be *permitted* to export produce to any part of the world, except Great Britain," etc. Finally, May 15, 1776, the congress recommended the various assemblies and conventions of the colonies "to adopt such government as shall in the opinion of the representatives of the people best conduce to the happiness and safety of their constituents in particular and America in general"; and the national power which thus brooded over the state governments themselves is indicated in an address of congress to the people of the United States, May 8, 1778: "Your interests will be fostered and nourished by governments *that derive their power from your grant*." Even the state constitutions which declare the sovereignty of the state show the underlying consciousness of the delegates that a national power was in existence, though it was more prone to show itself by acts than by words. The constitutions of Delaware, Georgia, New Hampshire, New Jersey, New York, North Carolina and Pennsylvania, all refer expressly to the previous action of congress, and particularly to its resolution of May 15, 1776, as the justification of their action; and the four state constitutions (of Massachusetts, Maryland, Virginia and South Carolina) which do not expressly refer to it, do so tacitly by their long delay until congress took the initiative. The preamble of the South Carolina constitution of 1778 even assigns, as a reason for a new constitution, that "the United Colonies of America have since been constituted independent states * * * by the declaration of the honorable the continental congress, dated the 4th day of July, 1776." But the first constitution of South Carolina, March 26, 1776, strikes the deadliest of all possible blows at the theory of state

sovereignty, whose essential dogma is that the United States exists in a state only by the continuing will of the state. On the contrary, article twenty-eight of this constitution declares that "the resolutions of the continental congress, *none of force in this colony*, shall so continue until altered or revoked *by them* [congress]." The resolutions of the national congress in force in South Carolina, prior to any declaration of the "sovereign" will of South Carolina! Certainly Calhoun had no hand in framing this constitution. — Having stated the arguments, *pro* and *contra*, this article can only conclude that the arguments from authority are quite evenly balanced, but that the argument from fact is overwhelmingly against "state sovereignty." The states declared themselves sovereign over and over again; but calling themselves sovereign did not make them so. It is necessary that a state should be sovereign, not that it should call itself so, while still sheltering itself under a real national authority. The nation was made by events and by the acts of the national people, not by empty words or by the will of sovereign states; but the sovereign will of the nation has always been that there should be states, that the people should act politically through them, and that their rights and privileges should be respected. — 2. If the argument from fact, that the separate states were never more than sovereignties *in posse*, and that they never ventured to become sovereignties *in esse*, is sound, it, of course, disposes of state sovereignty not only in the birth of the nation and in the formation of the confederation, but in the adoption of the constitution also. If a sovereignty was created by general and national obedience to the resolutions of a revolutionary national assembly, unlimited by any organic law; and if that sovereignty was maintained by a successful national war, there is no argument to the contrary in the fact that the new sovereignty allowed its agents, the state governments, to shape the articles of confederation, and to appoint delegates to the convention of 1787. The national sovereignty thus created *might* have disintegrated and died; New York or Virginia *might* have broken away and sustained herself as a sovereignty *in esse* as well as *in posse*; but there was in fact no such result. The national feeling held the nation together, and forced the unwilling state governments to stand sponsors to a new national assembly. Such a body was the convention of 1787. It could not have been an assemblage of ambassadors from sovereign states, for, as is noted hereafter, no state constitution ever purported to give its legislature power to send such ambassadors or make such a treaty, and no governor ever ventured to assume such a power. And the convention, when it met, proved its national character by disregarding altogether the articles of confederation, which were never to have been even amended, except by unanimous vote of *all* the legislatures; and by giving the ratification of the new form of government to state conventions, not even allowing the legislatures a voice in the matter. — Nevertheless,

state sovereignty adduces a great mass of argument from authority in all the transactions which led to the adoption of the constitution, and in the constitution itself. The convention itself struck out the word "national" from the first resolution proposed to it, "that a national government ought to be established." Its debates are marked by frequent use of expressions relating to the sovereignty of the states. "That the states are at present equally sovereign and independent has been asserted from every quarter of this house," said one delegate. The expression "We, the people of the United States," in the preamble to the constitution, and the omission of the names of the states, are usually cited as decisive proofs against state sovereignty. Undoubtedly the people of the nation were making the constitution, but it is very doubtful whether many of the delegates were aware of the fact: most of them probably still applied the word to the people of their own individual state, and felt, as the "Federalist" (No. 39) expressed it, that "each state in ratifying the constitution is considered as a sovereign body, independent of all others, and only to be bound by its own voluntary act." The omission of the names of the states seemed decisive to so respectable an authority as Mr. Motley, but unluckily the omission cuts the other way. In the first draft of the constitution, as reported by the committee, Aug. 6, 1787, the preamble reads, "We, the people of the states of New Hampshire, Massachusetts," etc. [naming them in order], and the names were left out in the final draft from the apprehension that one or more of the states named might, by virtue of its supposed "sovereignty," reject the constitution, drop out of the Union, and compel an after alteration of the preamble. To the same effect is the seventh article of the constitution, as finally adopted: "The ratification of the conventions of nine states shall be sufficient for the establishment of this constitution between the states so ratifying the same." What, then, was to be the status of the states which should refuse to ratify? Were they still in the Union, perhaps as territories? Or were they to secede from the Union? Or had the other states already seceded, and left them to keep warm the ashes of the old confederation, if they could? Was the constitution itself a successful secession from the confederation? or did it only provide for necessary secession in this seventh article? Such questions as these have always had an obvious fascination for the advocates of state sovereignty, while their opponents have usually avoided both Scylla and Charybdis by going overland and ignoring them altogether. But, in any candid discussion of the subject, they must be met and answered; and, in order to answer them, the effort has been made to state them fairly and strongly. — Such questions, with their tacit implication that "sovereignty" is a mere affair of words, that any body of men, in order to be sovereign, has only to call itself, or be called, sovereign, afford silent but weighty testimony to the peculiar natural advantages which the American people enjoy, and

have always enjoyed. If the proximity of more powerful neighbors had ever compelled the American people to sacrifice one or more states or parts of states as the price of a treaty of peace, the fallacy of state sovereignty would have been exposed. But this has never been necessary, except in the partial example of Maine in 1842 (see MAINE); and annexation, which is the complement of such territorial sacrifice, is always ignored by the advocates of the doctrine. Free from dangerous neighbors, the American people did not, until 1861, learn the truth which bitter experience had made familiar to less favored quarters of the globe, that sovereignty is always potentially an affair of "blood and iron"; and that it needs not only men who know, or think they know, their rights, but men who, "knowing, dare maintain." Sovereignty is indivisible, as any controlling will is indivisible. As between the nation and the states, the only question must be, Which was the sovereignty? And it can only be answered by asking, Which dared to go alone, to carve out its own path, and achieve its own destiny? The question answers itself. Two states, Rhode Island and North Carolina, refused to ratify, and the constitution went into force without them. There could have been no more excellent opportunity than this to convert a sovereignty *in posse* into a sovereignty *in esse*; but this first and last test for sovereignty compelled each of these states to answer, "It is not in me." Within two years both were confessedly in their natural places as part of the nation, both had ratified the constitution, nominally as their voluntary act and deed, but actually, like other states, under stress of circumstances. We can not know how far Rhode Island was influenced by unofficial propositions to carve up her territory between Massachusetts and Connecticut, or how far North Carolina was influenced by official propositions in congress to suppress or restrain her commerce with the neighboring states. (See SECESSION.) We can only see the patent fact that these two states had and shrank from the opportunity to attempt to become sovereign in very truth. — But the constitutional phrase, "between the states so ratifying the same," brings up the further question, Where were Rhode Island and North Carolina between March 4, 1789, and their respective ratifications in 1789–90? Were they in or out of the Union? Unless the nation existed, and these states were still a part of it, we are completely at sea. The nation which had by successful war extorted from Great Britain a recognition of its boundaries, would not have been slow upon occasion to compel Rhode Island and North Carolina, and Vermont as well, to respect those boundaries, and to recognize themselves as included within them. But no such occasion arose, and no argument can fairly be drawn from a *forbearance* of the nation to enforce its sovereign will. Failure to overcome an open defiance would have been a different matter; but a father's authority is not to be fairly impeached from his forbearance in allowing a recalcitrant son

an hour for consideration. In point of fact, Rhode Island and North Carolina finally ratified the very constitution which they had at first rejected, without a single amendment to commend the chalice to their lips. There was no escape for them; they had to ratify; but the forbearance of the nation gave them an opportunity to do so "voluntarily." That the new scheme of government should have been defeated by the will of two states, or that these two should remove themselves without successful war, from the boundaries fixed in 1783, would have been equally impossible; but the nation had been guilty of an oversight in allowing state legislatures to form the articles of confederation, with their absurd provision for a unanimous ratification of amendments, and the nation scrupulously atoned for its oversight by forbearing to press even the weakest of its states. There is of course a still stronger argument drawn from the nature of the constitution, but that will best be considered under the second head of this article. — It would be unfair to deny that the various conventions which ratified the constitution in 1787–90 considered themselves as acting for "sovereign states." The debates of the Virginia convention show that the word "people" meant the people of the several and individual states, and not of the nation, in this declaration, which was a part of the ratification: "That the powers granted under this constitution, being derived from the people of the United States, may be resumed by them, whenever the same shall be perverted to their injury or oppression"; and these words, in their literal meaning, have the essence of the doctrines both of state sovereignty and secession. But these words, again, are mere "authority," void as against facts. Whose was the uncontrollable will, the sovereignty, that extorted ratification from an unwilling majority in Virginia, New York, New Hampshire and Massachusetts, and, later, in Rhode Island and North Carolina? Was it the will of any state? or was it the will of the nation, acting, according to its own preference, through state organizations? The question answers itself, provided the questioner will confine himself to the facts of our history, and turn a deaf ear to the conflicting arguments from authority, the opinions, sometimes correct and sometimes incorrect, of the actors in the history. But the question is often triumphantly asked, What would have happened if a part of the states had refused finally to ratify? Either the recusants would have left the constitutional number of ratifying states (9), or less than that number. In the latter case the condition placed upon ratification by the national will would not have been fulfilled; and the whole scheme of the constitution would have failed. In the former case, the pressure upon the recusant states would have been gradually increased until the alternative of ratification or force would have been distinctly presented. In either event, that of general confusion or that of the forcible maintenance of the national will, the sword, the *ultima*

ratio of sovereignty, would have made its appearance; and, whatever the result of the struggle might have been, "state sovereignty" would certainly have received before 1800 the quietus which it finally received in 1865. One sovereignty, or two, or three, might have emerged from the chaos, but state sovereignty, and even state rights, would hardly have survived. In this point of view the ratification debates of 1787–9 show the usual contradiction between authority and fact, between the constant assertion of state sovereignty and the ever-present fear that force might dispel the illusions of the assertion. A contemporary tradition is, that Washington, while signing the constitution, thus struck the key-note of this feeling: "Should the states reject this excellent constitution, the probability is that an opportunity will never again offer to cancel [substitute] another in peace: the next will be drawn in blood." "I fear a civil war," said Gerry. "Apprehending the danger of a general confusion and an ultimate decision by the sword, I shall give the plan my support," said Charles Pinckney. "Is it possible to deliberate between anarchy and convulsion on the one side, and the chance of good to be expected from the plan on the other?" asked Hamilton. "Suppose," said Thompson, in the Massachusetts convention, "nine states adopt this constitution; who shall touch the other four? Some cry out, Force them. I say, Draw them." In the Virginia convention Patrick Henry unconsciously drew a pregnant parallel between the forbearance of the nation in forming the confederation and in forming the constitution: "During the war America was magnanimous. What was the language of the little state of Maryland? 'I will have time to consider. I will hold out three years. Let what may come, I will have time to reflect.' Magnanimity appeared everywhere. What was the upshot? *America triumphed.*" (See TERRITORIES.) Where was the sovereignty, then, the uncontrollable, though self-controlled and "magnanimous," power in the cases of Maryland under the confederation, and of Rhode Island and North Carolina under the constitution? Finally, Dec. 14, 1787, in a public letter, Washington used the following language, which sums up the case against state "sovereignty" in framing the constitution: "Should one state, however important it may conceive itself to be, or a minority of the states, suppose that they can dictate a constitution to the majority, unless they have the power of administering the *ultima ratio*, they will find themselves deceived" — As a summary, we may say that the ratification of the constitution by the conventions of six of the states, New Hampshire, Massachusetts, Rhode Island, New York, Virginia and North Carolina, was not at all voluntary; that it was extorted by the evident preponderance of the national will, including minorities in their own states, as well as majorities in other states, and by a fear of arraying a *pseudo* sovereignty against a real sovereignty; that the whole process was a national act; and that

the strongest arguments from authority can not avail against the facts of the case. Nevertheless, there is one expression of opinion which should be cited here, not as an argument from authority, but as giving exactly and tersely the writer's belief. It is that of James Wilson, in the Pennsylvania convention of Dec. 4, 1787. "My position is, that in this country the supreme, absolute and uncontrollable power resides in the people at large; that they have vested certain proportions of this power in the state governments; but that the fee-simple continues, resides and remains with the body of the people." He who asserts the contrary, who holds that the will of a state is, or has ever been, uncontrollable, must prove it by adducing facts, not opinions, whether contemporary or subsequent to the revolution. — 3. After 1789 state sovereignty entered upon the seventy-five years struggle with the national idea which ended in 1865. (See KENTUCKY RESOLUTIONS; CONVENTION, HARTFORD; JUDICIARY; ALLEGIANCE; NULLIFICATION; SECESSION; RECONSTRUCTION; NATION.) Throughout this struggle almost every state in the Union in turn declared its own "sovereignty," and denounced as almost treasonable similar declarations in other cases by other states. Where these declarations stopped, and were intended to stop, at naked assertion, they come properly under our third head of "state rights." In this form they have always been common, and probably will again be common, though they have much decreased in frequency since 1865. So late as March 19, 1859, on the occasion of a supreme court decision against the Wisconsin "personal liberty law" (see that title), the state legislature passed a series of resolutions, the last of which spoke the following strong language: "that the several states which formed that instrument [the constitution], being sovereign and independent, have the unquestionable right to judge of its infractions; and that a *positive defiance* by those sovereignties of all unauthorized acts done under color of that instrument is the rightful remedy." References to sovereign states and the sovereignty of the states have since been by no means unusual in legislative resolutions and judicial decisions. A good example is in the message of Gov. Robinson, of New York, June 14, 1878, vetoing a bill to enable creditors of other states to sue through New York state officers: "It requires the state to lay down its dignity, its honor and its integrity as a sovereign state of the Union, and to become a collecting agent for speculators in state bonds." In none of them has there been any apparent notion of a possible maintenance of the so-called sovereignty by force in case of opposition to it. We are interested only in the cases where this final test of sovereignty has been brought in question. It is fairly doubtful whether the New England opposition to the embargo and the war of 1812 falls in the former or in the latter class. The probability is that it really meant state sovereignty to a few of the leaders, but only state rights to the mass of the leaders and followers. The

action of Pennsylvania in the *Olmstead* case, in 1809, and of Georgia in the *Cherokee* case, in 1830-32 (see that title), inclined toward the forcible maintenance of the state's will. In the former case the national authority was enforced, and in the latter it was yielded. South Carolina's nullification of the tariff act in 1832 fulfilled every requisite of the theory of state sovereignty by employing a formal state convention to declare the uncontrollable will of the state. This was therefore the first fair and open attempt in our history to maintain the doctrine to its logical consequences, and it was a failure. The inability of the state to maintain its ground was so evident that an unofficial assemblage suspended the sovereign will of the state to a point beyond the designated time. From this time state sovereignty became inextricably blended with slavery, until the growing union of both ended in secession in 1860-61. (See SLAVERY, SECESSION.) It is very true, as most southern writers assert, that the fundamental issue on which the seceding states waged war in 1861-5 was the maintenance of "the right of self-government," that is, of state sovereignty; and that, in comparison with this, slavery was of little importance. It is true, that, when a state had once pronounced its will to secede, both the supporters and the opposers of secession felt bound to maintain the will of the state, even to the extent of war against the United States. But it is equally true, that no such issue would ever have been presented but for slavery and its progressive influence in arraying the will of the state against the will of the nation. When the issue was at last presented, it could no longer be avoided. There was no room for forbearance, or, as Patrick Henry termed it, "magnanimity"; sovereignty was brought to the touchstone, and state sovereignty was found wanting. — In the subsequent process of reconstruction (see that title), there was very much that was at variance not only with state sovereignty, but with state rights as well. The power over the militia, the elective franchise, the state courts, and the police regulation of cities and towns, which the universal national will decrees to be in the states, was for a time withheld from the lately seceding states. If this was intended in any way as a certificate of burial for the defunct theory of state sovereignty, it served the further purpose of bringing into plainer view the healthy doctrine of state rights; for the punishment was so abhorrent to the national instincts that it was very rapidly abandoned. Out of all the struggles of the past has come the unanimous will of the nation, equally opposed to state sovereignty and to centralization, that it shall be an indissoluble Union of indestructible states. — II. Under the first head the effort has been made to show the baselessness of state sovereignty from the single historical fact that the will of the nation has always been the controlling power, though it has always been forbearing in non-essentials. It is necessary further to adduce some other more isolated facts, all showing that the states were never

sovereigns. — 1. It is essential that a sovereignty should have complete power of independent action in external affairs as well as in internal affairs. Foreign nations, in their intercourse with a state, look, not to assertions of sovereignty, but to the fact, and regulate their recognition and diplomatic relations accordingly. What are we to think of a "sovereignty" that never declared or waged a war, never concluded a peace, never sent or received an ambassador, never flew a recognized flag, and never formed a treaty or an alliance? And yet this is the history of nearly if not quite all the states. The few exceptions, the New England union (see that title), the Indian wars and treaties of New England and the south, the pine tree flag and coinage, were *sub rosa* appropriations of the insignia of sovereignty, unrecognized by any others than the appropriators, and most of them occurred in colonial times, when sovereignty, other than the king's, was unthought of. Even when the colonies became states, the usual American political sense showed itself through all the declarations of state sovereignty: none of their state constitutions purported to give the state governments any of the powers above enumerated, nor was this withholding of power the consequence of any agreement in the articles of confederation, for all the state constitutions were framed before, most of them five years before, the articles of confederation went into force. It was the consequence of the instinctive national sense that these belonged to the real sovereignty, the nation. There is a single remarkable exception, the twenty-sixth article of the South Carolina constitution of 1776: "That the president [governor] and commander-in-chief shall have no power to make war or peace, or enter into any final treaty, without the consent of the general assembly and legislative council." But even this (unaltered until 1790) must be taken as only an argument from authority, since the implied treaty power of the state was never maintained in fact. — 2. The states have nowhere shown their lack of the essentials of sovereignty more conspicuously than in their self-confessed inability to stand alone. At the very outset of the struggle between the nation and the king, in 1775, the boldest of the states, Massachusetts, was the loudest in calling upon the continental congress for help to maintain her integrity. The first state to form a constitution, New Hampshire, did so only after seeking the patronage of congress, and all the other states, except South Carolina, waited, before taking the same step, for the general recommendation of congress, May 15, 1776, referred to above. In the articles of confederation each state legislature undertook to covenant with all the others for protection. This was found to be too weak a safeguard, and the nakedness of state sovereignty was fully exposed in the adoption of the constitution: "The United States shall guarantee to every state in this Union a republican form of government, and shall protect each of them against invasion and * * * against domestic violence." Even in

1861 the seceding states, which so loudly declared their sovereignty, were at the same time contradicting the assertion by their instinctive efforts to form a new nation for the protection of state sovereignty. A sovereignty incapable of self-maintenance, and always under the protection of a higher power, is a contradiction in terms. — 3. A still stronger objection is the nature of the governments, whether they be called federal or national, which have been formed in, for and by the Union. The first, or revolutionary, government of the continental congress, was absolutely opposed to state sovereignty. The armies which were mustered, the navies which were created, the war which was waged, the flag which was displayed, the treaties which were made, and the debt which was contracted, were all exclusively national, and depended for their credit on the will of the whole people. Congress even showed its national nature by declaring independence without the assent of New York, and by practically making Washington dictator in 1777. Even the articles of confederation, though they declared the sovereignty of each state, contradicted the assertion by leaving the insignia of sovereignty to the national government. When we come to the constitution, the objection becomes absolutely insuperable. The prohibitions upon the states in section 10 of article I. are all prohibitions of the exercise of sovereign powers; the states, then, were not in fact regarded as sovereignties, either by themselves or by others. The same argument can not be applied to the preceding section, prohibiting the exercise of certain powers by the United States; for these are all matters of routine, not sovereign powers. Under the constitution the states were not to have even the appearance of sovereignties: the powers to declare war, to make peace, to conclude treaties, to suppress insurrections, and to punish treason, were now placed where they belonged, in the national government. If states formed the constitution, they stultified their own assertions of sovereignty. The conclusion must be, not that states, state governments or the federal government is sovereign, possessed of uncontrollable power, but that the people of the nation, divided by its own will into states, is sovereign. — The idea that the sovereignty of the states was only suspended by the formation of the constitution, ready to be revived at any moment by the will of the state, though it was the general southern doctrine after about 1803 (see SECESSION), is altogether too fine spun for practical use or recognition. The idea of a comatose sovereignty, of a sovereignty which sleeps like Rip Van Winkle, but wakes at the exercise of its own suspended will, of an uncontrollable will which still exists though it has resigned its essence to another, of an abdicated sovereign peaceably reviving its own sovereignty, is certainly an extraordinary political dogma; and its evident fallacy is enough to disprove the notion that the states were ever sovereign. — Above all, the provision for amendment by three-fourths, not by all, of the states, is a flat negative to state sovereignty.

There is, with the obsolete exception of the retention of the slave trade until 1808, and with the always controlling retention of state lines, no limit upon the power of amendment. Can we imagine real sovereignties not only "suspending" the exercise of their own wills on points certain, but agreeing to accept as their own the unlimited and indefinite future will of three-fourths of their associates? And yet the only alternative for state sovereignty is to imagine the states as making the agreement without the intention of keeping it. This one provision for amendment is sufficient to outweigh all the arguments from authority that could be adduced. — 4. It is usually assumed that state sovereignty is essential to a federal government, and is only denied because of the desire to introduce the idea of a national or centralized government. In fact, the government is both national and federal: not, as the "Federalist" asserts, partly national and partly federal, by the will of the states; but together national and federal, by the will of the whole people. Powerful enough to have established the most centralized government, if it had been foolish enough to desire it, the national will has always, of its own motion, limited itself to such a government as the states should agree upon, a federal government. When the nation's first instruments, the state legislatures, proved unfit, the nation was strong enough to wipe out their work and substitute a better; but it still pledged itself to maintain the states intact, and to make no change in the constitution on which three-fourths of the states could not agree. This universal American predilection to a federal form of government has made it possible to argue in favor of the sovereignty of the original thirteen states, but the case is altogether different when we come to the states which have been subsequently admitted under the constitution. So difficult is it to ascribe their existence to their own uncontrollable will, or to anything else than the uncontrollable will of the nation, that the advocates of state sovereignty here find (and evade) their Scylla and Charybdis. Take the state of Missouri as an example. Its territory was sold by France to a sovereignty, the United States, not to any or all of the states. It was bought by the nation as a sovereignty, not by any permission given by the states in a written constitution. Its original acquisition, its erection into a territory, its government as a territory, were alike the results of the national will. And when its population had grown sufficiently to justify hope of stability, the national authority regulated the formation of a state government, established its boundaries, and finally, in its own time and on its own terms, admitted the new state to the Union. Will any man be bold enough to specify where and when the sovereignty, the uncontrollable will, of Missouri came into this long process as a factor? To whom, then, do the people of Missouri owe what would still often be called their "sovereignty," the absolute power over their own affairs, which they have enjoyed since 1820, but did not enjoy before 1820? Evi-

dently, to the national will. There is not a state, old or new, in this Union, whose will has been considered in the establishment of its own boundaries. The boundaries of the original thirteen states and of Vermont were fixed by the royal power and its agents; the boundaries of new states, and the rearrangement of the boundaries of the old states, have been fixed under the supervision of the new national sovereignty; and neither of these classes of *pseudo* sovereignties has ever had the power to add one cubit to its area of its own uncontrollable will. Indeed, one of them (Iowa) was refused admission until she would accept the boundaries which the national will had fixed for her. The only fair arguments to the contrary are Rhode Island and Texas. (See those titles.) But these were only apparent. The long resistance of the former to the encroachments of her neighbors was passive, not active; and the boundaries of the latter, which her own power had been unable to establish as she claimed, were finally fixed by the United States. Texas, indeed, is a good deal of an anomaly in her entrance to our system. An undoubted sovereignty previously, she was rather united to the Union than admitted to it. Some of the whigs, who were opposed to the admission, even claimed at the time that it was a fair question whether the United States had annexed Texas, or Texas had annexed the United States; that the junction of the two republics had properly abolished the constitutions of both, and vacated the offices of their respective presidents; and that a new constitution and a new president were necessary for the new nation. But the overwhelming superiority of one of the two parties was taken as a sufficient offset for all legal informalities, and the "annexation" was consummated. Barring this anomalous case, the origin of state sovereignty in new states is a field of inquiry which the advocates of the theory of state sovereignty can not be induced to enter. The ablest and latest of them, in his "Republic of Republics," cited below, has a chapter of eight pages on "Sovereignty in the new states," in which the whole question is evaded carefully and successfully. Its only attempt at argument is in the closing sentences of the chapter: "Can you think, dear reader, of any political difference between Ohio and Connecticut, Virginia and Missouri, New Jersey and Texas, Georgia and California, as to *status*, capacity or rights?" And the answer must be: There is no difference; each and all owe their *status*, capacity and rights to the power which won them, by force or purchase, from Great Britain, France, Spain or Mexico, and which has since maintained them, the nation. — In fact, state sovereignty is the deadliest of all enemies to a federal government. In a government without the federal principle, the entrance of the error is impossible, or extremely difficult. As soon as the federal principle enters, its parasite enters with it, and usually succeeds in destroying it. A permanent federal Union, based upon the uncontrollable will of the states which composed it, would be as impossible as permanent

connection between man and woman without lawful marriage. The sovereign power of the nation, by the certainty which it gives to the bond, places in the category of the impossible countless grievances which, without a national power, would soon be magnified by state jealousy and state demagogues into good reason for dissolution of the bond. He, then, who denies state sovereignty, but upholds state rights, does so not in defense of the national power, which is perfectly able to defend itself, but in defense of the most beautiful and yet delicate of all schemes of government, the federal system. — III. STATE RIGHTS. From 1800 until 1865 the phrase "state rights" looked directly or indirectly to but one of the supposed rights of a state, the right of secession. The political revolution of 1800 was caused very largely by the revolt of the mass of the people against the federalist idea that the federal government was sovereign, a very different thing from the assertion that the nation is sovereign. The new party that then assumed control of the federal government did so on the theory that the federal government was the servant of the states, and that the Union was wholly voluntary on the part of the states. This theory was summed up in the name "state rights democrat." In the north and west the theory had disappeared in reality long before 1860, and men in those sections who called themselves "state rights democrats" were hard pressed to reconcile their party name and their support of the war against the rebellion. In the south the name and theory were kept in complete sympathy by the multifarious influences of slavery until state sovereignty and slavery went down in a common overthrow in 1865. "State rights" may now take its proper signification, that which belonged to it in reality even while "state sovereignty" was given as its formal name. — In reading the debates of the period from 1775 until 1789, no one can help noticing the peculiar way in which the word "sovereignty" is used. The same men who recognize at every step in fact the existence of a national sovereignty, continue to refer to the states as "sovereignties." The same Wilson, whose exact and satisfactory statement of the ultimate national sovereignty has been used above, speaks thus in another place: "The business of the federal convention * * * comprehended the views and establishments of thirteen independent sovereignties." And such apparent contradictions are not the exception, but the rule. "The American Statesman's Dictionary," says von Holst, "was written in double columns, and the chief terms of his vocabulary were not infrequently inserted twice: in the right-hand column, in the sense which accorded with actual facts, and was in keeping with the tendency toward particularism; in the left, in their logical sense, the sense which the logic of facts has gradually and through many a bitter struggle brought out into bold relief, and which it will finally stamp as their exclusive meaning." If they endeavored to "outdo the mystery of the Trinity by making thirteen one, while leav-

ing the one thirteen," it was because they were conscious that the thirteen were thirteen by the will, protection and support of the one. It is by the citation of one member of each of these verbal contradictions that the advocates of state sovereignty have built up their argument from authority, making the "fathers of the republic" the fathers of their theory, while ignoring the practical application by which the fathers aforesaid explained their apparent contradictions. The contradiction will disappear if we take in set terms what the fathers took in practice, that the states were not sovereign of their uncontrollable will, but that they possessed absolute power in their own sphere by the will of the nation. "State sovereignty" then takes its proper form of "state rights." The nation may diminish or enlarge the sphere of the states: it has repeatedly done both by amendments; but, whatever the sphere of the states may be, they are supreme within it. It may be said that this reduces the states to the rank of counties, but the objection will not hold. The will of a state, to which the nation has abandoned the control of cities, towns and counties, is easily expressed and exercised: but the will of the nation can only be expressed and exercised with such enormous difficulty that the states are practically safe from it, unless an unusually great emergency calls it forth. What present hope is there for any suggested amendment to the constitution? It may further be said that such a theory allows the possible establishment of a monarchy in the United States. Be it so: pray, who is to prevent it if the national will should incline to a step so foolish? He who assumes to prevent it must do so by force. Who could have prevented it in 1775 or in 1787-9, if the nation had willed it? The report was common in 1787 that a part of the convention's plan was to call an English prince of the blood to the throne of the United States. Had the report been correct, and the step been ratified, the only difference in the result would have been that Rhode Island and North Carolina would have felt from a selfish royal personality a pressure very different from the magnanimous forbearance which a republican government could afford to exercise. But the sovereignty would have been alike in both cases, and its exponent the same in kind, differing only in degree. — And how in reality does this assail the dignity of the states, since it plants their authority on a base so broad as to be practically immovable? Federal government and state governments are alike exponents of the national will, and the effort to secede on the one hand, and to unconstitutionally oppress a state on the other, are alike defiances of the national will, though, if successful, the latter may be atoned for, while the former can not. It is notorious matter of fact, that, in a peaceable and legal struggle between the federal government and a state government, the national sympathy is rather with the latter than with the former; and the state government, supported by the consciousness of this general sympathy, and aided by its own greater intensity of interest, has a much greater

probability of success. If the struggle verges toward a settlement by force, national sympathy for the state government decreases, until the distinctive federal authority is formally or actually acknowledged; and then the controlling national feeling shows itself by marking as a victim for political punishment any department or officer of the federal government that has been instrumental in thrusting upon a state the alternative of force or submission. The national will approved the federalist measures of 1798, the action of President Adams against Georgia in 1824, the nullification proclamation drawn up by Edward Livingston against South Carolina in 1832, and the forcible suppression of ku-klux disorders by the Grant administration in 1871-3; and in all these cases the national sympathy almost instantly showed itself against the authors of the acts which had been approved. Even in ordinary politics, there is no greater danger to an American administration than the well or ill founded belief that it is endeavoring to coerce the will of its own party in a state. "[American] men," said Hamilton, bitterly, "are rather reasoning than reasonable animals"; and the national devotion to a federal system must be fully taken into account by any one who would attempt to study American political history. — And we can not doubt that the national feeling is justified by reason, by the events of the past, and by the probabilities of the future. It is so obviously impossible for any mere centralized government to consult wisely and well the diverse interests of California, Maine and Florida, as far apart in distance and climate as London, Teheran and Morocco, that the absolute necessity of the federal system is everywhere recognized without question. The people of each state feel that the principle on which their own happiness and comfort rest would be destroyed if they should connive at an encroachment by the federal government upon the sphere of another state. They know instinctively that in so vast a country the choice is between the federal system and disunion, for the most solidly based centralized government could not hold the nation together six months; and in the train of disunion come diplomatic relations, international wars, standing armies, and the subordination of the many to the few. Rather than admit the first appearance of such evils, they have denied to the states the power to recall their senators; rather than suffer the reality, they have surrendered the dearest prejudices of their nature, and conquered and reconstructed a portion of the states of the Union. They perceive that a federal system, so far from being in any need of state sovereignty, is injured by the first appearance of state sovereignty and the diplomatic relations implied in it; but that any abandonment or infringement of state rights is an insult and an injury to the nation, and a subtle attack upon the federal system, in which alone the nation can maintain its unity. And the lessons which the past has taught are of such a nature that the future can only add force to them. State

sovereignty, with its shifting possibilities of rearrangements of federal associations, disunions and reunions, might have been possible in a limited area, with small population, slight internal interests, and no foreign intercourse; but it was impossible even in 1775, and every doubling of population and wealth since has only made the impossibility more patent. And in exactly the reverse order, the maintenance of state rights, comparatively unimportant in 1775, has grown every year more essential to the well-being of the people, whether viewed as states or as a nation. The area of the state of New York is closely similar to that of England, and there seems to be no great reason why New York should not expect to rival England in population and in wealth. At any rate, every advance toward that point is a stronger reason not only why the welfare and happiness of the increasing population of New York should be consulted, but also why the rest of the country, with its increasing stake in the welfare of New York, should consult it by maintaining the state rights of New York. — In this essential respect, there seems at present to be little fear for the future. It is, of course, not so easy for one who is in the current of events, as for one who looks from the outside, to calculate exactly their force and direction; but so far as can be seen now, the intensity of the national predilection for state rights is increasing, not diminishing. Mr. E. A. Freeman, in his magazine article, cited below, lays stress on the general American substitution of the word "national," since 1860, for the word "federal." "It used to be 'federal capital,' 'federal army,' 'federal revenue,' etc.; now, the word 'national' is almost always used instead. This surely marks a tendency to forget the federal character of the national government, or at least to forget that its federal character is its very essence." The argument would be very strong if the change had taken place in a period of peace, but the change really shows no sign of permanence, and is only one of the last waves of the tremendous exertion of national sovereignty in 1861-5, never, it is to be hoped, to be again made necessary. A stronger argument is drawn from the passage of laws by congress, such as the national banking law, the general election law, and a few other statutes, which conflict with what were long considered state rights. But these are exceptional cases, due to causes entirely outside of state rights. It is far more noteworthy that state rights, even of the conquered states, have come unscathed through the storm of a desolating war directed against a number of the states. It would be difficult to specify any point in which the theory of government by states has been seriously marred since the adoption of the constitution. Wherein do the people of New York or Virginia govern themselves less now than in 1789? The only fear to the contrary is in the encroachments of the federal judiciary; but these would punish and correct themselves by so clogging the federal courts with business as to compel their reformation by the national

will. And while the outlines have been maintained, the state's power has grown *pari passu* with that of the nation: New York is now a stronger and richer state, a more powerful government, a more valuable friend in peace, a more formidable enemy in war, than the whole United States in 1789. Under the silent but potentially omnipotent sovereignty of the nation, New York has always enjoyed a power of self-government which her own sovereignty could not have made more absolute, and might easily have made much more doubtful. Under the shadow of the powerful commonwealths of Massachusetts and Pennsylvania, the little states of Rhode Island and Delaware are living their own peculiar life, under the national *ayis*, with an absolute fearlessness of interference from their neighbors for which many a stronger state elsewhere might well have bartered the Philistine armor of "sovereignty." The very same cause, the steady growth of the states in population, wealth and material interests, which would have made state sovereignty yearly more dangerous and hateful to the nation, makes state rights dearer and more evidently essential. — And it does not require a very close scrutiny of passing events to see that the same cause which has just been mentioned is actually developing a deeper shade of particularism than even state rights. As the state grows more populous and wealthy, a growing diversity of interests in different parts of the state develops a particularist feeling within the state itself. The germ of the feeling has always existed in some of the states. Western and eastern Massachusetts, New York, Pennsylvania, Virginia and North Carolina have quite regularly taken opposite political directions, and in one of them (Virginia) the fissure, expanding under the force of open war, has resulted in the formation of a new state. But in all the larger states, there are indications of the steady growth of the feeling; and the probability is, that, as soon as population becomes dense, the pressure of conflicting interests will be relieved by the throwing off of new states. Already New York has three fairly defined sections, the west, the north, and the southeast, any one of which is a potential state. The enormous and diversified area of Texas was never made for a single state; and only increasing density of population is needed to make the same thing evident in other cases. The silent growth of the feeling may be estimated from a single instance. In 1794 the so-called "whisky insurrection" (see that title), in western Pennsylvania, was suppressed by militia, a part of the force being drawn from New Jersey, Maryland and Virginia. In 1877 the same region was the scene of a part of the railroad riots, and the attempt was made to employ militia from the eastern part of the state in restoring order. Let him who remembers the delirium of passion with which men of all classes resisted the attempt, ask himself what the result would have been if New Jersey, Maryland or Virginia militia had again been introduced, and say whether the particularist feeling is less

strong in that region now than in 1794. It is even evident that the particularist feeling is not confined entirely to sections of states, but that the great cities which have been growing up on our soil are also developing a particularism of their own. The shibboleth of "home rule," the abandonment of state and national parties in local elections, which has of late years developed so strong a following in Philadelphia, Brooklyn and New York city, is only a phrasing of this new and deeper shade of particularism, which will come out to full view as soon and as fast as it is needed. Mr. Freeman, in the article before referred to, notes this very peculiarity: "An American city is more thoroughly a commonwealth, than an English city has." Such evident tendencies may well offset a temporary exaggeration of the word national. They seem to show that the people of the United States are justified in their abounding confidence that their political machine has the power to correct its own errors and to guard against its own dangers. — A complete definition of state rights is an impossibility. Theoretically, they consist of all the powers of government which the nation has not transferred to the federal government or forbidden the states to exercise. (See CONSTITUTION.) By leaving the states and their governments *in situ* at the outbreak of the revolution, the nation confirmed to them a power over their own territory practically unlimited at the time; but the rights and powers which they have since lost have gone to the general government by direct transfer. The rights of the federal government and of a state government must be ascertained by two directly opposite questions: in the case of the former we must ask what rights have been directly transferred to it by the federal constitution; but in the case of the latter, what rights and powers have been forbidden to it by the state or federal constitutions. In the case of doubtful powers the presumption is against the federal government and in favor of the state, for the nation has given the federal government a limited charter, while it has only circumscribed the state government in certain particulars. The *onus probandi* is upon the asserter of federal authority and the denier of state authority. The state's direct and indirect powers cover all the field of daily life and interests, while multitudes of persons live and die without once coming directly in contact with federal power or practically realizing the existence of the federal government except by participation in biennial elections. But even this does not quite express the sum total of state rights. The states still assert a power to punish for treason, though the power in offenses against the United States has been transferred to congress (see TREASON); and there are certain powers, such as the passage of insolvency laws, and the regulation of congressional elections, which they exercise in default of action by congress. And, in general, they have whatever powers their courts may define as their right, and may succeed, by

persistence or ingenuity, in maintaining against the federal courts, always provided that the controversy does not take the aspect of force: in that case the state must yield to the more direct representatives of the national will. Even in this latter case, the chances are still decidedly in favor of the state; for it has, unless it is very evidently in the wrong, the pronounced sympathy of the nation, which works in its favor in innumerable ways. Conflicts of this kind are not uncommon: one is in progress at the present writing (1883) between the federal and state courts in New Jersey. They are always compromised or evaded, and results will show that the state court, by claiming more than its right, regularly obtains all it can fairly ask. (See, in general, CONSTITUTION, Art. I., §§ 4, 8-10; Art. III., §§ 2, 3; Art. IV., §§ 3, 4; Art. V.; Art. VII.; and Amendments, Arts. X.-XV.)—The theory of state sovereignty is best stated in 1 Tucker's *Blackstone*, Appendix, note D, and in Story's *Commentaries*, §§ 310-318. For the arguments in favor of it see, "Centz" 's *Republic of Republics*; 1 Calhoun's *Works*; 2 *ib.*, 197, 262; 3 *ib.*, 140; 1 Stephens' *War Between the States* (see index); Fowler's *Sectional Controversy*, 351; Harris' *Political Conflict in America*, 212; Pollard's *Lost Cause*, 33. For the Madison theory, see *Federalist* (No. 39); *North American Review*, October, 1830, 537; 2 Curtis' *History of the Constitution*, 377. STATE, The. Although natural, and founded on what is most imperious in our sympathies and our wants, society is not maintained and preserved without an effort. The bond which holds it together would be weak indeed and forever in jeopardy if a protective power were not established superior to individual wills to keep them within bounds and to defend the persons and the rights of each against the attacks of violence. Men may wish to see the authority here referred to invested with this form or that; they may attribute to it this or that historical origin; but all agree that it is indispensable to the maintenance of human society, and that only perfectly wise or perfectly brute creatures can do without government.—But it is clear

that there is a great difference between the purely repressive authority with which the elders of a tribe are invested, and the complicated and powerful organism called the state in nations advanced in civilization. When society has reached a certain degree of development; when the cultivation of land possessed in common or appropriated by individuals requires security; when foresight inspired by offensive or defensive war has engendered the habit in a people of making certain preparations in common in view of common danger and enterprises in common; and when certain ideas, beliefs and feelings, held by all the members of a given society, have given birth to the moral unity of the nation, the nation is necessarily developed, and assumes a character of solidity, duration and permanence. It extends its sphere of action, and is completed by the addition and regular working of numerous wheels, each having a distinct existence, and all functioning in harmony. The living personification of the fatherland, the instrument of its strength at home and abroad, the author and enforcer of the law, the supreme arbiter of interests, judge of peace and war, the protector of the weak, the representative of all that is general in the wants of society, the organ of the common reason and of the collective force of society: such is the state in all its power and majesty. Superior to all it governs, the state nevertheless owes to its own citizens all that it is. But it is absolutely necessary that we should remark: what society has confided to the guardianship of the state as a precious deposit depends no more upon society than it does upon the state—the sacred deposit of justice. (See JUSTICE.) Justice does not emanate from the individuals who compose society; it imposes itself on them as their rule of action. In vain do certain publicists maintain that the state can do everything because it is above everything. Nothing is more destitute of foundation than such an assertion. Its rights would be limited by its duties even if they were not limited by positive guarantees written in the laws. The state, too, has a rule and bridle in justice. The law emanates from the state. But the power to make the law and to employ force in its service, does not imply that the state has the unlimited power to make what is unjust just, or the just unjust, at its pleasure. Human beings are subject to moral laws, against which the state has no more power than it has against the physical laws which govern matter.—(See NATION, CHECKS AND BALANCES, GOVERNMENT, GOVERNMENTAL INTERFERENCE, LEGISLATION, REPRESENTATION.) B.

STATES, Constitutional and Legal Diversities in. Nothing more forcibly evinces the complex character of American political institutions than the numerous variations in the constitutions or fundamental laws of the states forming the American Union. The controlling power of the federal constitution in matters where it is made the supreme law of the land is fully treated

elsewhere in this work. But the large variety of powers relating to the internal polity of states, to local administration, revenue, expenditure and taxation, to the laws of property, to corporations, municipal or private, to the administration of justice, to the domestic relations, etc., come within the cognizance of the several state constitutions, and of the laws made in pursuance thereof by state legislative bodies. States exercise not only the right of eminent domain within their own boundaries, limited only by the power granted to congress to regulate commerce between the states (a power of hitherto undefined and unknown extent), but they are continually adding statute to statute for the regulation of the community in every conceivable direction, until their constitutions and the body of laws enacted in each state form a vast and sometimes unwieldy mass of legislation, rendering it difficult to ascertain with precision the actual law on any subject, in any state. Still more complicated and vexatious, to the stranger studying our institutions, is the divided jurisdiction between the national and the state governments, and between the latter and the counties or municipalities and towns which combine to make up the state. A citizen of the United States, besides his allegiance to the national government, which manages foreign relations, and legislates for commerce and navigation, public lands, pensions, patents, copyrights, money, tariff and internal revenue, and other objects of national control, also owes allegiance to the state government, which taxes him to maintain a large body of legislative, executive and judicial officers, an extensive public school system, institutions for the care of the unfortunate classes, for the punishment of crime, and sometimes for a system of public and internal improvements of great extent, besides other collateral objects of expenditure. To this is to be added a citizen's share in local government and expenditure, including highways and the administration of justice, besides, in frequent cases, taxes for public buildings, bridges, or other objects of county necessity or ambition. Then, to close the chapter of his divided political allegiance, after he has discharged his obligation to the United States, to his state, and to the county to which he belongs, the citizen is still further subject to participation in the maintenance of a city or town government in the place of his immediate abode. — It had been designed to treat, under the head of Constitutions (variations of State), in the first volume of this work, the diversities prevailing in the political regulations of the various states of the Union; but it was found that very many of these variations are controlled by statute, and not by direct constitutional provisions. To sum up in connected order the more important differences which prevail in the various states in matters of the widest public interest, is the object of the present article. For greater convenience the several topics will be treated in alphabetical order. — **ALIENS.** Most of the state constitutions exclude aliens, or the subjects of foreign governments, from suffrage, until their residence is judged to have been long enough to familiarize them with our political system. But in fifteen states, aliens who have declared their intention to become citizens are invested by the constitution with the right to vote at elections, on the same terms with natives or actual citizens. These states, thus relaxing the rule which excludes from political power aliens who have not fulfilled the prescribed term for naturalization, are Alabama, Arkansas, Colorado, Florida, Indiana, Kansas, Louisiana, Michigan, Minnesota, Missouri, Nebraska, Nevada, Oregon, Texas and Wisconsin. (See **ALIENS**, 1 Cyc., p. 60.) Aliens have the right of purchasing, holding and conveying real estate and personal property by the laws of nearly all the states. — **AMENDMENTS.** (See *Constitutions and Constitutional Amendments*.) — **BALLOT.** With the single exception of Kentucky, the constitutions of all the states require the vote at the popular elections to be taken by ballots. Kentucky's constitution provides that the people shall vote *viva voce*, which, however, is suspended in the case of congressional elections by the United States law requiring congressmen to be chosen by ballot. Voting in state legislatures, however, is almost uniformly *viva voce*, and this is a constitutional requirement in Alabama, California, Florida, Georgia, Indiana, Kansas, Kentucky, Louisiana, Nevada, North Carolina, Pennsylvania, Tennessee and Texas. (See **BALLOT**, 1 Cyc., p. 198.) — **BANKS.** Some of the state constitutions prohibit absolutely the incorporation of any banks issuing circulation (*e. g.*, California, Illinois, Indiana, Oregon and Texas). The Wisconsin constitution prohibits the charter of any banks, except on approval by a majority of the qualified voters of the state at a general election. In most of the older state constitutions, adopted before the congressional legislation establishing the national bank system, the legislature is empowered to provide for the organization of banks by a general banking law. In ten or twelve states the constitution provides for the individual liability of the stockholders to the bank creditors to an amount equal to their respective shares. (See **BANKING**, 1 Cyc., p. 204.) — **CAPITAL PUNISHMENT.** (See *Death Penalty*.) — **CAPITATION TAX.** (See *Poll Tax*.) — **CENSUS.** While the constitution of the United States requires a decennial census, which is at intervals so far removed as greatly to lessen its value in a rapidly growing country, but few of the states have made provision for taking a state census in intermediate years. Constitutional provisions in the following named states require the legislature to provide for an enumeration of the people at the dates named respectively: New York and Wisconsin, in 1855, and every tenth year thereafter; Indiana (of voters only), in 1853, and every sixth year thereafter; Michigan, in 1854, and every tenth year thereafter; Kentucky (voters only), in 1857, and every eighth year thereafter; Kansas, Massachusetts, Minnesota and Oregon, in 1865, and every tenth

year following; Tennessee (of voters only), in 1871, and each tenth year thereafter; Florida, Iowa, Nebraska, Nevada and South Carolina, ["if deemed necessary"] in 1875, and each tenth year thereafter; Colorado, in 1885, and every tenth year thereafter; Louisiana, in 1890, and every tenth year thereafter; Maine and Mississippi, once in ten years, to be fixed by the legislature. The constitutions of New Jersey and Rhode Island permit the taking of a census by act of the legislature, and this was last done in 1875. No constitutional provision on the subject exists in Alabama, Arkansas, California, Connecticut, Delaware, Georgia, Illinois, Missouri, New Hampshire, North Carolina, Pennsylvania, Texas, Virginia, and West Virginia. The constitutions of Maryland, Ohio and Vermont, permit the taking of a census, but no legislative provision has been made for it. It thus appears that in less than half the states is there any provision for a general enumeration of the people which might serve at once as a check upon the national census, and a supplement to its statistics, of incalculable economic value for purposes of comparison. In several states whose constitutions formerly provided for a census, this requirement has been dropped out in new constitutions adopted within the last decade. The failure on the part of state legislatures to take an interest in a proper periodical census of their state resources, is to be attributed mainly to a spirit of false economy. Such great commonwealths as Ohio, Pennsylvania, Indiana and Illinois, while providing for certain classes of statistical reports through state officers, have no provision whatever for the record or publication of vital statistics, or of a complete periodical census of their populations. An attempt has been made by congressional legislation to encourage the state governments in the work of taking account of their population and resources by providing (act of March 3, 1879), that any state or territory which shall complete a census in 1885, 1895, etc., according to the forms used in the census of the United States, shall be paid from the treasury 50 per cent. of the expenses of actual enumeration in such state at the United States census, increased by one-half the percentage of gain in population in such state or territory between the two United States censuses next preceding. — CITIZENSHIP. (See *Suffrage*.) — CONSTITUTIONS AND CONSTITUTIONAL AMENDMENTS. All the state constitutions have certain common characteristics, while there are great diversities as to political regulations and the distribution and details of legislative, executive and judicial powers. The great cardinal features found in all embody (in some form) a declaration of rights; an assertion of the sovereignty of the people through a representative system; the creation of three co-ordinate departments of government, divided into legislative, executive and judicial; a prescription of the qualifications for the right of suffrage; and a recognition of local self-government. The latter, however, is usually implied rather than formally declared. Constitutions

are not the source but the result of personal and political liberty; they grant no rights to the people, but define the rights which they already possess, and provide a systematic organization of governmental powers for their protection. A written constitution is to be viewed in the light of a limitation upon the powers of government in the hands of agents delegated by the people. — How far state constitutions shall enter into the details of government is a matter determined by the public opinion of the time, as reflected in the popularly elected conventions which frame them. While the earlier constitutions, adopted at the period of the American revolution and later, were more general in the scope of their provisions, many of the more recent ones descend into the particulars of governmental control in each department. The tendency has been to restrain the legislature from passing special acts, and all measures conferring corporate rights or special privileges. It may be said, in general, that, with the fewest exceptions, the states of the Union revise their constitutions in from ten to thirty years, each new constitution growing more democratic than the preceding. The southern states have had much more frequent adoption of new constitutions, since the civil war, growing out of the temporary ascendancy of influences and opinions fully treated elsewhere. It is of course a cardinal principle in the making of a constitution that it must be ratified by the people, who alone possess the power of sovereignty. The only exception is in Delaware, whose constitution may be amended by the act of two successive legislatures. The long-established usage, when a constitution is revised or superseded by a new one, is for the legislative branch of the government to submit to the qualified voters the question of calling or refusing to call a constitutional convention. The method of doing this is prescribed by the constitution itself, which is to be made the subject of revision. The provisions in the constitutions of the various states differ widely as to the proportion of the legislative body required to submit to the people the question of amendment or revision; as to the time fixed for deliberation upon the proposed changes; and, finally, as to the majority of the popular vote required to call a constitutional convention, or to amend the constitution directly. The following analysis exhibits the requirements as to the recommendation and adoption of constitutional amendments in each of the thirty-eight states. Two-thirds of both houses of the legislature must concur in order to propose amendments to the constitution to the popular vote in the following states: Alabama, California, Colorado, Georgia, Illinois, Kansas, Louisiana, Maine, Michigan, Mississippi, Texas and West Virginia. In Florida and South Carolina a two-thirds vote of two successive legislatures is required to submit amendments. In Massachusetts a majority of the senate and two-thirds of the house of two successive legislatures are required, and in Vermont two-thirds of the senate and a majority of the house, confirmed by

a majority of the next legislature. In Vermont, also, constitutional amendments are adopted by a majority of the votes of the citizens voting thereon. In Delaware the constitution may be amended by vote of two-thirds of each house of the general assembly if the proposed amendment shall be ratified by three-fourths of the next succeeding legislature. This is without direct reference to the people, although the legislature must "duly publish in print" the proposed amendments, "for the consideration of the people," before the election of the legislature which is to pass upon them. Three-fifths of the legislature are required in Maryland, Nebraska, North Carolina and Ohio to propose constitutional amendments. A majority of the members of both houses is sufficient to propose constitutional amendments in Arkansas, Minnesota, Missouri and Rhode Island. A majority of two successive legislatures is required in Indiana, Iowa, Nevada, New Jersey, New York, Oregon, Pennsylvania, Tennessee, Virginia and Wisconsin. In Connecticut a majority of the house of representatives may take the initial step of referring proposed amendments to the next succeeding legislature, and two-thirds of each house must concur in recommending them to the popular vote. In New Hampshire the constitution provides for no legislative action, but requires the selectmen of towns to take a vote in town meeting every seven years whether a convention shall be called to revise the constitution. A majority of voters can order a convention, but two-thirds of the popular vote are required to adopt a constitutional revision or amendment. There is no submission of amendments without a convention. In Kentucky there is no provision for direct amendment, but a majority of the legislature may submit to the people the question of calling a convention; and this requires a majority of legal voters to be carried. — The provisions as to the majority of the popular vote requisite to ratify amendments to the state constitution also vary in different states. Thus, a majority of the whole number of qualified voters is required in Indiana, Missouri, Nevada, New Jersey, New York and Oregon. Rhode Island requires a majority of three-fifths of the votes cast to ratify constitutional amendments. Alabama, Arkansas, Mississippi and Tennessee require a majority of the votes cast for the general assembly to ratify. In South Carolina alone, of all the states, amendments of the constitution require in order to their adoption not only a majority of the qualified voters of the state, but they must afterward be ratified by two-thirds of each house of the general assembly next succeeding. In the remaining states, California, Colorado, Connecticut, Florida, Georgia, Illinois, Iowa, Kansas, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Nebraska, North Carolina, Ohio, Pennsylvania, Texas, Vermont, Virginia, West Virginia and Wisconsin, constitutional amendments are ratified by a majority of the votes cast on the question of amending the constitution. It very frequently happens in states requiring for

ratification a majority of the voters qualified, instead of those actually voting, that the amendments proposed are lost from sheer lack of interest in them. Popular indifference to constitutional questions is very general, and a majority of all the voters has frequently elected candidates for office, while at the same poll constitutional amendments have been lost because failing to receive the required majority of the qualified voters. In the following states a convention to frame a new or revised constitution may be ordered by a vote of a majority of the votes cast: Alabama, California, Colorado, Connecticut, Iowa, Maine, Minnesota, Missouri, Nebraska, Nevada, New Jersey, North Carolina, Pennsylvania, South Carolina, Tennessee, Virginia, West Virginia and Wisconsin. In Maryland, New York and Ohio the question of calling a constitutional convention must be submitted to the people once in every twenty years, and a majority of those voting thereon legalizes it. In Michigan the question must be submitted every sixteen years, and in New Hampshire every seven years. In the latter state the town meetings act directly on the question, without intervention of the legislature. In Rhode Island three-fifths of the qualified electors must vote to call a convention. In Delaware, Indiana and Kentucky a majority of the legal voters is required to call such a body. In Florida, Illinois, Kansas, Michigan and Mississippi a majority of those voting at the same election for members of the legislature is required to call a constitutional convention. — **CORPORATIONS.** Most of the more recent state constitutions restrict the power of the legislature to create private corporations by special act, but permit their organization under general laws. The aim is to prohibit or curtail special privileges. Stockholders are generally made liable to creditors for the full amount of their respective interest in the stock. — **COURTS.** The court of highest powers or final jurisdiction, called in a few states the court of appeals, is designated in nearly all as the supreme court. The mode of appointment, the tenure of office, the number of judges constituting the supreme court, and their compensation, differ greatly in various states. In all, the constitution fixes the mode of appointment and the jurisdiction, both original and appellate, with power usually given to the legislature to modify the latter; in a few states the number of judges, and in most states their salaries, are left to be fixed by the legislature. The table on page 804 exhibits these variations in a succinct view. It will be seen that only four states provide a life tenure for the judges of the highest judicial tribunal; and in these the incumbents are removable by the legislature for cause or by impeachment. In the remaining thirty-four states the terms for judicial office vary from two years in Vermont, which is the shortest, up to twenty-one years in Pennsylvania, which is the longest, elective term prescribed; although in New Hampshire the judges must retire upon reaching seventy years of age. In all the states judges are re-eligible to

that high office. The people elect the judges in twenty-four states; in six states they are chosen by the legislature; while in eight states the governor appoints the supreme court, subject to confirmation by the senate or the council. — **DIVORCE.** (See *Marriage and Divorce.*) — **DUELING.** This barbarous practice can not claim to be in any popular favor in the United States, since the mark of reprobation has been placed upon it by the constitutions of twenty-five states. The giving or accepting a challenge to fight a duel, or engaging therein either as principal or accessory, is made a disqualification for office by the constitutions of Alabama, Arkansas, Colorado, Georgia, Indiana, Iowa, Kansas, Kentucky, Maryland, Missouri, North Carolina, Ohio, Oregon, Pennsylvania, South Carolina, Tennessee and West Virginia. The constitutions of nine states go further, and declare that a duelist (actual or intended) shall forfeit the privilege of voting at elections, viz., Connecticut, Delaware, Florida, Michigan, Mississippi, Nevada, Texas, Virginia and Wisconsin. Several state constitutions further require that the legislature shall make laws to enforce these disabilities, and to visit other punishments upon offenders. In most of the remaining states special statutes have assigned to dueling a place in the rank of infamous crimes. — **EDUCATION.** The constitutions of all the states, except that

of Delaware, contain provisions designed to favor the increase of knowledge and the creation of intelligent citizenship through the education of the young. While any system of compulsory education or of training in the higher branches of learning is much controverted, it is generally conceded that the state has the right to require that every child should receive some degree of elementary education. This is directly recognized in all the later and in most of the earlier constitutions, and the general assembly is required to legislate for the establishment and maintenance of a public school system. State school funds are created and invested in most states for educational objects, and the lands granted by congress to the states for school purposes, with their proceeds or income, constitute in many the basis of this fund. Various other funds are pledged to educational purposes in some states. The supervision of common schools is intrusted to a state officer, variously known as superintendent of public instruction, commissioner of common schools, or the secretary of the state board of education, who is usually elected for two years (sometimes four) by the people of the state. Several states devote the entire proceeds of the capitation tax to the school fund, e. g., Alabama, Arkansas, California, Louisiana, Mississippi, North Carolina, Tennessee, Texas, Virginia and West Virginia. Many states devote

a specific quota of every dollar of tax raised to the fund for public instruction, which is regularly apportioned by the treasury among the county or local officers. Many state constitutions prohibit the legislature, and the counties, towns and school districts, from devoting any school funds to institutions controlled by any sect. Colorado, Florida, Mississippi and Virginia have a state board of education, composed of the superintendent of public instruction (president), the secretary of state, and the attorney general. Missouri adds the governor to these three officers. The constitution of North Carolina provides that the governor, lieutenant governor, secretary of state, treasurer, auditor, superintendent of public instruction and attorney general shall constitute a state board of education. In Texas, the governor, comptroller and secretary of state constitute the board of education. — Educational statistics do not come within the purpose of this article, but the variations of what is fixed by law as the school age in the different states may here be noted. In Connecticut the age for enrollment in the public schools is from four to sixteen years; in Florida and Maine, four to twenty-one; in Oregon and Wisconsin, four to twenty; in Massachusetts, New Hampshire and Rhode Island, five to fifteen; in California, five to seventeen; in New Jersey, five to eighteen; in Maryland, Michigan and Vermont, five to twenty; in Iowa, Kansas, Minnesota, Mississippi, Nebraska, New York and Virginia, five to twenty-one; in South Carolina, six to sixteen; in Georgia, Louisiana and Nevada, six to eighteen; in Kentucky and Missouri, six to twenty; in Arkansas, Colorado, Delaware, Illinois, Indiana, North Carolina, Ohio, Pennsylvania, Tennessee and West Virginia, six to twenty-one; in Alabama, seven to twenty-one; and in Texas, eight to fourteen. — Regarding compulsory attendance in the public schools, although it has been strongly urged for many years, no wide foothold for the system has yet been acquired in the United States. Connecticut enforced the first practical compulsory education law by its colonial code adopted in 1650; at present, however, even in the "land of steady habits," the difficulty of enforcing the law, with a large school population of foreign birth, is very great. The amended law forbids manufacturers to employ minors under fourteen, unless they have attended school at least three months in each year. Massachusetts has a similar law, and compels parents and guardians to send children between eight and fourteen to school, for twenty weeks every year, unless otherwise under instruction. The Maine school law authorizes towns to enforce the attendance of scholars between six and seventeen. In 1871 New Hampshire and Texas passed laws requiring compulsory school education. In 1872 Michigan passed a compulsory school law, requiring at least twelve weeks' schooling yearly of all between eight and fourteen, not otherwise taught. Nevada, in 1873, passed a law requiring sixteen weeks' attendance. In 1874 similar compulsory laws were passed by California,

Kansas, New Jersey and New York. The New York law (unlike the others) specifies the studies in which the child is to be instructed; namely, spelling, reading, writing, arithmetic, geography and English grammar. Laws enacting some degree of compulsion to attend school also exist in Ohio, Rhode Island, South Carolina, Vermont and Wisconsin; though in some of these states they are generally disregarded. In no other states, so far as known, are compulsory education laws enforced. — ELECTIONS. The time of holding elections for state officers is fixed in some states by the constitution, while in others it may be prescribed or altered by the legislature. By act of congress (March 3, 1875) elections of representatives in congress are required to be held on the Tuesday next after the first Monday in November every second year, in 1876 and following years. The states which had different seasons for election of state officers have by degrees assimilated their laws so as to hold all state elections on the Tuesday after the first Monday in November, the only exceptions being Alabama, Arkansas, Georgia, Iowa, Kentucky, Louisiana, Maine, Ohio, Oregon, Rhode Island, Vermont and West Virginia. Annual elections formerly prevailed in most states; but the tendency has been steadily toward electing state officers and legislatures biennially, and the former even once in every four years only, as in California, Louisiana, Mississippi, Missouri, Nevada, Oregon and West Virginia. The only states now holding annual elections are Connecticut, Iowa, Massachusetts, New Jersey, New York, Ohio, Pennsylvania and Rhode Island. — ELECTORS. (See *Suffrage*.) — EXEMPTION. (See *HOMESTEAD AND EXEMPTION LAWS*, 2 Cyc., p. 464.) — GOVERNORS. The following table gives the variations as to length of terms of office and salaries of governors of the various states :

STATES.	Term.	Salary.
	Years	
Alabama.....	2	\$ 3,000
Arkansas.....	2	3,000

See *Pardoning Power, Succession, Veto Power.* — **HOMESTEADS.** (See **HOMESTEAD AND EXEMPTION LAWS**, 2 Cyc., p. 464.) — **INSOLVENCY.** The general subject of bankruptcy has been treated in vol. I., p. 223. In the absence of any general law of the United States, most of the states have provided acts regulating insolvency and assignments for the benefit of creditors. The states which have no laws for insolvent debtors are Alabama, Colorado and North Carolina. In California the act of 1880 provides for both voluntary and involuntary bankruptcy through the courts. In the following states assignments of property for the benefit of creditors do not discharge the debtor, except upon the amounts paid, the balance of liabilities standing against him: Delaware, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Minnesota, Nebraska, New Hampshire, New Jersey, Ohio, Pennsylvania, Rhode Island, South Carolina and Virginia. In Connecticut the debtor can procure a discharge from liabilities to creditors when his estate pays 70 per cent., but not otherwise. In the following states, debtors making assignments can be released only upon the consent of all the creditors: Maryland, Mississippi, Missouri, Oregon, Tennessee and Texas. Louisiana provides for a discharge of the debtor upon the consent of a ma-

jority of his creditors in number and amount. In New York an insolvent debtor is discharged on the concurrence of two-thirds in amount and value of his creditors. In Maine, creditors representing three-fourths of the indebtedness must agree in writing to accept a certain percentage, before the debtor can have his discharge. In Massachusetts, voluntary insolvency is provided for, on giving up all property not exempted by law. Involuntary proceedings against a debtor may be instituted by any creditor, on proof of insolvency or fraud. If the assets pay 50 per cent. the debtor is entitled to his discharge; if not, he must obtain the written consent of a majority in number and value of his creditors. In Vermont, the provisions of the insolvent law are similar. In the following states a discharge from indebtedness is granted to the debtor upon surrender of his entire estate for the equal benefit of creditors: Arkansas, Florida, Michigan, Nevada, West Virginia and Wisconsin. — **INTEREST AND USURY.** The legislatures of all the states in the Union have fixed what shall be the legal rate of interest on money. In thirteen states, however, any rate of interest that may be agreed upon between borrower and lender is legalized; in twenty-four states, there are two interest rates legalized, the lower one to prevail in all cases in the absence of contract, the higher rate to be legalized upon express agreement in writing. Usury is punished by various forfeitures, in thirty-two states and territories. The following table exhibits the various interest rates and penalties for usury in the thirty-eight states, the eight territories, and the district of Columbia :

STATES AND TERRITORIES.	Legal Rate of Interest	Rate Allowed by Contract.	Penalties for Usury.
	Per Cent.	Per Cent.	
Alabama.....	8	8	Forfeiture of entire interest.
Arizona.....	10	Any rate.	No penalty.
Arkansas.....	6	10	Forfeiture of principal and interest.
California.....	7	Any rate.	No penalty.
Colorado.....	10	Any rate.	No penalty.
Connecticut.....	6	6	No penalty.
Dakota.....	7	12	Forfeiture of excess.
Delaware.....	6	6	Forfeiture of principal.
District of Columbia.....	6	10	Forfeiture of entire interest.
Florida.....	8	Any rate.	No penalty.
Georgia.....	7	8	Forfeiture of excess.
Idaho.....	10	18	Forfeiture of three times excess of int.
Illinois.....	6	8	Forfeiture of entire interest.
Indiana.....	6	8	Forfeiture of excess of interest.
Iowa.....	6	10	Forfeiture of 10 per cent per year on amt.
Kansas.....	7	12	Forfeiture of excess of interest.
Kentucky.....	6	10	Forfeiture of excess over 10 per cent.
Louisiana.....	5	8	Forfeiture of entire interest.
Maine.....	6	Any rate.	No penalty.
Maryland.....	6	6	Forfeiture of excess of interest.
Massachusetts.....	6	Any rate.	No penalty.
Michigan.....	7	10	Forfeiture of excess of interest.
Minnesota.....	7	10	Forfeiture of excess over 10 per cent.
Mississippi.....	6	10	Forfeiture of excess of interest.
Missouri.....	6	10	Forfeiture of entire interest.
Montana.....	10	Any rate.	No penalty.
Nebraska.....	7	10	Forfeiture of interest and cost.
Nevada.....	10	Any rate.	No penalty.
New Hampshire.....	6	6	Forfeiture of thrice the excess.
New Jersey.....	6	6	Forfeiture of entire interest.
New Mexico.....	6	12	No penalty.

— JUDGES. (See *Courts*) — LEGISLATURES. All the state constitutions limit and define more or less fully the legislative powers of the body variously styled "the General Assembly," "the Legislature," and (in Massachusetts) "the General Court." The qualifications required for membership in state legislatures vary considerably, prescribing a greater or less term of residence in the state, a limit of age (in certain states only), and, in nearly all cases, the requirement of being qualified voters. The number of senators and representatives prescribed in the state constitutions varies greatly in different states. The senatorial bodies are conveniently small, running from nine members only in Delaware, to fifty-one in Illinois, while the members of the other house vary from twenty-one to 321 in number. The popular branch is usually styled "the House of Representatives," but is called "the Assembly" in California, Florida, Nevada, New Jersey, New York and Wisconsin; in Maryland, Virginia and

West Virginia it is styled "the House of Delegates," and in all the other states its constitutional designation is "the House of Representatives." The legislative sessions were formerly held annually in most of the states. Of late years, however, there has been a steady drift toward less frequent meetings of state legislatures, nearly every constitution adopted within thirty years providing that the sessions shall be held only biennially, unless special or extraordinary sessions are called. The states whose legislatures still meet every year are six only: Connecticut, Massachusetts, New Jersey, New York, Rhode Island and South Carolina. In Ohio, however, the legislature holds adjourned sessions practically amounting to annual meetings. Some constitutions limit the length of session to terms variously running from forty days to 150. In sixteen states, however, the legislature is without limit save its own discretion as to length of session. The following table exhibits the numbers, terms of office and salaries of state legislatures:

STATES.	Sessions.	Limit of Session.	No of Senators.	No of Representatives.	Term of Sen's.	Term of Rep's.	Salary
Alabama.....	Biennial.	50 days.	33	100	4	2	\$4 per day and 10c. per mile.

Mississippi.....	Biennial.	None.	37	120	4	2	\$400 per year.
Missouri.....	Biennial.	70 days.	34	141	4	2	\$5 per day and mileage, and \$30.
Nebraska.....	Biennial.	40 days.	33	100	2	2	\$3 per day and 10c. per mile.
Nevada.....	Biennial.	60 days.	20	40	4	2	\$8 per day and 40c. per mile.
New Hampshire.....	Biennial.	None.	24	321	2	2	\$3 per day and mileage.
New Jersey.....	Annual.	None.	21	60	3	1	\$500 per year.
New York.....	Annual.	None.	32	128	2	1	\$1,500 per year and 10c. per mile.
North Carolina.....	Biennial.	60 days.	50	120	2	2	\$4 per day and 10c. per mile.
Ohio.....	Biennial.	None.	33	105	2	2	\$600 per year and 12c. per mile.
Oregon.....	Biennial.	40 days.	30	60	4	2	\$3 per day and 15c. per mile.
Pennsylvania.....	Biennial.	150 days.	50	201	4	2	\$1,000 for 100 days and 5c. per mile
Rhode Island.....	Annual.	None.	36	72	1	2	\$1 per day and 8c. per mile.
South Carolina.....	Annual.	None.	35	124	4	1	\$5 per day and 10c. per mile.
Tennessee.....	Biennial.	75 days	33	99	2	2	\$4 per day and 16c. per mile.
Texas.....	Biennial.	60 days.	31	106	4	2	\$5 per day and mileage.
Vermont.....	Biennial.	None.	30	240	2	2	\$3 per day.
Virginia.....	Biennial.	90 days.	40	100	4	2	\$540 per year.
West Virginia.....	Biennial.	45 days.	26	65	4	2	\$4 per day and 10c. per mile.
Wisconsin.....	Biennial.	None.	33	100	4	2	\$500 per year and 10c. per mile.

— **LIBEL, AND LIBERTY OF THE PRESS.** The declaration of rights in nearly every state constitution prohibits any laws to restrain or abridge the liberty of speech or of the press. Many constitutions couple this with a provision that in all prosecutions for libel the truth may be given in evidence to a jury, and if they find the matter charged as libelous to be true, the party shall be acquitted. This clause is a part of the constitutions of Alabama, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Michigan, Minnesota, Mississippi, Missouri, Nevada, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, West Virginia and Wisconsin. In the constitutions of the following states the jury is empowered to determine both the law and the facts in cases of libel: Alabama, California, Colorado, Connecticut, Delaware, Georgia, Kentucky, Maine, Maryland, Michigan, Mississippi, Missouri, Nebraska, New Jersey, New York, Pennsylvania, South Carolina, Tennessee, Texas and Wisconsin. — **LIEUTENANT GOVERNORS.** In twenty-seven states the lieutenant governor is *ex officio* president of the senate, and succeeds to the office of governor only upon the death, disability or resignation of that officer elect. The constitutions in eleven states provide for no such officer as lieutenant governor, viz., Alabama, Arkansas, Delaware, Georgia, Maine, Maryland, New Hampshire, New Jersey, Oregon, Tennessee and West Virginia. — **LIMITATIONS, STATUTES OF.** Limitation laws are designed to fix a reasonable time within which a party is permitted to sue for the recovery of his rights, and imply that his failure to do so furnishes legal presumption that he has no rights in the premises. The following table gives the present state of the laws, barring actions in civil and criminal matters in the various states and territories:

— **LOTTERIES.** The mischiefs arising from the lottery system, as exhibited in the early decades of this century in many states of the Union, led to constitutional and legal interdiction of these demoralizing games of hazard. In seventeen states the constitution absolutely prohibits the legislature from authorizing any lottery, and in most of them requires it to pass laws prohibiting the sale of lottery tickets. These states are Alabama, Arkansas, California, Colorado, Illinois, Maryland, Michigan, Minnesota, Mississippi, Missouri, Nebraska, New Jersey, Tennessee, Texas, Virginia, West Virginia and Wisconsin. In the following eleven states the constitution itself prohibits lotteries absolutely: Florida, Georgia, Indiana, Iowa, Kansas, Nevada, New York, Ohio, Oregon, Rhode Island and South Carolina. In Louisiana alone the constitution provides that "the general assembly shall have authority to grant lottery charters or privileges; *provided*, each charter or privilege shall pay not less than forty thousand dollars per annum in money into the treasury of the state; and *provided, further*, that all charters shall cease and expire on the first of January, 1895, from which time all lotteries are prohibited in this state." Kentucky tolerates lotteries by law. In the remaining nine states there is no constitutional provision on the subject, but lotteries are illegal. — **MARRIAGE AND DIVORCE.** In view of the vast importance of the marriage relation to the moral and material well-being of every community, the hasty and shifting legislation which makes a chaos of conflicting state laws, instead of a uniform system, can not be too much deplored. The recently growing laxity of the laws, and still more, of the practice under them, in many states, has led to an unprecedented multiplication of divorces. It is here proposed to note only the diversities prevailing in the statutes regulating marriage and divorce in the various states. — **Marriage** is defined as a civil contract in the codes of fifteen states: Arkansas, California, Colorado, Indiana, Iowa, Kansas, Louisiana, Minnesota, Missouri, Nebraska, Nevada, New York, North Carolina, Oregon and Wisconsin. Whether a marriage by simple consent of the parties (without civil or ecclesiastical formalities) is valid at common law, has been disputed; but the supreme

court of the United States decided that the intervention of a clergyman is not necessary, and that in the absence of a statute containing express words of nullity, a marriage by mere consent is valid. (96 U. S. Reports, 76.) In two states only, California and Iowa, do the laws expressly recognize simple consent of the parties as adequate to constitute a binding marriage. On the other hand, three states declare void all marriages not solemnized by authorized persons. In twenty-two states whose laws do not declare such marriages invalid, the courts have usually sustained them, when followed by cohabitation, as valid under the common law. Six states, Maine, Maryland, Massachusetts, North Carolina, Tennessee and Vermont, do not recognize such marriages, but require consent before a magistrate or a minister. In some other states, both the law and its adjudication are doubtful on this point. — Whether a valid marriage can be contracted between those of different race and color, is a question variously decided. The statutes of eighteen states prohibit or render void marriages between whites and persons of African descent, viz., California, Colorado, Delaware, Florida, Georgia, Indiana, Kentucky, Maine, Michigan, Mississippi, Missouri, Nebraska, North Carolina, Ohio, Oregon, Tennessee, Texas and Virginia. — The required ages to render a marriage valid vary greatly. The old common law limit of at least fourteen years for the groom and twelve for the bride, is fixed by statute in Kentucky, Louisiana, New Hampshire, Tennessee, Virginia and West Virginia; the ages of sixteen and fourteen are required in Iowa, North Carolina and Texas; seventeen and fourteen in Alabama, Arkansas, Georgia, Illinois and Indiana; eighteen and fifteen in California, Minnesota, Oregon and Wisconsin; and eighteen and sixteen in Delaware, Michigan, Nebraska, Nevada and Ohio. In other states the common law limit of fourteen and twelve years is upheld without special statute. In seven states, marriages may be annulled because of impotence, and the same disability is made ground for divorce in thirty states. Consanguinity within certain degrees renders marriage void in twenty-seven states. A marriage between an uncle and a niece is valid in Maryland if contracted before 1878, and absolutely void in Connecticut. In thirty-one states a marriage license or certificate is required, and if the parties are minors, consent of parents must be shown. — The persons before whom marriages must be solemnized are variously directed to be judges of courts, mayors, justices of the peace, notaries, elders, ministers of the gospel, etc. Public registration of marriages is required by law in thirty-three states, but by no means generally enforced. — Regarding divorce, three widely different views prevail: 1. That marriage is a sacrament, and indissoluble for any causes arising after marriage. This is the view of the Roman Catholic church. 2. That marriage is a sacred relation, and should be dissolved only for adultery and desertion. 3. That marriage is simply a civil contract, without any re-

ligious element, which, while not revocable by mutual consent, may properly be dissolved for a variety of cogent reasons. The legislation of the various states now recognizes divorce as procurable for cause in all except South Carolina, which, in 1878, repealed all acts permitting divorces. The constitutions of several states prohibit the legislature from granting divorces by special acts; doubtless upon the principle that this is in its nature a judicial act, to be determined on evidence and inquiry, and that legislatures should be restrained from usurping (as the British parliament set the example of doing) the power to declare marriages dissolved. No such restriction of the legislature exists in the New England states, or in New York and Delaware. The latter, however, is the only state where individual cases of divorce are legislatively taken up, and in 1881, thirteen divorces were actually granted. The former law of Connecticut, permitting courts to grant divorces for "any misconduct permanently destroying the happiness of the petitioner, and defeating the purposes of marriage," in force for nearly thirty years, produced a scandalous and constantly increasing crop of divorces, and was repealed in 1878. Among the legal causes for divorce are: 1, previous marriage, undissolved, in seven states; 2, impotence, in thirty states; 3, insanity at time of marriage, in two states; 4, consanguinity, in five states; 5, pregnancy at time of marriage, without the husband's knowledge or agency, in nine states; 6, conviction of an infamous crime before marriage, concealed, in two states; 7, adultery, in thirty-seven states; 8, desertion, in thirty-seven states; 9, cruelty, in thirty-seven states; 10, conviction of or imprisonment for crime, in thirty states; 11, habitual drunkenness, in thirty-five states; 12, neglect or refusal on the part of a husband to provide for his wife, in nine states; 13, gross neglect of duty in four states. In New York alone the sole recognized ground for an absolute divorce is adultery. As to desertion, willful absence continued for one year is ground for divorce in eight states—Arkansas, California, Colorado, Florida, Kansas, Kentucky, Missouri and Wisconsin; absence for two years, in nine states—Alabama, Illinois, Indiana, Iowa, Michigan, Mississippi, Nebraska, Nevada and Tennessee; absence for three years, in thirteen states—Connecticut, Delaware, Georgia, Maryland, Massachusetts, Minnesota, New Hampshire, New Jersey, Ohio, Oregon, Texas, Vermont, and West Virginia; and desertion for five years, in three states—Louisiana, Rhode Island and Virginia. In the other states, no limit of willful absence is specified by statute. — PARDONING POWER. In most of the states the governor is invested by the constitution with the power of granting pardons, reprieves or commutation of sentence to convicted criminals under sentence; exceptions are made, in the constitutions of twenty states, of treason and impeachment, as cases where no pardoning power can be exercised. In the constitutions of fourteen states impeachment alone with-

draws the convicted person from the exercise of the pardoning power. In Vermont alone the crime of murder is added to the two cases just named as beyond the reach of executive clemency. In Oregon the only crime not subject to pardon is treason. In Illinois the governor may grant pardon for all offenses without exception. In Kansas the governor is to exercise the pardoning power only under such restrictions as provided by law. While in twenty-seven states the governor alone is invested with the pardoning power, this power is vested in the governor and council in the states of Maine, Massachusetts, New Hampshire and Vermont; and in the governor and the senate in Rhode Island. Four state constitutions create a board of pardons, to share the responsibility of exercising this power. In New Jersey this board consists of the governor, the chancellor, and the six judges of the court of appeals, a majority of whom must concur in granting pardons. In Florida and Nevada the governor, the justices of the supreme court and the attorney-general, or a majority of them, of whom the governor must be one, may grant pardons. In Pennsylvania the governor may exercise the power of pardon only on the written recommendation of the lieutenant governor, secretary of state, attorney general and secretary of internal affairs, or any three of them, after full hearing and public notice recorded and filed in the secretary's office. In Connecticut the governor can grant reprieves only until the end of the next legislative session; he has no pardoning power. In California neither the governor nor the legislature can pardon when the convict has twice been convicted of felony, except on the recommendation of a majority of the judges of the supreme court. The states in which the governor alone is invested with the pardoning power are Alabama, Arkansas, California, Colorado, Delaware, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maryland, Michigan, Minnesota, Mississippi, Missouri, Nebraska, New York, North Carolina, Ohio, Oregon, South Carolina, Tennessee, Texas, Virginia, West Virginia and Wisconsin. In Louisiana the governor can pardon only on the recommendation of the lieutenant governor, attorney general, and the presiding judge of the court trying the case, or of any two of them. — **POLL TAX.** While a capitation tax is imposed upon males over twenty-one years of age in most of the states by their constitutions or laws, Kansas, Maryland and Ohio have prohibited by their constitutions the levying of any poll tax. No capitation tax is levied in Delaware, Illinois, Indiana, Iowa, Kentucky, Michigan, Minnesota, Missouri, New York and Pennsylvania. In the remaining states a poll tax is levied, varying in amount from fifty cents to three dollars per annum. These states are Alabama, Arkansas, California, Colorado, Connecticut, Florida, Georgia, Louisiana, Maine, Massachusetts, Mississippi, Nebraska, Nevada, New Hampshire, New Jersey, North Carolina, Oregon, Rhode Island, South Carolina, Tennessee, Texas, Ver-

mont, Virginia, West Virginia and Wisconsin. The payment of this tax is a condition precedent of the right to vote in two states only, viz., Massachusetts and Rhode Island. In Virginia the making the payment of a poll tax a condition of suffrage was abolished by constitutional amendment in 1882. In Nevada the legislature may make such payment a condition of the right of voting. In Delaware and Pennsylvania a county tax must have been paid by all electors to entitle them to suffrage. The constitution of Kansas prohibits making the payment of a tax a qualification for exercising the right of suffrage. — **REGISTRATION.** In view of the great importance of a well-regulated registration system to secure fair elections, it is not surprising to find it required by law or constitution in twenty-nine states. The constitutions of Colorado, Florida, Maryland, Mississippi, Nevada, North Carolina, Pennsylvania and South Carolina require registration as a prerequisite to suffrage. Missouri's constitution requires it in cities only, doubtless on the theory that in country voting precincts fraud is more easily detected, and less probable, than in populous cities, with floating populations. In like manner the laws of New Jersey and New York require registration in all cities of 10,000 inhabitants and upward, but not elsewhere. No registration is required in Arkansas, Delaware, Georgia, Indiana, Kentucky, Ohio, Oregon, Tennessee, Texas and West Virginia. The constitutions of three states prohibit registration, viz., Arkansas, Texas and West Virginia. In the remaining states a registration system is established by law. It has been asserted (though not generally sustained) that acts of the legislature requiring registration as a prerequisite to voting are unconstitutional in states where the constitution is silent as to registry, because it establishes a test for qualifications of electors not found in the fundamental law. — **RELIGION.** Most state constitutions embody in a bill of rights, or elsewhere, a declaration that no religious test shall be required for the enjoyment of any civil or political right. But persons who deny the existence of God are disqualified for office by the constitutions of Arkansas, Mississippi, North Carolina, South Carolina and Tennessee; while the constitutions of Maryland, Pennsylvania and Texas imply a belief in a Supreme Being as a qualification for office. Tennessee goes further in requiring belief in a future state of rewards and punishments as a qualification for office, and this after adopting, in its declaration of rights, a provision that "no religious test shall ever be required." The majority of constitutions declare that no preference shall be given by law to any religious sect; New Hampshire alone provides in its constitution that the legislature may authorize towns and parishes to provide for the maintenance of *Protestant* teachers of religion. Connecticut gives the same guarantee to every society or denomination of *Christians*. The free enjoyment of all religious sentiments and modes of worship is guaranteed in

nearly all constitutions. The constitutions of the following states declare that no witness shall be held incompetent to testify because of his religious opinions: California, Florida, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, Nevada, New York, Ohio, Oregon, Texas, West Virginia and Wisconsin. Clergymen are ineligible to the legislature by the constitutions of Delaware, Kentucky, Maryland, Mississippi, New York and Tennessee, and in several of these states they are excluded from any civil office. — **SUCCESSION.** Various methods of providing for the succession to the chief magistracy, in case of the death, resignation or disability of the governor, prevail in the different states. Eleven states have no lieutenant governor, and in nine of these the constitution devolves the office of governor upon the president of the senate and the speaker of the house, successively, in case of vacancy. In Maryland the general assembly must elect a governor, if in session when the office is vacant; otherwise, it is filled as in other states. In Oregon, vacancy or inability in the office of governor, devolves it on, 1, the secretary of state, 2, the president of the senate. In nine states the succession falls, first, to the lieutenant governor; second, to the president of the senate *pro tempore*; third, to the speaker of the house. In twelve states the same constitutional provision exists, except that there is no provision for a vacancy in the third degree. In Wisconsin the vacancy is filled, first, by the lieutenant governor, and secondarily by the secretary of state. In Massachusetts, if the offices of governor and lieutenant governor both become vacant, their duties devolve upon the council. In case of a double vacancy, the constitutions of Indiana, South Carolina, Vermont and Virginia require the general assembly to provide by law what officer shall act as governor. — **SUFFRAGE.** The right to participate in elections is fixed in each state by its own constitution and laws; these being subject only to the 15th amendment to the constitution of the United States prohibiting any disabilities as to suffrage on account of color or race. While aliens are generally excluded, fifteen states admit to the suffrage foreigners who have declared their intention to become actual citizens. Other qualifications for suffrage embrace in some states registration (see above), and in all, a certain time of residence within the state and locality where the voter seeks to exercise the suffrage. The constitution of Kentucky requires two years' residence in the state before one can vote; and this is the longest residence required by any state. The constitutions of Maine and Michigan require only three months' residence in the state; and this is the shortest period anywhere required. Nine states require six months' residence, viz., Colorado, Indiana, Iowa, Kansas, Mississippi, Nebraska, Nevada, New Hampshire and Oregon. All the other states require one year's residence within their boundaries before conferring the right to vote. Residence within the county is required for periods varying from one month to one year,

and within the voting precinct for various times running from only ten days to six months. The restrictions upon the right of suffrage are somewhat numerous, but of late years are becoming steadily lessened in number. A property qualification, which formerly prevailed in some states, now exists only in Rhode Island, where the possession of property to the value of 134 dollars in real estate over all incumbrances is required, or (as an alternative) the payment of a tax to the amount of one dollar. The payment of a tax is a prerequisite to the right of suffrage in Delaware, Massachusetts, Pennsylvania and Tennessee. In all the states voters must be male citizens of twenty-one years of age or upward, although a limited suffrage has been extended to women, enabling them to vote at school district elections only, in Colorado, Massachusetts, Minnesota, and some other states. Illiteracy, it has been widely claimed, should be a bar to suffrage, but this view has prevailed continuously in two states only; Massachusetts requiring that a voter shall have the capacity to read the constitution and to write his name, and Connecticut that he shall be able to read the constitution or statutes. Among the most widely enforced disabilities, idiots and insane persons are expressly excluded from the suffrage by the constitutions of Alabama, Arkansas, California, Delaware, Florida, Georgia, Iowa, Kansas, Louisiana, Maryland, Minnesota, Mississippi, Nebraska, Nevada, New Jersey, Ohio, Oregon, Rhode Island, South Carolina, Texas, Virginia, West Virginia and Wisconsin. Paupers are excluded in Delaware, Maine, Massachusetts, Missouri, New Hampshire, New Jersey, South Carolina, Texas, West Virginia and Wisconsin. Persons convicted of crime are excluded by the constitutions of all the states except Indiana, Maine, Massachusetts, Michigan, Missouri, New Hampshire, Ohio, Pennsylvania, Tennessee and Vermont. In most other states the laws make the same exclusion. Persons under guardianship are excluded in Florida, Kansas, Maine, Maryland, Massachusetts, Minnesota, Rhode Island and Wisconsin. Bribery, or offer to bribe an elector to influence votes, is made a disqualification for suffrage or office by the constitutions of Alabama, Connecticut, Indiana, Louisiana, Maryland, Missouri, New York, Pennsylvania, Vermont and Wisconsin. Most of the other states have provided by law severe penalties for bribery, including, in some cases, exclusion from suffrage for a term of years or indefinitely. — **SUNDAY.** The laws against desecration of the first day of the week have no constitutional sanction except the recognition of Christianity (in the constitutions of a few states) and the permission to the legislature to make laws promoting religion and morality. The prohibition of labor or sports on Sunday, although found in the laws of most states, is not rigidly or continuously enforced in any. While these laws may be defended on authority and long custom, the fact that their enforcement has more and more fallen into desue-

tude, is too palpable for denial. These laws may rest either upon specially religious grounds, or upon the humane argument that experience shows one day's rest in seven to be needful to human welfare. Many judicial tribunals, in applying the Sunday laws, have preferred to rest their enforcement upon the second ground rather than the first, but if this utilitarian view of enforced Sunday rest as a benefit to the individual is to prevail, the argument against special Sabbath laws, made by those who rest on the seventh day of the week, is unanswerable. The Jew may urge that the law discriminates against his religion, and is therefore unconstitutional in most of the states. Sunday as a religious obligation properly rests upon the consciences of the community; and the sanction thrown around it by state laws, while of indefinable extent, and often incapable of enforcement, marks the deference that is shown to the habits of the majority in the state. Contracts made on Sunday are void by the laws of many states, though by no means of all. — **USURY.** (See *Interest and Usury.*) — **VETO POWER.** In thirty-four states the assent and signature of the governor are required by the constitution to enact any law. The uniform provision is, that, in case of disapproval of any act by the governor, he shall return it to the house in which it originated, with his objections; the vote must then be taken in both houses by yeas and nays. In nine states the constitution provides that a majority of the whole number of members of the legislature shall be sufficient to enact a law notwithstanding the objections of the governor, viz., in Alabama, Arkansas, Connecticut, Indiana, Kentucky, New Jersey, Tennessee, Vermont and West Virginia. In twenty-three states two-thirds of the members of each house are required to pass a law over the governor's veto, namely, in California, Colorado, Florida, Georgia, Illinois, Iowa, Kansas, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Nevada, New Hampshire, New York, Oregon, Pennsylvania, South Carolina, Texas, Virginia and Wisconsin. In two states, Maryland and Nebraska, the constitution requires three-fifths of the legislature to make a law without the approval of the governor. The constitutions of four states confer no power on the governor to veto any act of legislation; these are Delaware, North Carolina, Ohio and Rhode Island. — **WOMEN.** The separate rights of married women to their property acquired before marriage, as well as to that acquired afterward by gift or otherwise, are guaranteed by the constitutions of eleven states, including the provision that the wife's property shall not be liable for the debts of her husband. Essentially the same provision has been incorporated in the statutes of nearly all the states. Women are made eligible to offices connected with schools by the constitutions of Louisiana, Minnesota and Pennsylvania, while the right to vote in the election of school officers is conferred upon women in Colorado, Massachusetts, and several other states. A. R. SPOFFORD.

STATISTICS. From the numerous definitions of statistics which have been given since Achenwall, the learned professor of Göttingen, established this science and gave it a name, we might think that it is very difficult to define its nature and the extent of its domain. Such is not the case, however. The most different definitions have served as introduction to the most similar works, and the ordinarily informed person is no more ignorant than the adept, that, without figures, without "numerical terms," there is no statistics. The quantity of explanations, developments and deductions which can be added without encroaching upon some neighboring domain, is all there can be any discussion about. — The question whether statistics is a method or a science, as if it could not be both, will also be discussed. As a method, it is an instrument of observation; instead of saying that the use of such and such a remedy succeeds *often* or *sometimes* in such and such a disease, the professor of medicine should say to his pupils: According to the experiments made up to the present time, the remedy has produced its effect in 63 cases out of 100, or in such and such a settled proportion. As a method of observation, it is applied only to large numbers. To speak of 33 per cent. or of 25 per cent. when only three or four experiments have been made, is to abuse scientific forms, and sometimes knowingly to deceive the public. — As a science, statistics embraces all social and political facts presented in their numerical relations to one another, as well as to space and time. As there is no political or social fact without men, we need not add, as certain authors have done, that all statistical facts must have relation to men. — It seems that there are here well-determined limits, and that there is no need of so many definitions. If no author has been satisfied with the definition of his predecessors, it is not because he wished to see his own figure in the introduction to treatises on statistics; it is because statistics, since its origin, has followed a two-fold tendency. The one gave rise to descriptive statistics, as Achenwall defines it: the thorough knowledge of the respective and comparative situation (*status*) of each state; or of which Schlözer said that it was history at rest, while history is statistics in motion (in other words, statistics is the situation of a people taken at a given moment); finally, what Napoleon I. called the budget of things. Statistics thus understood is a more or less reasoned inventory. The other tendency which statistics has followed would prove relations, discover laws; it is what, in the last century, was called political arithmetic. It was probably from this point of view that Goethe viewed it when he said: "If figures do not govern the world, they show at least how it is governed." For this purpose the inventory is not sufficient; it is necessary to go to the bottom of "numerical terms," to scrutinize them, compare them, draw deductions from them; according to some, averages, and according to others, laws. Here is M. Guerry's definition: "General statistics * * ex-

cludes descriptions, and consists essentially in the methodical enumeration of variable elements, whose average it determines." And M. Dufour's: Statistics is "the science which teaches how to deduce from analogous numerical terms the laws of the succession of social facts."—Thus, some make of statistics a descriptive science more or less allied to geography; others, a science of deduction, employing mathematical processes, and notably the calculation of probabilities. We believe that it is very easy to combine these two points of view. People always commence by describing the present; this is one of the forms of established statistics. When many descriptions have succeeded one another, it is possible to compare the present situation with previous situations; this is done for the whole of the facts as well as for one of the details; from this comparison is drawn a theory, averages, laws; and this is how the form of statistics, once called political arithmetic, is developed.—This term leads us to the consideration of another subject of discussion. Are "numerical terms" applicable to political facts or to social facts? William Playfair says of statistics, that it consists of investigations into the political material of states. The definitions of Peuchet, Gioja, Schubert, Quétélet, Villermé and many others, insist chiefly upon the political application, while, with M. Dufour, M. Moreau de Jonnés applies statistics only to social facts. He says: "Statistics is the science of social facts, expressed in numerical terms. Its object is the thorough knowledge of society, considered in its elements, its economy, its situation and its movements." Nevertheless, the discussions maintained as to the distinctions between the political domain and the social domain, are so trifling that perhaps none of the authors whom we have cited have had the least scruple to pass from "political facts" to "social facts," and *vice versa*. Moreover, are not these two categories of facts most frequently confounded? We will not stop, therefore, at these useless distinctions.—Let us limit ourselves to a few words upon another point, which has been very much debated. M. Moreau de Jonnés maintains that "statistics without figures, or whose figures do not enumerate social facts, does not merit the title which it borrows." Statistics without figures is like a river without water, but a statistics consisting only of figures is not the ideal one; in this shoreless sea, where can the ship land? A text is therefore necessary. But there is no general rule as to the amount of explanations which must accompany the "numerical terms." In addressing specialists, accustomed to study political and social questions, few should be given; they should be given more amply when it is intended to enlighten or convince that portion of the public whom figures repel, and who find "numerical terms" very dry, and, to speak plainly, perfectly wearisome. It is therefore only a matter of judgment, of tact.—This settled (and we have commenced by clearing the ground of obstacles easily removed), we approach a much more delicate

point. Let us again quote an author: we are so fond of leaning upon something, even upon a cane which bends under our hand. M. Moreau de Jonnés says: "It [statistics] proceeds constantly by numbers, which gives it the character of the precision and certainty of the exact sciences." This is a quality which people do not tire of denying to statistics. Rightly or wrongly? Rightly and wrongly. In fact, numbers are always precise, but they are not always exact. It is not difficult, however, to know what figures are exact and what are not; we have only to find out how they were obtained. That is the whole secret. If the verification has been made in a positive and material manner, by counting, measuring and weighing, the exactness is absolute, and no one has the right to attack such figures, unless because of false entries in the public accounts. A great deal of information is obtained in this manner for the wants of public administration. Thus the amount of the finances rests upon mathematical elements, and error is impossible. The case is about the same with the statistics of hospitals, prisons, births, marriages and deaths, justice, means of communication, the post-office and other similar things. But there are statistics, like those of agriculture, industry, consumption, the revenue, and, in general, of all facts which can not be determined by exterior, palpable signs, which often leave something to be desired on the score of exactness, and give occasion for serious criticism. However, there are two kinds of exactness; one is absolute, the other approximative. The approximation is a makeshift; but at bottom it is makeshifts which rule in life; the absolute contrary of the makeshift would be the ideal. But we do not insist upon this. Every one understands that approximation is sufficient for almost every use, even when there is question of information which can be obtained with great exactness. For example, if we should say: The budget of receipts is 2,450,000,000, would it not be generally satisfactory? and would it be necessary to give it to a cent? We said, for almost every use, and notably for the descriptive part of statistics; mathematical exactness is indispensable only when it is intended to state laws. For the rest, it is necessary to beware of the evil tendency of certain authors to set up statistical laws, and to have ever present to the mind that an *average* is not a *law*. Averages only show that there are constant relations between such a fact and such another; this constancy permits us to think that these relations are necessary, and often this conjecture will be seen to be well founded, but the indication of figures has need of confirmation. Therefore, leaving out of the question all bad faith, there are statistics naturally exact, and others more or less so, according, 1, as the external signs of the facts to be collected are more or less evident; 2, as individuals are less interested to dissimulate; and 3, as agents bring more skill, knowledge or conscience to bear upon their statements. But there is also a secondary cause of

inaccuracy, or rather of apparent contradiction, in the statement of statistical facts, namely, that different figures often bear the same title. It often happens that one lays stress, without knowing it, or saying so, upon the net product, another upon a gross product, a third upon a product still more gross. Again, one will understand by the word *England* only the country which bears that name, a second will add to it the principality of Wales, a third the islands, a fourth may go so far as to confound England with Great Britain or even with the United Kingdom: this confusion often occurs in ordinary conversation. We could cite examples by the hundred in which there was no question of ignorance, or of bad faith, or of negligence, but of too great conciseness or a lack of precision. — These examples explain, in some measure, the reproach so often brought against statistics, of furnishing arms at once both *for* and *against* the same proposition. To the extent that this reproach is founded—and this extent is not large—it is deserved by the statistician, and not by statistics. Thus, *the art of grouping figures* is only a branch of the art of maintaining all theses, of having arguments for all paradoxes and all sophisms. When one wishes to defend his point of view at any cost, he *chooses* figures, or makes some prominent, and leaves others in the shade. The enthusiastic man may sometimes proceed thus with the best faith in the world: passion blinds. Still, beyond the art of grouping figures, there remains also, to justify the difference of conclusions, the possibility and even a certain facility of interpreting the same fact in different ways. It is wrong to say of a fact or of a set of figures that it is brutal. A man stretches out his hand to another: is it to give him an alms or a thrust with a dagger? A man places a sum of money in the hand of his companion: how will you interpret the act? Is he giving aid, or the price of a crime? In such a year 100,000,000 kilogrammes of meat were consumed in Paris: was it evidence of plenty or of dearth? The fact or the figures alone mean nothing; it is the interpretation which renders them eloquent. Now, the field of interpretation is vast, and commentators can often launch out in opposite directions; so much the worse for the one who is deceived and for those he deceives. To sum up: if statistics gives arms for and against, it is not because of the nature of statistics, but because of the nature of our mind, for the same reproach is applied to religion, philosophy, the law, and to all moral and political sciences, and, in a less degree but still in a degree great enough, even to the sciences called exact. — Statistics must have a very certain utility, if it has been able to withstand all the attacks of which it has been the object, attacks which embrace in their generality at once the accurate part and the inaccurate part of the science of “numerical terms.” In fact, it remains always true that statistics is the budget of things, that inventory which no government can dispense with. It is no less true that the comparison of many *well-proven* facts makes us

find, or at least catch a glimpse of, truths which might have escaped us. The faults of the instrument impose upon us a prudence which is nowhere out of place, but do not oblige us to renounce its employment. Fortunately, it is not with this instrument, as with many others, whose use is prohibited for fear of abuse. The person who does not know how to manage it, does not touch it, therefore no one will be wounded through his awkwardness; the only inconvenience which it can have is to remain inert in hands which have not learned the use of it. In other words, figures are a language which everybody does not know how to read, and from which few know how to draw all the information contained in it.* MAURICE BLOCK.

* Statistics is the picture or representation of social life at given periods of time, and especially of the present time, drawn on a scale in accordance with the laws of development discovered by means of the theoretical sciences: political economy, the science of finance, administrative science, etc. Schöler calls statistics *history standing still*. Statistics, as thus defined, is as far removed from saying too much as from saying too little. To give a complete tableau of its object, statistics should, of course, take in the life of a people in all its aspects. But it should look upon such facts only as its own property, the meaning of which it is able to understand; that is, such only as can be ranged under known laws of development. Unintelligible facts are collected only in the hope of penetrating into their meaning in the future, by comparing them with one another. In the meantime, they are to the statistician what unfinished experiments are to the investigator of nature. — The view is daily gaining ground, that statistics should be occupied (without, however, confining themselves to them) with *present* facts, with “facts affecting society and the state which are susceptible of being expressed in figures.” The more deceptive the immediate observation of an individual, isolated fact is, in cases in which a great number of simultaneous or scattered individual, isolated facts of national life are observed, the more important it is to discover proper numerical relations, by noting all the like acts or experiences of men, the time and place in question, and the relation of the aggregate of these phenomena to the sum total of the population, or to the sum total of corresponding phenomena in other places. When this is done, and the facts are completely enumerated, and correctly recorded, there is no danger of subjective error. And this species of “political and social measurement,” as Hildebrand calls it, may be applied not only to quantities, but to all qualities accessible to the observation of the senses; since the individual or isolated qualities of the things enumerated may be again made objects of enumeration. Without doubt, this mode of numerical procedure is the most perfect for all those divisions of statistics in which it can be followed, and hence it should be our endeavor to make the numerical side of statistics as comprehensive as possible. But one side of a science is not a science itself. As there is no natural science proper, called microscopy, embracing all the observations made by means of the microscope, so, care should be taken not to deduce the principle of a science from the chief instrument it employs. There will always be many and important facts in national life, which can not be subjected to numerical calculation, although they may be established with the usual amount of historical certainty. Were statistics to be limited in the manner mentioned above, it would remain a collection of fragments, and, instead of being a science, become a method. Besides, it is evident, that, of statistics in general, economic statistics constitutes a chief part, and precisely the part most accessible to numerical treatment. As economic statistics needs to be always directed by the light of political economy, it also furnishes the latter with rich materials for the continuation of its structure, and for the strengthening of such foundations as it already has. It is, moreover, the indispensable condition of the application of economic theorems to practice.” — WILLIAM ROSCHER.

STEPHENS, Alexander H., was born in Wilkes (now Taliaferro) county, Ga., Feb. 11, 1812, and died at Atlanta, March 4, 1883. He was graduated at the university of Georgia in 1832, and was admitted to the bar in 1834. On the formation of the whig party in the state from the old state rights, or Troup, party, he became one of its prominent leaders. After six years' service in the state legislature, he became congressman from his state, 1843-59, taking rank as a whig leader in congress until the whig party was dissolved, and afterward as an independent democrat. In 1860-61 he opposed secession earnestly, but yielded when his state seceded. (See *ALLIANCE*, III.) He then became vice-president of the confederacy until the downfall of the rebellion. (See *CONFEDERATE STATES*.) In 1877 he was again sent to congress as a democrat, where he remained until his election as governor in the autumn of 1882.—See Johnston & Browne's *Life of A. H. Stephens* (1878); Savage's *Living Representative Men*, 451; Bartlett's *Presidential Candidates of 1860*, 179; Cleveland's *A. H. Stephens in Public and Private* (1866); A. H. Stephens' *Constitutional View of the War Between the States*, and *The Reviewers Reviewed*. ALEXANDER JOHNSTON.

STEVENS, Thaddeus, was born at Peacham, Vt., April 4, 1792, and died at Washington city Aug. 11, 1868. He was graduated at Dartmouth in 1814, and was admitted to the bar in Pennsylvania. After serving in the state legislature at intervals from 1833 until 1841 (see *BROAD SEAL WAR*), he was sent to congress as a whig 1849-53, and as a republican 1859-68. During this latter term of service he became most conspicuous as a leader in the work of reconstruction by congress. (See *RECONSTRUCTION*, and authorities under it.)—See *Thaddeus Stevens, Commoner*, and the *Memorial Addresses* in the house on his death, published in 1868. Harris' *Political Conflict in America* was originally designed as a biography of him, but it is written from a very adverse standpoint. ALEXANDER JOHNSTON.

STOCK JOBBING. (See *AGIOTAGE*.)

STORY, Joseph, was born at Marblehead, Mass., Sept. 18, 1779, and died at Cambridge, Mass., Sept. 10, 1845. He was graduated at Harvard in 1798, and was admitted to the bar in 1801. He served as a democratic congressman 1808-9, and in 1811 was appointed associate justice of the supreme court. In his judicial work he was the founder of admiralty jurisprudence in the United States; and, in conjunction with Chief Justice Marshall, was instrumental in securing recognition for the national existence of the United States by the supreme court. (See *NATION*, II.; *JUDICIARY*.) This latter part of his work he put into form in 1833 in his "Commen-

taries on the Constitution."—See *Story's Life and Letters of Story*; *Story's Miscellaneous Works*; 2 *Webster's Works*, 297; *Story's Commentaries on the Constitution*; and his decisions in Cranch's, Wheaton's and Peters' *Reports*, and Gallison's, Mason's, Sumner's and Story's *Reports* (Circuit).

ALEXANDER JOHNSTON.

STRICT CONSTRUCTION. (See *CONSTRUCTION*.)

STRIKES AND LOCKOUTS are suspensions of work growing out of differences between employers and employed. Though it is customary to speak of all such interruptions of labor as strikes, some are more properly termed lockouts, there being an essential difference between a strike and a lockout. A strike is a suspension of work resulting from a dispute originating in some demand of the employed; a lockout, in some demand of the employer. A stoppage of work, for example, resulting from a demand on the part of employes for an advance in wages, would be a strike; a stoppage resulting from a demand by the employer for a reduction, would be a lockout. An apparent exception to this definition, are those strikes and lockouts entered upon for the purpose of influencing the settlement of other strikes and lockouts, as, when workmen who are satisfied with their own wages cease work, to assist in enforcing the demands of other workmen who are not satisfied, or, when employers "lockout" their employes with whom they have no differences, depriving them of work and its wages for the purpose of preventing them from assisting striking workmen. In these and similar apparent exceptions, however, there is always a formal or implied demand.—It is frequently difficult to determine whether a labor contest should be classified as a strike or a lockout. Practically the distinction is of little importance, except as it bears on the question of the relative tendency of employer and employed to take the initiative in these industrial conflicts. Unless, therefore, it is expressly stated to the contrary, the word strike in this article will include both strikes and lockouts.—*Classification of Strikes.* Strikes and lockouts may be divided into three general classes.* They are occasioned by 1, differences as to future contracts; 2, disagreements as to existing contracts; or 3, quarrels upon some matter of sentiment. These contracts may be agreements more or less formal, or customs of the trade and methods of work and administration, which, from long usage, have the force of agreements. The first class named would include strikes arising from differences as to the present and future wages of labor; from attempts to change existing agreements, customs or methods, or to introduce new ones. Disagreements under the second class would arise either upon matters of fact or con-

* This is substantially the classification of Sir Rupert Kettle, in his admirable work, "Strikes and Arbitrations," London, 1866.

struction ; while quarrels of the third class grow out of the offended *amour propre*, either of the individual or the class. — *Causes of Strikes.* In the early history of labor troubles the causes of strikes were few. They arose chiefly from differences as to rates of wages, which are still the most fruitful sources of strikes, and from quarrels growing out of the dominant and servient relations of employers and employed. While labor remained in a state of actual or virtual servitude, there was no place for strikes. With its growing freedom "conspiracies of workmen" were formed, and strikes followed. The scarcity of labor in the fourteenth century, resulting from the "black death," and the subsequent attempts to force men to work at wages and under conditions fixed by statute, were sources of constant difficulties, while the efforts to continue the old relation of master and servant with its assumed rights and duties, a relation that English law recognizes to this day, were, and still are, the causes of some of the most bitter strikes that have ever occurred. — With the rise of the craft-guilds, the opportunities for strikes were increased, and the list of causes enlarged. These craft-guild strikes rarely grew out of differences as to wages, but from disputes regarding presumed infringements of privileges, or innovations of trade customs, and were sometimes undertaken for the most trivial causes. The custom of blacklisting or "reviling," as it was termed, practiced by these guilds as a method of punishment, was also a constant source of strikes, the craftsmen refusing to work for the "reviled" master, or with the "reviled" journeyman, until he had made atonement, and had been recognized as honorable by the guild. In many respects strikes growing out of modern trades unionism resemble those of the craft-guilds, which organizations are the precursors, if not the parents, of modern unionism. In addition to these causes named, many of which are still as potent as ever, the changes in the relations of employer and employed, and of workmen to each other, and to their occupations, arising from the modern organization of labor and industry, have introduced new sources of discontent, and consequently increased the list of causes from which strikes may arise. The possible causes of strikes at the present time, therefore, are much more numerous than they were formerly, and the liability to trouble greatly increased. — While this is true, a careful analysis of the various causes shows that they can all be grouped under a few general heads. Strikes are caused by differences as to: 1, *rates of wages*, demands for advances or reductions, chiefly; 2, *payment of wages*, changes in the method, time or frequency of payment; 3, *hours of labor*; 4, *administration and methods of work*, for or against changes in the method of work or rules and methods of administration, including the difficulties regarding labor-saving machinery, piece-work, apprentices and discharged employes; 5, *unionism*; 6, *miscellaneous*, including strikes from matters of sentiment, and a few others that do not

admit of classification. — Strikes result most frequently from differences regarding rates of wages. In an investigation into the strikes of 1880, made for the United States census by the writer, a classification according to causes gave the following result:

CAUSES.	Number.	Percentage of each to whole
Rates of wages.....	582	71 59
Payment of wages.....	35	4 30
Hours of labor.....	7	86
Administration and methods of work.....	107	13 17
Trades unionism.....	22	2 70
Miscellaneous.....	9	1 11
Not given.....	51	6 27
Total.....	813	100 00

This exact proportion will not hold good for all years, but it is safe to assert that strikes growing out of disputes regarding rates of wages will always be more than 50 per cent. of the whole number of strikes. The proportion of strikes arising from demands for advances or demands for reduction, the two chief causes of difficulties connected with rates of wages, will vary greatly in different years, depending chiefly upon the condition of business, demands for advances being more frequent in years of high prices, and for reductions in years of low prices. Of the strikes arising from differences as to rates of wages, which were reported upon in the above table, 86 per cent. were for advances, and 14 per cent. against reductions. — *Conditions Influencing the Frequency of Strikes.* Our information is too meagre, and what is available too fragmentary and inexact, to justify the formulating of any universal laws as to their frequency, or any unconditional proposition as to their justice or policy. There are, however, certain facts which a study of strikes and lockouts seems to make evident. Consider, first, the conditions that influence their frequency. As has already been indicated, the modern organization of industry and labor has largely increased the possibility of strikes. While I can not accept the definition of some writers, that strikes are "refusals of a number of workmen in combination to work on the terms offered by the employer,"* there can be no doubt that the opportunities offered for combination by the aggregation of large bodies of workmen of the same trade in the same locality, and the ease of communication between those of the same class employed in different localities, have greatly increased the number of strikes, and made those that have occurred of much greater importance. It will, therefore, be found, as a rule, that in those trades in which a large number of men are engaged in the same occupation, and in localities where large bodies of workmen congregate, strikes are comparatively

* This is Prof. T. E. Cliffe Leslie's definition. It does not seem to me that "a number of workmen in combination" are essential to a strike, and all strikes, using the word as Prof. Leslie does, to indicate strikes and lockouts, are certainly not refusals of workmen to work on the terms offered by the employers.

frequent. There are but few strikes in the agricultural occupations; but many in the mining, mechanical and manufacturing industries. — Frequently changes in the prices of commodities increase the number of strikes. These render necessary more frequent changes in the rates of wages, and in the relations of employer and employed, and, as it is not possible always to agree as to what these changes shall be, strikes follow. The improved methods of communication and transportation, and the remarkable development of manufacturing industry in modern times, has much to do with these fluctuations, and consequently with the increase of strikes. Under the methods and facilities of some centuries ago, the periods of fluctuations were spread over many years. Agreements concerning work, or “terms of hiring,” as they were called, were for the year, and demands for advances or reductions were made at the time of the yearly contracts. This is changed now; fluctuations in prices follow each other at times with the greatest rapidity, and with them come demands for an increase or reduction in wages, which, if not granted, end in strikes or lockouts. It will be found, however, that strikes arising from these fluctuations are not always the most frequent during the period of rapid advances, nor lockouts during a decline, though demands for changes in wages are most prevalent at such times. They generally occur at or near the beginning of such periods, or near their close. When the market is rapidly advancing or declining, the conditions are usually such as to render opposition futile, and a demand made is conceded, but when the advance or decline in prices is beginning, or when it is nearing its end, there is so much opportunity for differences, not only as to the existing conditions of business, but as to its future, that a peaceable solution can not be reached so readily as when there is no uncertainty as to the state of prices. — It is upon the existence of one or both of these conditions, viz., opportunities for combination, and the fluctuations in prices of commodities, and the advantage taken of their presence, that the frequency of strikes and lockouts largely depends. Whatever may be the real or apparent necessity for an appeal to industrial warfare, neither employer nor employed will inaugurate a strike or lockout, except in very rare cases, without a reasonable prospect of success. In estimating these probabilities the strength and character of the combination that the workmen may form, or that the employer must meet, as well as the state of the market, are the chief determining elements. It will be found that it is a belief, that the party making the demand is strong enough to enforce it, or that the condition of the market is such that the party upon whom the demand is made can concede it, and will eventually be forced to do so, that determines whether or not a strike or lockout shall be undertaken. — *Trades Unions and Strikes.* Much has been written as to the influence of trades unions upon the frequency of strikes. As has already been stated, there can be no doubt that combinations of work-

men, or trades unions, have had a marked influence in increasing the number of strikes. Many never would have been undertaken had it not been for a conviction of success through the power of combination. While this is true regarding all combinations, it is very doubtful if it is true of the strong, well-organized unions that have represented certain classes of workmen for some years. While many of these unions are responsible for some of the most determined, hotly contested and important strikes of the century, some of which were totally indefensible, it is also true, as a rule, that their utterances and influence are against strikes. Their refusals to undertake general strikes, or to countenance local ones, are quite frequent. Not only has their positive influence been exercised against strikes, but indirectly they have had a marked effect in reducing their number. Adjustments of wages to which they have been parties have, as a rule, been for longer periods than when rates have been fixed without unions; their strength has made them respected, and deferred demands upon the trades they represented until a real necessity for reductions existed; while their accumulated funds and the force of public opinion, to which they are quite sensitive, have rendered them conservative and disinclined to enter upon a strike until no other course seemed open. — *The Statistics of Strikes.* It is manifestly impossible to secure complete and accurate statistics of strikes. Many are never heard of by others than the parties engaged, and when information concerning those that are known is not refused, the statements made are frequently so incomplete and inaccurate, and so evidently colored by the views and supposed interests of the party giving them, that they are far from reliable in many of their particulars. Notwithstanding this, the published statistics of strikes are of great importance. They render available much valuable information concerning the number, character, losses and results of strikes, and furnish many facts necessary to a decision as to their policy and justice. The most important publications on this subject are the “Report of the British Social Science Association” (“Trade Societies and Strikes,” London, 1860); a paper read by Mr. G. Phillips Bevan before the statistical society, London, Jan. 20, 1880, the first attempt to give the statistics of the strikes of any country for a series of years; the “Report of the Massachusetts Bureau of Labor Statistics” for 1880, and of Pennsylvania for 1882, giving the statistics of strikes in these states for a series of years; and the “Report on Strikes in the United States for 1880,” compiled for the United States census by Jos. D. Weeks. The reports of several of the royal and parliamentary committees of Great Britain on labor subjects, and the annual reports of many trades unions also, contain much valuable information on strikes. These latter, however, are not generally available. Mr. Bevan reports on 2,352 strikes in Great Britain, covering the years from 1870 to 1879. The loss in wages alone from 114 of these strikes was £5,067,825. In the writ-

er's "Census Report," statistics more or less complete are given of 762 strikes that occurred in the United States in 1880. In 414 of these, 128,262 persons were engaged. The report gives quite full returns from 226 strikes, in which 64,779 persons took part. The time lost was equal to the work of one man 1,989,872 days, and the wages unearned for this time, \$3,711,097. Of the direct losses in the remaining 506 strikes no statement was received, nor of the indirect losses to capital, to the workmen not directly engaged, and to the wealth of the country. It is probable that the striking workmen recouped their losses in part from their society funds and from contributions, as well as by working at other employments; but, after all allowances are made, it still remains a deplorable fact that the waste and loss from strikes are enormous. — *Results of Strikes.* The history of strikes abundantly proves that as a rule they are not successful; that is, the demand which was the cause of the strike is not conceded. Of 351 of the strikes reported upon by Mr. Bevan in his paper already referred to, 189 were unsuccessful, 71 successful, and 91 compromised. Of 149 reported upon by the Massachusetts bureau of labor statistics, only 18 were successful, 109 unsuccessful, 16 compromised, and 6 partially successful. The report of the Pennsylvania bureau on 185 strikes showed 45 successful, 66 unsuccessful, 13 compromised, and 11 partially successful. The census report gives the results of 481 strikes, of which 169 were successful, 227 unsuccessful, and 85 compromised. This report shows also that the workmen are more successful in strikes growing out of demands for advances than they are in resisting demands for reductions. With the exception of the census report on strikes, these statements cover a series of years, including periods of great depression in business, as well as prosperous times, and may, therefore, be regarded as giving fairly average results. — *The Expediency of Strikes.* Of the utter folly of many strikes, there can be no question. They have been doomed to defeat from their inception. They have been undertaken in defiance of all economic laws, in ignorance of the real condition of trade, and without any just cause. They have wasted capital and decreased the wealth of the country. They have brought hunger, misery, debt; have broken up homes, severed long associations, forced trade to other localities, and driven men and women and little children into the very shadow of death; and yet men, knowing that all of these possibilities are before them, will deliberately enter upon strikes, will cheerfully bear all these privations, and, what is more remarkable still in many instances, the wives of the strikers, upon whom the misery falls with the most crushing force, will be the most determined in their resolution. It would seem that there must be some reason for this, and I believe it will be found that strikes are not wholly wrong, and that even unsuccessful ones are in many ways advantageous to the strikers. Labor has had to fight for every advantage it has gained, and though it is often defeated in

its struggles that are called strikes, it has not only learned in these contests how better to wage future battles, but it has so impressed employers with its strength that it has made them shy of encountering antagonists constantly growing more formidable. The most hopeful indication of modern industrial society is the great increase of mutual respect and good-will between employers and employed, as well as a greater regard on the part of each for the rights of the other. To this result strikes have contributed in no small degree. They have also asserted the right of combined labor to deal with combined capital, and have denied the claim that the true labor market was found in the "higgling" of capital with all its power, and one individual workman with his weakness and necessities. In addition to this, it will be found that many of the movements that have bid fair to improve the condition of labor, such as co-operation, industrial partnerships, boards of conciliation and arbitration, as well as wise rules and policy on the part of trades unions, owe much to strikes.

Jos. D. WEEKS.

SUBSIDIES. This word has been used in three quite distinct senses. 1. In earlier English constitutional history it is applied to the form of special tax most frequently resorted to until the last century. It was assessed not directly upon property, but upon persons. Its most important element was a land tax of one-fifth the nominal rental. A single subsidy yielded about £70,000. On extraordinary occasions more than one at a time was granted by the house of commons. (Blackstone, vol. i., p. 311.) 2. In the last century and the beginning of the present century, we find the term commonly used to denote payments to an ally to assist in carrying on a war. This practice was largely resorted to by England; but since 1815 it has fallen into disuse. 3. In its modern use, dating from about 1840, it has been applied to any direct pecuniary aid rendered by the state to industrial enterprises of individuals. In its widest sense it includes all such government aid, even to mercantile and manufacturing industry, as, for instance, the system of bounties on exports, which holds so important a place in the commercial policy of France. Practically, it is better to apply the term only to grants in aid of transportation interests. — The earlier form of state aid to these enterprises was by enabling them to secure monopoly rights. These were fully embodied in the early trading charters; the principle survives to this day in the navigation laws of the United States. Our earliest railroads attempted to secure similar provisions. But the development of the transportation system in the present century, and the growing repugnance to monopolies, made this policy more unwise than ever; and the system of subsidies, that is, of direct state aid, was resorted to instead. Such aid may be given either by assuming part of the burden and risk of construction, or by increasing the current receipts for a term of years. The former policy has prevailed for railroads, the latter for

steamships. — Railroad building has been encouraged in three ways: 1. By the state building the lines for the companies to operate for a term of years, either with or without payment of rent; 2. By a guarantee of interest on a part or the whole of the bonded debt, or even on the capital stock; 3. By direct grants, either of money or of public lands. Every large European state, except England, has adopted one or more of these methods. France built the roadbed for most of her main lines, and guaranteed the interest on the bonded debt incurred by the operating companies in building branches. Prussia gave extensive guarantees of interest, until the adoption by her government of the policy favoring state ownership and control of railways. Austria started with a system of state railways, but, between 1850 and 1860, ceded to private companies, for very inadequate compensation, the right to operate most of them for long terms of years. Practically, the results to the companies have been much the same as under the French system. Austria also gave extensive and ill-judged guarantees of interest, on stock as well as bonds. Nearly the same course of events has taken place in Italy. Russia has given interest guarantees, and also direct pecuniary aid in large amounts. — In the United States payments of money to assist railways have been mainly appropriated by towns and other local organizations. Much has been spent in this way, but in such a manner as not to attract public attention. National aid to railroads has been, with one exception, in the form of land grants. Even before the time of railroads, there had been such grants in aid of canals, two million acres in 1827 being the chief instance. But the system really took its start in the year 1850, with the grants to the Illinois Central and the Mobile & Ohio railroads. These grants, like those that followed them, were for form's sake not made directly to the railroads, but through the medium of the states of Illinois, Alabama and Mississippi, in which the lands were situated. Similar grants followed in Missouri in 1852, Arkansas in 1853, and in a number of other states in 1856. By these and subsequent concessions nearly fifty-seven million acres of land in organized states were granted in all, of which fully three-fifths have been certified to the corporations. In addition to this, immense tracts of the so-called swamp land, often very valuable, have been appropriated by individual states for the same purpose. — The matter took a new shape in 1862, when Thaddeus Stevens, in order to bind California closer to the Union, introduced and carried the Pacific railroad bill. By the terms of this act there were granted 12,800 acres of land to each mile of road built (ultimately amounting to about 33,000,000 acres in all); and, in addition, the credit of the United States was pledged to the amount, on an average, of \$25,000 per mile, or about half the cost. On the money thus advanced, the United States had paid, up to 1880, principal and interest, about \$112,000,000, and had received from the road about \$15,000,000 worth of payment. When

it came to the incorporation of the Northern Pacific railroad, the promoters would have been glad to cite this as a precedent; but, as they could not obtain the government credit, they secured a double grant of land per mile, 47,000,000 acres in all. Subsequently the two southern routes secured together about 70,000,000 acres. There have been granted to railroads, in all, nearly 160,000,000 acres of territorial land, besides the state lands above mentioned. — Land concession came to an abrupt end twelve years ago. It is a question whether, apart from its abuse, it was a good system. Its advocates claim: 1, that the country was the gainer by the construction of long lines of useful railroad at a much earlier time than would have been possible otherwise; 2, that the government was no loser, because the land was only granted in alternate sections, and the immediate increase in value of those sections retained by the government was more than an equivalent for the much slower increase in the value of the whole which would otherwise have accrued; 3, that the settler was a gainer because he could better afford to pay the additional price for the sake of being near a railroad. On the other side it is charged: 1, that it stimulated unsound railroad schemes and caused too much railroad building; 2, that the provisions intended to protect the government interests were almost systematically disregarded; 3, that the settler, once established so far from markets and from competing transportation routes, was placed at the mercy of the railroad; while the real gainer by these enhanced values was generally the land speculator. The comparative force of these arguments must be decided by the special circumstances of each case where they are applied; but there have been so many mistakes, and so much corruption, that the burden of proof in every case lies upon the advocates of the land-grant policy. — England never adopted any system of railroad subsidies. Her inland relations were such that her people were only too ready to undertake the construction of the necessary lines without government encouragement. But England's foreign and colonial relations were such as to force her government to take the lead in the matter of steamship subsidies; and it did so with great promptness. It was not until 1838 that the practical importance of ocean steam navigation was made to appear. Proposals for a line of Atlantic mail steamers were at once invited, and in 1839 the contract was awarded to Samuel Cunard, whose bid was the most favorable. The original contract was for three ships at an annual compensation of £55,000; it was soon modified to four ships at £81,000. This contract was extended and modified to the advantage of the company in 1846, 1854 and 1858; it is only within the last fifteen years that it has been greatly reduced. In 1840 a contract for fourteen ships at £240,000 was made with the Royal Mail steam packet company, for the carriage of the mails to the West Indies and southern United States. This company afterward extended its field of operations to South America.

In 1845 the Peninsular & Oriental company, which had had for some years a small mail contract, engaged to run seven mail steamers to India for £160,000; and this company gradually extended its engagements with the government, so that for a series of years it has received more than £400,000, and often £500,000, annually. The contracts with these three companies have been by far the most important; of the rest only those with the Pacific steam navigation company and with the Union steamship company, to Africa, need be mentioned. Under contracts like these, England expended in forty years nearly £45,000,000 sterling. The expense is now gradually decreasing, but still amounts annually to some £700,000 sterling. — These payments are so often cited as an example for America to follow, that we must consider carefully how far they were actually of the nature of bounties for the encouragement of the shipping interest. The early contracts with Mr. Cunard were unquestionably of this nature. Ocean steam navigation was then an experiment; and Great Britain's colonial relations made it a political necessity for her to try the experiment first. Her statesmen were forced to take the burden of risks which no private individual could prudently bear; hence the apparent disproportion of the payments to the cost of the steamships. Nor is there good reason to doubt the candor of the commons committee, who, in 1846, reported, in answer to some complaints on this head, that the service was better performed by that company for the price than it would be by any other. But twelve years later, when the business was thoroughly established, the conservatism of the admiralty allowed the Cunard contract to be renewed at a figure which was then quite in the nature of a bounty, and was felt by the postoffice to be burdensome and unfair. There was somewhat the same spirit shown in dealing with the Royal Mail company, especially in renewing their contract in 1868, when, for certain reasons, the business was not thrown open to public competition, as had been the case in all other instances since 1860. The question is a complicated one; but it is impossible to read the correspondence of the authorities with a rival line, and particularly a report for the government by Mr. Scudamore (Parl. Papers, 1867-8, xli.), without feeling that there was an anxiety not merely to have the service well done, but to keep in good condition the line which had done it in the past. — The company whose case is oftenest cited as an example of what is done by government subsidy, is the Peninsular & Oriental. But here there is much less ground for so doing than in the two former cases. The company owed its origin and early development to private enterprise; so far from being favored by government contract, it often seemed as if partiality was shown against it; and when it was finally recognized as the only agency competent to perform certain necessary parts of the mail service, the contracts were awarded grudgingly at a sum which was considered scarcely an equivalent for the extra liabilities

and expense incurred. The facts which have given rise to the public impression, are the enormous aggregate sum paid to the company, the renewal of one of its contracts some years before its expiration, on terms which seemed especially advantageous, and, above all, the guarantee, for some years in force, of a 6 per cent. dividend on the capital stock of the company. The enormous aggregate pay is explained by the enormous aggregate service. The contract renewal in 1870 was really sought by the authorities to obviate some difficulties under the old contract, which gave them far more trouble than they did the company. The guaranteed dividend requires a word of explanation. In 1867 the company was disinclined to take the government contract, believing that the pay offered would not compensate the service required. The authorities were equally persuaded that it would. As no other company would undertake the work, the matter was compromised; the company taking the contract with the proviso that if they should, under its terms, be unable to pay a 6 per cent. dividend (not 8 per cent., as has been frequently stated), the government should make good the deficiency. Experience proved the company's original estimate a correct one. How the matter was regarded by the government is illustrated by the following extract from Mr. Scudamore's report (Parl. Papers, 1867-8, xli., 131, incl. 3): "It would seem that in dealing with ocean services the postoffice has only two questions to consider: first, what is the nature of the service required; and, second, what is the proper price to pay for it. In the case of communication with the east, parliament has openly declared in favor of a more frequent and equally regular and rapid communication; the postoffice has ascertained that only one company will undertake the maintenance of that communication, and I think I may also claim to say that it has ascertained, with a reasonably close approximation to accuracy, the proper price to pay for it. For the proper price must in every such case be that which, taken together with the revenue from traffic, will cover the working expenses and give a moderate dividend on capital. It is impossible to obtain good service on other terms. The question can not be dealt with on commercial principles, because the conditions of the postal service compel the contractors to disregard commercial principles. * * For the sake of keeping up such communication with the east as the nation requires, they must set commercial principles at defiance; and, cost what it may, the nation must either pay them what they lose thereby, or forego the communication." (See also Rep. of Com. on Affairs of Oriental S. S. Co., 1867, ix.) — Of England's mail contract system it may be fairly said: 1, that its aims are political and not commercial. It is a necessity for England to have constant communication with her colonies, and she has spent large sums for this object. It is almost equally important for her to have an efficient naval reserve and transport service, and she has made

her mail contracts one among several means toward this end. 2. That the incidental commercial advantage to the subsidized companies has not been generally great, except at a very early period of the system. This is evinced by the fact that rival unsubsidized lines have been equally successful, and that the largest contracts have been on terms which made them a matter of indifference to the party receiving them. — The French government encouraged the Mediterranean steamship service from the first, and in the years 1861–5 extended its operations to the support of lines to North and South America, India and China. The annual amount recently paid under these contracts has been more than four and a half million dollars. These efforts met with some degree of success; but the attempt, by the law of January, 1881, still further to increase the French carrying trade by bounties on ship building, sometimes as high as 60 francs per ton, and by a navigation bounty with a maximum of 1.50 francs per ton per thousand miles, did not produce the desired results. Of other nations, Italy, in 1880, spent more than three million dollars on steamship subsidies; Brazil, one million seven hundred thousand; Japan, half a million. Belgium, in 1878, spent over a quarter of a million; Austria, a mileage rate, with a maximum of about three hundred thousand dollars; Russia, a moderate fixed sum, and a mileage rate in addition. The subsidies of Portugal and Holland are small; those of Germany and Denmark apply only to Baltic steamers. The most successful ocean steamship lines of the continent, those of Hamburg and Bremen, receive no pay from the government other than the very moderate postage rates. (45th Cong., 2d Sess., Ex. Doc. 38; 46th Cong., 3d Sess., House Com. Report, 342.) — The United States was reluctant to allow England to get the start in ocean steam navigation. In 1841, only two years after the first Cunard contract, T. Butler King, of Georgia, chairman of the house committee on naval affairs, presented a report urging similar subsidies on the part of the United States. In 1845 an act was passed authorizing the postmaster general to make contracts for the carriage of the foreign mails in American steamships. The first line established under this system was from New York to Bremen; the first passage was made in 1847. The steamers ran ultimately twice a month, to Havre and Bremen alternately, for an annual subsidy of \$350,000. Mr. King continued to push the subject; and in March, 1847, an act was passed requiring the secretary of the navy to contract for mail service from New York to Liverpool, to New Orleans, Havana and Chagres, and from Panama up the Pacific coast. From these contracts arose the Collins line, the George Law line to Aspinwall, and the Pacific Mail steamship company. In 1848 there were further resolutions in congress looking to the establishment of lines to China, to Antwerp, and to the mouth of the Elbe, but these proposals were never actually carried out. By the act of March 3, 1851, the amount

expended for Pacific mail service was largely increased, provision being at the same time made for the Panama railroad; and in July, 1852, the subsidy for the Collins Line to Liverpool, originally \$385,000, was increased to \$858,000. Oct. 1, 1852, the United States foreign mail service was as follows :

No. of Route.	Points.	No. of Trips.	Amount of Pay.
1.	New York to Bremerhaven	Once a month.	\$ 200,000
2.	Charleston to Havana	Twice a month.	50,000
3.	{ New York to Aspinwall New Orleans to Aspinwall New York via Havana to New Orleans }	Twice a month.	290,000
4.	Panama to Oregon	Twice a month.	*348,250
5.	New York to Liverpool	26 per year.	858,000
6.	New York to Havre	Once a month.	150,000
7.	Aspinwall to Panama	Twice a month.	50,436
Total			\$ 1,946,686

— By far the most ambitious of these enterprises was the Collins line to Liverpool. The United States government had demanded such vessels as would afford a very high rate of speed; therein departing from the English policy, which demanded regularity and great safety at comparatively slow rates, as exemplified in the Cunard and Peninsular & Oriental lines. The Collins steamships thus cost a large sum in their construction, and a career of exceptional prosperity was needed to support them even with the assistance of the subsidy. This prosperity they enjoyed for four years, from 1850 to 1854. In September of that year they lost the steamship "Arctic," and little more than a year later the "Pacific." Under the dissatisfaction produced by these disasters, combined with other reasons, the subsidy was withdrawn. The line succumbed, and in 1858 the steamships were sold. The other subsidies were discontinued at about the same time. The Bremen line withdrew its steamships on the expiration of the contract in 1858; the Havre line continued operations until after the breaking out of the rebellion. A considerable portion of the United States mail service was at this time maintained by Vanderbilt's steamships without subsidy; but these ceased in the war time to be employed in this way. At the beginning of 1864 we had no steamships crossing the ocean, and none engaged in foreign trade except the Havana and Pacific lines. (See Memorial of New York Chamber of Commerce, 1864.) — In that year congress authorized a mail contract for twelve round trips, of vessels of not less than 2,000 tons, from New York to Brazil, at an amount not exceeding \$150,000. The most favorable offer was made by J. F. Navarro, representing what afterward became the United States & Brazil steamship company. The negotiations dragged on for a long time; there were many irregularities, including most suspicious and persistent efforts on the part of the company to make the government accept

* Owing to a misprint in the original report to congress, both this sum and the total are usually quoted half a million dollars too large.

unsuitable vessels. In the latter part of 1865 a conditional contract for ten years was entered into and finally ratified. (See 39th Cong., 1st Sess., Ex. Doc. 121.) — Early in 1865 a contract was made with the Pacific Mail steamship company for a monthly mail service to China, in vessels of 3,000 tons, at an annual payment of \$500,000. No further lines were subsidized, in spite of the well-known report of the Lynch committee in 1870, favoring an extension of this policy. But in 1872 an additional subsidy of \$500,000 was offered the Pacific Mail for the establishment of a second service per month; this time in vessels of 4,000 tons. But the Pacific Mail was unfortunate in every way. Before the subsidy contract of 1865 it had been a sound and well-managed concern; since that time it had been the plaything of speculators. It lost nine vessels in as many years. Foreign shippers had become dissatisfied with its rates and methods. The shares had fallen from above par to below 40. Nor did the supplementary contract bring the expected relief. It was found impossible to complete the vessels for the new service within the contract time. As there had been apparently no lack of intention on the part of the company, the government hesitated what to do, and seemed disposed to grant the company special favor. But then came the disclosures as to how the contract of 1872 had been obtained, the evidence of vast amounts of money spent for corrupt purposes. Public sentiment was strongly aroused, as was evinced by the vote on Mr. Holman's anti-subsidy resolution. In the face of feeling like this a much better case than that of the Pacific Mail would have had no chance of a favorable hearing; and the decision of the senate judiciary committee that the subsidy of 1872 had been forfeited by non-fulfillment of the contract, was almost a foregone conclusion. (43d Cong., 2d Sess., Senate Rep., 268; House Rep., 674.) The subsidy of 1865 ran on till the middle of 1875. The Brazilian line subsidy expired at about the same time. With that year ended the second systematic attempt at thus supporting steamship lines, even more completely and decisively than the former attempt had ended in 1858. Since that time there has been more or less agitation in favor of subsidies, but without distinct results. Even the Russell committee of 1880, with their obvious leanings in that direction, did not venture to propose anything specific. An attempt on the part of the Pennsylvania railroad company to support a line from Philadelphia to Liverpool by similar payments, was, after full trial, finally abandoned. — It is urged by the advocates of a subsidy system for the United States steam marine, 1, that we stand almost alone among maritime nations in not doing so; 2, that we lose not merely the carrying trade, but a large part of our foreign commerce; 3, that we are left defenseless in case of war. To this the reply is made, 1, that the example of England does not really apply to our own case, while that of France and other nations can hardly be appealed to as successful; 2, that the loss of our carrying trade and foreign

commerce is due to other causes, and can not be remedied in this way. The third point is more difficult to meet directly. There can be no doubt that England's brilliant success in Egypt, and her power of waging distant wars elsewhere, are due to the readiness and efficiency of her transports, and that this reserve transport service was partly connected with her system of mail contracts. Nor is there any doubt that at the beginning of the rebellion the control of a number of really swift steamers would have been of inestimable service to the government. But such a naval reserve is much more needed for offensive than for defensive war, the general carrying trade being, in the latter case, a source of actual weakness. And whether, in the existing machinery of the United States government, and the liabilities to fraud on government contracts, such a naval reserve could be secured by a system of subsidies, is, to say the least, doubtful; whether it would ever be worth the money we should have to spend upon it, is even more doubtful; not to speak of the possibility of obtaining the same result on a larger scale, with less cost and less fraud, by the removal of some of the restrictions upon commerce. (For a strong statement of some of the arguments against subsidies, see David A. Wells' "Our Merchant Marine," chap. viii. See also, ENCOURAGEMENT OF INDUSTRY BY THE STATE.)

ARTHUR T. HADLEY.

SUB-TREASURY. (See INDEPENDENT TREASURY.)

SUFFRAGE means a vote or a participation in government, and, specifically, the privilege of voting under a representative government, upon the choice of officers, and upon the adoption or rejection of fundamental laws. This privilege has always and everywhere been conditioned, at least, upon age and sex. Universal suffrage, therefore, is an inaccurate though popular description of manhood suffrage—that of males of full age, and there is no right of suffrage except in the sense that this privilege is created and sanctioned by positive law. The object of suffrage is the continuity of government and the preservation and perpetuation of its benefits. — There are two important theories regarding the basis of suffrage. 1. That it is a privilege granted by the state to such persons or classes as are deemed most likely to use it for the public weal, a device to secure good government whose application must depend upon social conditions, civil institutions and political aptitudes. Most states have acted upon this theory, and, at different times, conditioned suffrage upon age, sex, nativity, religious profession, rank, military service, possession of property, tax payment, character, intelligence, residence. "While the action of a state in determining what political status shall be given to children, women, aliens, inferior races and others, is necessarily arbitrary and artificial, and reflects the convictions of the nation and generation upon the moral claims which arise from the natural facts that differentiate these

groups of persons and form their relations" to other groups of persons possessing political power, no disfranchisement is a violation of institutional liberty if it only recognizes natural (physical, mental or moral) inequalities of condition, or of political justice if civil institutions bear equally upon all who are in the same political status, or of equality before the law if due relation is preserved between the political rights and duties that are imposed. 2. That, like life, it is a gift from nature—a natural right of all persons. This political dogma of the eighteenth century is a pure fiction. If this so-called natural right is denied by a state, it can not be enforced: if it exists, it must be unconditioned, but few who affirm it work to secure its enjoyment to females, and none claim that it can be safely exercised by minors. The democratic spirit, formulated in the second theory, and voiced in the American and French revolutions, has been a powerful dissolvent of political privileges justified, in their origin, by the first theory. In one century it has led to a wide adoption of manhood suffrage. Statesmen have sought to direct this movement; demagogues, to profit by it; fools, to stay it. — Advocates of any extended suffrage claim: 1, that it gives the state the greatest practicable security against internal violence; 2, that the chances of a wise conduct of both its internal and external affairs are increased with every addition of individuals or classes consulted; 3, that each individual and class best knows its own interests and wants; and 4, that no individual or class can be as safely intrusted to protect another's interest as that other itself. These claims are now being tested by manhood suffrage, which is of too recent origin to yield anything more than material for suspended judgment. Yet it is undeniable that the first results of this greatest political experiment of the century are not unmixed good: it has sometimes, especially in cities, borne the evils of ignorant rulers, insecurity of life and property, extravagant and corrupt administration. But good or evil, no large curtailment of this suffrage is now possible. The old qualifications are felt to be unjust: the intellectual and moral development of man has made a wide bestowal of the suffrage not only possible but expedient. Any disfranchisement, to be successful, must follow closely the lines of least reasonable resistance, and clearly tend to lessen the enumerated evils. Within such lines there are three such qualifications which may be prescribed by the state with justice, and which only apply the principle that political rights should be correlated to political duties. 1. An educational qualification evidenced by ability to read and write. "No one," says Mill, "but those in whom an *a priori* theory has silenced common sense, will maintain that power over others, over the whole community, should be imparted to people who have not acquired the commonest and most essential requisites for taking care of themselves—for pursuing intelligently their own interests, and those of the persons most nearly

allied to them." Intelligence is not an infallible test of political wisdom, but it is essential to the safe conduct of government; and if it is an admitted evil to withhold the suffrage from any person, the prevention of greater evil demands its denial to the illiterate. So low an educational test can not, with present private and public aid for elementary instruction, long bar any one from the electorate who would strengthen the state. 2. An economic qualification evidenced by maintenance without municipal aid, and the payment of a poll tax. In politics, as elsewhere, only that which costs is valued. The industrial virtues imply self-denial, which prepares their possessors to wield political power; but pauperism raises a presumption of unfitness to share in political power. The person who can not support himself has no moral claim to rule one who can. The payment of one direct tax is a political object-lesson, useful to all, and imperatively needed by those who pay no other tax and occasion the greater part of all police expenditure. In cities an additional qualification—the payment of such taxes or rent as give a substantial interest in the economical administration of the municipality—should be imposed upon the electors of the local body which makes municipal appropriations and lays municipal taxes. Its necessity is fully set forth in the report of the commission appointed in the state of New York, in 1876, to devise a plan for the government of cities. (See CITIES.) "Non-taxpayers," says Mill, "have every motive to be lavish, and none to economize. As far as money matters are concerned, any power of voting possessed by them is a violation of the fundamental principles of free government, a severance of the power of control from the interest in its beneficial exercise." 3. A moral qualification evidenced by habitual obedience to the positive law of the state. Such obedience, practically, is the interpretation given by the courts to the phrase "good moral character." Theoretically the wisdom of thus restricting the suffrage has long been admitted. One of the present state constitutions mentions "good moral character" as one of the conditions to citizenship; the United States statutes require an alien applying for naturalization to "make it appear to the satisfaction of the court admitting such alien, * * * that during that term (five years) he has behaved as a man of good moral character." Practically, the enforcement of these constitutional and statutory requirements has been impossible, for the law has never given naturalization courts and registrars of elections any adequate means for the determination of the law-abiding character of applicants for citizenship and registration. — The political injustice of allowing law-breakers, inflicting heavy taxes upon law-keepers, to become and remain voters, that is, law-makers, is equaled only by its danger, for wherever a bare majority rule, and the will of law-breakers is allowed legal expression, the action of the majority and of the state may be determined by its basest elements. This danger can be diminished by 1, Laws estab-

lishing a systematic registration of criminals, with provisions for the publication and exchange of criminal registers. 2. Laws so extending the use of disfranchisement as a penalty for crime for males, that conviction for any felony shall, in addition to other punishments, entail, *ipso facto*, permanent political disability; and that a single conviction for certain misdemeanors which imply unfitness to discharge the duties of a voter (as, for example, illegal voting and *petit* larceny), or such repeated convictions for any misdemeanor or different misdemeanors as may by statute law and judicial construction constitute one an "habitual misdemeanant," a "common drunkard," or a "repeater," shall, in addition to any other penalties, be followed by a temporary loss of the suffrage. 8. Laws requiring clerks of criminal courts to report at stated times the names and descriptions of all persons convicted of disfranchisable crimes to clerks of naturalization courts and to registrars of elections, whose duty it shall be to refuse to such persons citizenship and registration until the disability is removed. — This policy of punishing crime politically, if adopted and maintained, would tend first, to purify the electoral body by purging it of its most corrupt and corruptible elements, and so preserve the national life by limiting its control to law-abiding citizens; second, to lower taxes by divesting the most wasteful and least productive members of society of all power, directly or indirectly, to appropriate the public moneys, and by substituting, in many cases, an inexpensive disability for an expensive confinement; third, to reform occasional offenders, and to deter the young from criminal acts by appealing to two of the strongest motives to lawful action which operate in a democratic country, viz., fear of permanent political inferiority, and hope of civic honor. — *In the American Colonies, 1619–1789.* The original settlers, with unimportant exceptions, all had a voice in public affairs. The founders of Virginia and of New England (the original forces which determined the course of colonial development) were mainly Englishmen, accustomed to self-government, and in each colony homogeneity of character, community of interests and belief, economic conditions, and military necessities, found expression in equality of political privileges till the arrival of men of other blood and religion, of "indented servants," "redemptioners," transported felons, and negroes, introduced social inequalities. From that time electoral qualifications varied greatly, and often in different colonies, the most constant tests being religious profession and possession of property. The influx of immigrants of different religions soon compelled the abolition of the former test, and the economic conditions of the country, tending powerfully to equality of condition, early in the colonial period produced a movement which has been "constant though not steady, and is not yet spent, toward absolute equality of political rights and privileges." The first legislative body that ever sat in America (at Jamestown, July 30,

1619) was elected by all the male inhabitants. Notwithstanding some fluctuation, both before and after, the Virginia colony, from 1670, restricted the suffrage to "freeholders and housekeepers," the reason stated being that the "usual way of choosing burgesses by the votes of *all persons who, having served their time, are freemen of this country,*" produced tumults at the election, and that it would be better to follow the English fashion and "grant a voyce in such election only to such as by their estates, real or personal, have interest enough to tye them to the endeavor of the publique good." The first legislative body in New England (at Plymouth, 1620,) was composed of all the male inhabitants, and this township type and school of government was adopted in other New England settlements. It was ordered, May 18, 1631, before there was a representative body in Massachusetts, "that no man should be admitted to this body politic but such as are members of some of the churches within the limits of the same." This was not repealed until Aug. 3, 1664. It excluded for thirty years three-fourths of the male inhabitants from the ballot box; and a parallel law is found only in New Haven colony, where, June 4, 1639, a fundamental agreement was adopted providing "that church members only shall be free burgesses, and they only shall choose among themselves magistrates and officers to have the power of transacting all public civil affairs of this plantation." The first representative court in Massachusetts, in 1634, ordered "that none but freemen should have any vote in any town." The Massachusetts charter of 1691 restricted suffrage to the possessors of an estate of freehold in land to the value of 40s. per annum, or other estate to the value of £40. At the beginning of the eighteenth century a freehold test had become common in the colonies, though all attempts (see Locke's "Fundamental Constitutions of Carolina," 1669,) to limit political power to *hereditary* wealth had failed. In some colonies, laws imposed penalties on absentees from town meetings or elections, a survival of which appears in the constitution (article xii.) of Georgia, in force 1777–89. From 1700 to 1776, inclusive, no change occurred in the social condition of the colonies necessitating any radical change in the suffrage, except that parliament, in 1746, substituted for the various naturalization acts which their need of immigrant laborers had induced several colonies to pass before the close of the preceding century, a uniform system of naturalization, on the basis of seven years' residence, an oath of allegiance, and profession of the "Protestant Christian faith." Independence brought about some extension of the suffrage, but, though the demonstrated capacity for self-government of the colonists led to a declaration of the right of self-government in all classes of mankind, the principle was not consistently followed by revolutionary statesmen. "They extended it just so far as the conditions of the time and place at once necessitated and made safe; and sought to shun

two opposite dangers: danger to the government from the supremacy of any class, and danger to the government by the exclusion of any class which might have sufficient unity, self-conscious power and independent interest to attempt the same kind of revolution which the colonists had themselves sanctioned." The last survival of the test of religious profession appears in the constitution of South Carolina (article xiii.) in force 1778-90, which limited suffrage to "every free white man who acknowledges the being of a God, and believes in a future state of rewards and punishments."—When the federal constitution was adopted, each state was left by its constitution, or by its charter from the crown (under which two states, Rhode Island and Connecticut, continued to act), to prescribe for itself who should have the privilege of voting. No state then granted that privilege to all of its citizens. It was limited to the following classes of persons: in New Hampshire, "every male inhabitant of each town and parish with town privileges, and places unincorporated in the state, of twenty-one years of age and upward, excepting paupers and persons excused from paying taxes at their request"; in Massachusetts, "every male inhabitant of twenty-one years of age and upward, having a freehold estate within the commonwealth of the annual income of three pounds, or any estate of the value of sixty pounds"; in Rhode Island, "such as are admitted free of the company and society," freeholders of estate of the value of \$134, and the eldest sons of such freeholders; in Connecticut, such persons as had "maturity in years, quiet and peaceable behavior, a civil conversation, and forty shillings freehold or forty pounds personal estate," if so certified by the selectmen; in New York, "every male inhabitant of full age who shall have personally resided within one of the counties of the state for six months immediately preceding the day of election, if during the time aforesaid he shall have been a freeholder, possessing a freehold of the value of twenty pounds within the county, or have rented a tenement therein of the yearly value of forty shillings, and been rated and actually paid taxes to the state"; in New Jersey, "all inhabitants of full age, who are worth fifty pounds, proclamation money, clear estate in the same, and have resided in the county in which they claim a vote for twelve months immediately preceding the election"; in Pennsylvania, "every freeman of the age of twenty-one years, having resided in the state two years next before the election, and within that time paid a state or county tax which shall have been assessed at least six months before the election"; in Delaware "as exercised by law at present," all resident tax-paying freemen; in Virginia, "as exercised by law at present," persons having a freehold estate of one hundred acres of unimproved land, or twenty-five acres of improved land, or a house and lot in a town; in Maryland, "all freemen above twenty-one years of age, having a freehold of fifty acres of land in the county in which they offer to vote,

and residing therein, and all freemen having property in the state above the value of thirty pounds current money, and having resided in the county in which they offer to vote one whole year next preceding the election"; in North Carolina, for senators, "all freemen of the age of twenty-one years who have been inhabitants of any one county within the state twelve months immediately preceding the day of election, and possessed of a freehold within the same county of fifty acres of land for six months next before and at the day of election," and for members of the house of commons, "all freemen of the age of twenty-one years who have been inhabitants of any one county within the state twelve months immediately preceding the day of any election, and shall have paid public taxes"; in South Carolina, "every free white man of the age of twenty-one years, being a citizen of the state, and having resided therein two years previous to the day of election, and who hath a freehold of fifty acres of land, or a town lot of which he hath been legally seized and possessed at least six months before such election, or (not having such freehold or town lot), hath been a resident within the election district in which he offers to give his vote six months before said election, and hath paid a tax the preceding year of three shillings sterling toward the support of the government"; and in Georgia such "citizens and inhabitants of the state as shall have attained to the age of twenty-one years, and shall have paid tax for the year next preceding the election, and shall have resided six months within the county."—*In the United States, 1789-1884.* During this period freehold franchise has given way to manhood suffrage. The French revolution, intensifying the democratic spirit till Americans abhorred all political privileges as British badges; the transfer of political leadership from conservative statesmen of long experience to radical politicians echoing the French dogma of political equality; the vast expansion of territory, with the settlement of new states bidding against each other with political franchises for immigrants; the growth of population, with the rise of large cities inhabited by many uninterested in the soil; the anti-slavery agitation, spreading the doctrine of the "rights of man"; the gradual popular recognition that the principles of the declaration of independence had not been logically applied; the private interest of demagogues, and the fierce competition of parties careful for the next election if neglectful of the next generation; and, finally, the alleged necessity imposed by a war, one of whose incidents was the emancipation of a race—are some of the causes which have united to produce the existing electoral franchise. Eleven of the thirteen original states have abolished the tax and property tests, as follows: New Hampshire, the tax test in 1792; Georgia, the property test in 1798; Maryland, the property test in 1801 and 1809; Massachusetts, the property test in 1821; New York, the property test in 1821, and the tax test in 1826;

Delaware, the property test in 1831; New Jersey, the property test in 1844; Connecticut, the property test in 1845; South Carolina, the property test in 1865; North Carolina, the property test in 1854 and 1868; Virginia, the property test in 1850, and the tax test, established in 1864, in 1882. The only new states which have required a property or even a tax qualification, are the following: Tennessee, admitted in 1796 with a freehold qualification, abolished it in 1834; Ohio, admitted in 1802 with a tax qualification, abolished it in 1851; Louisiana, admitted in 1812 with a tax qualification, abolished it in 1845; Mississippi, admitted in 1817 with a militia or tax qualification, abolished it in 1832. Long before they disappeared, tax and property tests had become forms. Parties or candidates paid the taxes of unqualified citizens whose votes were needed and could thereby be had, or conveyed land to them before election, which was deeded back after election. Thus, by degrees, all native-born white males of age were allowed to vote upon taking the freeman's oath, after a brief term of residence in a state or town, and the competition of new states for laborers led to the gradual extension of suffrage to alien declarants, who now have it in thirteen states. After the rise of the American party, Massachusetts, during 1859-63, denied the suffrage to aliens, unless "they shall have resided within the jurisdiction of the United States two years subsequent to naturalization, and shall be otherwise qualified." Free black males of age, who could vote in some slave states, as Tennessee (Const. of 1834), were disfranchised in some free states, as Connecticut (Const. of 1818). — In the southern states political power was held exclusively by the property-owning and educated classes till the close of the rebellion. When slavery was abolished by the 13th amendment (see Const. III., Amendments) in 1865, the dominant party in congress apparently had no intention of interfering with the control of the suffrage in the states. But the inadequate protection given the negro in the southern states, and the unwillingness of the northern states that his freedom should increase the political power of those lately in rebellion, led to the adoption of the 14th amendment (see Const., III., Amendments) in 1868. This conferred citizenship upon the negro, guaranteed to him the same rights enjoyed by white citizens of the United States, and made it for the interest of the southern states to voluntarily extend the suffrage to the negro, by providing that when the right of voting is denied to any of the male inhabitants of any state, being twenty-one years of age and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, such state's representation in congress shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such state. This amendment not being promptly ratified when proposed, in 1866 (see Const., III., Amendments), was followed by the reconstruction act of March

2, 1867 (see RECONSTRUCTION, for temporary political disabilities), which made it a condition of the restoration of the seceding states that new constitutions should be adopted, framed by "delegates elected by the male citizens twenty-one years old and upward, of whatever race, color or previous condition," and securing "to all such persons" the elective franchise, and by the adoption of the 15th amendment, in 1870, which provides that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race, color or previous condition of servitude." The reasons for this amendment were (Cooley's Con. Law, 264, 265; Hunt J., in U. S. vs. Reese, 92 U. S. R., 214, 247): "1. That unless the ballot was given to the freedmen, the government of the southern states must for a considerable time be in the hands of those lately in rebellion, and that the existence in a political community of a great body of citizens against whom the laws discriminate in a particular which makes the discrimination a stigma and a disgrace, must always be an occasion of discontent, disorder and danger. 2. That it would benefit the colored race by giving them importance, securing to them respect, protecting them against unfriendly action or legislation, and by acting as an educational process." This enfranchisement of the negro is the last of a series of extensions of the suffrage which began in the colonial period, and have ended by nominally conferring political supremacy in some states upon those whose former status as slaves leaves them illiterates and non-taxpayers, unhabituated to the obedience of law. — The existing conditions of the suffrage in the United States are now the following: The constitution of the United States confers the right to vote upon no one. That right is not a "privilege or immunity" of citizens of the United States: when they possess it at all, even for electing representatives and presidential electors—the only federal officers chosen by popular vote—it is created by state constitutions and state laws. (Const. of U. S., Art. I., Sec. 2; Art. II., Sec. 1.) The fifteenth amendment to the constitution does not confer the right of suffrage upon any one, but it invests citizens of the United States with the right of exemption from discrimination in the exercise of the elective franchise, on account of their race, color or previous condition of servitude, and empowers congress to enforce that right by appropriate legislation. The power of the states to exclude from the franchise upon other grounds, including those of nativity, sex, illiteracy and non-payment of taxes, remains intact. The power of congress to legislate at all upon the subject of voting at state elections rests upon this amendment, and can be exercised by providing a punishment only when the wrongful refusal to receive the vote of the qualified elector at such elections is because of his race, color or previous condition of servitude. The third and fourth sections of the act of May 31, 1870 (16 Stat., 140), not being confined in their

operations to the above-described unlawful discrimination, are beyond the limit of the 15th amendment, and unauthorized. (U. S. ex. Reese, 92 C. S., 214.) Qualifications of electors are defined in the several state constitutions, and no additional qualifications can be required by the state legislature, but the legislature may prescribe by law "such conditions to the exercise of the elective franchise as shall seem reasonable to protect the privilege, and to prevent impositions and other frauds, and also all proper regulations for receiving and canvassing votes." (Cooley's Con. Law, 252.) The qualifications prescribed by existing state constitutions are shown in the table on pages 828, 829.—Some constitutions require registration; some disfranchise any persons while under guardianship; some, any person while kept in any poor-house or other asylum at public expense, or while confined in any public prison; some, any person stationed in any state while in the military, naval or marine service of the United States; some, idiots or insane persons, but these persons, without express mention, are excluded from voting, as incapable of exercising legal volition. The educational test shown in the table was established in Connecticut in 1855, in Massachusetts in 1857, in Missouri in 1876. The constitutions of Alabama and Mississippi forbid the imposition of such a test. That of Florida allows it after 1880; that of Colorado, after 1890. The economic test shown is at least the prepayment of some tax, in Massachusetts, Rhode Island, Pennsylvania, Delaware, Tennessee and Georgia. The constitutions of Alabama, Arkansas, California and Mississippi, expressly forbid a property test, and the constitution of Arkansas also expressly forbids a poll-tax test; that of Nevada allows it. Paupers are expressly disfranchised in Maine, Massachusetts, New Hampshire, New Jersey, Rhode Island, South Carolina, Texas and West Virginia. A moral test exists in all the states except four (Colorado, Massachusetts, New Hampshire, and West Virginia), but if satisfactory proof of the reformation of the offender is given, the constitutions of ten states (Connecticut, Florida, Kansas, Minnesota, Nebraska, Nevada, North Carolina, New Jersey, Rhode Island and Wisconsin) expressly permit restoration to the suffrage; some of them by a two-thirds vote of the legislature, others by a majority vote.—The table on page 831 shows the offenses for which states disfranchise for crime by the express terms of their constitutions, or for which their legislatures may make disfranchisement a penalty. It shows that conviction of the offenses enumerated, does or may disfranchise, specifically as follows: of bribery, in twenty-three states; of felony, in sixteen states; of infamous crime, in sixteen states; of treason, in eleven states; of dueling, in eleven states; of perjury, in ten states; of forgery, in seven states; of larceny, in seven states; of embezzlement of public funds, or fraud, in seven states; of election misdemeanors, in six states; of other high crimes or malfeasance in office, in six states; of murder, in two states; of

robbery, in two states. Conviction of some of the enumerated crimes also disqualifies for jury service in some of the states, while permanent ineligibility to office is the sole political disability that is inflicted upon those guilty of bribery or of dueling in other states. Three states (Nebraska, Nevada and Wisconsin) admit the principle of the exterritoriality of crime in their constitutional provisions for disfranchisement.—*Territories.* The ordinance of 1787, for the government of the northwest territory, provided that "so soon as there shall be 5,000 free male inhabitants of full age in the district, they shall receive authority to elect representatives to a general assembly: provided, also, that a freehold in fifty acres of land in the district, having been a citizen of one of the states, and being resident in the district, or the like freehold, and two years' residence in the district, shall be necessary to qualify a man as an elector of a representative." The constitution having given congress power to make all needful rules and regulations respecting the territory belonging to the United States, two forms of territorial government have from time to time been established: 1, by an executive and judges of federal appointment, who together constitute a legislature; 2, by an executive and judges of federal appointment, and a legislature composed of representatives chosen by the people of the territory. In the second form of government, the basis of suffrage has been substantially uniform, being limited commonly, as it now is by law in the first election in a territory, to "every male citizen above the age of twenty-one years, including persons who have legally declared their intention to become citizens in any territory hereafter organized, and who are actually residents of such territory at the time of the organization thereof." At subsequent elections the qualifications of voters may be prescribed by the legislative assembly of each territory, provided that the right of voting shall be exercised only by citizens of the United States above the age of twenty-one years, and by alien declarants above that age, who have taken the required oath; that it be not denied to a citizen on account of race, color or previous condition of servitude; and that no person in the army or navy, or attached to troops in the service of the United States, shall be allowed to vote by reason of being on service in the territory, unless it has been for six months his permanent domicile.—*District of Columbia.* The government of this district, over which congress has the power of exclusive legislation, was originally vested in a board of three commissioners under the act of July 16, 1790. This board was abolished by act of May 1, 1802, and the city of Washington was incorporated by act of May 3, 1802, which provided that its council should be elective "by the free white male inhabitants of full age who have resided twelve months in the city, and paid taxes therein the year preceding." An act of May 13, 1820, provided that both the mayor and the council should be elective by "every free white male citi-

STATES.	Description of Person		Residence.			Age	Taxes.	Education.	Character.
	Citizen.	Declarant of intention to become citizen.	State.	County.	District, town, city, precinct or ward.				
Alabama	Every male citizen of U. S.	Declarant. ^a	1 year. ^b	3 months.	30 days. ^c	21			
Arkansas	Every male citizen of U. S. Every native male and every male naturalized citizen of U. S. who shall have become such 90 days prior to any election. ^a	Declarant.	12 mos.	6 months.	1 month.	21			
California	Every male citizen of U. S.	Declarant not less than 4 months before he offers to vote.	1 year.	90 days.	30 days.	21			
Colorado	Every male citizen of U. S.		6 mos.	["Such time as may be prescribed by law."] 6 months.	["Such time as may be prescribed by law."] 6 months.	21	Who shall be able to read any article of the constitution or section of statutes of the state.		Good moral character.
Connecticut	Every male citizen of U. S.		1 year.	1 month.	6 months.	21	Who has, if 22 years or upward, paid a county tax assessed 6 months previous to election.		
Delaware	Every male citizen.		1 year.	1 month.	30 days.	21	Who has paid all taxes for year preceding.		
Florida	Every male citizen of U. S.	Declarant.	1 year.	6 months.	30 days.	21	Who has paid all taxes for year preceding.		
Georgia	Every male person born or naturalized in U. S.	Declarant.	6 mos.	30 days.	30 days.	21			
Illinois	Every male citizen of U. S.	Declarant who shall have resided in U. S. 1 year, and state 6 mos.	1 year.	90 days.	30 days.	21			
Indiana	Every male citizen of U. S.		6 mos.	6 months.	In township 60 days. In ward 30 days.	21			
Iowa	Every male citizen of U. S.	Declarant.	6 mos.	60 days.	30 days.	21			
Kansas	Every male citizen of U. S.	Declarant.	6 mos.	1 year. ¹	60 days.	21

Wisconsin.....	{ Every male citizen of U. S., and persons of Indian blood described in note. }	Declarant.	1 year.			21		"Who is of quiet and peaceable behavior."

(See notes to this table on page 830.)

zen of the United States of lawful age, who shall have resided in the city for one year next preceding the day of election, and shall be a resident of the ward in which he shall offer to vote, and who shall have been assessed for the year ending on the 31st day of December next preceding the day of election, and who shall have paid all taxes legally assessed and due on personal property, when legally required to pay the same." The act of May 17, 1848, re-enacted this qualification, with the addition that it apply to persons assessed "as subject to a school tax for that year (except persons *non compos mentis*, vagrants, paupers or persons who have been convicted of any infamous crime), and who shall have paid the school tax and all taxes on personal property due from him." An act of March 4, 1855, for the codification of the laws of the District of Columbia, provided for the submission of the proposed code to the votes of "every free white male citizen of the United States above the age of twenty-one years, who has resided in said district for one year next preceding such election." The act of Jan. 8, 1867, extended

Notes to Table on pp. 828, 829.

The adjective "white" before "male" in some constitutions, adopted before the 15th amendment, is here omitted.

a Declarant means a male person of foreign birth, who shall have declared his intention to become a citizen of the United States, conformably to the naturalization laws of the United States.

b "Immediately preceding the election at which he offers to vote."

c "The general assembly may prescribe a longer or shorter residence in any precinct or county, or in any ward in any city or town having a population of more than 5,000 inhabitants, but in no case to exceed three months." (Const., Art. VIII., Sec. 1.)

d "Provided no native of China shall ever exercise the privileges of an elector."

e "Provided that no person shall be denied the right to vote at any school district election, or to hold any school district office, on account of sex." (Const., Art. VII., Sec. 1.) And "The general assembly may enact laws to extend the right of suffrage to women of lawful age, and otherwise qualified. No such enactment shall be of effect until submitted to the vote of the qualified electors at a general election, nor unless the same be approved by a majority of those voting thereon." (Idem, Sec. 2.)

f "In the county, town or city in which he offers to vote."

g "The legislature may provide by law that any woman of the age of twenty-one years and upward may vote at any election held for the purpose of choosing any officers of schools, or upon any measure relating to schools, and may also provide that any such woman shall be eligible to hold any office pertaining solely to the management of such schools." (Const., Art. VII., Sec. 8.)

h "Who have adopted the customs and habits of civilization."

i "Persons of Indian blood residing in the state, who have adopted the language, customs and habits of civilization, and shall have been pronounced (by any district court of the state) capable of enjoying the rights of citizenship."

j "If twenty-two years of age or upward."

k "Provided, that no person shall at any time be allowed to vote in the election of the city council of the city of Providence, or upon any proposition to impose a tax, or for the expenditure of money in any town or city, unless he shall, within the year next preceding, have paid a tax assessed upon his property therein, valued at least at \$134."

l "Who have once been declared by law of congress to be citizens of the United States, and civilized persons of Indian descent, not members of any tribe."

the suffrage in the District of Columbia to "every male person, except paupers and persons under guardianship of the age of twenty-one years and upward, who has not been convicted of any infamous crime, and excepting persons who have voluntarily given aid and comfort to the rebels in the late rebellion, and who shall have been born or naturalized in the United States, and who shall have resided in this district for one year, and three months in the ward in which he shall offer to vote, without distinction on account of race or color." The act of Feb. 21, 1871, created a legislative assembly for the District of Columbia, consisting of a council and house of delegates, to be elected by "all male citizens of the United States above the age of twenty-one years, except such as are *non compos mentis*, and persons convicted of infamous crimes, who have been actual residents of the district for twelve months prior to any election therein, and of the election district or precinct in which they shall respectively reside, for thirty days immediately preceding such election." This act applied a severe test to the political theories of the advocates of unrestricted suffrage. The white population of the district always contains a large mobile element which has no large interest in its weal; almost the whole black population was ignorant, and without political responsibility. From 1860 to 1870 the white population had increased from 60,763 to 88,278, and the black population from 14,316 in 1860, to 43,404 in 1870. Under these conditions unrestricted suffrage produced extravagance, corruption and other incidents of bad government. Congress was petitioned for relief, and by the act of June 11, 1878, representative government was abolished, a population of 177,000 left without a voter, and the government vested, as originally under the act of July 16, 1790, in a board of commissioners. — WOMAN SUFFRAGE. The political dogma of the eighteenth century, that suffrage is a natural right, led to an early demand for its extension to woman. Condorcet published July 3, 1790, in *Journal de la Societe de 1789*, a plea for citizenship of women. The constitution of New Jersey, framed in 1776, permitted all inhabitants of certain qualifications to vote, and an act to regulate elections under it, passed in 1793, provided that "every voter shall, openly, and in full view, deposit his or her ballot, which shall be a single written ticket containing the names of the persons for whom he or she votes." This act was repealed in 1807. Agitation against slavery in the United States gave prominence to the dogma of "natural rights," and small groups of persons before the close of the first half century demanded its universal application. The first woman's rights convention was held at Seneca Falls, N. Y., July 19, 1848. It based the claims of woman on the declaration of independence, and demanded equal rights. The first national woman's rights convention was held at Worcester, Mass., Oct. 23, 1850. The attention of the English people was called to the subject of woman suffrage by an article in the "Westminster Re-

view" in 1851, and effective demand for the enfranchisement of woman dates from this time, 1850-51. Its advocates argue that it is a natural right, and that "the consent of the governed" is not "the governed property holders, nor the governed voting men, nor the governed married men," but all the governed men and women; that taxation without representation is tyranny; that the voting of males is no longer conditioned upon military service; that no class is as safe a guardian of the interests of another class as that other class

Notes to Table on p. 831.

a A crime punishable by death or imprisonment in a state prison.

b * The constitution adopted by California in 1879 expressly disfranchises for infamous crime, embezzlement or misappropriation of public money, and dueling, and says that laws shall be made to exclude from the right of suffrage persons convicted of the above starred crimes.

c Theft is the term used in the constitution of Connecticut.

d The legislature may make the forfeiture of the right of suffrage a punishment for crime.

e No person who has been dishonorably discharged from the service of the United States is qualified to vote or hold office in Kansas.

f Since 1876 "the legislature may enact laws excluding from the right of suffrage, for a term not exceeding ten years," for this crime at any election.

g These crimes forever disqualify for voting.

h "Under the law of the state, or of the United States, unless restored to civil rights."

i "In any state or territory of the United States, unless restored to civil rights."

j The constitution of Nevada, Art. IV., Sec. 10, makes ineligible for office persons convicted of embezzlement, or defalcation of public funds, or bribery, and empowers the legislature to make these crimes punishable as felonies; and by Art. II., Sec. 1, felony disfranchises.

k The constitution of New Jersey, Art. II., Sec. 1, says that "no person convicted of a crime which now excludes him from being a witness, unless pardoned or restored by law to the right of suffrage, shall enjoy the right of an elector." The laws of the state make persons convicted of the tabulated crimes incompetent as witnesses, and if the crime is perjury or subornation of perjury, a pardon does not remove the incompetency.

l Disfranchises "at such election," as do all corrupt offers to give or receive money or other valuable thing for a vote, in both New York and Pennsylvania.

m Any person convicted of this offense "shall, in addition to any penalties provided by law, be deprived of the right of suffrage absolutely for a term of four years."

n "Any elector who shall receive any gift or reward for his vote, in meat, drink, money, or otherwise, shall suffer such punishment as the laws shall direct."

o "Subject to such exceptions as the legislature may make."

p "Any elector who shall receive any gift or reward for his vote, in meat, drink, money, or otherwise, shall forfeit his right to elect at that time, and suffer such other penalty as the law shall direct."

q "Petit larceny"

r "No person who is under conviction of treason, felony or bribery in an election, shall be permitted to vote while such disability continues." (Const. of W. Va., Art. IV., Sec. 1.) This phrase, "while such disability continues," has not received judicial interpretation in West Virginia, but is construed by election officers to mean during imprisonment.

s "These crimes are treason, felony, and the 'crimen falsi,' - which term includes crimes which involve a charge of such falsehood as may injuriously affect the public administration of justice by the introduction therein of falsehood and fraud, such as forgery, perjury, subornation of perjury, or conspiracy to procure the absence of a witness."

t And persons "who may be under interdiction."

itself; and that woman needs a vote to adequately protect and advance her interests. Its opponents reply, that the suffrage is not a natural right, that in all ages and countries it has been conditioned by qualifications of expediency; that representation of tax-paying women practically exists; that the interests of the family and of the state will be best preserved by continuing the division of labor which hitherto has exempted women not only from military service, but from the performance of political duties; that the interests of women are not so distinct from those of men as to make their representation as a class either necessary or expedient; and that their interests can be adequately protected without their having a vote. The agitation has resulted in the limited and tentative enfranchisement of woman in certain states, and for certain purposes. In 1866 the American equal rights association presented the first petition ever laid before congress for woman suffrage. In 1868 the New England woman suffrage association was formed, and the first systematic effort begun for memorializing legislatures and congress, obtaining hearings before these bodies, holding conventions, publishing and distributing tracts and documents, and securing lecturers. The agitation had, by 1870, assumed such dimensions in Massachusetts, that the republican convention, held Oct. 5, 1870, admitted Lucy Stone and Mary A. Livermore as regularly accredited delegates. The Massachusetts republican state convention of 1871 indorsed woman suffrage, and the national republican conventions of 1872 and 1876 resolved that the subject "should be treated with respectful consideration." The legislature of the territory of Wyoming, by an act approved Dec. 10, 1869, granted the right of suffrage to women. The same right was extended to women in the territory of Washington in 1883, and has long been exercised by them in the territory of Utah. Woman suffrage limited to school elections has at various times been conferred as follows: Women may vote at school meetings in Kansas, Nebraska, New Hampshire, Vermont, Dakota and Wyoming; at school elections in Colorado and Minnesota; and for members of school committees in Massachusetts; at school meetings in Michigan and New York, if they are tax payers; in Washington territory, if they are liable to taxation. Widows and unmarried women in Idaho may vote as to special district taxes, if they hold taxable property. In Oregon, widows having children and taxable property may vote at school meetings. In Indiana, "Women, not married nor minors, who pay taxes and are listed as parents, guardians, or heads of families, may vote at school meetings." In Kentucky any white widow, having a child of school age, is a qualified school voter; if she has no child, but is a tax payer, she may vote on the question of taxes. — The first European legislature to give the right of suffrage to woman was the house of keys, in the Isle of Man, which passed an act, approved Jan. 5, 1881, to extend this privilege to women having certain property qualifications. The Brit-

ish parliament, by an act approved Aug. 2, 1869, granted the municipal franchise to women in England and Wales; by an act approved June 3, 1881, extended the municipal franchise in Scotland to unmarried woman, and women not living in families with their husbands; and by an act approved in 1870, extended the privilege of voting for school boards to rate payers, including women. Prior to the passage of these acts, women had, by the custom of London, and the custom of some other parts of England, certain rights of suffrage in municipal affairs. — A summary of the laws relating to suffrage, in the Dominion of Canada and in the principal countries of Europe, will be found in the books below, cited under the title "In foreign states." — See, on suffrage: Mill's *Representative Government*, chap. viii.; Lieber's *Civil Liberty and Self-Government*, chap. xvi. and app. i.; Woolsey's *Political Science*, vol. i., pp. 299-302, and vol. ii., pp. 111, 112; Sumner's *Theory and Practice of Elections*, in "Princeton Review," March and July, 1880. JAMES FAIRBANKS COLBY.

SUMNER, Charles, was born at Boston, Mass., Jan. 6, 1811, and died at Washington, D. C., March 11, 1874. He was graduated at Harvard in 1830, studied law with Story, whose decisions he afterward reported, was admitted to the bar in 1834, and was for the next three years a lecturer in the Harvard law school. In 1837-40 he was absent

in Europe, and on his return resumed practice. He had always been an anti-slavery whig, but in 1848 became a free soiler; and a coalition of democrats and free-soilers, in 1851, sent him to the United States senate, where he remained until his death. (See MASSACHUSETTS.) In the senate, Sumner, Seward, Hale and Chase were at first the anti-slavery leaders, and among them Sumner was as pre-eminent for polished oratory and radical independence of thought and speech as Seward was for keen appreciation of popular feeling, Hale for powers of sarcasm, or Chase for sound common sense. Southern leaders seem to have felt considerable contempt for the last three; but an active hatred was developed against Sumner, and resulted in a brutal assault upon him in May, 1856. (See Brooks, P. S.) In 1860 he resumed his seat in the senate; and in July, 1861, he became chairman of the committee on foreign relations. He was now one of the national leaders of the dominant republican party, and took an active part in anti-slavery legislation, in reconstruction, in the impeachment of president Johnson, and in the prosecution of the Alabama claims upon Great Britain. His assertion of the validity of indirect claims, made with his usual force of argument, made him for some time extremely unpopular in England. In December, 1870, he opposed and defeated president Grant's project for the annexation of San Domingo (see that title); and in 1871, through the influence of the administration, he was removed from the chairmanship of his committee, which was given to Simon Cameron, of Pennsylvania. The ostensible reason for this action, offered by the state department, was an alleged neglect of Sumner to take action on treaties intrusted to him; but this was entirely disproved. His real offense seems to have been his continuing purpose to maintain the cause of the negro race, with little deference to party considerations or to the dignity of party leaders. — From this time he was an outspoken antagonist of the administration, his finest speeches being made in February, 1872, on the government's sale of arms during the Franco-German war, and in May, 1872, on the president's abuse of the appointing power. In December, 1874, he introduced a resolution to remove from the army register and flags the names of battles with fellow-citizens. For this his state legislature censured him by resolution, but the resolution was rescinded before his death. (See also AMNESTY, CIVIL RIGHTS BILL.) — See Lester's *Life of Sumner*; Harsha's *Life of Sumner*; Pierce's *Memorial and Letters of Sumner*; and Sumner's *Orations and Speeches* (1850), *Speeches and Addresses* (1856), and complete *Works* (1875), the first four volumes including the years 1845-60, and the last eight the years 1860-68. The most celebrated of his anti-slavery speeches are, "The Crime against Kansas" (4:127), and "The Barbarism of Slavery" (5:1).

ALEXANDER JOHNSTON.

SUMPTUARY LAWS. (See LAWS, SUMPTUARY.)

SUPPLY. (See PARLIAMENTARY LAW.)

SUPREME COURT. (See JUDICIARY.)

SWEDEN. A kingdom situated in the north of Europe and in the east of the Scandinavian peninsula, about three-fifths of which it occupies. Its area is 444,814 square kilometres, of which more than 37,000 are covered by lakes. The area of Norway (see NORWAY) is not comprised in these figures. The country is mountainous, but its mountains, situated mostly in the north, do not reach the height of those in Norway; the highest mountain in Sweden, Sulitelma, is only 6,342 Swedish feet above the sea level. In Norway more than half the country is 2,000 feet high, while not more than one-twelfth part of Swedish soil reaches this elevation; nearly one-third, especially in the south, does not exceed 300 feet. — The population, which is of the Scandinavian race, except about 16,000 Finns, 6,000 Lapps and 1,100 Jews, was 4,204,177 in 1872; on Dec. 31, 1880, the population was 4,565,668. In 1867 the total population was 4,195,681; 3,673,828 inhabitants (87.51 per cent.) living in the country, and 521,853 (12.49 per cent.) in the city. — I. *Constitution.* Four fundamental laws account for the present political constitution of Sweden: the law concerning the form of government (*regerings-formen*) dated June 6, 1809; the law on representation (*riksdags-ordningen*), June 22, 1866; the order of succession (*successions-ordningen*), Sept. 26, 1810; and the law on the liberty of the press (*tryckfrihets-förordningen*), July 16, 1812. The union with Norway is regulated by the act of union (*riks-akten*), Aug. 6, 1815. — The government is a limited monarchy, hereditary in the agnatic line. The king governs alone, on condition of consulting on all affairs, before arriving at a decision, his responsible ministers, (*statsråd*, counselor of state) whom he chooses freely among Swedes by birth, members of the evangelical church, and whom he replaces whenever he sees fit; thus they are justly considered to have his confidence so long as they are retained in office. The council of ministers is composed of ten members, seven of whom are heads of departments (with the departments of justice and foreign affairs is connected the title of ministers of state; next in title come the ministers of war, of the navy, of the interior, of ecclesiastical affairs and of finance); three members of the council, without portfolios, have only a consultative vote. The king can not decide any affair on which the council must be heard, unless in presence of three ministers at least, besides the one who reports the affair or calls attention to the matter. The entire council must be present when important questions are discussed. A protocol or record of all the questions brought before the council is drawn up. The members present are obliged to express and give the reason for their opinions in the protocol; and they are responsible for their opinions. Should the decision of the king happen to be contrary to the fundamental law of the kingdom, the ministers are

obliged to protest. Should a minister not give a contrary opinion in the protocol, he becomes responsible for the decision taken. On the other hand, no royal ordinance is binding unless countersigned by the minister whom it concerns. The minister who refuses to countersign, by this fact alone, lays down his portfolio, retaining his salary. He can not resume office until after the chambers have examined and approved his conduct. The ministers are responsible for their advice or their silence; in no case can they make a decision; this always belongs to the king. — The Swedish constitution does not, as we see, admit of a government by ministers in the modern sense. The royal authority is exercised, in foreign affairs, by his supreme direction of chief questions of diplomacy, and by his right of concluding treaties or alliances, and of declaring war or peace. The king can conclude treaties or alliances after having heard the advice, on the subject, of the minister of state and of foreign affairs, and of another member of the council summoned for this purpose. For war or peace he must assemble the whole council, explain the reasons and circumstances, and ask the opinions of all the ministers, which they give, each one separately, and which is embodied in the protocol, on their responsibility. The king alone can make a decision; but no tax can be laid or loan made without the consent of the diet. There is, it is true, a sum set aside for the requirements of war; but the king can dispose of it only after a special meeting of the diet. Besides, the army and navy of Norway can not be employed in aggressive warfare except with consent of the storting. The king governs in the interior by officials who derive all their authority from him, but whose salaries depend upon the diet. He has legislative power; the general rule is, that the king and the diet together enact the laws, observing certain forms in enacting them. The king has judicial power. From time immemorial he has been the judge of all; but his right of judging is transferred to his supreme tribunal. The king has the right of pardon, but only after having heard his tribunal does he decide the case in a council of ministers. He can not dispense any one from the law, unless in cases fixed by the law itself. If the king leaves the kingdom to go to a war, or if he visits provinces distant from the centre, or visits Norway, he must appoint three of his ministers, presided over by a prince of the royal house or by another minister, to transact the business with which he intrusts them. Under such circumstances, the king reserves to himself certain affairs, and therefore takes one or more of his ministers with him. But if he travels outside the kingdom, he can not exercise his authority while abroad. In such case, and also in that of sickness, power is intrusted to the prince nearest the throne, if he has reached the legal age, or if there is no such person, to a government *ad interim*, composed of the ten ministers of Sweden and the ten ministers of Norway. If this state of affairs does not cease within a year, the diet is summoned, and takes such measures as

it finds necessary. — The representation of the nation, since the law of June 22, 1866, rests not as formerly on the division of the nation into four orders, but on election only. Two chambers, having equal authority, compose the diet. The members of the first chamber are elected for nine years by the *landstingen* (species of provincial assemblies) and by the *stadsfullmäktige* (municipal councilors) of cities which do not sit in the *landeting*. A member is elected by 30,000 inhabitants. Candidates are eligible, without reference to place of domicile, who have completed their thirty-fifth year, and who own or have owned for at least three years before the election, immovable property, estimated for taxation at 80,000 rixdalers, or such as have, during the same length of time, paid taxes on at least 4,000 rixdalers of an annual income, either from their capital or their labor. If, after the election, a member of the diet finds his fortune insufficient to render him eligible, he is obliged to resign. Members of the first chamber receive no salary. Members of the second chamber are elected for three years, a member for each jurisdiction (*domsaga*) of the country, if the population does not exceed 40,000 (if it does, it is divided into two districts); one member for every 10,000 inhabitants in the cities, those having less than 10,000 being grouped into electoral districts of at least 6,000 inhabitants, and at most 12,000. In cities populous enough to send one or more members to the diet, the election is direct; in the others and in the country, it is of two degrees, unless the electors themselves decide by a vote to make the election direct. No man is a voter for and eligible to the second chamber except in the commune where he is domiciled; whoever possesses, in his own right or in *usufruct*, immovable property in the country or the city, assessed for taxation purposes at 1,000 rixdalers at least, is eligible, or who rents for life, or for five years at least, an agricultural holding valued for taxation purposes at 6,000 rixdalers at least, or who pays taxes on a yearly income of at least 800 rixdalers. To be eligible to the second chamber a candidate must have completed his twenty-fifth year, and have possessed for at least one year the right of election in the commune or in one of the communes in which he is a candidate. The members of the second chamber receive a salary of 12,000 rixdalers per year. If a member resigns after having served some time, his successor is elected only to fill the unexpired part of the term; so that every three years there are general elections for the second chamber. — The ordinary session of the diet begins each year on Jan. 15, and can not be dissolved, without its consent, before the expiration of four months. The king, however, may exercise his right of calling new elections to one of the two chambers, or to both simultaneously. The king may call and adjourn an extra session of the diet at his pleasure; such a diet can examine only the questions which it was summoned to consider. The presidents of both chambers are appointed by the king. No deliberation is had,

and no resolution taken in presence of the king. The ministers may be members of the diet; those who are not members have the right of being present in both chambers and taking part in deliberations, but without a vote. The initiative in the diet belongs in part to the king, who makes propositions to the two chambers, and in part to the deputies, whose motions must be made within ten days after the opening of the diet, unless as to questions concerning constitutional changes, or those caused by facts which have arisen during the session. — Business is prepared by committees, who give their views to the chambers. There are five permanent committees, which are formed at the opening of each ordinary diet: 1, the committee on the constitution—for all questions of change in the constitution—this committee examines the reports of the council of ministers, and gives its opinions on them; 2, the committee on finance (*stats-utskott*), which examines the public revenues and expenditures; 3, the committee on taxation, which proposes new taxes, and calculates the income therefrom; 4, the bank committee (*bank-utskott*), which inspects the royal bank and directs its administration; 5, the committee on legislation (*lag-utskott*), which gives its opinion on everything relating to civil, criminal and ecclesiastical law. Special committees, for the discussion of questions connected with the permanent committees, may also be formed, if the diet thinks necessary. Finally, if a question arises outside the jurisdiction of the permanent committees, a special committee (*tillfällig-utskott*) is appointed. The permanent and special committees are appointed half by one and half by the other chamber. Special mention must be made of the so-called secret committee (*hemliga-utskott*), which is appointed by the two chambers at the request of the king, for the purpose of giving its advice to the king himself on such questions as it shall please him to propose. — If the two chambers agree in a decision, it becomes the decision of the diet. If they are opposed in opinion, it is for the competent committee to endeavor to bring them to an agreement; should it not succeed, the question is adjourned till another session. If, however, this question concerns the taxes, public expenditure, or the bank, the two chambers vote separately, and the opinion which has the majority of votes, without regard to the chambers, becomes the decision of the diet. In case of necessity, the diet elects the king, the successor to the throne, or the regent. Together with the king, it frames the laws, votes the taxes, fixes the budget, and exercises control over the government and its officials, through the agency of its procurator general (*justitie-ombudsman*) elected each year by forty-eight electors chosen for this purpose, twenty-four by each chamber. It is the duty of this procurator general of the diet to see that the laws are faithfully executed by all functionaries; he has access to all tribunals, and central administrative bureaus; he may have all records or reports brought to him; he publishes each year a general statement, which is printed. —

It has been stated that the committee on the constitution is obliged to report on the action of the ministers; if it accuses any one of them of negligence or incapacity, it informs the king of its desire to see such minister removed; or if it discovers an illegal act or a violation of the constitution committed by a minister, it orders the procurator general of the diet to summon that minister before the court of the kingdom (*riksrätt*), a tribunal appointed in advance for cases of this kind. — The administration of financial affairs is controlled by the diet through deputy directors and deputy controllers appointed in the two chambers on the occasion of each diet. The diet, its committees and its members, are inviolable. No deputy can be brought to justice or deprived of his liberty for any of his acts, or for any of his words during the session, unless the chamber of which he is a member gives its consent by five-sixths of its votes. — Two special establishments are entirely under the management of the diet: the national bank (*riksbank*), and the office of the public debt (*riksgäldkontor*). The bank is managed by seven delegates of the diet, elected at each session. The office of the public debt is an institution altogether peculiar to Sweden. It dates, with its present organization, from 1789. Gustavus III. had allowed the public debt to increase; the diet, after it had regained something of the power which it wielded under the preceding reign, claimed this branch of the financial management. The duties of the office of the public debt since 1809 are, to see to the payment of the debt, with the taxes set aside for this purpose, to the expenditures and necessary loans made on the credit of the debt. Its revenues are: the contribution called *allmänna bevilning*, the stamps on newspapers and playing cards, a part of the profit of the bank, etc. It is needless to say that this financial administration of the diet greatly hampers that of the minister of finance, and that continual efforts are made to reconcile them. — Every three years the diet appoints six members, distinguished for their knowledge and enlightenment, to watch over the liberty of the press, together with the procurator general, their president. These delegates, of whom two besides the procurator general must be jurists, are elected by ballot by twenty-four electors chosen by each of the chambers from its own body, twelve from each. If an author or a publisher sends them a manuscript, asking whether the publication of this writing would cause any prosecution, the procurator general of the diet, and at least three delegates, of whom one is a jurist, must give their opinion in writing. If they declare that the work may be printed, the author and the printer are free from all responsibility; it falls on the delegates entirely. — Communal liberties, formerly very considerable in Sweden, have become weakened during recent centuries, especially outside the cities, to the advantage of centralization; but they have never become extinct. They are regulated at present by the royal ordinance of 1862, the chief provisions

of which are as follows: Parish affairs, in which every tax-paying Swedish subject (except those of the lowest grade) of good moral character has a voice, are of two kinds: those relating to the church and its property, schools, and the salaries of the clergy and schoolmaster, are managed by the church assembly (*kyrkostämman*), composed of all inhabitants having the right of suffrage and belonging to the Swedish church. The pastor is president. All other affairs are managed by the communal assembly (*kommunal-stämman*), which chooses its own president, or by municipal delegates. Both councils can levy taxes for objects which concern them. The church assembly has two delegates, the council of the church and the council of the school (*kyrkoråd skolråd*), elected for four years. The communal assembly appoints a communal jury (*kommunal-nämnd*) of from three to eleven members, which exercises executive power in its name, manages the communal property, the income and expenditures. The communal assembly may delegate its right to the *kommunalfullmäktige*, that is to say, to the members of the communal jury, and to a number three times as great of persons specially elected for four years, by the assembly alone, which can not, however, without consent of the king, convey property or issue loans redeemable in more than two years. Every city (*stad*) forms a commune of itself, its communal assembly takes the name of communal house (*allmän rådstuga*). In every city with more than 3,000 inhabitants the right of decision belongs to delegates of the city (*stadsfullmäktige*), who are elected by the assembly of the communal house for four years, to the number of from twenty to sixty, according to the population. The executive authority in each city, in the name of the commune and the state, is the magistrate (that is to say, a burgomaster, selected by the king from a list of three candidates chosen by the city, and councilors chosen by the city.) The communal property and finances are managed by a chamber of finance (*drätselkammare*) which appoints the delegates or the members of the city council. — The most remarkable of new communal institutions which revives under other forms an institution fallen into disuse for about two generations, is the *landsting*, a sort of general council. In the terms of the royal ordinance of March 21, 1862, every *län* is to have a *landsting* composed of twenty members at least, delegated by the cities (*städer*), by the *härad*s and the *tingslags* (places inferior to cities) comprised in the *län*. However, the cities having more than 25,000 inhabitants, Stockholm and Göteborg, are not included. The *landsting* examines and decides the communal affairs of the *län* relative to general administration, agriculture, ways of communication, public health, education, public order, etc. It meets in regular sessions every year, in the month of September, for eight days, excluding holidays; but it may hold extraordinary sessions of its own motion or by order of the king. The presidents are appointed by the king; its deliber-

ations are public; the initiative belongs both to the royal power and to every member of the *landsting*. The *landshöfving*, or prefect of the *län*, assists and takes part in the deliberations. The *landsting* has the authority to fix, according to a budget agreed upon, the taxes or necessary loans. But it must have the royal approval for expenditures involving taxation for more than five years, or loans payable at a time longer than five years, or for the alienation of the domains. — The relation established between the various communal authorities and the royal power is such that, though a certain number of their resolutions, to be valid, must obtain the consent of the king or of his representatives, a consent which may be refused, communal liberties at least can suffer no prejudice, it being impossible to make any provisions to their prejudice. The royal authority in case complaints are preferred to the king, may annul, administratively, communal decisions if they violate any private right. This new institution of the *landsting* has perhaps not been in operation long enough yet to be judged accurately. It is probable, however, that it affords an efficient intermediary between the central power and the local authorities. — II. *Finances*. Each diet frames the budget of receipts and expenditures for the following year. The expenditures are ordinary or extraordinary, a division which is not expressed in the law regulating the form of government, but which was established by the force of things, and has been practiced since 1841. The ordinary expenditures are included under nine principal heads: the civil list, the seven ministerial departments, the pensions, and the retired list. — The following is a comparison between the budgets of 1869 and 1841: Civil list, in 1841, 1,079,550 riksdalers riksmünt (royal mint), (6.7 per cent. of all the expenditure); in 1869, 1,417,000 r. (3.7 per cent.); increase since 1841, 31 per cent. Justice, 1,034,355 r. (6.4 per cent.); 2,354,100 r. (6 per cent.); 12.7 per cent. Foreign affairs, 338,475 r. (2.1 per cent.); 457,950 r. (1.1 per cent.), 32 per cent. War, 6,159,765 r. (38.2 per cent.); 9,528,000 r. (24.9 per cent.); 54 per cent. Navy, 1,997,145 r. (12.3 per cent.); 3,963,800 r. (10.3 per cent.); 98 per cent. Interior, 1,268,550 r. (7.8 per cent.); 9,086,500 r. (21 per cent.); 53.7 per cent. Finances, 2,071,155 r. (12.8 per cent.); 6,359,200 r. (16.6 per cent.); 20.7 per cent. Public worship, 1,483,320 r. (9.2 per cent.); 4,714,700 r. (12.3 per cent.); 20.7 per cent. Pensions and retired list, 682,005 r. (4.2 per cent.); 1,321,373 r. (3.4 per cent.); 93 per cent. To sum up: in 1841, 16,114,320 riksdalers riksmünt; in 1869, 38,202,629 r.; increase, 137 per cent. The riksdaler riksmünt is worth 1 franc 429 m., for there are 100 öre in the riksdaler, and a franc is worth 70 öre. (The riksdaler is valued at 1 fr. 41½.) The considerable increase of expenditures for justice is explained, not by the number of crimes and misdemeanors, but by the erection of prisons of a new system. It will be remarked also that one of the principal items of increase was for public instruction. The increase of expenditures touch-

ing finances and the postal service is explained by the increase of commercial activity, which also naturally figures among the sources of income. The diet of 1856 marked one of the stages of this transformation by increasing the salaries of officials; the budget of ordinary expenditures was increased that year from 19,315,380 to 25,508,500 riksdalers riksmünt, that is to say, 32 per cent. — Extraordinary expenditures are voted for one year, and must be paid partly by the office of the state, and partly by the office of the public debt (*riksguldskontor*). In 1869 the first had to pay 5,496,371 riksdalers riksmünt for the artillery service and the railroads; the second, 1,187,999 r. for roads, canals, etc. All the expenditures for 1869 amounted, therefore, to 45,086,999 r. Two special credits in view of unforeseen expenditures should also be mentioned: the first of which can only be employed in case of war, the second may be used for other pressing needs. The public revenues, for the greater part, are paid to the office of the state. There is the ordinary income, which combines several varieties of ancient land tax, estimated, in 1869, at 4,693,800 r.; crown tithes, that is to say, that part of the tithes which, at the time of the reformation, was reserved to the crown, and which now amounts to 1,684,200 r.; the poll tax, a personal tax which has become insignificant, 600,000 r.; and the farming of royal domains, 410,000 r. Many of the ordinary taxes have been abolished in recent years, but the produce of those which remain (most of them are paid in kind) are increased by a more exact estimate of prices. The ordinary revenues increased notably in 1869, since that was the first year in which they included the product of the railroad traffic, 6,400,000 r., so that the sum total of receipts was 15,260,720 r. — Extraordinary resources consist in taxes voted by the diet each year: 1, the customs, which produced, in 1861, 14,857,508 r., and in 1871, 19,116,601 r. 2, the tax on the manufacture of spirits; in 1861, 8,002,669 r., and in 1871, 11,719,493 r.; this tax has become important only since the diet of 1854 provided that this manufacture should pay 50 öre on a measure called *kanna*, and the diet of 1857 raised this figure to 60 öre. 3, the postal service, the produce of which (serving simply to maintain and extend it) was, in 1861, 1,675,446 r.; in 1871, 2,271,306 r. 4, stamps; in 1861, 1,551,408 r.; and in 1870, 1,347,215 r. The whole amount of extraordinary receipts was, in 1841, 7,006,500 r.; in 1869, 26,350,000 r.; in 1872, about 49,400,000 r., including the communal tax (*allmänna-bevilling*); in 1871, 2,887,400 r. was paid to the office of the public debt. This office has to meet the public debt with this and its other resources, under the direction, control and administration of the diet. The budget of 1874 reached 60,000,000 riksdalers of ordinary and extraordinary expenditures. — Till 1854 Sweden had only an insignificant debt; but in that year the diet decided that railroads should be built by the state, and the necessary capital be obtained by loans. The years immediately

following gave receipts sufficiently good to redeem a number of these loans; but at the end of 1867 there were 91,148,235 r. of Swedish bonds; to which, in 1868, a foreign loan of 18,000,000 riksdalers was added. [The national income at present (1883) is derived, to the extent of one-third, from direct taxes and national property, including railways; and the rest, mainly from indirect taxation, customs and excise duties, and an impost on spirits. The sources of revenue and branches of expenditure of the kingdom for the year 1882-3 were established as follows, in the budget estimates passed in the session of 1882 by the diet:

Sources of Revenue for 1882-3.

	Kroner.
Domains, railway, land taxes, etc.....	20,590,000
Customs.....	27,500,000
Post.....	5,100,000
Stamps.....	3,000,000
Impost on spirits, etc.....	17,070,000
Impost on income.....	4,100,000
Net profit of the state bank.....	1,600,000
Surplus from previous years.....	2,789,137
Total revenue.....	78,749,137

Branches of Expenditure for 1882-3.

Ordinary:	
Royal household.....	1,338,000
Justice.....	3,753,000
Foreign affairs.....	613,800
Army.....	17,205,000
Navy.....	5,375,000
Interior.....	4,896,800
Education and ecclesiastical affairs.....	10,192,551
Finance.....	13,293,000
Pensions.....	2,480,000
	58,596,711
Extraordinary.....	7,827,589
Expenditure through the riksgäldskontor:	
Paying of loans.....	9,522,132
Miscellaneous.....	665,800
	10,187,932
Carried to floating capital.....	2,196,005
Total expenditure.....	78,749,137

—The expenditure for the army, church, and for certain civil offices, is in part defrayed out of the revenue of landed estates belonging to the crown, and the amounts do not appear in the budget estimates. To the expenditure for foreign affairs Norway contributes annually 304,700 kroner, a sum not entered in the estimates. The expenses for public instruction are in great part defrayed by the parishes and the provincial assemblies (*landsting*).—To the *riksgäldskontor*, the supervision of which is exclusively exercised by the diet, belongs the administration of the public debt—exclusively incurred for the construction of railways—and the right to contract any loans which the diet may vote.—On Jan. 1, 1881, the public liabilities of the kingdom were as follows, according to reports laid before the diet:

	Kroner.
Railway loan of 1858, at 4½ per cent.....	13,942,400
“ “ 1860, at 4½ “.....	14,270,133
“ “ 1861, at 4½ “.....	1,802,800
“ “ 1864, at 4½ “.....	8,853,000
“ “ 1866, at 5 “.....	25,263,467
“ “ 1868, at 5 “.....	20,052,272
“ “ 1870, at 5 “.....	14,150,700
“ “ 1872, at 4 “.....	18,356,700
“ “ 1875, at 4½ “.....	36,309,333
“ “ 1876, at 4½ “.....	35,539,130
“ “ 1878, at 4 “.....	26,232,000
Unfunded obligations repayable by Nov. 1, 1886..	9,000,000
Total.....	226,399,102

In 1880-81 a further loan of \$22,000,000 was issued at 4 per cent., mainly to redeem previous issues bearing higher rates of interest. All the loans are paid off gradually by means of sinking funds.—F. M.] A. GEOFFROY.

—III. *Religion.* Religious liberty has been, till within recent years, entirely unknown in Sweden. Two laws of 1860 gave, in this regard, very incomplete satisfaction to public sentiment. The following is, according to the terms of this new legislation, the actual condition of dissenting Christians living in Sweden. Dissenters, who wish to meet and form a religious association in a given place, must present a request to the king, in order to obtain the necessary permission for the exercise of their religion. Every authorized association must choose a head, and have its choice approved by the civil authority of the place. The elected head must furnish all information demanded of him by the government relative to his coreligionists. No religious order is permitted. Associations or religious communities can not, unless by special authorization of the king, own real estate, except for churches and cemeteries. Celebration of mixed marriages belongs to the clergy of the Swedish church. Legitimate children born of dissenting parents may be freely educated in the doctrines professed by their parents. In case of a mixed marriage, if the father belongs to the national church, the children must be educated in the Evangelical doctrine. If the father is a dissident, the agreement written at the time of marriage must be followed, or, in default of agreement, the father is at complete liberty to educate his children in the dissenting community. But he must inform the pastor of the parish of his determination, and undergo the remonstrances of this pastor, together with those of the chapter. Sweden has an archbishop, at Upsala, and eleven bishops, who are appointed by the king from a list of candidates drawn up by the clergy. The pastors of cities are also appointed by the king. The ministers of rural parishes are elected by the people. The mass of the population adhere to the Lutheran-Protestant church, recognized as the state religion. At the census of 1870 the number of “Evangelical Lutherans” was returned at 4,162,087, the Protestant dissenters, Baptists, Methodists, and others, numbering 3,999. Of other creeds, there were 573 Roman Catholics, 30 Greek Catholics, and 1,836 Jews.—IV. *Public Instruction.* Sweden has long been one of the countries of Europe in which primary instruction is most disseminated. Education is not free except for the poor, but it is obligatory, in this sense, that children can not be admitted to their first communion until they are able to read and write. In each parish there is a school directed by a teacher and supervised by the pastor. The teacher is generally appointed by the bishop of the diocese. The programme of primary instruction includes reading, writing, Swedish grammar, the catechism, sacred history,

sacred music, swimming, gymnastics, an abridgement of national history, and a brief study of the physical and political constitution of the two united kingdoms. In certain districts there are traveling teachers, who go from farm to farm and place themselves for a certain time at the disposal of parents who are unable to send their children to the parish school. Establishments for intermediate instruction, called Latin schools, or learned schools, are under the almost exclusive control of the bishops. The study of the German, English and French languages is the object of particular care. Several large cities contain also gymnasia, or day colleges, and free institutions founded and managed by private persons. Higher instruction is given in the two universities of Upsala and Lund. The university of Upsala is one of the oldest and richest in Europe. Its foundation goes back to the year 1476. It is placed under the direction of a chancellor (who is generally one of the great personages of the state, sometimes even a prince of the blood), and is managed in fact by a rector aided by a consistory. The ordinary fellows, or *tutors*, are not clothed with any official title, but they are authorized to teach freely in the halls of the university. The university is divided into four faculties: theology, law, medicine, and philosophy. The university of Lund is organized on the same plan. Both universities are under the same chancellor. In the year 1878 nearly 98 per cent. of all the children between eight and fifteen years visited the public schools. There were 5,031 male and 5,183 female teachers in the primary schools in 1878. The university at Upsala is frequented by 1,500, and that at Lund by 650, students per annum.

—V. *Army and Navy.* The Swedish army is composed of four distinct classes of troops. 1. The *varfrade*, or enlisted troops, to which belong the royal life-guards, one regiment of hussars, the artillery, and the engineers. 2. The *indelta*, or national militia, the privates of which are paid and kept by the land owners. Every soldier of the *indelta* has, besides a small annual pay, his *torp*, or cottage, with a piece of ground attached, which remains his own during the whole period of service, often extending over thirty years, or even longer. In time of peace the infantry of the *indelta* are called up for a month's annual practice, and the cavalry for thirty-six days. In time of war, an extraordinary *indelta* has to be raised, partly by land owners, who, on this account, enjoy certain privileges, including non-contribution to the cost of the peace establishment. 3. The militia of Gothland, consisting of thirty companies of infantry, and three batteries of artillery. They are not compelled by law to serve beyond the confines of the isle of Gothland, and have a separate command. 4. The *betäring*, or conscription troops, drawn by annual levy, from the male population, between the ages of twenty and twenty-five years. The law of conscription was introduced into Sweden in 1812, but the right of purchasing substitutes, which formerly existed,

was abolished by the diet in 1872. — The total strength of the armed forces of Sweden in 1882 was as follows:

	Line.	Bevaring.	Militia.	Total.
Officers and staff.....	1,905	337	127	2,369
Infantry.....	28,692	126,000	8,038	162,730
Cavalry.....	5,076	4,000	—	9,076
Artillery (258 guns).....	4,248	5,000	228	9,476
Engineers.....	915	—	—	915
Total.....	40,836	135,337	8,293	184,566

There are also volunteers, first organized in the year 1861, by the spontaneous desire of the population of the kingdom. In time of peace the volunteers are individually free, and bound by no other rules and regulations than their own, but in time of war they may be compelled to place themselves under the command of the military authorities. However, they can be required only to serve within the limits of their own districts. At the end of 1882 the volunteers numbered 11,065 men. In 1882 the total army of Sweden, officers and men, numbered 195,901, with 258 guns and 6,646 horses. — In the parliamentary session of 1862, and again in the sessions of 1865, 1869, 1871 and 1875, the government brought bills before the diet for a reorganization of the whole of the army, but none of them were adopted by the representatives of the people. — The navy of the kingdom is divided into three classes, namely, first, the royal navy; secondly, the royal naval reserve; and thirdly, the naval *bevaring*. The fleet in 1882 consisted of 15 ironclads, 29 unarmed steamers, 10 sailing vessels, and 105 galleys; with a total: horse power, 20,060; guns, 373; crew, 5,204. — VI. *Resources.* Agriculture, long developed in Sweden, has attained proportions truly remarkable. The southern provinces, whose soil is very fertile by nature, have at present the smiling and fruitful aspect of the richest plains of central Europe. In 1825 the production of cereals did not suffice for the consumption of the inhabitants, and the annual importation varied from 200,000 to 300,000 tons. Toward 1834 Sweden commenced to export wheat and flour. From 1840 to 1845 exportation rose to an average of 116,000 tons; in 1849 it rose to 377,000 tons (165 litres), and in 1855 it reached 1,739,000 tons. In 1869 the harvest consisted of 582,019 tons of wheat, 3,738,917 of rye, 2,798,634 of barley; 7,322,652 of oats, and 7,671,492 of potatoes. In the same year the live stock of Sweden numbered 420,859 horses, 1,874,360 head of horned cattle, 1,539,079 sheep, 121,911 goats, 339,248 hogs, and 140,000 domesticated reindeer. The exportation of timber has increased at a still greater rate, if possible. — The mineral wealth of Sweden is recognized, and it is universally known how much the iron of Dalecarlia is sought for in the different markets of Europe. Since 1830 the iron industry has acquired new vigor. In 1833 the manufacture of bar iron was 452,000 *skeppunda*

(the skeppund is 135 kilogrammes), in 1856 it rose to 840,000 skeppunds, in 1860 to 3,219,660 quintals, and in 1870 to 4,559,331. The production of copper is as follows: in 1833, 5,519 skeppunds; in 1856, 13,402 skeppunds; in 1860, 37,251 quintals; in 1870, 43,853 quintals. There is but little coal in Sweden, for only 1,754,083 cubic feet were taken out in 1870. — Swedish manufactures extend to almost every branch of industry: woolen cloth, silk, cotton, cotton woven and spun, refined sugar, tobacco, paper, leather and oil. The value of all the products of industry in the country, which in 1830 was a little more than 13,000,000 riksdalers, rose in 1850 to about 37,000,000, in 1870 to 92,281,084, and in 1871 to 105,000,000 of riksdalers (of 1 fr. 41½c.), or more than 148,000,000 francs. — The increase of commerce in Sweden was the natural consequence of the growth of population and the progress of industry. Importation has, since 1852, progressed at the following rate: In 1852, 43,573,000 riksdalers riksmünt; in 1861, 106,570,000; in 1871, 169,179,000. Exports have increased in the following proportion: in 1852, 41,487,000 riksdalers rm.; in 1861, 81,084,000; in 1871, 161,023,000 rd. In 1836 the merchant marine numbered 1,809 vessels, carrying 63,874 lasts. (The last is equal to two English tons.) In 1856 it rose to 3,020 vessels, carrying 138,793 lasts; in 1861 to 3,313 vessels carrying 153,426 lasts; in 1871, to 3,495 vessels, carrying 113,112 nylasts (of about 3½ tons). In 1861 Sweden possessed, besides, 219 merchant steamers, having 8,970 horse power; and in 1871, 406 steamers, of 12,450 horse power. — Notwithstanding the decrease in duties the product of the customs increased five-fold in twenty-five years. It reached 16,500,000 riksdalers in 1874. — The railway system of the state covers more than 1,250 kilometres, and that of private companies, 660 kilometres. The number of travelers was 1,593,141 in 1870; merchandise transported amounted to 16,764,820 quintals (10,829,419 in 1867); the gross receipts were 6,791,193 riksdalers, and the expenditures absorbed 53 per cent. of the receipts. The traveler now reaches Stockholm from Malmö in twenty hours, Göteborg from Stockholm in twelve hours, and Christiania from Stockholm in fifteen hours (since June 16, 1872). — The telegraphic lines were (1874) 7,057 kilometres long; there were 306 offices, which dispatched, in 1871, 418,161 telegrams in the interior, and which received from abroad or sent abroad 190,853 telegrams. — The circulation of letters for the same year was nearly twelve and a half millions.*

B. AND T.

* The commercial intercourse of Sweden is chiefly with Great Britain, as regards exports, and, next to it, with France and Denmark. As regards imports, the commercial intercourse is largest with Great Britain, Germany, Denmark, Russia, Norway and the United States, in the order here indicated. The imports consist mainly of textile manufactures, coal, and colonial merchandise, the last largely on the increase, while the staple exports are timber, bar iron and corn. Both the imports and exports more than doubled in the ten years from 1870 to 1880, the total imports rising from £7,500,000 to over £16,000,000, and the total exports from £5,000,000 to £12,500,000. — The commercial navy of Sweden,

SWITZERLAND. A federative republic, situated in the centre of Germany. — *I. Territory*

at the end of 1880, numbered 4,385 vessels, of a burden of 560,893 tons, of which total 3,613 vessels, of 474,095 tons burden, were sailing vessels, and 772 vessels, of 86,598 tons burden, were steamers. The port of Göteborg had the largest shipping in 1879, namely, 277 vessels, of 87,674 tons, and next to it came Stockholm, possessing 253 vessels, of a total burden of 31,668 tons. In 1864 Stockholm had 110 vessels, of 28,216 tons, registered for foreign trade, and Göteborg 124, of 35,626 tons: so that the shipping of the latter port showed the largest increase in the course of the fourteen years. — Mining is one of the most important departments of Swedish industry, and the working of the iron mines in particular is making constant progress by the introduction of new machinery. There were raised in the year 1878, throughout the kingdom, 15,821,520 cwt. of iron ore from mines, besides 115,585 cwt. from lake and bog. The pig iron produced amounted to 7,845,578 cwt., the cast goods to 489,454 cwt., the bar iron to 4,657,000 cwt., and the steel to 1,476,061 cwt. There were also raised in the same year, 2,983 lbs. of silver, 25,565 cwt. of copper, and 947,635 cwt. of zinc ore. There are not inconsiderable veins of coal in the southern parts of Sweden, giving 4,429,889 Swedish cubic feet of coal in 1878. — Within recent years a network of railways, very important for the trade and industry of Sweden, has been constructed in the country, partly at the cost of the state. The state railways include all the main or trunk lines, the chief of which are the North Western, connecting the capitals of Sweden and of Norway; the Western, between Stockholm and Göteborg; the Southern, terminating at Malmö, opposite Copenhagen; the Eastern, from Stockholm to Malmö; and the Northern, passing from Stockholm, and connecting the capital with the north of the kingdom. The following table gives particulars concerning the length and cost of construction of all the Swedish railways open for traffic on Jan. 1, 1880, distinguishing the railways belonging to the state, and the private railways:

RAILWAYS	Length in Eng. Miles.	Cost per Eng. Mile
State railways	1,203	£ 8 446
Private railways:		
Gefle-Dalu	57	9,023
Upsala-Gefle	81	5,190
Frövi-Ludvika	61	10,249
East Vermeland	42	5,371
Kaping-Hult	44	6,368
Stockholm-Vesterås-Bergslagen	151	4,787
Nora-Karlskoga and Nora-Ervala	81	5,697
Vestervik-Atvidoberg-Berabo	57
Uddevalla-Venersborg-Herrljunga	58	4,615
Näsje-Oskarshamn	92	6,531
Vexjö-Karlskrona	70	4,084
Oxelösund-Flen-Vestmanland	97	6,816
Karlskrona-Vialanda	48	2,670
Hessleholm-Helsingborg	49	4,630
Bergslagenas	302	7,400
Ystad-Ærlöv	47	4,535
Forty-seven other private lines	988
Total	3,528

In the end of 1881 the total length of the railways of Sweden opened for traffic had increased to 3,830 English miles, of which 1,365 miles belonged to the state. — All the telegraphs in Sweden, with the exception of those of private railway companies, belong to the state. The total length of all the telegraph lines at the end of 1881 was 11,596 kilometres, or 7,210 English miles, and the total length of telegraph wires 29,575 kilometres, or 18,380 English miles. The number of telegraphic dispatches sent in the year 1881 was 1,118,081, of which number 591,576 were from and for Sweden, 398,531 from and for other countries, and 128,271 in transit. — The Swedish postoffice carried 63,731,121 letters, post cards, journals, etc., in the year 1881. The number of postoffices at the end of the year was 1,835. The total receipts of the postoffice in 1880 amounted to 5,132,211 kroner, or £285,122, and the total expenditure to 4,463,283 kroner, or £247,960, leaving a surplus of 668,928 kroner, or £37,162.

and Population. The territorial extent of Switzerland, according to the figures of the federal topographical bureau, is 41,148 square kilometres. According to the census of Dec. 11, 1870, the pop-

ulation was 2,669,147. The following table shows, by cantons, the territorial extent, the number of the population, and the religion of the inhabitants, at that date :

CANTONS.	Square Kilometres.	Total Population.	Catholics.	Protestants.

By adding to the Catholics and Protestants 11,435 adherents of different Christian sects and 6,996 Israelites, we find the total population at the date above mentioned. In 1880 the population was 2,846,102, of whom 1,394,626 were males, and 1,451,476 females. The number of Protestants amounted to 1,667,109; of Roman Catholics, to 1,160,782; and of Jews, to 7,373. — As regards language, there are in Switzerland, out of a hundred households, sixty-nine in which German is spoken, twenty-four speaking French, five Italian and two Roman. In five cantons, Berne, Fribourg, Grisons, Tessin and Valais, several languages are spoken. In the cantons of Vaud, Neuchâtel and Geneva, only French is spoken; in the other fourteen, the German language is the only one used. — The first general census of the Swiss population dates only from 1836. It must be remarked, however, that previous censuses were taken in many cantons; there are some which go back to the sixteenth century. In 1836 the population was estimated at 2,190,258 souls; in 1850, at 2,390,116; in 1860, at 2,510,494; in 1870, at 2,669,147. The percentage of increase is: 1836-50, 9.12; 1850-60, 5.04; 1860-70, 6.46. — II. *Federal Constitution.* The present constitution of the confederation, adopted Sept. 18, 1848, has undergone a total revision. The revision received the sanction of the federal chambers, Jan. 31, 1874. The vote of the people took place April 19 following, and the vote of the chambers was fully confirmed. — The confederation has for its object to assure the independence of the country against foreigners, to maintain order and tranquillity at home, to protect the liberty and the rights of the citizens, and to increase their common welfare. All Swiss are equal before the law. There are in Switzerland

neither subjects nor privileges of any sort. The confederation guarantees to the cantons their territory, their sovereignty within the limits of the federal pact, the liberty and rights of the citizens, as well as the rights and the functions which the people have conferred on the authorities. The cantons are obliged to demand of the constitution the guarantee of their constitutions; this is granted to the constitutions which contain nothing contrary to the provisions of the federal public law, which assure the exercise of public rights according to republican forms that have been accepted by the people, with power of revision when the absolute majority of the citizens demand it. All special alliance and all treaties of a political nature between cantons are forbidden. On the other hand, the cantons have the right to conclude among themselves agreements concerning the objects of legislation, of administration and of justice; they must, however, bring them to the knowledge of the federal authority, which, if these agreements contain provisions contrary to the confederation or the rights of other cantons, may prevent their being carried into execution. The confederation alone has the right to declare war and to conclude peace or alliances and treaties with foreign countries. The cantons, however, preserve the right to conclude treaties with foreign states in regard to certain special objects. Military capitulations can not be concluded. The members of the federal authorities, the civil and military functionaries of the confederation, the representatives, or the federal commissioners, can not receive pensions or salaries, nor titles, presents or decorations, from a foreign government. The federal authority has not the right to maintain a standing army. No canton or demi-canton can have more than 900

men, without the permission of the federal power. When differences arise between cantons, the latter can not decide them themselves, but must submit to the decision taken conformably to the federal provisions. When there is danger from without, the government of the canton threatened must ask for the aid of the confederation, and immediately advise the central authority of it, all without prejudice to the action which it may take in case of urgency. The expense of federal intervention is supported by the confederation. In case of trouble at home, or when the danger comes from another canton, the government of the canton threatened must immediately advise the federal council, which takes the necessary measures within the limits of its authority, or convokes the federal assembly. When it is urgent, the government is authorized, immediately advising the federal council of it, to call for the aid of the other cantons; this aid can not be refused. When the government of the canton attacked is not in a state to ask assistance, the federal central authority intervenes by virtue of its office, especially when the troubles endanger Switzerland. — The confederation guarantees to the Swiss the right of settling freely throughout the whole extent of its territory. Every citizen of a canton is a Swiss citizen, and can, by virtue of that title, exercise political rights for federal affairs in whatever canton he is established. The canton in which a Swiss establishes his domicile can not exact from him a bail bond, nor impose upon him any particular charge by reason of establishment. In the same way the communes can not impose upon Swiss domiciled in their territory taxes other than those imposed upon citizens belonging to their own jurisdiction. As for the liberal professions, legislation provides what proofs of fitness shall be valid for all Switzerland. Foreigners can not be naturalized in a canton, unless they have ceased to belong to the state of which they are natives. Liberty of conscience and of belief is inviolable. No one can be forced to form part of a religious association, to submit to religious instruction; nor shall he incur penalties of any nature because of his religious opinions. Whoever exercises the authority of a parent or a guardian, has the right to dispose, conformably to the above principles, of the education of the children up to the age of fourteen. — The exercise of civil or political rights can not be restricted by prescriptions or conditions of an ecclesiastical or religious nature of any sort. No one can, because of his religious opinions, be freed from the performance of a civic duty. No one is bound to pay taxes, whose product is applied to the expenses of the worship of a creed or of a religious community to which he does not belong. The free exercise of worship is guaranteed within the limits compatible with public order and good morals. — The liberty of the press is guaranteed, with the reservation of the laws which must repress its abuse; these laws are subject to the approval of the federal council. The citizens have the right to form associations, whose purpose and the means

employed by them have nothing illicit, or dangerous to the state. The cantonal laws provide for the repression of abuses. The right of petition is guaranteed. The *abzugrecht* is abolished.* — The confederation has the right to banish from its territory foreigners who compromise its internal or external security. The order of the Jesuits and societies affiliated to it can not be received in any part of Switzerland. This interdiction may be extended by a federal decree to other religious orders, if they disturb the peace between the different creeds. — The right of marriage is placed under the protection of the confederation. No hindrance to marriage can be based upon religious motives, upon the poverty of either the man or the woman, upon their conduct, or upon any other police motive whatever. No charge for a marriage license, nor any similar tax, can be collected from either bride or groom. — The confederation has also, according to the new constitution, the right to establish uniform provisions in regard to the work of children in factories, and in regard to the hours of labor which shall be imposed upon adults in the factories, as well as, in general, in regard to the protection to be accorded to workmen against unhealthy and dangerous industries. — Legislation in regard to the construction and management of railroads comes within the sphere of the confederation. Formerly this matter belonged to the province of the cantons, which caused much confusion. — The confederation may order at its own expense, or encourage by subsidies, public works which interest Switzerland or a considerable part of the country. It has the right of surveillance of the police of dams and forests in the mountainous regions; it contributes to the correction in the courses of streams, to their damming up, as well as to the re-wooding of the regions where they have their source; it decrees measures necessary to assure the maintenance of these works and the preservation of the existing forests. It establishes legislative provisions to protect the birds useful to agriculture and sylviculture, and to regulate fishing and hunting. — The supreme authority of the confederation is exercised by the federal assembly, which is composed of two sections, or councils, namely, the national council and the state council. — The national council is composed of deputies of the Swiss people, elected one out of every 20,000 inhabitants of the total population. Fractions over and above 10,000 inhabitants are counted as if they were 20,000. Each canton, and, in the cantons divided into two states, each half canton, elects one deputy at least. The elections for the national council are direct. They take place in the federal electoral colleges, which can not, however, be formed of parts of different cantons. Every Swiss has the right to vote, who is twenty years of age, and from whom the legislation of the canton in which he lives has not taken away the right of an active citizen. (This

* The *abzugrecht* is the old right of the state to confiscate a certain part of the fortune of a citizen who proposes to leave the country.

right is taken away only from those who have been deprived of civic rights by virtue of the penal law and in consequence of a judicial sentence, sometimes also from insolvents and paupers.) Every Swiss citizen who is a layman having the right to vote, is eligible as a member of the national council. Swiss who have become citizens by naturalization, are not eligible until five years after they have become citizens. The national council is elected for three years, and is wholly renewed at the expiration of that term. The deputies to the state council, the members of the federal council, and the functionaries appointed by that council, can not be at the same time members of the national council. The latter chooses from its own body, for each ordinary or extraordinary session, a president and a vice-president, who can not be charged with this function during two consecutive ordinary sessions. In case of a tie, the president has the deciding vote. The members of the national council receive a compensation from the federal treasury of fourteen francs a day. — The state council is composed of forty-four deputies of the cantons. Each canton appoints two deputies; in the divided cantons, each half canton elects one. The members of the national council and those of the federal council can not be at the same time deputies to the state council. The state council chooses, from its own body, for each session, a president and a vice-president; neither can be elected from among the deputies of the canton which furnished the president or vice-president of the preceding ordinary session. The deputies of the state council receive a salary from their respective cantons. Every Swiss citizen having the right to vote is eligible to it, the same as to the national council. The members of the state council are appointed by various methods, which are as follows: The little cantons, in which the people assemble annually, in a general assembly (*landsgemeinde*, see below), have their deputies to the state council appointed by the assembly. The citizens vote by raising up the hand for such or such a candidate. In the cantons of Zurich, Thurgau, Basel-Country, etc., the whole canton forms but one district for the nomination of members of the state council. The votes are deposited in the ballot box of the commune. These votes are collected and counted by a cantonal board. Finally, in the cantons which have preserved the purely representative system, such as Geneva, Fribourg, Tessin, etc., the great council appoints the deputies to the state council. The simple majority of voters always decides the election. — *Federal Assembly.* The national council and the state council deliberate upon: 1, the laws relating to the organization and relation of the authorities of the confederation; 2, the laws and decrees upon all matters which, according to the federal constitution, come within the jurisdiction of the confederation; 3, the salaries and compensation of the members of the authorities of the confederation; 4, the election of the federal council, of the federal tribunal, of the chancellor

and of the commander-in-chief of the army; 5, the alliances and treaties with foreign states; 6, the measures for the external safety, as well as for the maintenance of the independence and of the neutrality,* of Switzerland, the declarations of war and the conclusion of peace; 7, the guarantee of the constitutions and of the territory of the cantons, intervention in consequence of this guarantee, the measures for the internal safety of Switzerland, for the maintenance of tranquillity and of order, and amnesty and the exercise of the right of pardon; 8, the measures necessary to make the federal constitution respected; 9, the legislative provisions touching the federal army; 10, the fixing of the annual budget of the confederation, the ratification of the accounts, and the provisions concerning loans; 11, the surveillance of the administration and of federal justice; 12, the exceptions taken to the decisions of the federal council made in matters of contentious administration; 13, the conflicts of jurisdiction between the authorities of the confederation; 14, the revision of the federal constitution. — The two councils assemble each year in ordinary session. They are convoked in extraordinary session by the federal council, or upon the demand of a fourth of the members of the national council, or upon that of five cantons. Federal laws, federal decrees or regulations can not be promulgated except with the consent of the two councils. Besides this, the federal laws which are not urgent must be submitted to the vote of the entire nation, if 30,000 active citizens or eight cantons demand it. The imperative mandate is not allowed. Each council deliberates separately. When there is a question, however, of the elections of the federal council, of the exercise of the right of pardon or of pronouncing upon a conflict of jurisdiction, the two councils unite to deliberate in common, under the direction of the president of the national council, and the majority of the voting members of the two councils decides. The initiative belongs to each council and to each of its members. The sessions of each of the councils are ordinarily public. — The directorial and executive authority of the confederation is exercised by a federal council, composed of seven members, appointed for three years, and chosen from among all the Swiss citizens eligible to the national council. However, not more than one member of the federal council can be chosen in the same canton. The federal council is re-elected after each renewal of the national council, but its members are re-eligible indefinitely. During their term of office the members of the federal council can not accept any other office, either in the service of the confederation or in a canton, nor follow any other career or practice a profession. The president of the confederation, who presides over the federal council, and the vice-president, are appointed for a year from among the members of the council;

* The act which establishes the neutrality of Switzerland is dated Nov. 20, 1815.

but neither can be re-elected the following year. The members of the federal council have a consulting voice in the two sections of the federal assembly, as well as the right to make propositions there in regard to the subject under deliberation. The principal functions of the federal council are the following: it directs federal affairs; watches over the observance of the constitution; presents bills; gives its advice upon propositions which are addressed to it by the councils or by the cantons, provides for the execution of laws, judgments and sentences; makes those appointments which it is not provided shall be made by the federal assembly or some other authority; examines the treaties of the cantons with one another or with foreign states; watches over the interests of the confederation abroad, etc. In case of urgency, the federal council is authorized to raise the necessary troops and to dispose of them; but it must immediately convoke the councils if the number of troops raised exceeds 20,000 men, or if they remain under arms for more than three weeks. It administers the finances of the confederation, proposes the budget, and renders the account of the receipts and expenditures; it watches over the management of all the functionaries of the federal administration, as well as the branches of the cantonal administration which the laws have placed under its control, such as the military, the customs, roads and bridges. The federal council must annually present to the federal assembly a report upon the situation of the confederation, both at home and abroad. — The three principal languages spoken in Switzerland, German, French and Italian, are national languages of the confederation. — All functionaries are responsible for their administration of affairs. — The federal constitution can be revised at any time. When a section of the federal assembly decrees the revision of the constitution, and the other section does not consent to it, or when 50,000 Swiss citizens having the right to vote demand the revision, the question is submitted to the vote of the Swiss people, and they vote *yes* or *no*. If the majority of Swiss citizens voting pronounce in the affirmative, the two councils are renewed to work at the revision. A new constitution, however, can not go into force except when it is sanctioned both by the majority of citizens taking part in the vote and by the majority of the cantons. In most of the cantons the affirmative or negative result of the vote of the citizens is considered as the voice of the canton. Some cantons have charged the great council to cast their vote for them. — III. *Cantonal Constitutions.* Revisions of the fundamental pact are made quite often in Switzerland; this is why most of the cantonal constitutions are of quite a recent date. Ordinarily these revisions are accompanied by a more or less profound agitation: but excess is very rare, because the people are accustomed to the use of liberty. From 1830 up to the end of June, 1873, there were in Switzerland, according to statistics prepared by Professor G. Vogt, eighty-three total or partial re-

visions of cantonal constitutions. If we subtract the partial revisions, numbering twenty-three, which are sometimes of little importance, we see that on an average a cantonal constitution only lasts about seventeen years, that is to say, half a generation. The oldest constitution now in force is that of Appenzell-Interior. — A distinction must be made between the cantons of the *purely democratic* system, in which all the citizens assemble personally in a general assembly called *landsgemeinde*, the cantons in which the *electors themselves vote or reject the proposed laws* elaborated by the great councils, and the cantons of the *representative* system. Of course, the first system is found only in the little cantons, namely: Uri, Unterwald (Higher and Lower), Glarus and Appenzell (Exterior and Interior). — Professor Cherbuliez, in his work, *La Démocratie en Suisse*, vol. ii., p. 122, has well described the institutions of pure democracy in Switzerland. We do not, however, accept all his conclusions. The salient traits which are common to the different constitutions of pure democracy, and which impress upon them a characteristic physiognomy, are three: the *landsgemeinde*, the *council*, and the *commission of state*; that is, 1, an assembly of the entire people; 2, a deliberative body, both legislative and administrative, composed of members elected by the local assemblies (of the communes or of the districts); and 3, executive functionaries appointed by the people. The *landsgemeinde* exercises two equally important functions. First, it elects the principal functionaries of the canton, especially the *landammann* and his substitute (*landesstatthalter*), the treasurer (*seckelmeister*), the chief of the cantonal militia (*landeshauptmann*), and some other functionaries, whose jurisdiction is cantonal. It also appoints the deputies for the Swiss national council and state council. Then, to it belongs the sanction of all cantonal laws and of all treaties which the state concludes with other cantons or with foreign states. The citizens vote by raising the hand. — It exercises, therefore, the legislative power in this sense, that it accepts or rejects, as a whole, the propositions which are made to it, without having the power to introduce changes in them. The state of Glarus, however, must be excepted from this rule. Article forty-four of the constitution says: "The *landsgemeinde* can adopt, *modify* or *reject* the propositions which are made to it, or refer them to the triple council finally, either to report on them, or to decide." Everywhere the propositions to be submitted to the *landsgemeinde* must be made public a certain time in advance. We shall also cite, concerning the *landsgemeinde*, an article of the constitution of the canton of Uri. After providing, "The people are responsible only to God and their consciences for the exercise of their sovereignty in the May assembly," it adds: "What must guide the May assembly is not, however, caprice, without limit and without condition; it is *justice and the good of the state*, which are alone compatible with it. The people are obliged to vote accord-

ing to these principles in taking annually the oath of the May assembly."—The administrative power (in part even the legislative power) is ordinarily confided to quite a numerous council, called *rath*, or *landrath*. The functions of this body are ordinarily the following: It watches over enforcement of the constitution, whether federal or cantonal; it regulates, in their general organization, public instruction, financial, military and sanitary administration, public works, charity, except the legal provisions regarding the province and obligations of inferior authorities; it receives the reports of the administration of all the functionaries of the canton; it deliberates upon the proposed laws to be presented to the *landsgemeinde*, through the intermediary of the triple council, of which we shall speak further on. Usually it watches over the execution of what the laws or decrees of the *landsgemeinde* prescribe to it. In the canton of Unterwald-Lower the council has, besides, judicial functions. In Glarus, Uri and Unterwald, there have been organized, side by side with the *landrath*, special authorities to which have been transferred all the judicial functions formerly granted to the *landrath*.—About the *landrath* are grouped in the pure democracies various bodies, evidently formed from it by addition or reduction. The *double* and the *triple*, or *great*, council are nothing but the council of the *landrath* itself, doubled or tripled by the addition of new members, whom the territorial divisions appoint in the same manner and in the same proportion as the first. In Glarus, for example, each local assembly (*tagwen*) adds two members to the one which it appoints, to form the simple council. Thus the triple council there is composed of 117 members, as follows: 1, of the nine members of the commission of state; 2, of thirty-five members appointed by the *tagwen* following fixed proportions; 3, of seventy members appointed by the same assemblies, following the same proportions; 4, finally, of three Catholic members appointed by the same council, and of which one forms a part. (This latter element was introduced by virtue of the principle of religious equality, in order to provide for the representation of the Catholic population in the communes in which they are in a minority.) The principal functions of the triple council are to watch over the council and the tribunals, to establish the project of the budget of receipts and expenditures, and to convoke the *landsgemeinde* in extraordinary assembly. The process of addition is applied in many ways in Appenzell-Interior; it is applied in particular to the little council, which is charged with the principal judicial functions. This body judges sometimes as a weekly council; it is then only a section of the little council; sometimes with a simple addition (*einfacher zuzug*); sometimes with a double addition (*doppelter zuzug*); sometimes with a re-enforced addition (*verstärkter zuzug*). Finally, with a last re-enforcement it forms what is called the council of blood (*blutrath*).—As there are councils formed by addition, so there are others

formed by reduction, as, for example, the weekly council of Unterwald-Lower. It is appointed by the great council (*landrath*) and chosen from its body. It is the executive, administrative and police authority, subordinated to the great council. It is composed of the landammann, as president, and of twelve members appointed for two years. It assembles in ordinary session on the Monday of each week, and in extraordinary session when convoked by the president, and as often as there is need.—We have still to speak of the third authority of pure democracy, the commission of state. It is appointed by the *landsgemeinde*, and replaces the council for affairs of lesser importance. In Glarus this commission is divided into two sections, to expedite business. The first is composed of all the members of the commission, and the second of three members, the president included, alternating among themselves after a manner of rotation established by the commission. The first section (or the commission *in pleno*) is charged with the correspondence with foreign states, the federal authorities and the confederated states, with giving preliminary advice upon questions referred to it, or even with deciding them by the council. The second section is charged with the ratification of deeds of sale and of wills, with decisions upon the prolongation of the terms for the liquidation of bankrupt estates, etc. The commission of state of Appenzell-Exterior has also the surveillance of the administration of the communes. The landammann presides over the *landsgemeinde*, the double or triple council, the council (*landrath*) and the commission of state. He receives all the dispatches addressed to the authorities presided over by him, and he is bound to make them known in the next session. He keeps the seal of state, signs and seals concordats and conventions, etc. He watches over the execution of the decrees of the *landsgemeinde*, the councils, and the commission of state, in so far as the execution is not intrusted to a special authority.—Let us pass on to the cantons in which there is no *landsgemeinde*. Here we must notice a very remarkable fact. Since 1803 the cantons of Zürich, Berne, Solothurn, Basel-Country, Aargau and Thurgau have replaced the representative system, which they followed up to that time, by the direct vote of the entire people, that is to say, of all the active citizens, upon the proposed laws (*referendum*). Only the cantons of Zug, Fribourg, Basel-City, Tessin and Geneva have resisted this political movement, tending to extend the exercise of the rights of the people. In the canton of Vaud they contented themselves with introducing into the constitution the right of initiative, and Valais and Neuchâtel recognize only a partial *referendum*. For a long time the great councils have been only deliberating authorities in the cantons of Schwyz and Grisons. Basel-Country first followed them in this respect. In the cantons of Lucerne, Schaffhausen and St. Gallen, the people do not positively sanction the laws, as in the cantons of the

referendum, but, during a certain time after the vote of the great council, they have the right to interpose a veto. — Representation in the great council is not always based upon the number of the population; sometimes it is determined by the number of active citizens; at other times, as in Lucerne, the number of the representatives is fixed by the constitution, without any regard to the number of the population. The members of the great council are not always salaried. Every active citizen is ordinarily eligible for the great council. Sometimes conditions of age are imposed, sometimes also a residence in the canton is required. The last vestiges of a property qualification have disappeared. In some cantons functionaries salaried by the state are excluded. The constitution of Neuchâtel provides that every member of the great council who, during his term of office, accepts public salaried functions, shall be considered as having resigned, but he is re-eligible. — The members of the great council are appointed for only one year in the canton of Grisons; for two in Zug and Geneva; for three in Basel-Country, St. Gallen, Zürich and Thurgau; for four in Berne, Aargau, Tessin, Vaud, Valais and Neuchâtel; and for five in Fribourg. — The great council, besides drafting the laws and decrees, and interpreting, suspending and repealing them, is ordinarily invested with the following functions: the organization of administrations, the surveillance of the execution of the laws, the right of pardon, the ratification of state agreements, naturalization, the establishment of imposts and taxes, the fixing the mode of their collection and employment, the ratification of the loans contracted by the state, the acquisition and alienation of property of the state, public buildings, the fixing of salaries and emoluments, the surveillance of the executive and judicial powers, the settlement of conflicts of jurisdiction between these powers, the fixing of the annual budget, the appointment of the deputies to the state council, and the appointment of the members of the executive power and of the supreme tribunal. In Geneva, Basel-Country, Thurgau, and Zürich, the members of the executive power are appointed directly by the people. — The committee to which the great council confides the executive and administrative power has different names, according to the different cantons. It is called sometimes council of state, sometimes executive council, and sometimes little council. This last name is old; it recalls the time before 1830, when this designation was found in almost all the cantons, and when the executive power was confided to a very numerous body. In recent times there has everywhere been a reduction in the number of the members of the executive council (ordinarily five to seven members, who distribute among themselves the different departments, interior, justice, instruction, etc.), and a higher salary has been granted to them, in order that the increase of work and responsibility imposed upon each of the members by the diminution of their number may

not turn away from these functions the most capable men. — The duties and powers of the council of state, or executive council, are almost the same as those of the commissions of state in the cantons of pure democracy. It proposes laws and decrees to the great council, and watches over the maintenance of public tranquillity and security, as well as over the execution of the laws, decrees and regulations of the great council; it administers the funds of the state, appoints those executive and administrative functionaries who are immediately subordinate to it, and watches over them; it has also the higher surveillance of the communal administrations, the poor, the schools and the churches. The members of the executive council are appointed for four years in most of the representative cantons; they are re-eligible; only the president or landammann (a title which is preserved in some cantons) can not ordinarily remain in office for more than one year. Some constitutions require that each district of the canton be represented by one member; others forbid the taking of two members from the same district. Cantonal elections take place for members of the great council, in the electoral circumscriptions prescribed by law; for the appointment of the members of the executive power, where it is not confided to the great councils, the whole canton forms only one electoral circumscription. Every elector receives a card of recognition, which he presents to the electoral board when placing his vote in the ballot box. For every commune of any extent there are several boards, in order to facilitate the business of counting the vote. — IV. *Administration*. All the cantons of a certain extent are divided into *districts*. Thus, Berne has thirty; Vaud, nineteen; St. Gallen, fifteen; Zürich and Aargau, eleven, etc. In these districts the government, that is to say, the administrative and executive authority, is represented by a prefect (*regierungsstatthalter*, or *statthalter*). Although agents of the executive council, they are not always appointed by it, but sometimes by the great council, often directly by the people. Besides the prefect, there is, above all in eastern Switzerland, the institution of district councils, which have sometimes quite extensive functions. If the government does not always appoint the district authorities, it has ordinarily still less influence over the communes. We say *ordinarily*, because there is a very remarkable difference in this respect between the cantons of Romanic Switzerland and of Germanic Switzerland. In the former, the communes are much less independent than in the latter. In the cantons of Appenzell and of Grisons they are, so to speak, sovereign; they may do whatever is not contrary to the federal and cantonal constitutions, to the laws and to the right of property of a third party; the state does not interfere. These communes administer their special interests in everything except in that with which the state has not expressly charged itself. These two cantons are evidently in some sort federations of

communes. — At the head of the commune is a *chief hauptmann* (Appenzell), *syndic* (Tessin and Vaud), *maire* (Geneva), *ammann* (Lucerne, Fribourg, Solothurn, St. Gallen, Aargau and Thurgau), or *president* (in all the other cantons). He is always appointed by the commune; and ordinarily supported by a communal or municipal council, of which he is the leading member. This council administers, within the limits fixed by law and under the control of the general assembly, all that enters into the province of the municipality, proposes the budget, collects the taxes and municipal revenues, controls guardians, and exercises the local police and other functions which the laws and ordinances place in the charge of the municipalities, and which have to do particularly with the public safety and health, with the fire police, with that of the taxes and of the fairs and markets. At the same time the municipal council is the agent of the government; its president represents in the municipality the prefect, whom he must second in the execution of the laws and ordinances. The state has often no particular receiver for its taxes, and the municipal receivers collect them for it. — V. *Justice*. For the administration of justice in federal matters, there is a special tribunal. There is besides a jury for criminal matters. The federal tribunal is composed of eleven members, with substitutes. The members of the federal tribunal and the substitutes are appointed for three years by the federal assembly. The federal tribunal is renewed after each renewal of the national council (but the members are re-eligible). Any Swiss eligible to the national council can be appointed to the federal tribunal; the members of the federal council, however, and the functionaries appointed by this authority can not at the same time form a part of the federal tribunal. The president and the vice-president are appointed each for a year, from among the members of the body. — As a court of civil justice, the federal tribunal takes cognizance: 1. In so far as they do not touch upon public law, of the differences between cantons, and between the confederation and the cantons; 2. Of differences between the confederation on the one side, and corporations or individuals on the other, when these corporations or these individuals are plaintiffs, and when it is a matter of important questions determined by the federal legislation; 3. Of differences concerning people without a country (*heimathlose*). The federal tribunal is obliged to assume jurisdiction in other cases, when the parties desire it, and when the object in litigation exceeds the value of 3,000 francs. According to the new constitution of the confederation, which went into force July 1, 1874, the federal tribunal takes cognizance also of: 1, differences in regard to their functions between the authorities of the confederation and the cantons; 2, differences touching public law between the cantons; and 3, cases concerning the violation of the constitutional rights of a citizen. This is a very notable extension of the province of the federal tribunal.

— As a court of criminal justice, the federal tribunal takes cognizance of the violation of the rights guaranteed by the constitution, when the complaints are referred to it by the federal assembly. The court of assizes, with the assistance of a jury which pronounces upon questions of fact, takes cognizance of criminal cases concerning functionaries, of cases brought by the federal authority which appointed them; of cases of high treason against the confederation; of revolt or of violence against the federal authorities; of crimes or misdemeanors against international law; finally, of political misdemeanors which are the cause of troubles by which an armed federal intervention has been occasioned. The federal assembly can always accord amnesty or grant pardon to the perpetrator of these crimes or misdemeanors. — Military justice is administered by a judicial staff, which has at its head an auditor in chief, having the rank of colonel. A military tribunal must be established in each brigade in active service. — The judicial organization differs materially in the different cantons. In some cantons of pure democracy, the legislative, executive and judicial powers are not yet thoroughly separated, as we have seen above (*Cantonal Constitutions*). The following is true of the great cantons. Civil questions are ordinarily first brought before the justice of the peace. If it is not possible to reconcile the parties, the questions are carried before a district court, and in the second resort before the cantonal court, the supreme court or court of appeal. Final judgments in civil cases given in a canton hold good throughout all Switzerland, according to article forty-nine of the federal constitution. A great number of cantons possess excellent civil codes. The tribunals of commerce are still rather few. In criminal matters the institution of the jury exists in most of the cantons. The members of the supreme court are appointed by the great council, which has also a surveillance over the court. All administrative functions are incompatible with the office of member of the supreme court. To be appointed it is not necessary to have regularly studied law, but of course, in point of fact, men who are not versed in the law are not chosen. The judges of the inferior tribunals are ordinarily appointed directly by the people, sometimes also by the great council. — The changes introduced by the new constitution had for effect to replace the twenty-five cantonal laws, often very dissimilar, by a federal law to be applied to the whole confederation, so that a uniform system is established upon the following points: legislation in regard to civil capacity, in regard to all matters of commercial law, in regard to literary and artistic property, in regard to suits for debt, and in regard to bankruptcy. The administration of justice, however, rests with the cantons, except as to what comes within the province of the federal tribunal. — VI. *Public Instruction*. The state of public instruction is one of the greatest glories of Switzerland. There is scarcely a country in which primary instruction is

more developed and more wide-spread than in the Helvetic republic. Some little cantons, which were backward in this respect, were forced to put themselves on a level with the rest. It is evident that where a people must govern themselves, they can not remain without instruction. However, a person is not obliged to send his children to a public school; he is perfectly free to have them instructed wherever he wishes, provided they receive an education at least as good as that which is given in the public schools. The new federal constitution, voted by the people April 19, 1874, contains the following provisions relative to primary instruction: The cantons shall provide for primary instruction, which must be sufficient, and placed exclusively under the direction of the civil authority. It is obligatory, and, in the public schools, gratuitous. The public schools may be attended by adherents of all creeds, without their having to suffer in any way in their liberty of conscience or of belief. The confederation shall take the necessary measures in regard to the cantons which do not fulfill these obligations. — Above the elementary primary schools, there are superior primary schools, called secondary. Then come the schools of commerce, the agricultural and industrial schools, the normal schools in which teachers are prepared, the gymnasiums (lyceums), the federal polytechnic school, the cantonal universities of Basel, Zürich and Berne, and the academies of Geneva and Lausanne. The polytechnic school is established at Zürich. It is subdivided into six special schools: school of civil building, school of civil engineering, school of mechanics, school of chemistry, school of forestry, and finally, a higher school of the natural and mathematical sciences, of the literary sciences, and of moral and political sciences. The studies are taught in the German, French and Italian languages. The importance which is attributed in Switzerland to good public instruction may be judged of by some figures we shall give. In the canton of Zürich the state and the communes have expended annually since 1873, for public instruction, a sum of 1,400,000 francs, not including the extra expenditures for the federal polytechnic school. Not included in this sum are the lodging, two cords of firewood and 20,000 square feet of arable land furnished by the communes to each primary and higher elementary teacher; nor is the hiring of places for schools. Berne expends annually 2,100,000 francs for the same purpose. Of this sum the communes pay three-fifths, and the state furnishes the rest; St. Gallen expends 600,000 francs; Aargau, 750,000; Vaud, 700,000 (not including the expenses for rent, heating, etc.); Neuchâtel and Geneva each, 400,000. For all Switzerland the total is more than nine million francs. STOESSEL.

— VII. *Finances.* The public revenue of the confederation is derived chiefly from customs. By the constitution of May 29, 1874, customs dues are levied only on the frontiers of the republic, in-

stead of, as before, on the limits of each canton. A considerable income is also derived from the postal system, as well as from the telegraph establishment, conducted by the federal government on the principle of uniformity of rates. The sums raised under these heads are not left entirely for government expenditure, but a great part of the postal revenue, as well as a portion of the customs dues, have to be paid over to the cantonal administrations, in compensation for the loss of such sources of former income. In extraordinary cases, the federal government is empowered to levy a rate upon the various cantons after a scale settled for twenty years. A branch of revenue proportionately important is derived from the profits of various federal manufactories, and from the military school and laboratory at Thun, near Berne. — The following table gives the total revenue and expenditure of the confederation in each of the years 1875–82, showing actual receipts and disbursements, except for 1882, for which the budget estimates are given:

YEARS.	Revenue.	Expenditure.
	Francs.	Francs.
1875	39,516,051	39,266,030
1876	41,487,402	42,422,017
1877	42,972,305	43,900,306
1878	41,536,225	41,469,641
1879	41,456,213	39,525,274
1880	42,511,848	41,098,228
1881	43,388,026	42,717,493
1882	41,929,000	42,294,000

The following table gives the budget estimates of revenue for the year 1883:

	Francs.
Produce of property of state.....	169,279
Produce of capital invested.....	733,000
General administration.....	31,000
Military department.....	3,463,632
Financial.....	7,616,000
Customs.....	18,250,000
Posts.....	15,442,000
Telegraphs.....	2,594,700
Railways.....	24,730
Commerce and agriculture.....	41,500
Miscellaneous.....	16,139
Total.....	48,382,000

The following table gives the budget estimates of expenditure for the year 1883:

	Francs.
Interest and sinking fund of national debt.....	1,869,340
General expenses of administration.....	717,600
Departments:	
Political.....	837,000
Interior.....	9,242,332
Justice and police.....	45,000
Military.....	16,594,931
Financial.....	8,202,300
Commerce and agriculture.....	725,570
Posts.....	14,213,000
Telegraphs.....	2,571,200
Railways.....	140,900
Unforeseen.....	10,224
Total.....	48,674,000

This shows a deficit of 292,000 francs; and at the end of the financial year 1882, there was found to be an actual surplus of 3,000,000 francs. — The public debt of the republic amounted, at the commence-

ment of 1882, to 86,947,044 francs. This arises mainly out of the conversion of three 4½ per cent. loans raised in 1867, 1871 and 1877. As a set-off against the debt there exists a so-called "federal fortune," or property belonging to the state, valued at 45,356,066 francs. — The various cantons of Switzerland have, as their own local administrations, so their own budgets of revenue and expenditure. Most of them have also public debts, but not of a large amount, and abundantly covered, in every instance, by cantonal property, chiefly in land. At the end of 1882 the aggregate debts of all the cantons amounted to about 300,000,000 francs. — The chief income of the cantonal administrations is derived from a single direct tax on income, amounting, in most cantons, to 1½ per cent. on every 1,000 francs property. In some cantons the local revenue is raised, in part, by the sale of excise licenses. In Berne they form one-fifth of the total receipts, in Lucerne one-seventh, in Uri one-tenth, in Unterwald one-eighth, in Solothurn one-sixth, and in the canton of Tessin one-fourteenth, of the total revenue. — VIII. *Army.* The fundamental laws of the republic forbid the maintenance of a standing army within the limits of the confederation. The eighteenth article of the constitution of 1874 enacts that "Every Swiss is liable to serve in the defense of his country." Article nineteen enacts: "The federal army consists of all men liable to military service, and both the army and the war material are at the disposal of the confederation. In cases of emergency the confederation has also the exclusive and undivided right of disposing of the men who do not belong to the federal army, and of all the other military forces of the cantons. The cantons dispose of the defensive force of their respective territories in so far as their power to do so is not limited by the constitutional or legal regulations of the confederation." According to article twenty, "The confederation enacts all laws relative to the army, and watches over their due execution; it also provides for the education of the troops, and bears the cost of all military expenditure which is not provided for by the legislatures of the cantons." To provide for the defense of the country, every citizen has to bear arms, in the management of which the children are instructed at school, from the age of eight, passing through annual exercises and reviews. Such military instruction is voluntary on the part of the children, but it is participated in by the greater number of pupils at the upper and middle-class schools. — The troops of the republic are divided into two classes, viz.: 1. The *bundes-auszug*, or federal army, consisting of all men able to bear arms, from the age of twenty to thirty-two. All cantons are obliged, by the terms of the constitution, to furnish at least 3 per cent. of their population to the *bundes-auszug*. 2. The *landwehr*, or militia, comprising all men from the thirty-third to the completed forty-fourth year. — The strength and organization of the armed forces of Switzerland was as follows, in 1882:

BRANCHES OF SERVICE.	Bundes-auszug.	Landwehr.	Total.
Staff	67		67
Infantry	99,466	78,219	168,685
Cavalry	2,991	2,453	5,444
Artillery	16,520	8,317	24,837
Engineers	3,771	1,531	5,302
Administrative troops..	726	120	846
Sanitary troops.....	1,659	382	2,041
Various			992
Total.....	115,135	92,022	208,216

Every citizen of the republic not disabled by bodily defects or ill health, is liable to military service at the age of twenty. Before being placed on the rolls of the *bundes-auszug*, he has to undergo a training of from twenty-eight to thirty-five days, according to his entering the ranks of either the infantry, the *scharfschützen*, or picked riflemen, the cavalry, or the artillery. Both the men of the *bundes-auszug* and the reserve are called together in their respective cantons for annual exercises, extending over a week for the infantry, and over two weeks for the cavalry and artillery, while periodically, once or twice a year, the troops of a number of cantons assemble for a general muster. — The military instruction of the federal army is given to officers not permanently appointed or paid, but who must have undergone a course of education, and passed an examination at one of the training establishments erected for the purpose. The centre of these is the military academy at Thun, near Berne, maintained by the federal government, and which supplies the army both with the highest class of officers, and with teachers to instruct the lower grades. Besides this academy, or *centralmilitärschule*, there are special training schools for the various branches of the service, especially the artillery and the *scharfschützen*. The nomination of the officers, up to the rank of captain, is made by the cantonal governments, and above that rank by the federal council. At the head of the whole military organization is a general commander-in-chief, appointed, together with the chief of the staff of the army, by the federal assembly. — The total expenditure on account of the army was, for 1881, 15,635,879 francs, and that of 1882, 16,598,934 francs; in the budget for 1882, 16,514,949 francs. Not included in the army expenditure is the maintenance of the military school at Thun, which has a fund of its own, the annual income from which is larger than the expenditure. — IX. *Trade and Industry.* The federal custom-house returns classify all imports and exports under three chief headings, namely, "live stock," "advalorem goods," and "goods taxed per quintal." No returns are published of the value of either the imports or exports, but only the quantities are given; and these, too, are not made regularly known by the customs authorities. The imports consist chiefly of food, and the exports of cotton and silk manufactures, watches, straw hats and machinery. In the year 1881 there were imported 5,722,409 quintals of provisions of various kinds (including

grain, flour and beverages), and 254,997 head of cattle. The principal exports of 1881 consisted of silk fabrics, cotton fabrics, watches and machinery. There were also some exports of cheese and other food substances. But the excess of food imports over exports amounted annually, in recent years, on an average to 8,000,000 cwt., purchased at a cost of 240,000,000 francs. — Being an inland country, Switzerland has only direct commercial intercourse with the four surrounding states—Austria, Italy, France and Germany. The trade with Austria is very inconsiderable, not amounting, imports and exports combined, to more than 25,000 francs per annum, on the average. From Italy the annual imports average 30,000 francs in value, while the exports to it amount to 1,500,000 francs. The imports from France average 500,000 francs, and the exports to it 5,500,000 francs. In the intercourse with Germany, imports and exports are nearly equal, averaging each 500,000 francs. — Switzerland is in the main an agricultural country, though with a strong tendency to manufacturing industry. According to the census of 1870, there are 1,095,447 individuals supported by agriculture, either wholly or in part. The manufactories employed, at the same date, 216,468 persons, the handicrafts 241,425. In the canton of Basel the manufacture of silk ribbons occupies 6,000 persons; and in the canton of Zurich silk stuffs are made by 12,000 operatives. The manufacture of watches and jewelry in the cantons of Neuchâtel, Geneva, Vaud, Berne and Solothurn, occupies 36,000 workmen, who produce annually 500,000 watches—three-sevenths of the quantity of gold, and four-sevenths of silver—valued at 45,000,000 francs. In the cantons of St. Gallen and Appenzell, 6,000 workers make 10,000,000 francs of embroidery annually. The printing and dyeing factories of Glarus turn out goods to the value of 150,000 francs per annum. The manufacture of cotton goods occupies up-

wards of 1,000,000 spindles, 4,000 looms and 20,000 operatives, besides 38,000 hand-loom weavers. — From official returns, it appears that the railways open for public traffic in Switzerland at the end of 1882, had a total length of 2,571 kilometres, or 1,594 English miles, besides 50 miles of funicular and mountain railways, and the St. Gothard system, which does not yet figure in the mileage returns. These are distributed among thirteen companies, the largest of which are, the Amalgamated Swiss railway, the Swiss North Eastern, the Swiss Central, the Canton of Berne State railway, the Swiss Western, the Fribourg railway, and the Franco-Swiss railway. — The postoffice in Switzerland forwarded 80,781,538 letters in the year 1881, of which number 56,221,228 were internal, and 24,530,310 international. The receipts of the postoffice in the year 1881 amounted to 15,998,837 francs, and the expenditure to 13,964,554 francs. — Switzerland has a very complete system of telegraphs, which, excepting wires for railway service, is wholly under the control of the state. At the end of December, 1881, there were 6,626 kilometres, or 4,140 miles, of lines, and 16,174 kilometres, or 10,110 miles, of wire belonging to the state. The number of telegraph messages sent in the year 1881 was 3,129,989; comprising 1,837,385 inland messages, 879,727 international messages, and 329,798 messages in transit. There were 1,210 telegraph offices, of which 1,034 belonged to the state. The receipts amounted to 2,453,972 francs, and the expenditure to 1,963,666 francs, in the year 1880. — BIBLIOGRAPHY. T

TABLE. (See PARLIAMENTARY LAW.)

TAMMANY HALL (IN U. S. HISTORY). A term applied in American politics, first, to the Columbian order, a secret society organized for social and political purposes in New York city in 1789, and which, upon incorporation in 1805, added the name of Tammany society; second, to the place of meeting owned or leased by this society, in which the "regular" democratic organization of the "city and county of New York" assembled up to 1879; and, third, to the political organization itself, meeting in Tammany Hall, whether "regular" or not. The entire subject will be clearer, if it is remembered that many things true of one of these three objects is not true of the other two, and that the same term

has been indiscriminately applied to all three, for eighty years. It was first freely used of the secret society, next of the regular political organization assembling in its hall, and in the third and last stage of its history has come to be applied to the democratic faction assembling in Tammany Hall, sometimes regular, sometimes dissident, but never since 1852, commanding the unquestioned allegiance of all the voters of its party in the city. Before that period rival democratic factions existed; since then there have been rival "Halls." The first of these periods covers the years 1800-1834, in which the extension of the right of suffrage and the grant of local self-government formed the chief political issues of the state; the second extends from 1834 to 1853-9, when federal patronage and the democracy of the interior of

the state retained the voters of the party in New York city in a tolerably continuous organization in spite of the changes worked in this vote, by foreign immigration and the appearance of the problems of the modern city—its ignorance, its supine wealth, and its costly public works. During the third and last period, while the political organization meeting in Tammany Hall has reached its final development as a well-disciplined body of predatory politicians, the democratic vote of the city, 1879-83, has become divided into two nearly equal divisions. One of these votes with the "county" organization, independent of Tammany Hall, and recognized by the party in the state as "regular." The other body of voters follows the "Tammany" organization, which is not so recognized, but which has a regular local succession to "Tammany," and, during the second and a large part of the third of these periods, was the representative of a majority of the democratic voters of the city. — As it was only during the first twenty or thirty years of its existence that the Tammany society, or the organization sharing its name, represented a genuine political movement, the history of Tammany for the last fifty or sixty years has been the record of an organization sharing the principles of a wider national party, but bent, first and foremost, on controlling the government of the city in which its lot was cast. Tammany has chiefly attracted attention in this phase as a highly successful effort to govern a great city by organizing its venal vote; a vote extending from the day laborer anxious for steady employment on the public roads, to the distinguished lawyer solicitous to secure a judgeship at \$15,000 a year, with its lucrative refereeships and wide influence. — The connection is of the slightest between Tamanend, the obscure Indian chief who put his mark to one of Penn's treaties, dealing with the lands of the Delaware Indians, and "St. Tammany," whose festival, on the 12th of May, came, in the closing days of the revolution, to replace St. George's day, three weeks earlier, much as Christmas replaced the Saturnalia. The significant fact is, that after William Mooney had organized the Columbian order, with its thirteen tribes, its twelve sachems, or directors, its sagamore, or master of ceremonies, and its wiskinski, or door-keeper, the secondary name of Tammany society was adopted, because it defined more clearly the popular and local character of the organization in its political action. The child-like interest of the revolutionary period in parades, trappings, terms and mysteries, was apparent in all the organization of the society. For it the year was divided into the seasons of flowers, of fruits, of hunting and of snow; the pipe of peace was smoked at its meetings; its members wore the Indian garb in the great processions of the day, and in 1790 entertained a Creek embassy for days together in costume, and the bucktail which Tammany societies wore throughout Pennsylvania, came, twenty years later, to be, in New York state, the name of one of the earliest of the democratic

factions whose intricate relations vex the political student. Tradition has preserved what the preference and fancy of an earlier day selected. The annual celebration of Independence Day in Tammany Hall is still made up of "long talks" and "short talks;" New York newspapers still contain the quaint notices of the annual meetings of the society in the "season of flowers," and its other "council fires," in the "great wigwam," which first appeared while Washington was president; but in the changes of time its great sachem has become a boss, and the chief duties of its wiskinski, who once gathered the Spanish dollars of the faithful at the door of Martling's long room, have come to be the prompt and persistent collection of political assessments from Tammany office-holders. — These things are the outer shell of the facts surrounding its early organization and its later development. They unite it, on the one hand, with the familiar channel of political action at the foundation of the republic, and recall its existence now, as the solitary link between the politics of New York city, with 5,189 votes, and the metropolis, with 336,137 males of the voting age. Organized by William Mooney, an Irish-American liberty boy and a violent whig, in the second week of Washington's first administration, the Columbian order represented, in federal politics, state rights; in state affairs, the demand for a wider suffrage; and in local affairs, the claim of the foreign-born citizen for a conspicuous part in politics. All this was not at first apparent. Of the first twelve sachems, ten were federalists. In the hot discussion which succeeded the outbreak of the French revolution, the Columbian order opposed a war with Great Britain. For several years the society was more conspicuous for its riotous celebration of May 12 than for its direct action in politics; but, in the eleven years which preceded its first recorded appearance as a political power, the democratic membership of the body put it in sympathy with the political organization which Aaron Burr was slowly maturing. The Poughkeepsie constitution had imposed a heavy property qualification, a freehold of \$50 to \$250, or a rental of 40 shillings annually, and the restoration of order had curbed the influence of the "Sons of Liberty"; a mob on the right side, but still a mob. A local moneyed aristocracy, supported by place and birth, resumed the control it enjoyed in colonial days. Its opponents, in 1788, polled one vote in seven in New York city, on a legislative ticket carrying Aaron Burr's name. For ten years the tide continued to run against the popular party, until, in 1800, the Columbian order began at the polls the careful, systematic organization of the voters of the city, to which the success of Tammany has ever since been due. The vote of the city had increased one-half in a decade—in 1801 the qualified voters numbered 7,988—but the city was canvassed, poor citizens were deeded freeholds, "faggot" voters were created by uniting a number of men in the ownership of a single piece of property, the society

kept open house during the election, voters were carried to and from the polls, and the entire machinery, long since become familiar, was set in motion to bring out the vote. The result was overwhelming success, and Aaron Burr, the next winter, was nominated as vice-president in the congressional caucus at Washington, on the strength of the victory. The control of the largest city in the Union carried Tammany, at a bound, to a position of influence in national politics which it has never lost. In despair, Alexander Hamilton wrote to Senator Bayard proposing the organization of a similar secret society in the federal party. — The annual convention in state, and a permanent organization in local politics, was still a quarter of a century distant in American affairs. A property qualification was required of voters; municipal officers were appointed by the governor and a council; a council of revision, made up of appointed officers, passed upon all legislation before it became law; while the representation accorded New York city, and its proportion of voters, left it less powerful in state affairs than at any time until the rapid growth of an urban population in the state at large, stripped it of its preponderating influence seventy-five years later. A permanent secret society was, under these circumstances, invaluable in securing continuous and coherent political action. The constitutional accident, which made the voting power of Tammany relatively greater in electing a president than in choosing a governor, early attracted to it federal patronage; first used with effect in New York state politics, under Madison. New York city was still small enough for the management of its politics by general meetings. The election of assemblymen and congressmen on a general ticket, contributed to concentrate political power. The germ of a general, popular and permanent organization began to show itself in the "general committees," for whose appointment general meetings provided, but such an organization was still far distant. The hard drinking of the day and the social contact of a small city each contributed its share to make acquaintance and frequent reunions a strong and powerful factor in political action. During the last sixty years the meetings of Tammany Hall, however turbulent and disorderly, have never been anything but meetings, differing wholly from the social gatherings of the first third of a century, when it was still true that—

There's a barrel of porter in Tammany Hall,
And the bucktails are swigging it all the night long.
In the time of my childhood 'twas pleasant to call
For a seat and cigar 'mid the jovial throng.

— In the first faction fight of this period, between the Burrists and the Lewisites over the election of Morgan Lewis as governor in 1804, Tammany acted with the former, and began its political career with a bolt; for, while no organization has ever shown a higher respect for local regularity, none has ever been quicker to bolt the action of an Albany legislative caucus or a state convention,

in which it has never been popular, and was and is generally in the minority. Before another election came, Tammany had developed, from its own ranks and among its ward workers, Daniel D. Tompkins, one of those young and brilliant leaders whose careers, from the day of Tompkins to the day of Hoffman, have opened so well and fared so ill. A "regular" caucus with which Tammany acted nominated Tompkins, and a year later George Clinton was shelved by his choice as vice-president. For a brief period his son, De Witt Clinton, had acted with Tammany Hall. Like all succeeding mayors, he found how difficult it is for the chief executive officer of the city to distribute his patronage without quarreling with the local organization, and being compelled to fight the organization by a personal machine; to submit; or to resign political power—the three alternatives for seventy years presented to every mayor by Tammany Hall. Clinton, like Fernando Wood, chose the first. The general meetings of Tammany Hall were supporting every step taken by Madison, and its members received, in return, federal patronage, whose importance was enormously increased by the heavy imposts of the day, which, for the first time, were centering at New York. Clinton bitterly complained of this use of patronage, but he was powerless, and the candidate who at last defeated him in a contest for his seat in the senate, was the federal district attorney, Nathan Sanford. The death of John Broome, in the same year, gave Clinton the opportunity of running for lieutenant governor, an office which he reached, and a year later a general meeting in New York nominated him for the presidency. Tammany Hall arrayed itself on the side of regularity, and enjoying federal, state and city patronage, crushed Clinton. The struggle lasted for years with varying success, and ended only with Clinton's death, in 1828, while governor. His previous removal from the office of canal commissioner by Tammany Hall, had aroused an overwhelming popular sentiment in his favor. The frauds charged against Gov. Tompkins—the first of the great public scandals of Tammany Hall—had earlier enabled Clinton (1817) to win in a contest in which the vote of the state at large steadily opposed the dominant city organization, whose wealth and ability enabled it each winter, at Albany, to retrieve in the legislative caucus what it had lost at the polls in November. — Federal patronage, army contracts and local public works—now first begun—had by this time given the Tammany society wealth. It built, in 1812, its first hall, on the site now occupied by the "Sun" building. Its membership showed that alliance between local politicians and local business men which it retained up to a very recent date. This alliance would be inexplicable in an organization which has uniformly opposed national and state measures, favorable to the city, and increased local taxation; but for the great profits which attend the use of active capital in contracts and in investments guided by an early knowledge

of public works. The organization itself has never been true at any period to the real interests of the city. It supported the embargo, it favored the war with Great Britain, and it denounced the Erie canal until the work had reached dimensions which made a share in its contracts profitable, when the votes of its representatives at Albany and the skill of its pamphleteers were enlisted in behalf of enormous appropriations. It opposed a permanent police, was disloyal, and aided Tweed's sack. Yet, neither in its early nor in its later days was the mob, the final residuum of the city, enlisted in Tammany Hall. Clinton, Wood and Morrissey, each commanded a lower stratum of voters than Van Buren, Schell and Kelly. Up to 1879, in spite of occasional eclipses, the lower middle class, which in the long run rules every great city, was the real strength of Tammany Hall. It is a curious illustration of this, that, in 1817 when the Tammany society issued one of its addresses on the state of public affairs, it deplored the spread of the "foreign" game of billiards among young men of the upper classes, and the presence of vice among the lower in the true spirit of a middle class precisian. The character and organization of Tammany Hall only changed for the worse estate, which has made its name a hissing and a by-word, when the small shopkeepers and the rising mechanics of the lower wards of New York were replaced, from 1850 to 1860, by a foreign-born population, with its tenement houses, its rum shops and its beer saloons. — A general meeting of Tammany Hall in 1820, attended by bucktails from all parts of the state, began the movement which resulted in the constitutional convention of 1821. Its constitution greatly lowered the franchise. This in its turn was followed in 1833 by charter amendments, making the mayor of New York elective. Both radically changed the character of local politics. The centre of political action on all local affairs was shifted from Albany to New York. State patronage ceased to be a conspicuous factor in local politics where the distribution of federal and municipal offices was the first object of political life. Up to 1831, every gubernatorial term but one had been filled by a man who began his active political life in New York ward politics. Since then only three terms have been filled by men (Morgan, Hoffman and Tilden) who were graduated from the same school. With this change in the electorate and the city government, there came an increase in the number of voters, which made it no longer possible for a general meeting to serve the purposes of local politics, or the social gatherings of a secret society to unite the politicians of a city whose population was (1830) 197,112, and whose voters numbered (1835) 43,091. The "general committee" succeeded the general meeting. This body, which survives to-day, grew from two separate sources. The general meeting, after making nominations, had habitually delegated the management of the canvass to a general committee. The ward and district

primaries in a similar manner turned over the practical work of the election to their own general committees. A list of the latter in one of the early mayoralty elections fills thirteen and one-half columns of a daily paper, and constituted a roster of the fighting force of Tammany Hall, and an almost equally complete list of local and federal officers. These two bodies gradually came to take shape in a representative general committee, based first on wards and their election districts, until the assembly district came, in 1871, long after the election of assemblymen by districts, to be the working unit in local politics. The wards elected aldermen long after the drift of population had greatly changed their relative vote, and this circumstance continued the ward in city politics, and perpetuated a rotten borough system, which, in the divisions opening the third period of Tammany Hall, placed the regular organization in the hands of men representing a minority of the voters. — The central and ward organizations grew and prospered together. The "general committee," under its early name as a "general council," first appeared in Tammany Hall in 1822, three delegates representing each of the eleven wards into which the city was divided. The creation of new wards raised the number to forty-five, in 1836 to seventy-five; and in 1843 the division of the city into election districts led to an increase in membership. The wards and their districts were abandoned later for the assembly districts and their election precincts. The steady growth of population has at last given an election precinct an average population from one-half to one-third of the early ward, and in the present (1883) Tammany general committee each precinct has two representatives. From thirty or forty members, the committee has therefore grown to over 1,400, but, instead of representing a majority of the voters of the city, it now controls the votes of a bare third. In the ward, and, later, in the assembly district, the precinct has been, since 1843, the unit of a like organization for ward purposes. — Theoretically it will be seen that this organization gives representative bodies chosen directly by the voters. Three circumstances, two of them common to all large cities, and the other peculiar to New York, have combined to remove this body from the control of the people. *First*, voters early abstained from the primaries. This was as much the case in 1830 as in 1880. The delegates to the first national democratic convention were chosen by a larger proportion of officeholders and a smaller number of voters, relative to the voting vote, than attended the primaries whose successive representatives elected the delegates to Cincinnati in 1880. *Second*, the law never protected these primary meetings from corruption. They began in riot and fraud. Clinton's meetings were regularly mobbed in 1812, and the primaries and meetings of the last decade have been incomparably more orderly, but no less corrupt, than those of previous years. *Third*, the circumstance that the mayors of New York were at first elected

in the spring led to the organization of a general committee at the close of each calendar year in primaries held for this purpose. These primaries, meeting in the ebb between the fall and spring election, never attracted general interest. Tradition and the convenience of politicians have continued them at a season when the average citizen has dismissed politics from his attention, and a brief notice yearly reminds the casual reader that a new Tammany Hall general committee is to be chosen on the last Thursday of the year. — The general committee, directly representing the ward workers, rapidly relegated the Tammany society to a relatively unimportant position. No careful student of New York politics for the last fifty years, and no one familiar with their actual working for the last fifteen years, can fail to see that the influence of the society has been exaggerated. It has always owned, and, of late years, has controlled by a lease, the hall in which the Tammany organization meets. Tradition and this circumstance render it necessary that the head of the political organization should control a majority of the society. In 1867 the society, and the organization with it, removed from its early quarters (rebuilt in 1860) to its present wigwam on Fourteenth street. Once since then (in 1872) the society closed its doors to the organization. But the organization has existed and acted apart from the society, to which a small share of its members belong. Perhaps no better proof of the local political vitality which accounts for this permanent separate existence without calling in the Tammany society to explain it, could be given than the circumstance that the local republican organization, aided by no society and having no such tie, has maintained its individuality, its existence and its succession for twenty-five years, and, for all practical political purposes, survived its summary reorganization in 1883-4. — From twenty to thirty years after its organization, the general committee had become an unwieldy body, open to the attacks of mobs, whose riotous proceedings perpetually threw doubt on the validity of the succession, and, what was more important in the eyes of politicians, hopelessly divided the democratic vote. After fifteen years of this condition of affairs, it became plain that the "general committee" was a body as little able to decide the regularity of conflicting ward partisans as the whole body of the faithful in Rome to elect a pope. Shortly after the close of the war, therefore, a new body appeared, reaching its power by slow degrees, in the "committee on organization." This body, at first one, and later two, from each ward or assembly district, secured powers, to carry the analogy a step farther, similar to those of the college of cardinals. Originally a subordinate committee of the general committee, to whom questions of regularity, party discipline and party organization were referred, the committee on organization has come to be the final authority in Tammany Hall. The chairman of this committee is the "boss" of the Hall, and while

the committee begins by naming its chairman, the chairman always ends by naming the committee. Its report admits or excludes contesting delegations from the general committee, and the general committee primaries are under the care of its members. The circuit of power is therefore complete, and the downfall of Tweed is the only instance on record of a successful attempt to carry the primaries against a majority of the committee on organization. — It is possible, if the general committee and the district committees of like character directly made nominations, that the general interest in local politics which renders the voting voter more numerous in New York city than in any city as large, would lead to the genuine popular choice of the general committee. The Tammany Hall organization, however, imposes a third screen between the voter and his vote. All nominations are made by conventions called for this purpose. The mayor, county officers, judges of all varieties, congressmen, senators, assemblymen and aldermen, are each nominated in conventions chosen to suit the occasion. The primaries for these conventions, in theory open to all democrats, are held by the members of the organization which radiates from the chairman of the committee on organization through the general committees to the district committees. These successive transmissions commit the entire organization into the hands of politicians; and Tammany Hall, in theory popular, becomes in practice a well organized and highly disciplined hierarchy of politicians and place-holders, who, in spite of all bolts, control and yearly poll over 50,000 votes, the greater part of whom are directly or indirectly interested in the enormous municipal expenditure of New York city. — Tammany Hall, during the two periods, in the first of which the general committee was developed, to pass later in the second period under the committee on organization, has shared in every election. Its political history is the political history of New York city, and it is not intended, in briefly sketching the course of the organization, to give more than is needed to make its development plain. The second period of "Tammany" may be considered as extending from the election of C. W. Lawrence as mayor, in 1834, to the crushing defeat of Tammany Hall by Mozart Hall in the election of Fernando Wood, in 1859. This election, the changes of the war and the Tweed ring ended in the Tammany Hall of to-day, and comprise the third period in its history. During the second period, Tammany Hall held the mayoralty for fifteen years out of twenty-five; during the third period, it has held the same office thirteen years out of twenty-four. Measured in this way, the supremacy of Tammany Hall appears to be evenly distributed, but of the last thirteen years seven were under Tweed's mayors, and paved the way for the present position of Tammany Hall as a democratic rump, whose vote has been cast more than once against the party. In the second period, when the Tammany society had been def-

nately succeeded by the more popular general committee, Tammany Hall was dominant in New York city because it contained the ablest politicians in a city narrowly divided between the whig and democratic voters. Tammany Hall entered its first canvass for mayor, in 1834, liberally supported by the federal patronage of the Jackson administration. The Sixth ward, known later as the "bloody sixth," was then the "office-holders' ward," and included hundreds of the federal employes, who continued to support Tammany Hall until the republican party secured control of the federal government. The whig party had behind it the growing power of the rural vote of the state, organized by Weed and Seward, which elected Seward governor, and changed the face of politics in New York state by transferring the counties of the interior from the democratic to the republican party. Lawrence became mayor by a narrow majority. One year later, in October, 1835, the division between the "loco-foco" or equal rights party and Tammany culminated in the riot which gave the former its name and offered the first proof of the ease with which a large convention could become a mob in a city of a quarter of a million, whose police force was still ten years distant. The alliance between the whig and loco-foco candidates, in 1836, ran through 1837 and 1838, defeating Tammany Hall in these years. The election of J. L. Varian, Tammany, in 1839, began a period of success which lasted until 1844, when James Harper, an American candidate, defeated Tammany Hall. With the election of W. T. Havemeyer, in 1845, the modern period of the city began. Its waterworks were completed, its police organized, and the influence of patronage and public works increased. With them, the prizes of local municipal life multiplied, and in the period from 1845 to 1853 the second of the great feuds in Tammany Hall opened between the "hards" and "softs." The two factions stood in a way for the "hunker" and "barn-burner" factions of the state democracy; but without entering into their state and national relations, the two factions grew out of the struggles in the local organization over nominations and the "regular" succession. The "hards" represented the office-holding faction; and when, in August, 1853, they were mobbed in Tammany Hall by the "softs," the chairman of the former was the collector of the port, Augustus Schell. A year later, Fernando Wood, who had successfully organized a "soft" machine, captured the primaries of the "hards," and secured a united nomination for mayor. The "adamantine" "hards" at once seceded from Tammany Hall, and organized at the Stuyvesant Institute, defeating the regular democratic candidate for governor, Horatio Seymour, by a bolt, precisely as Lucius Robinson was defeated by a like bolt in 1879. — For nearly ten years, from 1853 to 1863, the struggle between the opposing factions continued. The quarrel had practically begun in 1852, and the national conventions of 1852 and 1856 were asked to pass upon its merits. Every democratic state

convention had contesting delegations before it, and every city election saw the democratic vote divided by the presence of two tickets, both claiming regularity. It would be idle to go into the details of these contests. Fernando Wood retained his control over the regular organization until 1857, when the contest was transferred to the Tammany society in its first and last attempt to decide the regularity of two opposing factions. The result proved the attempt futile. Wood was defeated in the society, retained the organization, secured the regular nomination and was beaten, 1858, by Daniel F. Tiemann. The Tammany society, under its new sachems, excluded his general committee, and Wood seceded to Mozart Hall and was elected mayor in 1859 over the Tammany candidate, W. T. Havemeyer. Two years later, the split still continued, and a republican, George Opdyke, was chosen mayor. In 1863 Tammany was again defeated by the election of C. Godfrey Gunther, an independent democrat, over Frank Boole, who had received the Tammany and Mozart Hall nomination. — These successive defeats made necessary the change in policy and organization already described. The lavish expenditure which Fernando Wood had begun was resumed at the close of the war by W. M. Tweed. The ring, of which he was the conspicuous figure, combined with the corruption whose story has been so often told, a reorganization of Tammany Hall and the introduction of a sharp and summary discipline carried on by the committee on organization which promptly excluded objectors. The change altered the character of Tammany Hall. The loose and floating body of voters became a standing army of mercenary voters, which might suffer defeat, but never altogether lost its organization or left any question as to the regularity of its succession. John T. Hoffman was elected mayor by Tammany Hall in 1865, re-elected in 1867, and succeeded, on his own election as governor, by A. Oakey Hall, who held office past the defeat of the Tweed ring in 1871, until, in 1872, W. T. Havemeyer was chosen mayor on a citizens' ticket. The sack of the city treasury went on during this period without pause or check. The operations of the ring added over \$100,000,000 to the bonded debt of the city, doubled its annual expenditure, and cost tax payers, to take the best approximate estimates, first and last, at least \$160,000,000, or four times the fine levied on Paris by the German army. Many causes combined to render this gigantic devastation possible; but all combined could scarcely have compassed this plunder, if Tammany Hall itself had not been reorganized and converted into a standing army of voters encamped in New York city, obeying a single head and able to exclude all dissension from its ranks. — This organization, without its old opportunities and without its old flagrant corruption, but still a body living on politics, survived Tweed, and after various changes passed, in 1873, under the control of John Kelly, who has remained its head for ten years. Tweed's purposes rendered an alliance with the democracy

of the state indispensable. When that was lost, he went to the penitentiary. To John Kelly, this connection was not necessary. Tammany Hall, in 1874, elected W. H. Wickham, and, in 1878, chose Smith Ely. The personal honesty of its leader, the recent fall and punishment of Tweed, and the growth of an independent vote, led to nominations far above the average of past years. In 1878 successive secessions from Tammany Hall left it in a minority, and Edward Cooper was elected mayor by a combination between republicans and democrats in sympathy and full party communion with the state democracy. In 1879, when the state democracy nominated Lucius Robinson as governor, John Kelly was run as a bolting democratic candidate. This completed the isolation of Tammany Hall. The long series of steps by which a social organization with political purposes had become developed into an organized body of voters, acting for its own purposes, independent of all principle but plunder and all aim but office, was at last completed.

TALCOTT WILLIAMS.

TANEY, Roger Brooke, was born in Calvert county, Md., March 17, 1777, and died at Washington city, Oct. 12, 1864. He was graduated at Dickinson college in 1795, was admitted to the bar in 1799, and became attorney general of Maryland in 1827, and attorney general of the United States in 1831. In the following year he was appointed secretary of the treasury (see DEPOSITS, REMOVAL OF); but his nomination was not sent to the senate until the service for which he had been selected was performed, and then the senate refused to confirm it. Jackson then appointed him to the supreme court bench, and the senate again refused to confirm him. In 1836, the whigs having lost control of the senate, Jackson appointed him to fill the vacancy caused by the death of Chief Justice Marshall, and the senate confirmed the appointment. He filled the office until his death. His most interesting opinions, in a political point of view, were those given in the Dred Scott case (see that title) and the Merriman case. (See HABEAS CORPUS.)—Tyler's *Life of Taney*, 195 foll., makes it evident that Taney, in removing the deposits, acted from a sense of duty, and not from political motives. In the same work, p. 578 foll., is a supplementary opinion in the Dred Scott case, which will at least show Taney's honesty of belief. His opinion in the Merriman case was upheld by the supreme court, after the rebellion was ended, in the Milligan case. See, contra, 1 Greeley's *American Conflict*, 253; 2 Wilson's *Rise and Fall of the Slave Power*, 524; Giddings' *History of the Rebellion*, 403; *The Unjust Judge*. A. J.

TARIFFS OF THE UNITED STATES.

The theory of tariff taxation has been discussed in this work in the article CUSTOMS DUTIES. The subject of the present article is merely what has been done in the way of tariff legislation in the

United States; and mention can be made only of the more important acts, without any attempt to explain all the motives which led to their enactments, or the manifold results that have followed their adoption and administration. And, first, as to the power of congress to impose tariffs. Under the confederation the states retained the taxing power, and left the central body, the congress of the confederation, without any direct means of defraying whatever expenses the necessities of war compelled it to contract. Some attempts were made to secure for it an independent revenue, but they came to naught. On the return of peace, while still maintaining the form of a confederacy, the states, no longer united by a common danger, became, to a great extent, independent, and each managed its concerns with little regard to the interests of the others. Massachusetts had a navigation act, and levied import duties, and other states followed her example. The restrictions and prohibitions imposed on American commerce were vexatious and destructive, and while the congress had power to enter into treaties of reciprocity, it could not retaliate in any way were its offers of trade refused. The power to do this rested in the states individually, but in spite of many propositions to this effect, no uniform or decisive action on their part could be brought about. From 1783 until the adoption of the federal constitution it was generally recognized that congress should have the power to regulate commercial relations between the states and foreign powers, but the supposed interests of the different states presented an effectual bar against action. "The agitators for the regulation of trade in Virginia belonged to that class of the community which in the eastern and middle states was most bitterly set against the measure. In Massachusetts and New York the merchants were the supporters, and the farmers the opponents. In Virginia the planters were to a man united in the opinion that some steps must be taken to mend commercial affairs, and the merchants quite disposed to let trade alone. The reason is obvious. The condition of things to the south of the Potomac was precisely the reverse of the condition of things to the north of the Potomac. Beyond the north bank of the river the farmers thrived, and the merchants did a losing business. Beyond the south bank the merchants were daily growing more prosperous, and the planters more impoverished." (1 McMaster, 272.) The agitation over this question first assumed a definite form in Virginia, and led up to the national trade convention held at Annapolis in 1786, out of which movement arose the federal convention of 1787, which resulted in the framing of the constitution, and the foundation of a central government possessing definite and important functions, and clothed with the power necessary to perform them.—It would, however, be an error to attribute this action wholly to the commercial needs of the country. The states had just passed through an era of paper money madness, in which each state had vied with the others in excessive issues, with the

intention of allowing their inhabitants deeply immersed in debt to free themselves from such burdens. This alone was sufficient to create general poverty, and armed rebellions did occur in many quarters. Manufactures were beginning to arise in New England, and served to turn attention to the development of the internal resources of the country. The jealousies existing among the states had only aggravated the evils arising from mismanaged finances, and in the general scramble for vantage the many restrictions and limitations imposed hindered that industrial growth which, it was confidently believed, would restore prosperity. The folly of thus contending among themselves was seen by the clear headed, and the remedy they believed adequate was an extension of the power of the confederation. The debts contracted by the congress were about to fall due, but the confederation was without resources, and without credit. New York had expressed a willingness to grant to it power to levy duties on imports. Rufus King made a very able report to congress, in which he concluded that the impost was an absolute necessity to the maintenance of the faith of the federal government. While thus agitating for an independent revenue, the government did not cease to urge upon the states the disordered condition of trade and finances, and the advisableness of granting to congress the power to regulate trade. But while commercial reasons were thus at the bottom of the movement, political reasons, quite as cogent, existed in favor of a new distribution of powers, and the action of these two forces, combined, produced the constitution.—By this important instrument the new government was empowered to levy taxes of every description, and to regulate commerce with foreign nations. In connection with our subject it will be important to bear these two powers in mind, as the one has been made an instrument of the other. The right to levy duties upon imported commodities was conceded, and the only limitation imposed upon its exercise was that the duties should be uniform throughout the land. The question then arises whether the government ought to lay taxes for any other purpose than to raise revenue, which involves the question whether congress may lay taxes to protect and encourage manufactures. The arguments for and against this use of the taxing power will be found in Story's "Commentaries on the Constitution," §§ 959-973, and are summed up as follows: "So that, whichever construction of the power to lay taxes is adopted, the same conclusion is sustained, that the power to lay taxes is not by the constitution confined to purposes of revenue. In point of fact, it has never been limited to such purposes by congress; and all the great functionaries of the government have constantly maintained the doctrine that it was not constitutionally so limited." It was customary to regulate trade by taxing imports, and this practice was acted upon by all nations at that time. Retaliatory duties were recognized as a proper exercise of power, even when they produced no rev-

enue, and duties primarily intended for revenue purposes might incidentally afford protection to manufactures. The colonies always recognized the right of England to regulate their commerce; but when parliament undertook to levy taxes for another end, they revolted. It might further be said that every civilized nation at that time considered that the power to regulate commerce included the encouragement of manufactures, and acted upon this belief. Some of the states had already adopted regulations which were intended to give such encouragement to their industries, although this encouragement was secured at the expense of the other states; and in ceding this power to make such laws to the general government, it was claimed that the states had expected a continuance of this recognized policy. So that the weight of opinion was in favor of the right to regulate commerce by import duties or other taxes, and chiefly on the ground that the power was generally exercised among nations. From the very first, then, a tariff has been recognized as a measure for raising revenue, for protecting and encouraging domestic manufactures, and as an instrument for regulating commerce. (Story, Comm., §§ 1077-1095).—But the conditions which favored these views at the time the constitution was adopted no longer exist, and a very different set of circumstances has arisen to alter in a great measure the opinions on the tax power of the government. At the end of the eighteenth century it was not strange to find the power to regulate trade and commerce with foreign nations granted to congress. Nothing was more natural; for at that time the fiscal and commercial policies of nations were governed by the maxim that no trading or commercial people could ever prosper without regulation of trade, and the more their transactions were regulated by law the higher would be the resulting economic well-being of the country. Regulation, however, meant interference and restrictions. Innumerable laws are found on the statute books of nearly every nation that had any trade whatever, which were intended to foster and develop domestic manufactures and domestic commerce. Loans and important immunities were granted by the state to encourage the investment of capital in industrial enterprises; premiums, bounties and drawbacks were offered to producers and exporters; the importation of the raw materials of industry, and the export of manufactured products were unnaturally encouraged; while the importation of such commodities as would come into competition with domestic articles was discouraged by high customs duties, or was even expressly prohibited; the exportation of machinery and the emigration of skilled labor were forbidden under severe penalties; and through discriminating and retaliatory duties a species of commercial war was waged among nations. In fact, the whole system of trade was founded upon regulation, and was to that extent artificial and strained. And in no instance was this result more evident than in the commercial

relations which subsisted between a parent country and her colonies, in which all the advantage lay on one side. The American colonies had known no other trading system, and, therefore, believed that the adoption of the same illiberal laws was essential to their existence as an independent power. Their weakness invited insult and harsh laws from other nations; and while one of their first acts after the return of peace was to seek for commercial treaties with European powers, they also sought to protect their commerce with the instruments that were then everywhere employed. — All of this has changed. As the laws of trade were examined it was seen that they were natural laws, and that any interference with their free play was mischievous, and, instead of creating, destroyed commerce. The suicidal policy of taxing one's self in order to ward off an imaginary danger, became clearer to practical statesmen; and the old theory, that what one nation gains must be at the expense of another, has given way to a more just and accurate view that believes in leaving trade alone, to be governed by an enlightened self-interest. In spite, however, of this change of feeling, the United States has persisted in continuing along the old ruts, and has only two or three times shown any disposition to accept the truths that modern political economy has enunciated and is enforcing in spite of human laws to the contrary. But the inevitable is being enforced at a fearful cost to the people who have not recognized the true principles of trade and adapted their transactions to them. And the high industrial position which the United States holds at this time (1883) is in spite of restrictions, and not in consequence of them. — No sooner had the first congress met than a measure for taxing imports was introduced by Mr. Madison (April 8, 1789) for the purpose of giving some resources to the almost empty treasury. The measure proposed was extremely simple in its character, being intended as a temporary expedient, and enumerated rum and other spirituous liquors, wines, teas, coffee, sugar, molasses and pepper, as subjects for specific duties, while ad valorem duties were to be levied upon all other articles. The first debate at once disclosed a difference of opinion as to whether or not the tariff should be made protective in its character, but it was not for some years after this that the constitutional power of the government to lay duties for protection was called in question. The difference of opinion we have just noted has continued until to-day, and must always continue so long as a tariff is imposed. Those who favored a protective tariff could however point to existing industries, and claim that they were "infant" industries, requiring a protection against foreign competition. But at once the conflict of interests appeared. Massachusetts wished a duty on rum in order to protect her producers, but objected to one on molasses. Pennsylvania asked for protection to her iron and steel industries, but the southern states, which were chiefly agricultural, were opposed to granting it. The duty on hemp was

favored by the south but urged by the north, and so on through the list, hardly one item of which was not opposed on sectional grounds, that the benefits would accrue to certain states and at the cost of the other states. The bill was finally completed, and adopted as a protective measure, but it was so only in name. The preamble read: "Whereas it is necessary for the support of the government, for the discharge of the debts of the United States, and the encouragement and protection of manufactures, that duties be laid," etc.; and in the whole history of tariff legislation in this country it is the only law which was thus openly passed for protection to American industry. For prudential reasons this form of preamble was changed, and tariff enactments have on their face since been for the purposes of revenue only. This tariff became a law on July 4, 1789, and was to remain in force until June, 1796. The average duty levied under it was equivalent to an ad valorem rate of 6½ per cent.; and it was thought that this was too high a general scale of taxation, and would result in encouraging smuggling. As this act formed the foundation of our tariff system, we will give the duties imposed: distilled spirits, of Jamaica proof, 10 cents per gallon; other distilled spirits, 8 cents; molasses, 2½ cents; Madeira wine, 18 cents; other wines, 10 cents; beer, ale, and porter, in casks, 5 cents per gallon; in bottles, 20 cents per dozen; bottled cider, the same; malt, 10 cents per bushel; brown sugar, 1 cent per lb.; loaf sugar, 3 cents; other sugars, 2½ cents; coffee, 2½ cents; cocoa, 1 cent; teas from China and India, in American vessels, ranged from 6 to 20 cents per lb. and in foreign vessels somewhat higher; candles, from 2 to 6 cents per lb; cheese, 4 cents; soap, 2 cents; boots, per pair, 50 cents; shoes, from 7 to 10 cents, according to material; cables and tarred cordage, 75 cents per cwt.; untarred cordage, 90 cents; twine and pack thread, \$2; unwrought steel, 50 cents per cwt.; nails and spikes, 1 cent per lb.; salt, 6 cents per bushel; manufactured tobacco, 6 cents per lb.; indigo, 16 cents per lb.; wool and cotton cards, 50 cents per dozen; coal, 2 cents per bushel; pickled fish, 75 cents per barrel; dried fish, 50 cents per quintal; playing cards, 10 cents per pack; hemp, 60 cents per cwt.; cotton, 3 cents per lb. In addition to these specific duties, an ad valorem duty of 10 per cent. was imposed on glass of all kinds (black quart bottles excepted), china, stone, and earthenware, gunpowder, paints, shoe and knee buckles, and gold and silver lace and leaf; 7½ per cent. ad valorem was charged upon blank books, paper, cabinet wares, leather, ready-made clothing, hats, gloves, millinery, canes, brushes, gold and silver and plated ware and jewelry, buttons, saddles, slit and rolled iron, and castings of iron, anchors, tin and pewter ware. Upon all other articles, including manufactures of wool, cotton and linen, 5 per cent. ad valorem was to be charged, except on saltpetre, tin, lead, old pewter, brass, iron and brass wire, copper in plates, wool, dyestuffs, hides and furs, to be free of duty. Such was the first tariff, and such was

the entering wedge of the protective system. — Between the tariff of 1789 and that of 1816, which marks the second important step in the tariff legislation of the country, there were passed upward of seventeen acts affecting the rate of duties, and the tendency was ever toward higher rates. The most important event of this period was the preparation of Hamilton's famous report upon manufactures, which contained the earliest formulation of protective principles that is to be met with in our legislative history, and still remains the source of protectionist argument. It would be impossible even to briefly summarize in this place this important contribution to tariff history, but the conditions under which it was written were, as I have already stated, peculiar, and many of his doctrines, if not indeed the whole basis of his reasoning, have been swept away by subsequent events. For the protection he advocated was justified chiefly by the fiscal restrictions of other nations. "The restrictive regulations," he says, "which, in foreign markets, abridge the vent of the increasing surplus of our agricultural produce, serve to beget an earnest desire that a more extensive demand for the surplus may be created at home. * * If the system of perfect liberty to industry and commerce were the prevailing system of nations, the arguments which dissuade a country in the predicament of the United States from the zealous pursuit of manufactures, would doubtless have great force. * * But the system which has been mentioned is far from characterizing the general policy of nations. The prevalent one has been regulated by an opposite spirit. The consequence of it is, that the United States are, to a certain extent, in the situation of a country precluded from foreign commerce. They can indeed, without difficulty, obtain from abroad the manufactured supplies of which they are in want; but they experience numerous and very injurious impediments to emission and vent of their own commodities. Nor is this the case in reference to a single foreign nation only. The regulations of several countries with which we have the most extensive intercourse, throw serious obstacles in the way of the principal staples of the United States. In such a position of things the United States can not exchange with Europe on equal terms; and the want of reciprocity would render them the victim of a system which should induce them to confine their views to agriculture, and refrain from manufactures. A constant and increasing necessity, on their part, for the commodities of Europe, and only a partial and occasional demand for their own, in return, could not but expose them to a state of impoverishment, compared with the opulence to which their political and natural advantages authorize them to aspire." A tariff was thus, in Hamilton's view, an instrument of compensation and retaliation rather than a purely protective measure in the sense in which protection is viewed at the present day; and it is needless to add, that Hamilton's view has little force now when the greater number of restric-

tions upon commerce that existed when he wrote have been removed. A like stand was taken by Jefferson in 1793, when he advocated countervailing foreign restrictions in case they could not be removed by negotiation. — The wars in Europe tended at first toward a more liberal system of commerce, and the merchants of this country benefited largely by it. Some moderate increase in the rates of duties were from time to time granted, but no real demand for protection until the return of peace in 1801, when the old restrictive system was re-enacted by Europe. This peace was, however, of short duration, and on the resumption of hostilities the commerce of this country was so seriously involved as to create a demand for retaliation. In 1805 the importation of British manufactures was prohibited; a few years later the Berlin decrees of Napoleon and the orders in council of England practically closed the ports of Europe to neutral vessels, and American ship owners suffered greatly. As a measure of retaliation an embargo law was passed in 1807, which was followed by non-intercourse laws. The heroic remedy involved in these measures was equivalent to cutting off a leg to cure a corn, and, together with the commercial war which ensued, worked a revolution in American economy. Prevented from obtaining their usual supplies from Europe, our people began to manufacture on their own account, rendered sure of a market by the war, and also by a doubling in all tariff duties, which was done in 1812 as a war measure. But a return of peace threatened to do away with this artificial situation, in which many factors were combining to stimulate the beginnings of industry, and this the manufacturers clearly recognized. In February, 1816, Mr. Dallas, the secretary of the treasury, made a report to congress on the tariff, and the committee on commerce and manufactures laid before the house a report in which a protective policy was strongly urged. One month later Mr. Lowndes reported a bill from the committee of ways and means. Mr. Calhoun said in the course of debate that the capital formerly employed in commerce had by the war been turned into manufactures. "This, if things continue as they are, will be its direction. It will introduce a new era in our affairs, in many respects highly advantageous, and ought to be countenanced by the government. * * He then said, that war alone furnished sufficient stimulus, and perhaps too much, as it would make their growth unnaturally rapid; but that, on the return of peace, it would then be time for us to show our affection for them. But it will no doubt be said, if they are so far established, and if the situation of the country is so favorable to their growth, Where is the necessity of affording them protection? It is to put them beyond the reach of contingency. Besides, capital is not yet, and can not for some time be, adjusted to the new state of things. There is, in fact, from the operation of temporary causes, a great pressure on these establishments. They had extended so rap-

idly during the late war, that many, he feared, were without the requisite surplus of capital or skill to meet the present crisis. Should such prove to be the fact, it would give a backset, and might, to a great extent, endanger their ultimate success. Should the present owners be ruined, and the workmen dispersed and turned to other pursuits, the country would sustain a great loss. Such would, no doubt, be the fact to a considerable extent, if not protected." (Works, vol. ii., p. 169.) This utterance is very significant as coming from a southern man. In fact, in this instance it was the south that favored, and the north that opposed, protection; and Webster always referred to the tariff of 1816 as a South Carolina measure. (Works, vol. iii., pp. 297, 502.) Very little of the long debate that followed on the bill has been preserved; the measure passed the house by a vote of 88 to 54, and the senate by one of 25 to 7. It became a law April 27, 1816. — This tariff not only marked the introduction of an entirely new principle, being intended as a protective tariff in fact as well as in name, but there was also a tendency to adopt, as far as possible, specific duties. There was also introduced what was called the minimum principle, which was in effect a specific duty. Thus, the duty upon cotton goods was 25 per cent., but all goods that cost less than twenty-five cents per yard were to be deemed to have cost twenty-five cents, on which the duty at 25 per cent. would amount to six and one-fourth cents, so that the minimum duty which could be paid on cottons was six and one-fourth cents per yard. Still, little was accomplished by the measure. It was intended to break the fall of the manufacturers, taking them gradually down stairs instead of throwing them out of the window. But the enormous importations even under the new rates of duties, while it filled the public treasury, produced a revulsion in the markets of a country already disturbed and impoverished by the effects of the war. A period of speculation was entered upon, and it was greatly aided and its results aggravated by the excessive issues of paper money. "The new tariff did not have the anticipated effect in aiding manufactures; on the other hand, by tempting larger investments in the hope of anticipated profits, it increased the competition, while it dilated the circle of manufacturing interests. The capital of New England went more decidedly into that branch of industry, so much so that the voice of New England began now to be decidedly on the side of protection. There is no doubt but that competition had much to do with the continued alleged distress of the manufacturers," a distress that was augmented by depressed markets and the debilitating effects of the war. The cry arose that more protection was needed, that British manufacturers were in league against American industry, and naturally ended in an organized movement for higher duties, in spite of the mass of evidence offered that they would, if granted, only produce more competition and a more complex but artificial condition of in-

dustry. The crisis of 1819 materially aided the protectionists, who may now be recognized as a party, and having an organ in Niles' "Weekly Register." "National interests and domestic manufactures" were taken up as a war cry, and societies for the promotion of domestic industry were formed in many states. These from time to time held conventions, and formulated long addresses to the people, in which the hard times, the fiendishness of the British government and of British manufacturers, and the necessity of higher duties and more protection, were set forth in terms calculated to make the blood of every American boil. — This led up to an attempt in 1820 to pass a high tariff measure, and to do away with the credit system, which then applied to imports, and was the forerunner of the modern warehouse system. Auctions, by which it was claimed that the country was flooded with foreign goods to the detriment of domestic manufactures, were to be taxed, in order that the number and transactions might be diminished. Had the national finances permitted such a reduction in revenue from customs, the tariff measure would have prohibited the importation of iron, cottons and woollens, to such an extent had the protective sentiment grown among a very small but influential party. The main support, however, for any further modification in rates lay in the maintenance by foreign nations of their restrictions upon trade. The most important increase applied to cottons and woollens. That on woollens was in retaliation of the higher duties which England imposed upon wools, and which threatened to entirely exclude American wools from the English markets. France heavily taxed our cotton. A further grievance lay in the high duties imposed by European nations upon wheat, which was an important article of export. Discriminating duties on cotton brought from beyond the Cape of Good Hope were favored, because it was claimed those countries consumed none of our raw materials, afforded no market for our produce, employed none of our labor, and exhausted our specie. No act, however, was passed, and no change was made until 1824, when a general tariff measure became a law. — The commercial and industrial condition had remained much depressed since the crisis of 1819, which had resulted from overtrading and reckless banking. According to Mr. Clay (speech, March, 1824), the general distress of the country was indicated "by the diminished exports of native produce; by the depressed and reduced state of our foreign navigation; by our diminished commerce; by successive unthreshed crops of grain, perishing in our barns and barn yards for the want of a market; by the alarming diminution of the circulating medium; by the numerous bankruptcies, not limited to the trading classes, but extending to all orders of society, by a universal complaint of the want of employment, and a consequent reduction of the wages of labor; by the ravenous pursuit after public situations, not for the sake of their honors and the

performance of their public duties, but as a means of private subsistence; by the reluctant resort to the perilous use of paper money; by the intervention of legislation in the delicate relation between debtor and creditor; and, above all, by the low and depressed state of the value of almost every description of the whole mass of the property of the nation." He therefore thought it a fitting time to introduce a "genuine American policy," the object of which was to create a home market for the produce of American labor, and, it may be added, a policy that would directly afford relief to manufactures only. Mr. Webster made a most masterly speech in reply, in the course of which he questioned the universal distress of the country as depicted by Mr. Clay, while admitting the depression, and said, "when we talk, therefore, of protecting industry, let us remember that the first measure for that end is to secure it in its earnings; to assure it that it shall receive its own. Before we invent new modes of raising prices, let us take care that existing prices are not rendered wholly unavailable by making them capable of being paid in depreciated paper." As the presidential election was then depending, political matters were dragged into the debates, and now for the first time it was seriously questioned whether congress had the constitutional power to pass a measure purely for protection, and not as a revenue act. The debates in the house lasted more than ten weeks, and then the bill passed by only a majority of five votes, several of the members being brought into the hall on their sick couches in order that their votes might not be lost. In the senate it commanded a majority of four votes. It could not be regarded as a political measure, nor yet as a party question. Adams, Clay and Jackson, all voted for it; the southern states were dissatisfied with the result, as was also New England. But as iron, wool, hemp and sugar received protection, a combination of the western and middle states received sufficient support to pass the bill. The average rate of duties under the law of May 22, 1824, was 37 per cent. — Those who supposed that the protectionists would be contented with their victory were much mistaken. No sooner was the tariff of 1824 gained, when an agitation for higher duties was begun, the general depression and the illiberal commercial policies of other nations being the main pretexes. A change, however, was taking place in England, which in a measure compelled the protectionists to seek new reasons for their movement. The trade between the United States and the West Indies had been the cause of much retaliatory legislation on the part of Great Britain and this country since 1815; but in spite of restrictions and prohibitions a profitable though illegal commerce was maintained by American merchants. The measures adopted by the English parliament had not only aroused our congress, but had given rise to threats of retaliation on the part of other European nations. Mr. Huskisson, then president of the English board of trade, was wise

enough to recognize the necessity of a change in commercial policy, and inaugurated his system of reciprocity in 1823, which was carried into effect in the following year. This marks the first breach made in England's protective system, and logically led up to the repeal of the corn laws and the abolition of all protective duties, so that at the very time that England was throwing open her ports and removing the restrictions that were imposed on her commerce, the United States was preparing to increase the tariff and raise higher the barriers which were intended to limit her foreign trade. — In 1825 a financial crisis occurred, which was caused by a great expansion in the paper circulation, and was precipitated by extensive failures in London. This gave the protectionists an opportunity to attribute the distress to the operation of the tariff of 1824. The importations were large; and, owing to changes in the English customs by which important advantages were gained by the English manufacturers, it was argued that the woolen industry, which had grown enormously since the peace, encouraged by the federal legislation, would be ruined unless further protection was afforded. This indicated a marked change in policy, as Prof. Sumner points out. Formerly the "American system" meant retaliation to force a foreign nation to break down its protective system; it was now an instrument to counter-vail and offset any foreign legislation, even in the direction of freedom and reform or advance in civilization, if that legislation favored the American consumer. (Life of Jackson, pp. 196, 198.) — Another marked change of opinion was now seen. New England had heretofore opposed protection as hostile to her commercial interests. Manufactures were now springing up in those states, and had made such progress as to create a revulsion in public sentiment; and in 1826 a petition went up from Boston, praying for higher duties on woollens in order to protect this important industry in New England. In 1827 a bill to increase the duties on woollens passed the house, but failed to become a law. Even Buchanan, of Pennsylvania, a good protectionist, was opposed to it, "as prohibitive in its nature, and in no shape one for revenue. He had voted for the protection upon woollens in 1824, but that was no reason why he should favor the prohibition now proposed." "Politics ran very high on this bill. In fact, they quite superseded all the economic interests. * * Passion began now to enter into tariff discussion, not only on the part of the southerners, but also between the wool men and the woolen men, each of whom thought the other grasping, and that each was to be defeated in his purpose by the other." (Sumner.) The rejection of the measure, however, only served to increase the efforts of its friends. A convention of wool growers and manufacturers was held in July, 1827, at Harrisburg, and the iron, glass, wool, woolen, hemp and flax interests were represented, and asked to be recognized in any scheme of protection. The presidential election was to occur

in the next year, and the tariff was made a leading issue. The sectional feeling was being strongly developed. The planting states of the south became more determined to resist a policy which they regarded as benefiting the north at their expense, and the north and east became more urgent in demanding a continuance of a system which, they alleged, had tempted their capital into investments that must inevitably be ruined, unless the protective policy was not only maintained, but extended. The secretary of the treasury, Mr. Rush, took up the question in his report, and claimed, that, as the land laws of the country protected agriculture, at least a like amount of protection should be given to industry. (See article on PUBLIC LANDS in this volume, p. 472.) — A tariff bill was drawn up by Silas Wright, of New York, and he defended its protective features on the ground that "it was intended to turn the manufacturing capital of the country to the working up of domestic raw material, and not foreign raw materials." What followed can best be described in the words of Prof. Sumner: "Mallory tried to introduce those propositions [of the Harrisburg convention] as amendments on the floor of the house. All the interests, industrial and political, pounced upon the bill to try to amend it to their notions. New England and the Adams men wanted high duties on woolens and cottons, and low duties on wool, iron, hemp, salt and molasses (the raw material of rum). Pennsylvania, Ohio and Kentucky wanted high taxes on iron, wool, hemp, molasses (protection to whisky), and low taxes on woolens and cottons. The southerners wanted low taxes on everything, but especially on finished goods, and if there were to be heavy taxes on these latter they did not care how heavy the taxes on the raw materials were made. * * The act which resulted from the scramble of selfish special interests was an economic monstrosity." The legislature of South Carolina protested against the bill, but it passed by a vote of 105 to 74. Mr. Wilde moved to amend the title by adding the words "and for the encouragement of domestic manufactures," a motion that was opposed by Mr. Randolph, because he said domestic manufactures were those carried on in the families of farmers, and "this bill was to rob and plunder one-half of the Union for the benefit of the residue." Mr. Drayton also moved to change the title so that it might read "in order to increase the profits of certain manufactures." The tariff of 1828 became known as the "tariff of abominations." It was the immediate cause of the nullification movement. (See NULLIFICATION.) — In her protest against the tariff law of 1828 South Carolina spoke of it as "in violation of state rights, and a usurpation by congress of powers not granted to it by the constitution; that the power to encourage domestic industry is inconsistent with the idea of any other than a consolidated government; that the power to protect manufactures is nowhere granted to congress, but, on the other hand, is reserved to

the states; that, if it had the power, yet a tariff grossly unequal and oppressive is such an abuse of that power as is incompatible with a free government; that the interests of South Carolina are agricultural, and to cut off her foreign market, and confine her products to an inadequate home market, is to reduce her to poverty. For these and other reasons the state protests against the tariff as unconstitutional, oppressive and unjust." North Carolina also protested against the law, and Alabama and Georgia denied the power of congress to lay duties for protection. In 1820 the feeling in the southern states was very strong against the tariff, and threats of nullification and secession were freely made. In 1830 the tariff was more strictly enforced in spite of a movement looking to reductions in the rates of duties, and in the following year a free trade convention was convened at Philadelphia, and the protectionists met in New York. Addresses to congress were issued by each faction, and the next session of congress was full of the tariff. The president had recommended a revision in his message, and the discontent of the south became more and more apparent. Two bills were prepared by the committee of ways and means, and a third was presented by the committee on manufactures; the secretary of the treasury had his bill, and the senate compiled the fifth measure. The result was the passage of a bill which maintained all of the protective features of the tariff of 1828 while reducing or abolishing many of the revenue taxes. The tax on iron was reduced, that on cottons was unchanged, and that on woolens was increased, while some of the raw wools were made free of duty. This measure was passed on July 14, 1832. In November a convention in South Carolina declared the acts of 1828 and 1832 null and void in that state. The president issued his proclamation against nullification, and in his annual message advocated as early a reduction of duties to the revenue standard as a just regard to the faith of the government, and to the preservation of the large capital invested in establishments of domestic industry, might permit. In January, 1833, a bill to enforce the revenue laws was reported to congress. The state legislatures took a part in the controversy. Alabama, Georgia and North Carolina condemned the tariff as unconstitutional, while New Hampshire passed resolutions in favor of reducing the tariff to the revenue standard. Massachusetts, Rhode Island, Vermont, New Jersey and Pennsylvania thought that the tariff ought not to be reduced. In February Mr. Clay introduced a measure that was intended as a substitute for all tariff bills then pending, and looked toward a gradual reduction in duties: of all duties which were over 20 per cent. by the act of 1832, one-tenth of the excess over 20 per cent. was to be struck off after September, 1835, and one-tenth each alternate year thereafter until 1841. As first drawn the preamble stated that, after March, 1840, all duties should be equal, "and solely for the purpose and with the intent of providing such

revenue as may be necessary to an economical expenditure by the government, without regard to the protection or encouragement of any branch of domestic industry whatever." The enforcing and tariff acts were carried through together. This was the famous "compromise" tariff, and was followed by a repeal on the part of South Carolina of the nullification law. "This tariff," says Sumner, in his "History of American Currency," "was deceptive and complicated. It had no principle of economic science at its root—neither protection, nor free trade. It was patched up as a concession, although it really made very little, and its provisions were so intricate and contradictory that it produced little revenue. Specific duties were unaffected by it, and these included books, paper, glass and sugar. It did not run its course without important modifications in favor of protection, for it could not bind future congresses, and the doctrine of the horizontal rate of 20 per cent.—a doctrine which had no scientific basis—produced an increase on many articles." Elsewhere the same writer speaks of it as a "pure political makeshift," in which the public and private interests had no consideration." (Mr. Benton, in his "Thirty Years in the United States Senate," has several chapters on this measure, which should be consulted.)—The four years after 1833 were marked by great speculation, which was chiefly directed toward schemes of internal improvement, and culminated in the crisis of 1837. The depression that naturally followed was made use of by protectionists, and hard times, produced by low duties and insufficient protection, was again a prominent cry. In spite of the fact that in 1836 the government was in a position to distribute a large surplus revenue among the states, in 1838 it stood in need of a larger income. The compromise bill had guaranteed that after 1842 the highest duty levied should not exceed 20 per cent. except in case of war, and in order to maintain this guarantee a 20 per cent. duty was levied upon many new commodities, but without producing the requisite increase of revenue. In 1841 a home league was formed, the purpose of which was to agitate for high duties, and the president's message gave an opportunity for a general discussion of the subject in congress. A provisional tariff bill, by which the operations of the existing tariff were to be continued until August, 1842, passed the house, but in the senate was amended by a proviso postponing the distribution of the proceeds of the public lands until the same date. The president vetoed it, on the ground that it abrogated the provisions of the "compromise act," and for other reasons. Congress did not pass the measure over the president's veto, but incorporated the same proviso respecting distribution into a general tariff law, which suffered the same fate. The president objected to it, first, on the ground that the bill united two subjects which, so far from having any affinity to one another, were wholly incongruous in their character, as it was both a rev-

enue and an appropriation bill; secondly, the treasury being in a state of extreme embarrassment, the bill proposed to give away a fruitful source of revenue, a proceeding which he regarded as being highly impolitic, if not unconstitutional; and thirdly, because it was also in violation of what was intended to be inviolable as a compromise in relation to the tariff system. A general tariff act was passed without the obnoxious clause, and was a return to protection. The average rate of duty levied upon dutiable imports was about 33 per cent., and the principle of "home valuations," which had been adopted in the compromise tariff, was dropped. In 1844 Mr. Polk became president, and, as a southern man, it was expected that he would advocate a policy other than protective as a basis for tariff revision.—It will now be convenient to note some of the changes in circumstances that had occurred since 1825. Up to that time, as I have already said, the main object of the tariff was to countervail the restrictive commercial policy of other nations. It was an instrument for retaliation, by which it was hoped that concessions could be wrung from those countries with which we might have commercial relations. "To all the powers that wish 'free trade,' we say, Let free trade be; to all that will restrict us, we say, Let restriction be." So wrote that ardent protectionist, Niles, in 1826. Now, however, when England was preparing to mitigate the many limitations and restrictions that she had imposed upon her foreign commerce, it was claimed that her action would prove of injury to American interests, industrial and commercial, and that we must increase our restrictions in order that these interests might not suffer, but be amply protected. When Great Britain reduced the tariff on wools, a commodity that congress had more highly taxed in 1824, Mr. Everett said, "Unless the American people think it just and fair that the laws passed by the American congress for the protection of American industry should be repealed by the British parliament, and that for the purpose of securing the supply of our market to the British manufacturer to the end of time, it was the duty of congress to counteract this movement," and again, "Believing, of course, that there is no wish to single it out (the manufacture of woollens) for unfriendly legislation at home, I can not sit still, and see the gigantic arm of the British government stretched out across the Atlantic, avowedly to crush it." In 1832 the doctrine that a high tariff meant low prices was prominently advanced, and somewhat later the balance of trade theory, the excess of imports over exports, causing a drain of specie to the manifest impoverishment of the country, was harped upon. But all through this period the expediency and necessity of protecting "infant industries" were constantly depended upon by the defenders of the "American policy," and as a corollary to this a home market for the agricultural productions of the country, now excluded from foreign markets, was to be

created and maintained. In 1839 the agitation against the corn laws was begun in England, and resulted in their repeal in 1846. In 1849 another important step was taken, in the repeal of the navigation laws. Meanwhile a change was occurring in the complexion of the tariff debates in this country. "In the presidential campaign of 1840, protection was advocated, I believe for the first time, on the ground that American labor should be protected from the competition of less highly paid foreign labor. The pauper-labor argument appeared full-fledged in the tariff debates of 1842; and since that time it has remained the chief consideration impressed on the popular mind in connection with the tariff." (Tausig.)—Mr. Polk, in his inaugural address, was conservative. "I have heretofore declared to my fellow-citizens, that in my judgment it is the duty of the government to extend, as far as may be practicable to do so, by its revenue laws, and all other means within its power, fair and just protection to all the great interests of the whole Union, embracing agriculture, manufactures, the mechanic arts, commerce and navigation. I have also declared my opinion to be in favor of a tariff for revenue; and that, in adjusting the details of such a tariff, I have sanctioned such moderate discriminating duties as would produce the amount of revenue needed, and, at the same time, afford reasonable incidental protection to our home industry; and that I was opposed to a tariff for protection merely, and not for revenue." While Mr. Polk thus confined himself to general phrases, his secretary of the treasury, Mr. Robert J. Walker, prepared a report in which his treatment of the tariff question deserves to be ranked with Hamilton's famous report on manufactures. It stamped Mr. Walker as an economist and practical financier of the highest order, and his utterances mark an important stage of tariff legislation in this country. He laid down the following general principles as a basis for revising the revenue laws: 1, that no more money should be collected than is necessary for the wants of the government, economically administered; 2, that no duty be imposed on any article above the lowest rate which will yield the largest amount of revenue; 3, that below such rate discrimination may be made, descending in the scale of duties, or, for imperative reasons, the article may be placed in the list of those free from all duty; 4, that the maximum revenue duty should be imposed on luxuries; 5, that all minimums and all specific duties should be abolished, and ad valorem duties substituted in their place, care being taken to guard against fraudulent invoices and undervaluation, and to assess the duty upon the actual market value; 6, that the duty should be so imposed as to operate as equally as possible throughout the Union, discriminating neither for nor against any class or section.—In accordance with Mr. Walker's views, the tariff of 1846 was framed. He divided his classification into nine schedules, each of which had its own rate of duty (comprising many articles), running

from 100 per cent. (distilled spirits and brandy), down to 5 per cent. (the raw materials of manufacture). This number of schedules was in the bill altered to eight, and the highest duty levied was 75 per cent. ad valorem. The bill also allowed the warehousing privilege for the first time. (See WAREHOUSE SYSTEM.) After a general debate the measure passed the house by a vote of 114 to 95, but was nearly killed in the senate, being passed only by the casting vote of the president of the senate. The average rate of duty under this act was 25 per cent. ad valorem, and it produced an average annual revenue of \$46,000,000, as against one of \$26,000,000 under the tariff of 1842.—Of the consequences of this "revenue tariff of 1846," Prof. Sumner says: "The period from 1846 to 1860 was our period of comparative free trade. The sub-treasury act of 1846 removed subjects of currency and banking from national legislation. Thus these two topics were for a time laid aside. For an industrial history of the United States, no period presents greater interest than this. It was a period of very great and very solid prosperity. The tariff was bad and vexatious in many ways, if we regard it from the standpoint either of free trade or revenue tariff, but its rates were low and its effects limited. It was called 'a revenue tariff with incidental protection.' The manufactures which it had been said, would perish, did not perish, and did not gain sadden and exorbitant profits. They made steady and genuine progress. The repeal of the English corn laws in 1846 opened a large market for American agricultural products, and took away the old argument which Niles and Carey had used with such force, that England wanted other countries to have free trade, but would not take their products. The effect on both countries was most happy. It seemed as if the old system was gone forever, and that these two great nations, with free industry and free trade, were to pour increased wealth upon each other. The fierce dogmatism of protection and its deeply rooted prejudices seemed to have undergone a fatal blow. Our shipping rapidly increased. Our cotton crop grew larger and larger. The discovery of gold in California added mightily to the expansion of prosperity. The states, indeed, repeated our old currency follies, and the panic of 1857 resulted, but it was only a stumble in a career of headlong prosperity. We recovered from it in a twelve-month. Slavery agitation marked this period politically, and if people look back to it now they think most of that; but industrially and economically, and I will add also, in the administration of the government, the period from the Mexican to the civil war is our golden age, if we have any. As far as the balance of trade is concerned, it never was more regular and equal than in this period." (Lectures on Protection, p. 54.)—The revenue collected under this tariff was so large, that, in 1857, it became necessary to reduce it, as the circulating medium of the country was being locked up in the treasury. An attempt

was made to pass a protective tariff, but it was defeated. The secretary of the treasury had recommended that raw materials should be made free of duty, and also salt, as a necessity for the western packer. The eastern manufacturers favored this measure, and wool was the most difficult commodity to rate, as the west wished it made dutiable and protected. The tariff of 1857 was denounced as the result of a "fraudulent combination of those who favored the protection of hemp, sugar, iron and the woolen manufactures of Massachusetts. It was a blow at the wool grower." By this act the average duty was lowered to about 20 per cent. ad valorem.—The crisis of 1857 was followed by deficits in the government finances, and it became necessary to revise the tariff. In 1861 a measure known as the "Morrill tariff" was passed, which was a decided step toward a protective measure, but it remained in force only a few months. The war created necessities which compelled the government to seek every possible source of revenue, and while the dilatory and tentative tax methods applied in the first years of the war only complicated matters, and forced the government to have recourse to that most dangerous of financial expedients, an irredeemable paper currency, the tax privilege was exercised as far as it could be before the end of the war. In these years the tariff was carried from a low and revenue rate of duty to one of extreme protection—not for the sake of protection, but in order to obtain revenue. An internal revenue system that was all-pervading was imposed, and it was to counteract the high taxes levied under this system that many of the tariff duties were carried to such an excessive point. Measure after measure raising duties was adopted between the years 1861 and 1866, and it was inevitable that protective duties should creep in. Settled policy there was none, and while revenue was always the plea for action, the duties imposed often defeated that plea, by becoming prohibitive. Everything was taxed, and, under customs and excise laws, commodities might be taxed many times. On the return of peace the important changes made applied chiefly to the internal revenue system, and the perpetual tinkering of the tariff had served to bring out in bold relief the many protective features it contained. "With the termination of the war," writes Mr. David A. Wells when special commissioner of the revenues, "and with accruing receipts from the tariff in excess of the actual requirements of the treasury, the popular tendency, as expressed by legislation, accomplished or projected, has been to reverse the order of importance of these two principles, and to make the idea of revenue subordinate to protection rather than protection subordinate to revenue. And in carrying out, furthermore, the idea of protection, but one rule for guidance would appear to have been adopted for legislation, viz., the assumption that whatever rate of duty could be shown to be for the advantage of any private interest, the same would prove equally advantageous to the interests

of the whole country. The result has been a tariff based upon small issues rather than upon any great national principle; a tariff which is unjust and unequal; which needlessly enhances prices; which takes far more indirectly from the people than is received into the treasury; which renders an exchange of domestic for foreign commodities nearly impossible; which necessitates the continual exportation of obligations of national indebtedness and of the precious metals; and which, while professing to protect American industry, really, in many cases, discriminates against it. * * One of the first things that an analysis [of the existing tariff] will show is, that every interest that has been strong enough or sufficiently persistent to secure efficient representation at Washington, has received a full measure of attention, while every other interest that has not had sufficient strength behind it to prompt to action has been imperfectly treated, or entirely neglected."—The effect of the commissioner's recommendations was to lead up to a general debate on taxation in 1870. A bill which originally proposed to touch only internal duties, was gradually enlarged until it covered not only excise, but also customs duties. Protection had now become a cardinal principle of the republican party, the party in power, and most of the protective features of the tariff were retained under the new measure, which became a law July 14, 1870, and whatever reductions were made applied to commodities in common use, like tea, coffee, sugar, etc., or luxuries, like wines, spirits, brandy, etc. The reduction in revenue by these changes was estimated to be about \$29,000,000, and at the same time internal taxes to the amount of \$55,000,000 were removed. The real burden of the tariff was hardly lightened, as the high duties on the necessaries of life remained. In 1871 an attempt was made to repeal the duty on coal, but it failed. The question of protection, however, came up, and to prevent further discussion the duties were removed from tea and coffee (1872), and in the same year a general tariff was passed, which still left the protective duties almost unchanged; admitting large classes of manufactures to a reduction of 10 per cent. without designating specifically the articles to which the reduction should apply. Between March 1, 1861, and March 4, 1873, fourteen principal statutes relating to classification and rates, besides twenty other acts or resolutions modifying tariff acts, had been passed, and parts of each were in force. To this must be added the laws passed prior to 1861, and under which customs were still collected. This created great doubt as to what was the law, and the uncertainty gave much trouble to the government, and involved the importers in costly litigation and imposed upon them vexatious delays. "Under these various enactments, questions relating to the proper assessment of duties constantly arise. There is often a direct conflict between different statutes, and occasionally between two or more provisions of the same statute, while single provisions are frequently held to embrace different meanings.

These differences can be settled only by arbitrary interpretations or by adjudications in court. * * The number of statutory appeals to the secretary of the treasury on tariff questions during the last fiscal year (1873) was 4,731, exclusive of miscellaneous cases or applications for relief, numbering 5,065."—The financial crisis of 1873 naturally had some influence upon the revenues of the government, and in 1874 the cry was raised that the government finances were embarrassed through too large reduction in taxes. This allowed the protectionists an opportunity to carry a measure through congress restoring the 10 per cent. duties upon commodities which had been taken off in 1872, and also to increase by one-fourth the duties on sugar. While these movements precluded all idea of revising the tariff so as to return to a revenue standard of duties, yet great dissatisfaction was expressed with the operation of the law. I have just noted one of the difficulties connected with its administration, that of being needlessly complex. Other objections to it consisted in the great stimulus it gave to smuggling and undervaluation of imports, practices which even the honest importer was forced, in self-defense, to adopt. Moreover, the law became each year more and more complicated. It consisted, first, of the act of congress; second, of the decisions of the treasury officials interpreting the law, and these decisions had the force of law and were unchangeable; and, finally, of the decisions of the courts. The expediency, and even the necessity, of a revision, now became more and more urgent. "The revised tariff," writes the secretary in 1875, "contains thirteen schedules, embracing upward of 1,500 dutiable articles which are either distinctly specified or included in general or special classifications. To these must be added nearly 1,000 articles not enumerated, but which under the general provisions of two sections of the law, would be assigned a place as dutiable either by virtue of similitude to some enumerated article, or as articles, manufactured or unmanufactured, not otherwise provided for, making over 2,500 in all. The free list contains an enumeration of over 600 articles, thus constituting a total aggregate of more than 3,000 articles embraced by the tariff either as dutiable or free. Of the articles subject to duty, and either named in, or subject to, specific classification by schedule, 823 pay ad valorem rates varying from 10 to 75 per cent.; 541 pay specific duties, according to quantity or weight; and 160 pay compound, or both specific and ad valorem, rates."—Not only was a sentiment against the tariff being created on account of its many unreasonable and exorbitant features, but a like feeling was engendered by a desire to reduce war taxation to the limits that an economical administration of the government required. The largest sum collected from customs in any one year was in 1872, when it had attained the amount of \$216,370,286. During the years of depression that followed the crisis of 1873 the receipts from this source steadily dwindled, reaching

their lowest point in 1878, when they were only \$130,170,680. An improvement then became manifest, and in the following years the increase was enormous, giving, in connection with other sources of revenue, a revenue largely in excess of the wants of the government. In 1880 this surplus revenue was nearly \$66,000,000; in 1881, more than \$100,000,000; and in 1882, \$146,000,000. An examination of the annual appropriation bills for these years will show that expenditure kept pace with revenue. While these bills do not take into account the permanent appropriations—providing for the debt, for the collection of customs, etc.—yet, as they are prepared by the executive departments of the government, they give a better idea of the general tendencies of governmental expenditure than would the amounts actually expended. The total amounts appropriated by these bills vary from year to year, but they vary in a general way with the revenue of the government—increasing when the revenue increases, and decreasing when it becomes less. The ten years that followed 1873 gave a proof of this. The public income had hardly begun to be affected by the crash of 1873 when the appropriations for 1874 were framed; but from that year until 1878 there was a steady decrease. Beginning with the bill for 1881, when the effects of the revival of trade and industry in 1879 were beginning to be felt, the appropriations greatly increased, and culminated in the notorious bill for 1883, which included two of the most notorious legislative swindles that could be perpetrated—the river and harbor bill, and the arrears of pensions act. As the surplus revenue in the treasury increased, the demands upon it became greater, and the greater the surplus the more questionable became the schemes for spending it. The accumulation of such a balance was a source of danger, and a constant temptation to jobbers and swindlers who originate and live upon superfluous public expenditure.—It was now seen that some changes in the tariff would become necessary, not only for the purpose of simplifying its provisions, but also as a means of removing tax burdens from the people. The old question of revenue or protective taxation was revived, and it became manifest that the battle was to be fought on that line. While all right-minded persons saw that taxes should be reduced, when it came to a discussion of methods, a hopeless disagreement arose. Those who favored protection were desirous of abolishing all internal taxes in order that the tariff might remain untouched. The other side wished to reduce the tariff, and take from it the many extravagant protective features. Several measures of tariff reform were defeated in these years, and no final or decisive action was taken until 1882, when congress turned the subject over to a commission of nine members taken from civil life, for consideration. It was evident that here was an excellent opportunity offered for a satisfactory solution of the question. There was a general demand for reduced duties; even protectionists were willing to

submit to such a reduction. The presidential campaign of 1880 had been fought on the issue of the tariff, but in that blind and unreasonable way that settled nothing, though awakening a spirit of inquiry. This had given strength to many movements in favor of revenue reform, especially in the western states, and it was in answer to this feeling, which was developing into a political force, that the commission measure was adopted, because it was believed that such a plan would produce the best and speediest results. The president, who had the appointment of the members of the commission, nullified whatever of benefit might be expected of it, for he took men who were directly interested in the maintenance of high protection. Of the nine men chosen there was not one who could pretend to be a student of economic principles, not one who could have explained the incidence of a tax. The influence of the lobby in framing tariff legislation had become notorious, but in this commission the lobby influence was maintained, and allowed even better opportunities for carrying its point than it enjoyed before. The commission traveled over a part of the country taking testimony, and made its report to congress. It was afterward developed that the schedules of duties presented with the report had been prepared by men who were themselves manufacturers and therefore interested in keeping intact protection. The report, while promising a reduction in duties, contained some of the most barefaced attempts to double and triple duties; while making a pretense to revise and reform the tariff, it was but a juggle and a sham. The members of the commission (with one honorable exception, Mr. McMahon, whose technical knowledge of the operation of the then existing tariff was of great service) were wholly unfitted for the work intrusted to them, and as a consequence the results of their labors were of little value. One year had thus been wasted. — Nor were the events that followed the presentation of this report calculated to increase the expectation that the subject of revenue reform would be adequately handled by congress. The senate, rejecting the commission schedules, prepared a bill of its own; and the house also framed a new bill for its own consideration. The whole session of 1882-3 was given over to a discussion of these various measures, schedule by schedule, and line by line. Every possible difference of opinion was developed in these debates; but, as the high tariff party was in the majority, little toward a reduction of duties could be accomplished. A large number of ad valorem duties were made specific, though no change in the actual amount of tax was thus brought about. Owing to its being a short session, the house was unable to complete the consideration of its own bill, and took up that of the senate. Some differences being developed, they were referred to a conference committee, in which the high protectionists had a large majority. Here many changes were made, some of which had been voted down in both houses, and the re-

sulting hybrid measure became a law one day before the session closed, no time being given for an examination of the recommendations of the conference committee. The law, however, satisfied no one, and there is every likelihood that the whole tariff will be again revised at no late day. — Meagre as this outline is, it is enough to show that the United States has never had a tariff that was at all suited to its industrial and commercial interests since the first revenue tariff imposed before 1826. And as the average rate of the tariff has increased it has become more and more injurious to the interests involved, as no high tariff can be applied to such various conditions as are to be found in this country without doing as much mischief to one part as good to another. — **AUTHORITIES.** Prof. Wm. G. Sumner's *Lectures on the History of Protection, Life of Andrew Jackson and History of American Currency.* The writings of Henry C. Carey and H. C. Baird. There is no good history of the finances of the country in the English language. The pretentious work of A. S. Bolles is unsatisfactory, and the facts are much distorted. Niles' *Weekly Register* contains much valuable material, and the writings of Condy Raquet, now quite scarce, should be carefully read. The public documents contain many exceedingly valuable reports on the tariff, and the proceedings of some early conventions (1819, 1831, etc.) throw much light upon the effects of tariff legislation. Mr. David A. Wells has contributed much to a proper understanding of the last war tariff, and stands well to the front in the great number of writers who have given attention to this subject. A special *Report on Customs-Tariff Legislation* was prepared by the Bureau of Statistics in 1873, and the provisions of the laws are fully given, as also in Heyl's and Williams' two *Manuals.* WORTHINGTON C. FORD.

TARTAR, TARTARY. The Chinese Tâ-tâ, or Tâ-tar, was originally a generic term for tributary or vassal peoples, especially of those hordes inhabiting the plateaus of northern Asia beyond the great wall which was built to repel them. One sinologue finds the derivation of the word in one of the forms of obeisance in vogue among the tribes of Mongolia, in which the foot is struck on the ground, and a prominent article of dress, usually worn in front, is at the same moment thrown behind. The leaders of most of the uprisings of population in the grassy plateaus of central Asia that have emerged into history, spurning the epithet of Tâ-tars, have taken to themselves various dynastic names, such as Hun, Turk, Liào, Kitan, Kin, Mongol, Manchiu, etc. Genghis Khan, for instance, gave to his people the name Mongols (Mungku-jin), "braves," in order to show that they were no longer Tâ-tars, or tributaries, but conquerors. When the Mongols invaded Asia, and even Europe, overrunning Russia, and covering it with ashes and blood, the Christian monks, struck with the resemblance of the word Tâ-tar to Tartarus, and ready to associate these centaurs—

man and horse being as one animal—with devils from hell, called them "Tartars." Hence, our incorrect English spelling. Gradually the word Tartary was applied to all the lands ruled by the Mongols—the whole of eastern Europe, and central Asia; "European Tartary" was that part of Russia occupied by the Mongols, while "Asiatic Tartary" stretched from the Caspian to the Yellow sea. As the Mongols were by degrees expelled from Russia, the term was restricted to the Crimea (settled by the Crim Tatars) and to the Chinese dependencies north and west of the great wall. As Chinese geography was better understood, the once vague and elastic term more and more lost value as a geographical expression. It continued to be applied, however, to that part of Turkestan which was until lately neither Chinese nor Russian—an annually decreasing territory. Since the Russian campaigns under Kauffman and Skobeloff, resulting in the fall of Khiva (1873), of Khokand (1876), and of Merv (1879-80), the whole of "Independent Turkestan" may be considered part of Russian territory, since it has been formally annexed. In 1882 deputations of the inhabitants to St. Petersburg gave their formal adherence to the czar. With this extension of Russian arms to the very borders of Afghanistan, "Tartary" ceases to be a proper geographical expression. In China, the term "Tâ-tar" is popularly applied to the Mongols beyond the great wall, and, by ultra-patriotic haters of the ruling dynasty, to Manchius in general; but it is so mixed up with opprobrious epithets, such as "horsey," "raw," "green," etc., that the word is not in good repute among writers. In central Asia, "Turk" and "Tâ-tar" are synonymous. Foreigners distinguish the Chinese from their Manchiu conquerors, and we read in works of travel and history of "the Tartar city," "the Tartar garrison," as parts of Peking, Canton, etc.—Ethnologically the "Tartars" are the Altaian group of tribes and nations, not of Aryan blood, that did once, or do now, inhabit the lands of northern and central Asia, including the Scythians of classic writers, the Huns, the Turks, Kirghez, Calmucks, Mongols, Manchius, Tungusians, the various peoples of Turkestan, with many tribes now greatly modified by Aryan admixture, with others as widely scattered as the Tamils of southern India on the one hand, and the Coreans and Japanese on the other, between whose languages modern linguists (Thirwall, Dallet, Ross, Edkins, Aston, Chamberlain) have demonstrated close affinities. Notwithstanding all variations from the original type, the Tatar face has high cheek bones, thick nose depressed at the roots, scanty beard, round skull, and narrow, slit-like eyes, with a peculiar restless expression, which is the same whether in Constantinople or in Tôkiô. Balfour thus pictures from life the Manchiu and the Chinese, or the "Tartar," and the native Mandarin. "The Manchiu has a dark complexion and roughish skin; he is a large-boned man; his face is long and lantern-jawed; he has a wide mouth, and a firm, de-

cidéd nose. The expression of his eyes is shrewd, and under the gloss of etiquette you can detect the natural fierceness of the nomad. The Chinese is the exact reverse. His build is small and flexible; his face—round, unctuous and fat, unseared by the suspicion of a wrinkle—is the color of Devonshire cream. His movements are graceful and suave; they give you the idea of liberally-oiled joints; his hands are delicate, slim, and very plump; his expression is courtly, he has a winning smile and bow for every one. * * Good emperors are not made of such material." The Tâ-tar hordes which have repeatedly rushed out of the north into China, have kept the hoary empire periodically infused with fresh blood and vigor and new imperial dynasties. Yet, though able to conquer, destroy or build on a well-established foundation, they have no elements of permanence; and away from the deserts, cut off from nomadic life, the Tâ-tar fabrics of government in continental Asia have, one after another, fallen to ruins after a burst of grandeur that seems strangely brief in comparison with the enduring character of Aryan institutions and European governments. In religion the Tâ-tars were at first devotees to Shamanism, and then to Buddhism, which degenerated into Lamaism, while in Europe and western Asia many tribes have adopted the Sunni form of Islam. (See also MONGOLS.)

WM. ELLIOT GRIFFIS.

TA-TSING (Great Pure). The name of the ruling dynasty of China, under whose reign the Middle Kingdom has perforce begun to adopt and assimilate the forces of western civilization. Direct commercial and diplomatic relations between China and Europe can scarcely be said to have begun until the Ta-tsing line of emperors filled the throne in Peking. One of the several foreign imperial houses that have ruled the mightiest empire of Asia, the Ta-tsing, is "the best Tartar dynasty China has ever had." The ancestral home of the Manchiu chieftains, to whom divine honors as founders are now rendered in Peking, is the northern base of the ever-white mountains which separate Corea from Manchiuria. According to legend, one of three celestial virgins, while bathing in a lake on the surface of which were mirrored the snowy peaks, found on her clothes a red fruit dropped by a flying magpie, and immediately eating it, conceived, and gave birth to a son. On the death of his mother, he floated down the river Hurka, and being hailed by the warring chiefs as a supernatural leader, established his capital at Odoli, and began in the fourteenth century the unification of the Manchiu tribes. The name of this ancestor was Aisin-Gioro, or Golden Family Stem. Gradually encroaching upon the Chinese possessions, the Manchius were invited to Peking to assist against rebels. Finding themselves there, they stayed, and began the conquest of the great plain of China. In a word, they supplanted the native Ming dynasty. In exchange for the shaven forehead and long queue ("pig-

tail") which they inflicted upon the Chinese, they themselves took the civilization of China, and became docile pupils. The Jesuit missionaries in the capital enjoyed both the friendship and patronage of the first Ta-tsing emperors, Shun Chi, Kang Hi, Yung Cheng and Kien Lung. The sure foothold of the new dynasty in the empire was signalized by the compilation and issue of the famous "Imperial Dictionary," the "Webster's Unabridged" of the Chinese language. Learning and the arts flourished, and intercourse with western nations increased, until in this latter half of the nineteenth century we see that long contested problems are being solved in a manner not Chinese, but cosmopolitan. The old conception of China being the Middle Kingdom, around and far beyond the borders of which lay the uncivilized barbarian countries, is passing away. The long duel between Cossack and Tartar on the north has ended by making "ravenous Russia's" boundary lines the Amur and Usuri rivers, though Ili has been wrested back from the double-headed eagle; and strong garrisons, constantly maintained along her northern frontier, show China's determination to keep her borders from further "rectification" by diplomats. Her attitude toward France in Tonquin, and toward Japan in Corea, show her further intent to keep a "scientific frontier," and uphold her ancient doctrine of Whang-Ti, or sovereign over vassal nations. Under the pressure of necessity she has established legations and consulates in Europe and America, and has recognized the existence of her citizens abroad. At home the adoption of western military and naval organization and equipment, and of engineering, telegraphy and commercial methods, are largely due to the more practical and enterprising nature of the Manchiu leaders and statesmen. (See also TARTAR and RIU KIU.)—LITERATURE. WM. ELLIOT GRIFFIS.

TAUISM (TAO-ISM, TŌ, or Doctrine of Lao-Tse). One of the three state religions of China is Tauism. It is recognized and supported by the imperial government, and one of the popular sayings is, "However the empire be disordered and convulsed, the Changs (popes of Tauism) and the Kungs (descendants of Confucius) have no occasion to be troubled." Perhaps that which most attracts the attention of foreigners who observe the rites of the Chinese at home or on American soil, is that which is referred to Tauism, rather than to the cult of Buddha or the ethics of Confucius. Yet, the religion and the system of philosophy must be carefully distinguished; for, whatever else Lao-Tse is responsible for, "he ought not to bear the obloquy of being the founder of the Taoist religion." Pure Tauism is probably not to be found in China, though in Corea it is probable that it exists in something like its origi-

nal purity. In this article we shall briefly sketch the man and his system, describing in detail the widely spread and highly popular religion that calls itself by his name, and of which he is in no sense of the word the founder. Rejecting the vulgar fancies and later traditions which find so dazzling an expression in the gilt and paint and cabalistic characters and incantations of a "joss-house," we shall outline the historical career of Lao-Tse. He was born in the feudal age of China, in the petty kingdom of Tsu, now the province of Honan, in 604 B. C. His surname was Li (plum), and his personal name Ur (ear, or flat ear). From early life he was an arduous student and much given to meditation. When come to manhood, he was appointed librarian, or keeper of the records, at the court of the Chow dynasty. When eighty-eight years old, he was visited by Confucius, then thirty-five years of age, and a conversation between the two followed, in which the elder appears to have given the younger a tart lecture, couched in vaguely oracular language. Confucius seems to have left the sage with the impression that his words were too profound or too transcendental for practical purposes, and after that pursued his own methods of inquiry. It was perhaps subsequent to this interview that Li Ur was known as Lao-Tse, or Venerable Sage; though the two Chinese characters may also be rendered Old Boy—on which basis, the popular legend that he was born with white hair and with the expression of an aged man, was reared. There is not, however, one line in the sage's works, which gives countenance to marvels or supernaturalism of any kind, the multitudinous fantastic legends concerning Lao-Tse having been invented much later. The sage devoted himself to expanding his doctrine of Tau (the Way), and shunned all notoriety. Foreseeing the fall of the Chow dynasty, he left the capital with his face set westward. Before passing through the boundary gate, Yin Hsi, the warden and his admirer, persuaded the sage to commit his doctrines to writing. Lao-Tse complied, and wrote down what appear like lecture notes, which need further oral expansion. In this treatise, *Tau-ti King*, containing eighty-one chapters in not over 5,000 characters, his views on the Tau (Way) are set forth in an exceedingly terse, gnomic style. He then passed westward beyond the frontier, and with this final sentence of the historian Sze-ma Chien (B. C. 135-68) the voice of history is silent. He died probably about 523 B. C. The systems of Lao-Tse and Confucius may be thus stated: Confucius, a statesman rather than a philosopher, sought to find for men a rule of conduct in a code of practical morals founded on ancient precedents, the examples and precepts of kings and sages. Lao-Tse's labors, on the contrary, were purely philosophical. Man was to attain to the perfection of his nature through contemplation of God, by subduing his passions and possessing his soul in calm. Quietism is thus the first requisite of a true life. The highest morality is inculcated.

In speculative physics, Lao-Tse teaches that creation proceeded from a First Principle, impersonal, self-existent and self-developing, which produced motion, whence issued all things in the universe, which have in them the dual principle of active and passive, or male and female. In politics, the sovereign elected of the people should be their model and teacher rather than ruler and judge. The voice of the people is Heaven's voice. The ruler must first right himself, then the country will be well governed. Too much government is to be deprecated. Light taxation, moderate punishments, the people well fed, but not too much enlightened, courtesy and moderation between states, will secure lasting peace and prosperity. Previous to Lao-Tse's time, the Chinese worshiped Shang-ti (Lord of Heaven, Theos, Jehovah) and Tien (Heaven). The *Tau-ti King* recognized God (Shang-ti) as before Tau, though it is through Tau that Heaven is to be attained. By means of Tau the soul was to attain its original state and be immortal. European scholars at first believed that the Hebrew name Jehovah was contained in Lao-Tse's book, both in phonetics, and by popular apprehension, but this idea is now exploded. The sage recognizes as fact the existence of God (Ti), but makes his Tau (Reason, the Way) primal, and superior to God. The Ti, or virtue of the Tau, becomes fulfilled in man in its highest development, by his abstraction from worldly cares, and freedom from anxiety. In other words, he teaches that non-existence is the goal of man, and equivalent to pure existence; or, as Hegel would say, they are identical. "Being and Non-being are the same." Whether Lao-Tse borrowed this tenet from the India Brahmans, or originated it, is uncertain, but the very vagueness of the system, increased by the terseness of his style, resembling that of oracles or enigmas, made it the fit soil for the strange crop that afterward grew upon it. Until the introduction of Buddhism, 68 A. D., idols were unknown in China, and Taoism was but a philosophy and a literary puzzle, though with new codes of natural and psychical philosophy grafted on it by disciples. As such it was more acceptable to minds to which metaphysical speculation was congenial, than the bald ethics of Confucius, based as these were on materialism and routine precedents; but its evolution was toward degradation. In contact and rivalry with Buddhism, the occult arts and superstitions of centuries past fastened upon Taoism so firmly that what was parasite and what was original stock could not be popularly distinguished. While the mystic element expanded voluminously, professing to teach corporeal immortality, the transmutation of metals, the composition of the elixir of life which raised men to the equal of genii—arts long after introduced into Europe—the popular belief, travestying Buddhism, filled its temples with images of deities, which became gods of the state. Out of the crowd of the early fathers of war, medicine and literature, idol deities were multiplied indefinitely, until Buddhism

was offset with its own weapons, by a native instead of a foreign pantheon. The recognition of Taoism as a state religion practically began when Wu-ti (140–88 B. C.) encouraged the alchemists, though the Tang emperors (618–905 A. D.) first admitted Lao-Tse to the rank of gods, under the title of "Great Supreme, Emperor of the Dark First Cause." Later, titles were added by admiring emperors. It must be remembered that Confucianism was not until a thousand years after the death of its founder universally spread throughout China; nor was it until A. D. 1012 that he received by imperial mandate the title "Most Perfect Sage." During the early centuries of the Christian era, Taoism had the field. The first Taoist popedom, or patriarchate, held by Chang Tau-ling, which was founded in the first century, has been held in the line of his descendants to the present day, and the sect has spread into the various nations surrounding the Middle Kingdom that accept Chinese culture. In the popular religion, "the Three Pure Ones," which are found in Taoist temples, form the most conspicuous group of idols representing Lao-Tse, Chaos or Pan-kū, "The first man," and Shang-ti, or God, of the early Chinese religion. Many other idols, representing gods of every degree, incarnating perhaps the forces of nature, crowd the temples; and the religion of Taoism, though professedly based on reason, or at least rationalism, is a hopeless congeries of superstition. — LITERATURE. The *Tau-ti King* has been translated into English by the Rev. J. Chalmers (London), into French by Rémusat and Stanislas Julien, and into German by Pläncker and V. von Strauss, the first and last being considered the most faithful to the original. See also Legge's *The Religions of China*, New York, 1881; Martin's *The Chinese*, New York, 1881; and *Oriental Religions, China*, Boston, 1881.

WM. ELLIOTT GRIFFIS.

TAXATION, Principles of. It would seem to be in the nature of an economic or common-sense axiom, that a large and varied experience in respect to the management of any one of the great departments of the world's business would result in the gradual evolution and final definite establishment of certain rules or principles which would be almost universally recognized and accepted as a basis for practical application and procedure. But in respect to the matter of taxation—which is a fundamental necessity for the maintenance of civilization and of all government, and is constantly, outside of sheer barbarism, everywhere maintained—no such result has been attained. In no department of economic science is there so much of obscurity and conflicting opinion. "Most economists agree, that there is no science of taxation as there is a science of exchanges"; and "that there are no great natural laws running through and controlling taxation and its effects." And while the student will find examples in the history of states or govern-

ments of the practical application of almost every form of taxation which human ingenuity, prompted by necessity, selfishness or greed, could devise; and a sufficient record of effects, to warrant the drawing of general and correct inferences, it is nevertheless probably true, that there is not, at the present time, a single existing tax decreed by despotism, or authorized by the representatives of the tax payers, which has been primarily adopted or enacted *solely* with reference to any involved economic principles, or which has primarily sought to establish the largest practical conformity under the existing circumstances to what are acknowledged to be the fundamental principles of equity, justice and rational liberty. But, on the contrary, the influence of temporary circumstances, as viewed in most instances from the standpoint of a governmental administration—despotism or republican alike—desirous of retaining power, has ever been the controlling motive in determining the character of taxation; or, as Colbert, the celebrated finance minister of Louis XIV., is reported to have expressed it, in saying, “that the act of taxation consists in so plucking the goose [*i. e.*, the people] as to procure the largest quantity of feathers with the least possible amount of squealing.” Hence, apart from its methods of distributing power and patronage, the popular idea of evil, as connected with government, may almost always be referred back to unequal or excessive taxation as a source; and to the reality of which, as evils, more than to any other one agency, may be referred the French revolution, and the ferocity with which it was conducted. Hence, also, the preference almost always shown, on the part alike of those who enact and those who pay taxes, for *indirect* taxation, which very successfully blinds the tax payer as to the amount which he pays, and as to the time and place of its collection. And hence, finally, the idea, which has come to be all but universally entertained, that taxation *per se* is in itself an evil; something to be avoided if possible, and an escape from which is always “good fortune”; when the real truth undoubtedly is, that there is no one act which can be performed by a community, which brings in so large return to the credit of civilization and general happiness, as the judicious expenditure, for public purposes, of a fair percentage of the general wealth raised by an equitable system of taxation. The fruits of such expenditure are, general education and general health; improved roads, diminished expenses of transportation, and security for life and property. And it will be found to be a general rule, that no high degree of civilization can be maintained in a community, and indeed that no highly civilized community can exist, without comparatively large taxation; the converse of this proposition, however, at the same time not being admitted, that the existence of high taxes are necessarily a sign of high civilization. In short, taxation in itself is no more of an evil than any other necessary and desirable form of

expenditure; but it is an evil when taxation is rendered excessive through injudicious or wasteful expenditures; or when, by reason of ill adjustment, the levy of the tax is made an occasion for the collection from the people, through the enhancement of profits and prices, of a far greater sum than is requisite to meet the public requirements. — Adam Smith, in his “Wealth of Nations,” laid down four canons, or maxims, (to be hereafter stated), in respect to the levying and collection of taxes in general, which, as they are constantly quoted and referred to with favor, have a better claim to be regarded as in the nature of fundamental truths than any other propositions which have thus far been formulated on this subject. But as these propositions are, as their author characterized them, “general,” and not particular, in their nature; and as at least one of them is, in the light of a larger experience, not considered as correct, there is, it must be conceded, much warrant for the assumption, that in the sense of propositions, or rules, universally, or in any large degree, recognized and made the basis of practical application, there are no principles of taxation. To admit the correctness of such an assumption, is, however, at the same time to confess, that human knowledge, in at least one department, has reached its largest limit; and that a class of transactions, which, more than almost any other, are determinative of the distribution of wealth, and the forms in which industry shall be exerted, are best directed by accident or caprice. It is accordingly proposed, in the present article, to make the true state of the case the main objective of inquiry; and, in place of framing any theory at the outset, to rather aim to place before the reader such a review of our knowledge of this subject, and more especially such a summary of the most recent experiences and investigations, as will qualify him for the forming of an opinion, whether any deductions which may be made are to be regarded as merely curious or valuable contributions to the department of economic science under consideration, or whether they rise to the dignity and importance of fundamental and incontrovertible truths or propositions. And as the first step in such a discussion, it is important to start with a definition, and define, at the outset, what is meant by *taxation*. — *Taxation* (from the Latin *taxo*, or *taxare*, “to rate,” “to value”), in the ordinary sense, means the act or process of apportioning or assessing, and of collecting or gathering from a people, a portion of their property, for the use or support of their government, and for all public needs. The command of a constant and adequate revenue being absolutely essential to the existence of organized government, the power to compel or enforce contributions from the people governed, or, as it is termed, “to tax,” is inherent in and an incident of every sovereignty, and rests upon necessity. The question of the obtaining of such revenue, obviously, therefore, is the question of first importance in the economy of a state; the one in

comparison with which all others are subordinate. For without revenue (and a government never has any resources except what it has obtained from the people), regularly and uniformly obtainable and coming in, no governmental machinery for the protection of life and property, through the dispensing of justice, and the providing for the common defense, could long be maintained; and in default thereof, production would stop or be reduced to a minimum, accumulations would cease or become speedily exhausted, and civilization would inevitably give place to barbarism and the wilderness. — Again, *the power of taxation being an incident of sovereignty, the right to exercise that power must be coextensive with that of which it is the incident; or, in other words, as the power of every complete sovereignty over the persons and property of its subjects is unlimited, the power, therefore, in every such sovereignty to compel contributions for the service of the state, or, as we term it, "to tax," must be unrestricted. Thus, "the power to tax," says Chief Justice Marshall, in giving the opinion of the supreme court denying the right of Maryland to tax the bank of the United States, "involves the power to destroy"; and in the case of Weston vs. The City of Charleston, the same court, by the same eminent authority, held further, "that if the right to impose a tax exists, it is a right which in its nature acknowledges no limits. It may be carried to any extent within the jurisdiction of the state or corporation which imposes it, which the will of such state or corporation may prescribe."* In the United States, however, it may be here noted, that the sovereignty of the national government, and of the separate states, is materially limited in respect to both taxation and other matters; on the one hand, in virtue of an agreement of union accepted by all the states, and known as the federal constitution; and on the other, in virtue of certain original powers retained by the states, and not delegated by them, in entering the federal Union, to any other or higher sovereignty. Thus, no state of the federal Union can impose any tax upon any agency of the federal government, its mails, its custom houses, its lands, its judicial processes, its money, or through its evidences of indebtedness, upon its credit or borrowing power. On the other hand, the federal government can not tax the agencies or instrumentalities by which any state performs its functions. That such reciprocal limitations are natural and necessary, and exist by implication, not only in the constitution of the United States, but also in the very structure of the federal Union, must be evident, when one reflects that otherwise the federal government on the one hand, and the governments of the states on the other, might impose taxation to an extent that would cripple, if not wholly defeat, the operations of the two authorities, each within its respective and proper sphere of action.— *Natural Limitations on the Meaning and Exercise of Taxation.* The term taxation, however, in-

volves something more than the mere act of taking on the part of a government, or its unrestrained power of compelling contributions for the use of the state. *The essence of all taxation consists in making the burden of taxation equal upon all subjects of immediate competition; and when this principle is violated, the act of taking, or the enforced contribution, is no longer entitled to be considered taxation, but becomes at once an arbitrary spoliation or confiscation.* Thus, to illustrate: suppose it were proposed to tax the stock in trade of red-haired men 5 per cent., and those of red-nosed men 10 per cent.; or (as was proposed by a bill introduced into the congress of the United States in 1874) to exempt incomes below \$5,000 from taxation, and tax those equal to \$5,000 5 per cent., and all above, 10 per cent.; or to do as actually once was done in England under an income tax law enacted in 1691—tax Catholics at rates double those imposed on Protestants, it seems clear that such transactions could not involve any principle, or be regarded in any other light than the mere arbitrary and despotic exercise of power; or the making of the possession of a red nose, or red hair, or the result of enterprise, skill, economy, or the fortuitous circumstance of birth or belief, the occasion for inflicting a penalty. Yet, this was what substantially was done in the middle ages, when nobles were exempt from taxation because they were nobles, and the common people were taxed because they were villains or bondsmen; when Jews were assessed because they were not Christians, and Catholics because they were not Protestants. And if it be said, as it doubtless will be, in rejoinder to a part of the above illustration, that the rich, by reason of their riches, are abundantly able to pay, and, therefore, should be made to, the answer is, that under a universal and uniform income tax (if there could be such a thing), which would establish a comparative equality of burden, they would pay more by an inevitable law and yet pay equally; while under an unequal law, which takes from them because they are rich, the act of taking has no claim to be considered a tax, but is simply confiscation. For if the state may take five per cent. from the man with \$5,000 income, and ten per cent. from the man with more than \$5,000, why stop at this amount? We have not approximated the limit or capability of the persons assessed to make contributions. Why not take all that such individuals receive in excess of the average income of the masses? Why not divide up and put every one on an equality? The advocacy of any such forms of contribution under the name of taxation (although the advocates may not be, and generally are not, aware of it), is simply, therefore, the advocacy of the most radical principles of communism. There is, accordingly, a broad and philosophical distinction, which may be claimed to rise to the dignity of an economic principle, between "taxation" and "arbitrary taking." In the soundings which have been made at great depths in the

ocean for telegraphic or other purposes, the sounding line has not unfrequently brought up from the bottom small-chambered shells or other minute animals of exquisite organization and structure; and the question naturally arises, In what manner can these minute organisms live and flourish under the enormous pressure that in some instances must be exerted, of at least three tons to the square inch? The explanation is to be found in the circumstance that the pressure is everywhere equalized, being as much from within outward as from without inward, and thus an equilibrium is maintained under which development goes on and existence is made possible; and it is in preserving this equilibrium, this equalization of pressure (says Mr. Lowe, from whose speech as chancellor of the English exchequer the above illustration is derived), that the whole secret of taxation consists. All experience shows that a people who are moderately prosperous will bear the heaviest burdens of taxation without complaint when they feel that the distribution is just and equal; but when the distribution is unequal, somebody inevitably is being either plundered or crushed. — *Limitations of Territorial Sovereignty and Limitations of the Taxing Power Coextensive*. It would seem to be in the nature of a self evident proposition, although in fact it is by no means so regarded, that the power of every state or government to tax, must be exclusively limited to subjects within its territory and legal jurisdiction. "All subjects," says Chief Justice Marshall, in giving the opinion of the supreme court, in the case of *McCullough vs. Maryland* (4 Wheaton, 431), "*over which the sovereign power of the state extends, are objects of taxation; but those over which it does not extend, are, on the soundest principles, exempt from taxation.*" * * The sovereign power of the state extends to everything which exists by its own authority or is introduced by its permission." "Every nation," says Wheaton, "possesses and exercises exclusive sovereignty and jurisdiction throughout the full extent of its territory. It follows, from this principle, that the laws of every state control, of right, all the real and personal property within its territory. The second general principle is, that no state can, by its laws, directly affect, bind or regulate property beyond its own territory. This is a consequence of the first general principle; a different system, which would recognize in each state the power of regulating persons or things beyond its territory, would exclude the equality of rights among different states, and the exclusive sovereignty which belongs to each of them." (Wheaton's International Law, chap. ii., § 2; Fœlix International Prisé, §§ 9 and 10.) And in a decision of more recent date (*State Tax on Foreign-held Bonds*, 15 Wallace, 306, 328), the United States supreme court said: "The power of taxation, however vast in its character and searching in its extent, is necessarily limited to subjects within the jurisdiction of the state. Property lying beyond the jurisdiction of the state is not a subject upon which her

taxing power can be legitimately exercised. Indeed, it would seem that no adjudication should be necessary to establish so obvious a proposition." — *Protection the Correlative of Taxation*. The correlative of taxation, furthermore, is protection; or, in other words, according to the political theory of our governments, national and state, and in fact of every government claiming the title to be free, taxes are the compensation which property pays the state for protection. "*Taxes are a portion which each individual gives of his property, in order to secure and have the perfect enjoyment of the remainder.*" Governments are established for the protection of persons and property within the limits of the state, and taxes are levied to enable the government to afford and give such protection. They are the price and consideration of the protection afforded." (Ingersol, J., Circuit Court of the United States, *Duer vs. Small*.) "There is nothing poetic about tax laws. When they find property, they claim a contribution for its protection." (Lowrie, Chief Justice, *Tinley vs. The City*, etc., 32 Penn., 381.) Montesquieu, writing with the monarchical institutions of France mainly or solely in view, discusses this subject in his "Spirit of Laws" (book xxxi., ch. i.) as follows: "The public revenues are a portion that each subject gives of his property, in order to secure or enjoy the remainder." — These fundamental principles, defining sovereignty in respect to taxation are, however, violated, either in theory or practice, by most of the states in the federal Union (but not in other countries) in their exercise of the taxing power; as, for example, in Massachusetts, where the law defines personal estate for purposes of taxation so as to include "goods, chattels, money and effects, wherever they are; ships, public stocks and securities, stocks in turnpikes, bridges and moneyed corporations *within or without the state*"; and where the administrators of the law tax *residents* for personal property, even of a visible, tangible character, having a *situs* in another state or country; and, by another and irreconcilable rule, tax *non-residents* for all of their personal property having a *situs* within the state. The claim or argument, however, which the advocates of such a system set up in its defense is, that personal property (more especially what is termed in law *choses in action*, or credits, titles, notes, bonds, mortgages, which are in their nature incorporeal, and therefore invisible and intangible) has no *situs*, and, therefore, follows and adopts that of its owner. But this rule or fiction of law—*mobilia personam sequuntur*—was never invented with a view of its being used as a rule to govern and define the application and scope of taxation, but was originally a device of international comity, intended to subserve the convenience of the owner of property; "by which a state holding jurisdiction of the property permits an act, done by the non-resident owner at his domicile, to have the same effect, touching it, as if done at the *locus situs*. It means, simply, that for the purpose of sale, distribution, or other disposition of the prop-

erty, any act, agreement or authority, which is sufficient in law where the owner resides, shall pass the property where it is; and the true and right use of it is to facilitate affairs of commerce and the distribution of decedents' estates, by enabling parties to dispose of their property without embarrassment from their ignorance of the laws of the country where it is situated." (Catlin vs. Hall, 21 Vermont, 152.) It would be a more accurate rendering of the rule to say, "Personal property follows the law of the owner's domicile," and not, as in effect claimed, that the law of the owner's domicile follows the property. But "no fiction," says Blackstone, "shall extend to work an injury; its proper operation being to prevent a mischief or remedy an inconvenience, which might result from the general rule of law." At any attempt to misapply a fiction, it falls within and is terminated by that other authoritative maxim of logic and the common law, *cessante ratiōne legis, cessat ipsa lex*. Another great authority in law, Lord Mansfield, says: "Fictions of law hold only in respect of the ends and purposes for which they were invented; when they are urged to an intent and purpose not within the reason and policy of the fiction, the other party may show the truth." It is also worthy of note, that in Rome, where this fiction originated, its applicability to property was never held, according to Savigny, to extend beyond Roman territory.*—It is a curious fact,

* "But it may be said, that the state in taxing personal property situate beyond its territory, does not in fact tax the property, but the owner, over whom the state has jurisdiction in respect to such property. In answer to this claim, attention is here asked to the following extract from an argument made some years ago by Mr. G. P. Lowrey, of New York, before a committee of the legislature of New York, when this subject was up before them for consideration. 'This claim,' he said, 'involves a dangerous inaccuracy, and arises from a confusion of the idea of the assessment with the idea of the tax. These two stand upon altogether different bases. The assessment is to the person in respect to the property; but the tax is to the property in respect to itself alone. In the order of consequence a tax goes before an assessment. A tax stands upon an existing relation between the property and the state, as protector and protected, and is that portion of the public burden which the property ought to bear because of that existing relation. An assessment stands upon the existing relation between the property and its owner or possessor; it follows the tax, and is merely the method of securing it. The danger, in saying that the tax is to the person in respect of his property, is, that, by the form of the expression we justify an assessment upon a person for all property indiscriminately. We transpose the subjects, and make the law seek out the person, and then tax him according to his property, instead of first seeking property which it has a right to tax, and then as a secondary matter, a person to whom it may be assessed. Even if a knowledge of the property is obtained by inquiry addressed to the owner in the shape of a general assessment, still the rationale of the matter presupposes the right to tax on account of the property and our relation to it directly. If we disregard this rationale, we may, perhaps, register an assessment where we are not entitled to levy a tax.'—The person to whom the assessment is made need not be the owner. He may be the agent, trustee, guardian, executor or administrator. This is because the property, which owes the tax by reason of being protected, has not hands wherewith to take from itself a portion of itself, to pay for protection to be accorded to the remainder. Therefore the law, following the property to get the tax, makes its demand upon whoever it finds in possession, without inquiring upon what interest

also, that those states which adopt, in their systems of taxation, the rule of taxing property beyond their sovereignty or territorial jurisdiction, by reason of the possession of its owner, do not carry the principle involved to its logical conclusion, and tax real estate similarly situated. But for this distinction no good reasons can be given, although pretexts, claiming to be reasons, may. One claim, however, is obviously as good as the other. A robber who should draw romantic distinctions between watches and purses, would fail in business. If we are to be robbers in practice, let us, at least, secure some grace by honesty in our professions, and admit that what we thus

the property is based. This it does, ignoring all persons beneficially interested in the title, even the owner himself. 'Every person,' says the statutes of New York, 'shall be assessed, etc., for all personal property owned by him, including all property in his possession, or under his control, as agent, trustee, guardian, etc.'—Thus it will be seen, that, for the purpose of assessment, possession is a title superior to ownership. And I now reiterate, that, according to the theory of our government, a tax stands upon the just obligation of all property to contribute to the support of the power which protects it; but that the assessment stands upon the possession or power of the person assessed, over the property taxed. This may be further illustrated. Movables can never be out of the actual or constructive presence of some one, and, therefore, there is always a person *in esse* to whom the assessment may be made. But the case is very different with the immovables, and therefore, lands are often taxed and assessed by their own name and designation, and specifically sold to satisfy the specific assessment, no person's name anywhere appearing in the proceedings.—Keeping this vital distinction between an assessment and a tax clearly in view the mind will come by easy steps to an understanding of how it is that a tax, to a man who has no property in the state, is a tax upon his person. Process is the eye of the law. Its vision is limited by territorial boundaries. Whatever does not exist within that limit, does not, for any purpose of law, exist at all. The rich man, whose property is in Europe, and the pauper, whose property is nowhere, are then equal, as persons, before the law. A tax upon a pauper would be a personal tax. A tax upon the rich man is, by unimpeachable parity of reason, the same. Such a tax would be a gross solecism on our system. The philosophy of our plan of voluntary political association, is that all individuals, and all the values within a community, shall aggregate into one mass all the power which they separately contain, which sum total shall constitute a sovereignty of the whole. This sovereignty—the soul of the state, which can not be impaired, and the state survive—reflects back upon its constituents, in detail, all that it has received from them. What it receives, and what it returns, is of two kinds, as to both source and object, viz., individual service to the government, and protection to the individual from it. Thus, in his individual capacity, a man is bound to perform military service, and the state, by the military arm, is bound to protect him from invasion. He is bound to do jury duty, and the authorities are bound, upon his demand, to provide him a jury. He is bound to aid the sheriff, and the sheriff is bound to execute process in his favor by *posse comitatus*, if necessary. These personal services correspond to those which in feudal times the mesne lord holding a frank tenement owed the lord paramount. They can not be compounded for, for their value consists in their being rendered in kind. *Their performance is the only price which the citizen pays for his citizenship.* The terms are not only consistent and harmonious with our general scheme of government, but are highly politic. They are a liberal invitation to all men to come and add to ours their lives, their hopes, their strength, labor and courage, that we may build up a nation. To all political privileges we admit each one by virtue of his being a man, free born and of lawful age, we ask him nothing concerning his property, unless his property asks something from us."

take is not a tax received as the just recompense of a benefit conferred, but a compulsory levy, having its cause in our greed, and its justification in our power; and as these reasons are as good for a large levy as a small one, and the whole of a man's estate is greater than its part, why not take the whole? "Still further," says Mr. Lowrey, "if we tax a man (in New York or Massachusetts) who has come from Connecticut or England to stay a year, for the property he has left behind, why not the man who has come for a week?" If we are to do business upon the principle that "might makes right," would it not be a brilliant stroke to station ourselves at all the avenues of ingress to a state, and cry "Stand and deliver" to the passengers? From the above citations and arguments, the conclusion would seem to be inevitable, that when a state assesses property situated beyond its territory and jurisdiction, and which its laws and processes are not competent or able to either reach or protect, or assesses one of its own citizens in respect to such property, the act has no claim to be regarded as taxation, but is simply *arbitrary taking*, in no respect different in principle from confiscation.—It will be also here interesting to recall some of the antecedents of this fiction of law, that personal property, irrespective of its *situs*, follows the owner for the purpose of taxation. Its prototype was the ancient *taille*, or tax of servitude, imposed on persons originally bondmen, or on all persons who held *in farm or lease*, or resided on lands of the suzerain; and from which proprietors or suzerains of the land were exempt. And as no vassal could at will divest himself of servitude or allegiance to his lord or suzerain, so the obligation to pay taxes always remained upon him as a personal servitude, whatever might be the location of his property. In other words, the condition of the masses all over Europe during the middle ages was not unlike the condition of the slaves in the United States previous to emancipation. They (the slaves) had property in their possession, and spoke of themselves as owners of property, but in reality their property followed the condition of the servitude of their persons, and both persons and property belonged equally to the masters. The *taille*, furthermore, as a badge of servitude, was supposed to dishonor whoever was subject to it, and degrade him, not only below the rank of a gentleman, but of that of a burgher, or inhabitant of a borough or town; and "no gentleman, or even any burgher," says Adam Smith, "who has stock will submit to this degradation." Now, the idea embodied in the word servitude is, an obligation to render service, irrespective of, or without, compensation; and the idea upon which the taxation of personal property in this country has been based is, that the property owes a servitude to the state where the owner resides, irrespective of its actual location, in virtue of the obligation which its owner, as a citizen, may owe to the state by reason of the protection which the state gives him in respect to his

person.—Again, in old times, the division of property into real and personal was wholly unknown; and under the common law, all property was classed as lands, tenements, hereditaments, and goods and chattels. "In the course of time, however, leases of land for a term of years were classed as chattels, and were distinguished as *chattels real*; while other chattels, which did not savor of lands, were called *chattels personal*, 'because,' says Lord Coke, 'for the most part they belong to the person of a man, or else for that, they are to be recovered by personal actions.' And Blackstone tells us, that 'chattels personal are property, and strictly speaking, things movable, which may be annexed to or attendant on the person of the owner, and carried about with him from one part of the world to another'; and as instances, he mentions money, jewelry, garments. Personal property, in fact, consisted almost entirely of such things as could be, and actually were, carried about with the person of the owner, or could be easily secreted. And Blackstone also tells us, that the amount of the personal estate of our ancestors, was so trifling that they entertained a very low and contemptuous opinion of it; and that 'our ancient law books do not, therefore, often condescend to regulate this species of property.' Nothing of an incorporeal nature was anciently comprehended within the class of personal chattels. It was otherwise as to lands or real property, as to which 'incorporeal hereditaments' occupied a conspicuous place from the earliest times. Such was personal property in the early history of our laws. It was of comparatively small importance, and its laws were few and simple; while real property, being of a fixed and permanent nature, was regarded as immeasurably more valuable, and was governed by laws of its own, of the most intricate and abstruse character. Both species of property, when compared with that of our own time, were of small pecuniary value; but between the importance attached to personal and movable property, and the value of real property, there was a difference vastly greater than that which now exists, both because of the comparative insignificant value of personalty, and because of the feudal tenure by which lands were held, out of which grew some of the most important consequences to both the land and the person. From these circumstances arose the notion, which became a fiction of the law, that property merely personal always attended the person of its owner; while lands, tenements and hereditaments, being fixed and immovable, and of infinitely more consideration, were held, from their very nature, as well as from motives of political policy, to have a *situs* of their own, from which they derived their laws and incidents wholly regardless of the domicile of the owner. Growing out of the same reasons, it was also the prevailing opinion, that while immovables were exclusively governed by the law of locality, movables were controlled, according to the same maxim, by the law of the domicile of the owner, and not by that of its *situs*." In

the changed condition of wealth and property, such a fiction, however suitable and useful in primitive times, would now, in many cases, work the greatest injustice, and impair the supremacy which every government should maintain over everything within its territory, both on the ground of public expediency and the private interests of its citizens. And according to Wharton (Treatise on the Conflict of Laws, 1872), this fiction of law has been universally abandoned upon the continent of Europe, except in cases as to rights in respect to personalty, which spring from marriage and succession. (Hutchinson, "Southern Law Review.")—Finally, the attention of the reader or student should be asked to another interesting point in connection with this subject; and that is, that if this article were to have been written by a European, for incorporation into any foreign publication, this discussion of the taxation of extra-territorial property by a state would have no place, except possibly in review of curious tax experiences; for the reason, that nowhere, except in the United States, is there any such system of taxation, or any tolerance given to the ideas upon which it is founded. — *Legitimate Taxation Limited to Public Purposes.* Although this proposition has rarely received any notice or consideration by writers on the subject of taxation, and under despotic governments (where there is no restraint on the adoption of any economic policy on the part of the state) would obviously be regarded as of no consequence, or, if conceded, would be nullified by regarding the wishes or whims of the ruler and public purposes as matters synonymous, the experience of the United States, and the decisions of its highest courts, have nevertheless combined to establish it as an economic and legal principle under a free government of the very first importance. The record of this experience may be told as follows: In 1872 the legislature of the state of Kansas passed a law authorizing counties and towns of that state "to encourage the establishment of manufactories and such other enterprises as may tend to develop" such counties or towns by the direct appropriation of money, or by the issue of bonds to any amount that the local authorities might consider expedient; and under this act the city of Topeka created and issued its bonds, to the extent of \$100,000, and gave the same "as a donation," a majority of voters approving, to an iron-bridge company, as a consideration for establishing and operating their shops within the limits of the city. The interest coupons first due on these bonds were promptly paid by the city out of a fund raised by taxation for that purpose, but subsequently, when the second coupons became due, and the bonds had passed out of the possession of the bridge company by *bona fide* sale to a loan association, the city repudiated its obligations, on the ground that the legislature of Kansas had no authority, under the constitution of the state, to authorize the issue of bonds, the interest and principal of which were to be paid from the pro-

ceeds of taxes, for any such purpose as the encouragement of manufacturing enterprises. Legal proceedings to enforce payment were thereupon commenced by the bondholders in the United States circuit court, and judgment having been there given for the city, the case was appealed to the United States supreme court, where, with only one dissenting voice, the judgment of the lower court was affirmed, and the following opinions or statement of principles involved given: "It must be conceded," said the court, through Mr. Justice Miller, "that there are rights in every free government beyond the control of the state. A government which recognized no such rights, which held the lives, the liberty and the property of its citizens subject at all times to the absolute disposition and unbounded control of even the most democratic depository of power, is after all but a despotism. It is true it is a despotism of the many, of the majority, if you choose to call it so, but it is none the less a despotism." * * "The theory of our governments, state and national, is opposed to the deposit of unlimited power anywhere. The executive, the legislative and the judicial branches of these governments are all of limited and defined powers. There are limitations of such powers which grow out of the essential nature of all free governments—implied reservations of individual rights, without which the social compact could not exist, which are respected by all governments entitled to the name." * * "Of all the powers conferred upon the government, that of taxation is most liable to abuse. Given a purpose or object for which taxation may be lawfully used, and the extent of its exercise is in its very nature unlimited. This power can as readily be employed against one class of individuals and in favor of another, so as to ruin the one class and give unlimited wealth and prosperity to the other, if there are no implied limitations of the uses for which the power may be exercised. *To lay with one hand the power of the government on the property of the citizen, and with the other bestow it upon favored individuals to aid private enterprises and build up private fortunes, is none the less robbery because it is done under the forms of the law and is called taxation.* This is not legislation. It is a decree under legislative forms. Nor is it taxation. Beyond a cavil there can be no lawful tax which is not laid for a public purpose. * * It may not be easy to draw the line in all cases so as to decide what is a public purpose in this sense, and what is not. But in the case before us, in which towns are authorized to contribute aid by way of taxation to any class of manufacturers, there is no difficulty in holding that this is not such a public purpose as we have been considering. If it be said that a benefit results to the local public of a town by establishing manufactures, the same may be said of any other business or pursuit which employs capital or labor. The merchant, the mechanic, the inn-keeper, the banker, the builder, the steamboat owner, are equally pro-

moters of the public good, and equally deserving the aid of the citizens by forced contributions. No line can be drawn in favor of the manufacturer, which would not open the public treasury to the importunities of two-thirds of the business men of the city or town."— Other judicial authorities in the United States to whom weight is accorded, have also concurred in this opinion. Thus, Thos. M. Cooley, one of the justices of the supreme court of Michigan, and professor of law in the university of that state, in his work, "Principles of Constitutional Law," thus defines the limits of taxation under the constitution of the United States: "Constitutionally a tax can have no other basis than the raising of revenue for public purposes, and whatever governmental exaction has not this basis, is tyrannical and unlawful. A tax on imports, therefore, the purpose of which is not to raise a revenue, but to discourage and indirectly prohibit some particular import for the benefit of some home manufacture, may well be questioned, as being merely colorable, and therefore not warranted by constitutional principles." The question at issue has also formed the subject of review by the supreme court of the state of Maine, and the following are extracts from the opinions given by the members of this tribunal respecting the limitations on the powers of a free government to impose taxes: "No public exigency can require private spoliation for the private benefit of favored individuals. If the citizen is protected in his property by the constitution against the public, much more is he against private rapacity." "If it were proposed to pass an act enabling the inhabitants of the several towns to vote to transfer the farms, or the horses, or oxen, or a part thereof, from the rightful owner or owners to some manufacturer, whom the majority might select, the monstrousness of such proposed legislation would be transparent. But the mode by which property would be taken from one or many, and given to another, or others, can make no difference in the underlying principle. It is the taking that constitutes the wrong, no matter how taken." "Taxation," said the chief justice (in giving an opinion adverse to the right of a town to grant aid, under a permissible statute of the state legislature, to a manufacturing enterprise), "by the very meaning of the term, implies the raising of money for public uses, and excludes the raising of it for private objects and purposes." "No authority or even dictum can be found," observes Dillon, C. J., in *Hanson vs. Vernon*, 27 Iowa, 28, "which asserts that there can be any legitimate taxation, when the money to be raised does not go into the public treasury, or is not destined for the use of the government, or some of the governmental divisions of the state." "If there is any proposition about which there is an entire and uniform weight of judicial authority, it is that taxes are to be imposed for the use of the people of the state in the varied and manifold purposes of government, and not for private objects or the

special benefit of individuals. While the state is bound to protect all, it ceases to give that just protection, when it affords undue advantages, or gives special and exclusive privileges to particular individuals and particular and special industries at the cost and charge of the rest of the community." In short, the right of a government to levy discriminating taxes for purposes other than for defraying public expenditures, even though any injustice thereby done to the individual is more than compensated by some indirect benefit to the entire community, is one of those forms of procedure on the part of the state which is antagonistic to the principles of a free government, and which, if fully recognized and broadly carried out, will of necessity be utterly destructive of it; and in respect to which, as in the case of a tax to support an established church, or of a law compelling every man to help catch a fugitive slave, the dissent and resistance of even one citizen makes unjust any enactment authorizing such procedure. — *Subjects of Taxation.* The subjects of taxation, to use a happy generalization of the United States supreme court (*Foreign-held Bond Case*, 15 Wallace), "are persons, property and business. Whatever form taxation may assume, whether as duties, imposts, excises or licenses, it must relate to one of these subjects. It is not possible to conceive of any other, though as applied to them the taxation may be exercised in a great variety of ways." — A tax upon a person is a "poll" or head tax. The essential requisite of a poll tax is, that it be laid on all polls, and be unvarying in amount. A varying poll tax would be an arbitrary exaction, and would not be sustained for a moment as a proper exercise of the right of taxation, if laid without reference to a man's ownership of property. So soon, however, as the amount of the tax exacted is made dependent upon the amount of the property owned, the tax ceases to be a varying poll tax and becomes a tax on the property itself. — *Apportionment of Taxation.* This department of the subject of taxation, while the most practical, and, therefore, the most interesting, is at the same time the one most obscure, and the one about which there is the most striking difference of opinion among writers on economic and fiscal subjects. The following four maxims, or canons, laid down by Adam Smith in his "Wealth of Nations," have attained a world-wide celebrity, and are almost always referred to in all discussions of the subject. 1. "The subjects of every state ought to contribute to the support of the government as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state." 2. "The tax which each individual is bound to pay ought to be certain, and not arbitrary. The time of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the contributor and to every other person. The certainty of what each individual ought to pay is, in taxation, of so great importance, that a very considerable

degree of inequality, I believe, from the experience of all nations, is not near so great an evil as a very small degree of uncertainty." 3. "Every tax ought to be levied at the time and in the manner in which it is most likely to be convenient for the contributor to pay it." 4. "Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state."—Almost universally accepted, as the embodiment of the highest wisdom, these four canons or maxims have been, and are, nevertheless, open to some criticism. In the first place, they are so general in their nature, and so lacking in any precise rule or test for application, that they stand in the light of aphorisms, somewhat as the maxims "Honesty is the best policy," "Never put off till to-morrow what can be done to-day," etc., to which all respect is always given, except the desirable one, of practical use in actual cases. In fact, the originators of the very worst forms of taxation now existing, might and probably would plead, that their methods or practices were based on the ideas of Adam Smith, or were as near in conformity to them as was possible under the existing circumstances. Again, the first maxim or canon embodies two propositions antagonistic to each other, and one of which can hardly be considered correct, namely, that every citizen should pay taxes for the support of the government in proportion to his ability; for if, as almost all authorities are now agreed, taxes are the compensation which persons or property pay to the state for protection, then it of necessity follows, that where there is no protection, ability is no just guide for assessment. "Where there is no protection," said Judge Story (in the case of *United States vs. Rice*, 4 *Wheaton*, 276) "there can be no claim to allegiance or obedience" And that Adam Smith did not intend to have his first proposition fully accepted would seem evident from the circumstance that he added to it, and qualified it with these other words, "that is, in proportion to the revenue which they (the citizens) respectively enjoy under the protection of the state." Montesquieu, who wrote at an earlier date, also enunciated even more clearly this common-sense and equitable principle, when he said (see "Spirit of the Laws"), "that the public revenues ought not to be measured by the people's abilities to give, but by what they ought to give." "And what they ought to give," as has been remarked by another writer, "can of course be only measured by the benefit they are to derive."—*The True Measure of the Burden of Taxation on Production*. In addition to the maxims or canons proposed by Adam Smith, another, first pointed out by Mr. Edward Atkinson, of Massachusetts, is worthy of being added, and may even be regarded in the light of a fundamental principle; and that is, *that the burden or injurious effect of a tax on production or exchange, is not to be measured by the ratio which the tax may bear to the gross value*

of the subject of taxation, but rather by the proportion which the tax bears to the profit which might normally or naturally result from undertaking a certain line of industry or product. To practically illustrate this, let us take an example. Let us suppose two men, A and B, to start shops for the manufacture of machinery, each with a capital of \$20,000, and that each in his operations expends \$20,000 for coal and iron, \$40,000 in wages, and \$4,000 for transportation to the shops of the raw materials for manufacture. The total cost of the annual product of each shop will then be \$64,000, or a little more than three times the capital; and a sale of their respective products, at the net price of \$66,000, would yield the owners \$2,000, or 10 per cent. profit. Now, suppose further, that under such conditions, A has a tax imposed upon him of 3½ per cent. upon the value of his product; it may be a customs or excise tax, or an increased rate of railroad freight. This amounts to \$2,000 on \$64,000 of product; no excessive burden, it may be said, and only requiring A to sell his \$66,000 for \$2,000 additional. But suppose A can not get this \$2,000 additional; and he certainly can not, if the other man, B, is exempt from this 3½ per cent. tax, or contrives to evade it, and competes with A in the open market. Then, in such a case, this 3½ per cent. tax upon product manifests itself as 10 per cent. upon the entire investment, and absorbs the entire profits, which otherwise might have been realized; so that the business of A first drags, then stagnates, and is finally abandoned; while his workmen are discharged, the village where the shop is located runs down, the artisans, shopkeepers and professional men connected with it complain of hard times, and emigrate from the locality or the country, while the railroad fails to confer all the benefit to the community or profit to its stockholders that might be possible. B, on the other hand, exempt from the tax, keeps on working, and, when hard times come, continues his sales and the occupations of his workmen by taking five per cent. profits instead of ten, and selling his goods, as he can afford to, at reduced prices, to meet temporary conditions. Actual practical illustrations of the injustice and disaster consequent on such discrimination in respect to tax burdens and exemptions are afforded on a small scale in the history of much railroad management, and to a larger extent where two nations, with different systems of taxation, undertake to compete with each other in the sale of the products of their labor in the common markets of the world. We find here an explanation, also, of the immediate beneficial effects which attended the first tentative measures of reform in the British tariff instituted by Sir Robert Peel in 1842 and 1845, which, although consisting mainly in the removal of numerous small but obstructive duties, nevertheless started British industry forward by leaps and bounds, even before the larger burdens of tariff restrictions were removed in later years. — *Popular*

Theory of Taxation in the United States Stated and Examined. The general idea which constitutes the basis of the system of local taxation mainly recognized in the United States (though not in other countries) is founded on the assumption, that in order to tax equitably, it is necessary to tax everything; the term *everything* being at the same time used in a sense so indefinite as to embrace not merely things in the nature of physical actualities other than persons, but also persons, income, rights, representatives of property, titles, trusts, conclusions of law, debts, and, in short, any act of assessing capable of resulting in the obtaining of revenue. As a logical consequence of this idea, the exemption of anything from taxation is furthermore held to be not only impolitic but unjust, and if made necessary by circumstances, as something to be regretted. — Equally popular and plausible is the argument by which this assumption, and the administrative system based upon it, is upheld and defended. “Is not all property,” it is asked, “either directly, or through its owner, protected by the state, or sovereignty?” “Do not all persons owe allegiance to the state?” And if so, “why should not all persons and property contribute to the requirements of the state for revenue, in proportion to their ability?” — But, popular and plausible as are the arguments and assumptions for such a system of local taxation, which in the case of the United States has been made operative over the persons, property and business of nearly sixty millions of people, and fortified by a vast amount of adjudication, it will require but little investigation and analysis to satisfy any one who can divest himself from the influence of old prejudices, of the truth of the following propositions: *first*, that the assumption that it is necessary to assess everything in order to tax equitably involves an impossibility, and therefore unavoidable inefficiency, injustice and inequality in administration; *second*, that, as popularly used in respect to matters pertaining to taxation, the term *property* is made to apply equally to entities and to symbols or non-entities, which is in itself an absurdity; and *finally*, that the outcome of all this is a system which powerfully contributes to arrest and hinder natural development, to corrupt society, and is without a parallel in any country claiming to be civilized. — In the incipient stages of society, where property consisted almost or quite exclusively of things tangible and visible—lands, buildings, slaves, cattle, ships, household effects and implements—and the rate of taxation was small, the theory under consideration was not impracticable in its application, and under most circumstances afforded but little opportunity for the working of injustice in respect to arbitrary discriminations in assessing. But its full execution must, nevertheless, even in the most simple condition of society, have been always attended with great difficulties; for there is nothing which men more abhor in government than personal inquisitions; and, in the language of a committee of the French national assem-

bly of 1789 (of which Talleyrand and Laroche-foucauld were members), the recognition and practice of such inquisitions by any government is something inconsistent with and antagonistic to the maintenance of a free people. — It is not generally known, furthermore, that Alexander Hamilton, as a member of the conventions which framed the constitution of the United States, and the first constitution of New York, gave all his influence in favor of the restriction of all internal or local taxation to visible, tangible objects, and to the assessment of these specifically and by some uniform and simple rule. The language used by him in one of his papers (the Constitutionalist) on this subject, is as follows: “The genius of liberty reprobates everything arbitrary or discretionary in taxation. It exacts that every man, by a definite and general rule, should know what proportion of his property the state demands. Whatever liberty we may boast in theory, it can not exist in fact while (arbitrary) assessments continue.” — Again, had nothing come down to us in English history from the time of Edward III., other than one of the assessment rolls of that period (when there was little or no property capable of taxation but what was visible and tangible), the evidence would be complete that the mass of the English people were but little better than slaves; for the mere inspection of such rolls shows that their preparation involved such an inquisitorial scrutiny into domestic life, such a seeing, handling and valuation of everything in the household, from the utensils of the kitchen to the furniture of the bed-chamber, as to make personal freedom, or a sense of self-respect, on the part of the tax payer who submitted to such a scrutiny, almost an impossibility.* And in connection with this subject, it is interesting to note, that the famous insurrection of English yeomen and peasants under “Wat” the Tyler, in the reign of Richard II., the successor of Edward III., originated directly in the attempt of a tax gatherer or assessor to ascertain, by brutal personal examination, whether a daughter of “Wat” had attained the age of puberty, and in consequence had so become liable to enrollment for capitation assessment. — But to whatever extent simplicity in the elements of property simplified the original methods and ideas in respect to local taxation, the problem involved rapidly changed, and became more and more intricate as increasing population and increasing commerce and intercommunication required that property should, to a great extent, be put into a condition to admit of being readily mobilized, in order to allow of its most profitable use and application. Thus a large part, in fact, the larger part, of what is to-day termed

* A copy of an assessment roll of the time of Edward III. (1329-67) given by Lingard in his history of England, contains a list of articles, down to a towel and a bench; and the historian notes that in the returns are carefully mentioned the very rooms in which the articles were found, and that there were no exemptions except one suit of clothes for each person, which were supposed to be included in the tax levied on the poll or person.

"personal property" in every highly civilized state, is of the most intangible character, and in great part invisible and incorporeal; such, for example, as negotiable instruments in the form of bills of exchange, state, municipal and corporate bonds, and the multiplied forms of evidence of indebtedness, certificates of stock, copyrights, patents, legal-tender notes, etc., all of which, if entitled to the name of property, is, through a great variety of circumstances constantly fluctuating in value; is offset or measured by indebtedness which may never be the same one hour with another; is easy of transfer, and, as essential to using, is in fact continually transferred from one locality to another, and from the jurisdiction of one state to the jurisdiction and laws of another and a different state. In the absence of some superhuman power which will permit that to be seen, which to ordinary vision is invisible, and to know what through the exercise of ordinary reason can not be known, any attempt, therefore, on the part of an assessor to obtain independent cognizance of such commercial and financial instrumentalities for the purpose of valuation and assessment is, on its face, an impossibility; and if the co-operation of the person to be assessed is to be invited or relied on, two of the most powerful influences that can control human action—love of gain, or the unwillingness to part with property, and the desire to avoid publicity in respect to one's private affairs—immediately unite to oppose and prevent such co-operation.—A resort to personal inquisition, with the accompanying machinery of oaths, "dooming" and penalties, is next in order; under which the state, ignoring all rules enacted for the protection of debtors in the ordinary collection of debts, pursues the citizen for the collection of what it claims to be a debt, with no better result, in nine cases out of ten, than the impairment of the public sense of both justice and morality.*—

* "It is claimed that each individual owes the state annually a certain sum of money in the way of taxes, proportioned to his entire property. If he voluntarily pays, he escapes arbitrary measures. If he declines to pay, or tries to avoid payment, he has no just cause to complain if he is regarded in the light of a criminal, or if the same arbitrary measures are used to collect his tax, as if it were a debt owing by one citizen to another. But let us examine this averment. If the defaulting tax payer is to be regarded as a criminal, and as such placed in the worst possible light, he certainly ought not to be deprived of the privileges of a criminal; which are, a right to a public investigation according to the rules of evidence adopted by free and enlightened communities, a right to be heard before condemnation, and the right to be presumed innocent of having property subject to taxation until the fact is ascertained otherwise by legal proof. But under the existing tax laws of most of the United States there are not accorded to the tax payer the privileges of a criminal; for no tax can be assessed on a large proportion of the personal property of the state according to any rules of legal evidence that any common law court would adopt. No assessor, under the laws of New York, for example, in assessing personal property, can act judicially. The law gives him no power to obtain legal testimony of a character that is admissible in a court; he must act the part of an arbitrary despot against an inculpated tax payer, or not act at all, and his conclusions for acting must be reached at best by the testimony of those who have no

But this statement by no means presents all the difficulties that are encountered in the attempt to carry out the popular theory, that it is necessary to tax everything in order to tax equitably. A further large proportion of the so-called personal property of every highly civilized country which is *not* intangible and invisible, and which requires only ordinary perception for recognition and valuation, is in the nature of instruments or subjects of commerce between states and nations; such as railroad machinery, ships, steamboats, immense stocks of raw and manufactured products accumulated in store for the sole purpose of movement, or actually *in transitu*. What shall be the *situs* of all such things for assessment? If actual location is to be determinative, then a product of grain, or merchandise, which, in movement for a market or conversion into other forms, may happen to be in Illinois in April, in Ohio or Massachusetts in May, in New York in July, in New Jersey in August, and in Connecticut in October, will be liable to five separate taxes in one and the same year; for the laws of each of these states require their assessors to return for taxation all such property as at the periods mentioned may be actually within the sovereignty and jurisdiction of the taxing authority. On the other hand, if the fiction of law that personal property follows the owner is to govern, then all such property may be taxed *where it is not*, and be exempt from taxation in the place *where it actually is*, and where it shares in the benefits that flow from the protective expenditures—police, fire department, etc.—which are incident and necessary to

means of knowing anything, in a legal sense, about the subject matter under investigation. It seems clear, therefore, that any attempt to tax without legal evidence is an act of usurpation or despotism, wholly antagonistic to the principles of a free government, and that it is a mockery to characterize such acts as, in any sense, judicial proceedings. Nor does the right to reduce or regulate the assessment by the oath of the tax payer relieve the law in any degree of its unequal and despotic character; for every individual holding public office knows that oaths, as a guarantee of truth in respect to official statements, have ceased to be of any value. The assessments made according to the oaths of parties, furthermore, are not made according to legal evidence, upon examination and proofs; but according to the will and secret caprice of each tax payer, instigated by his selfishness, and the natural depravity of human nature. Each tax payer, under the present rule, becomes, therefore, the interpreter, not only of the law, but of the fact, and makes a secret interpretation of both, and we have as many interpreters of the law as there are numbers of tax payers; and also an indefinite multiplicity of assessors; for each person who unfairly reduces his own assessment, arbitrarily assesses thereby some other of the community for the difference. Could or would any people apply the same rules for the collection of debts? Is there any one who has so much confidence in human nature that he will propose a law, that a person who is sued shall be discharged from all claims of indebtedness if he will make oath, interpreting both the law and the fact himself, that he owes the claimant nothing? Is it believed, that under tariff laws, the government could get sufficient revenue to pay for its collection, if the importer was permitted to offset debts against the value of his goods; or if the law was peremptory that his oath alone should be given, and that there should be no legal examination, inspection or proof of the value or character of the importations?" (Second Report of Commissioners of New York, 1873.)

the locality. Furthermore, to tax the instrumentalities or objects of commerce in one locality, and to exempt the same from all direct taxation in another, will clearly not permit the former to enter a common market on an equal basis for competition with the latter. And yet this unjust discrimination is exactly what does result from the attempt of a majority of the states of the federal Union to tax all such instrumentalities or objects under the general head of personal property, and the exemption of the same classes of property from any corresponding assessment in the British provinces of North America, and in all foreign countries with which the United States enter into extensive commercial intercourse and competition. Boards of trade and commercial conventions may pass "deploring" resolutions concerning the decay of American commerce, and committees of congress may continue to investigate the same subject, but so long as ships engaged in the carrying trade on the *free ocean*, and owned in Canada, England, France, Germany and Holland, are not directly taxed, and ships engaged in competition in the same business, and owned in Portland, Baltimore, New Orleans and San Francisco, are taxed, and taxed heavily, commerce will incline to move in the paths which are made easy and profitable to it. The difference in cost of a single penny in laying down grain at Liverpool, may alone be determinative of the question whether millions of bushels shall be supplied by the wheat fields of the United States, or those of Russia, India or Hungary. — It is also to be noted, that a very large part of what is termed "personal property" is, through the necessities, policy or organization of governments, made exempt from taxation, as, for example, all instrumentalities and property of a government—its bonds, legal tenders and money—and very generally, also, the deposits and surplus of savings banks. At the present time about one-fifth of all of the personal property of the United States is believed to be embraced within such a category of exemption. And finally, as regards so much of other "personal property" as is tangible and visible and clearly within the jurisdiction and territory of the taxing power, such as articles of personal adornment, clothing, furniture, works of art, musical instruments, books, etc., shall we assume that we have here a class of articles on which it is desirable to levy taxes? Of course the popular answer will be in the affirmative; for are not all these objects, it may be asked, the very ones best fitted to sustain taxation? and are they not in great part luxuries rather than necessities? But how, it may be asked, are you going to tax them? for it is reasonable to suppose that if they are to be taxed, it is to be by a system that works equitably, and not by a system which, by taxing A, and letting B, C and D escape, brings the law into contempt; and, by making the sense of the commission of a wrong on the part of the state the excuse for the commission of another wrong on the part of the individual, grad-

ually undermines the morality of a community that does not wish to be dishonest. — *Distinction between "Real" and "Personal" Property Artificial, and not Natural.* As a further help to the understanding of the subject, it is important to here call attention to the circumstance, that the distinction between real and personal property is, to a very great extent, an artificial and not a natural one. Thus, for example, shares in the national debt of France (as well as stock in the bank of France), instrumentalities which in the United States would be regarded as personal property in its most typical form, may by French law be regarded as real estate, and, as such, administered upon. Again, before emancipation in the United States, slaves (which by the federal constitution were recognized as persons) were in some of the states regarded as real estate, and subject to all the laws pertaining to the mortgaging, sale and descent of real property; and at present in Wisconsin, the one species of property which is especially typical of mobility, and is of little value apart from its capability of motion, namely, the rolling stock of railroads, is also made by law real estate. Equally nice is the distinction in the case of machinery. Unattached, or movable, it is personal property; screwed or fastened permanently to the floor or wall, it becomes real estate. An apple upon the tree is real estate; but when fallen, and resting upon the ground, it is not real estate. The attempt to recognize in a system of laws distinctions of property which are purely arbitrary, and which sovereign states may alter at pleasure, are not likely, therefore, to result in anything generally harmonious and satisfactory. — But the advocates of the infinitesimal system will probably answer, that the fault here is not with the system, but with its administration. Therefore, let a law be made, they say, which will compel every person possessed of such description of property to make and hand in to the assessors a schedule, and certify to its correctness in respect to items and value by oath. But such substantially is already the law in most of the states of the federal Union, and its observance and execution amounts to nothing. Thus, in Ohio, the law subjects to taxation all visible personal property above fifty dollars in value, without any offset of debts; and yet the official reports indicate that not more than one in ten of the adult population of this great and rich state has any property in excess of this amount, which the eye of the law can discover: although investigation will show that it is impossible for a person to dress respectably, or live decently, outside of an alms-house, who has not always at least double this amount of property in his possession. Every intelligent assessor in Ohio, when questioned in respect to the law, will answer, that it can not be executed with even an approximation to exactness, and that a serious attempt to execute it would cause a political revolution; and yet such is the strength of popular prejudice, that any attempt to repeal this law would at present be wholly unsuccessful. In

Massachusetts, also, where the law admits no offset of debts against visible and tangible property, and is regarded as complete, and where its execution is acknowledged to be most arbitrary and inquisitorial—some towns publishing each year every known item of each man's personal property, even down to the family pig and a string of sleigh-bells—the most intelligent officials admit that their system is a comparative failure; and almost a complete failure as to reaching evidences of indebtedness, which, as before shown, constitute in modern times so large a part of the personal property of every civilized community. In the state of New York, where the letter of the tax laws in respect to the subjects of taxation is nearly the same as in Massachusetts and Ohio, but the administration less stringent, and where the aggregate of personal property nearly or fully equals in value the aggregate of real property, the proportion of the former returned for taxation is not in excess of one-fifth of the total assessed valuation; while in the great city of New York, with a population of over a million, not 1 per cent. of her citizens stand upon the books of the assessors as possessing any personal property subject to taxation other than shares in banking institutions. In the state of New York the assessed valuation of real estate for the year 1882 was \$2,557,218,240, an increase over the preceding year (1881) of \$124,556,861; while, on the other hand, the assessed valuation of personal property, in the same state, and under laws that allow but small exemptions, for 1882, was \$315,039,085; a decrease from 1881 of \$35,982,104. Again, according to the census reports for the United States, the gain in valuation of the real estate of the country between the years 1860 and 1880, was \$6,063,760,876; while during the same period the valuation of the personal property of the country declined to the extent of \$1,245,287,338. Now, as it is in the nature of an economic axiom, that the market value of the aggregate of land and that of the aggregate of productive capital are equal; and further, that the market value of land is merely the reflection of the value of the productive capital placed upon it, and its immediate vicinity, it follows that the decline in these valuations of personal property above noted, is not real; and simply represents the failure and utter inefficiency of the existing laws which attempt to assess and collect taxes upon such property. — Such, then, are some of the almost insuperable difficulties, having their origin in the nature of things, and growing out of the correlations of modern civilization, which must be always attendant upon the attempt of any sovereignty to tax everything over which it has dominion or jurisdiction. And hence it is, that, whenever a system of infinitesimal taxation has been projected, its authors have been led, as it were by instinct, to the conclusion, that its execution with any degree of effectiveness must depend upon the employment of extraordinary and arbitrary measures. Thus, the old Romans, who first established the

taxation of personal property at the period of the decadence of the empire, and who were not troubled with any restrictions of a constitutional character, or any very nice notions about personal liberty or general morality, clearly perceived this, and accordingly invested their tax officials with the power of administering torture as a means of compelling information and enforcing payment. And thus also have all the officials in every modern state, adopting the infinitesimal system, tried to act, so far as public opinion would uphold them.* — To complete the record of experience it is only necessary to add, that every effort which has been made in modern times to carry out the infinitesimal system of taxation has proved so uncertain and unsatisfactory, that every country, with the exception of Holland and the states of the federal Union of North America, have abandoned the project as something wholly impractical. †— *Considerations respecting an Income Tax.* Recognizing the difficulties attendant upon the attempt to collect taxes from a multitude of objects and by a large variety in methods of assessment, many economists and writers on the subject of taxation are inclined to fall back upon and recommend an income tax, as the one system of taxation most free from objection. What can be fairer, it is said, than that each person should pay in proportion to his annual net gain or income? But practically an equitable assessment, based on the

* The most curious and confirmatory evidence of this is to be found in a method of procedure adopted in the city of Boston, Massachusetts—a method which has no parallel except in the records of the middle ages and of the inquisition, and constitutes, in itself, a satire upon any claim to the enjoyment of a wholly free and enlightened government. For failing to obtain satisfactory information about the private affairs of any individual, the chief assessors and their subordinates in this city, to the number of some fifty, meet in secret session, in a large upper chamber set aside for the purpose, and appropriately termed the "dooming chamber," when the citizen in question, without being present either by counsel or in person, is arbitrarily doomed to the payment of any sum which a majority of those present may think proper; and from which "dooming" there can be no appeal.

† Holland, by reason of her immense national debt, the largest comparatively of any country, has been obliged to maintain a most rigorous and extensive system of taxation in order to raise revenue sufficient to the wants and requirements of the state. But it has been prominently brought out in recent years, that the decadence of Holland dates almost from the hour when taxes were imposed on manufactures, commerce, fishing industry, and moneyed capital. Business went elsewhere, and with the decline of business the ability to pay taxes diminished, and the burden of taxation augmented. (See *Journal des Economistes*, November, 1871; also, "Principles of Political Economy," J. R. McCulloch, pp. 470-71.) — Within recent years the local taxation of Great Britain has been made the subject of special inquiry and investigation by a committee of parliament; and, in addition to several official reports, two prize essays on the same subject have been published by the statistical society of London (*i. e.*, "On the Local Taxation of Great Britain and Ireland"; First and second Taylor Prize Essays, by R. H. Inglis Palgrave, and John Scott, of the Inner Temple); while the necessity of raising increased revenue in France has also drawn especial attention to the subject of local taxation in that country; but it is particularly noticeable, that in neither England nor France has any prominent speaker or writer advocated the direct taxation of personal property; or even alluded to the subject, except to scout the very idea of such a proposition.

known income of each man, is an idea that never has been and never can be realized. When we come to enacting laws for the collection of revenue, we must take human nature as we find it, and laws which are directly antagonistic to the two most powerful influences that can control human action—love of gain and a desire to avoid publicity in regard to one's private affairs—can never be efficiently administered. Under this head take one illustration. In 1868, with a federal law assessing all incomes over \$1,000, and with a trained corps of officials, only 259,385 persons, out of a population of nearly 40,000,000, acknowledged the receipt of any taxable income; and when the exemption was increased to \$2,000, the number of persons who paid an income tax was reduced to 116,000; and subsequently ran down to 71,000. Experience, therefore, would seem to demonstrate that an exemption in the United States of \$2,000 of income accredited to each individual (for, with a view of keeping up an appearance of equity, the amount of exemption was allowed to be deducted from all incomes), would exempt more than nine-tenths of the property and more than ninety-nine hundredths of the property owners of the United States from this tax. Under such circumstances it is a misnomer to call such an exaction taxation. — Again, unless an income tax is an exclusive tax, or if it forms (as in most instances it would) an element of a general system of taxation, it must necessarily involve double taxation; first, on the property yielding the income, and second, on the income itself. If the property yielding the income were under the jurisdiction and control of one state, and the person receiving the income was a resident of some other state, the duplication could hardly be avoided. All modern systems of income taxation have recognized the principle of discriminating in favor of persons in the receipt of comparatively small incomes; and have provided as a fundamental feature of their policy, that all incomes below a certain sum (usually a small amount) should be exempted from assessment. Thus, for example, the existing income tax of Great Britain commences with an assessment on incomes of £150 (\$750) and upward, and exempts all incomes of a smaller amount. In the United States the income tax, as first enacted in 1863, exempted \$600 annual income for each person, together with whatever was paid annually for rent and repairs of residence. But under this form of an income tax there can be no equality between taxed producers and untaxed producers; and more especially, as with any considerable amount of exemption, the untaxed producers will be the most numerous and the greatest producers in quantity as a body.* No man is a free man

the fruits of whose industry and capital are subject to surcharged (overburdened) exactions to an unlimited degree, and from which his immediate competitors are entirely exempt. Equality of taxation of all persons and property brought into open competition under like circumstances, is necessary to produce equality of condition for all, in all production, and in all the enjoyments of life, liberty and property. And any government, whatever name it may assume, is a despotism, and commits acts of flagrant spoliation, if it grants exemptions or exacts a greater or less rate of tax from one man than from another man, on account of the one owning or having in his possession more or less of the same class of property which is subject to the tax. If it were proposed to levy a tax of 5 per cent. on annual incomes below \$750 or \$2,000 in amount, and exempt all incomes above these sums, the unequal and discriminating character of the exemption would be at once apparent; and yet an income tax exempting all incomes below these is equally unjust and discriminating. In either case the exemption can not be founded or defended on any sound principles of free constitutional government; and is simply a manifestation of tyrannical power, under whatever form of government it may be enforced. The experience of Great Britain is often adduced as evidence in favor of the practicability and expediency of an income tax. But be this as it may, it would not seem to require argument to prove that any attempt to assess and collect an income tax which should be equal and have none of the features of spoliation or confiscation, from the sparse population of the United States extending from Florida to Alaska, would be entirely unpractical; and that unless the rate was excessive, the taxes received would not pay the cost of assessment and collection; while the rights of property, the great republican principle of equality before the law, and constitutional law itself, would alike preclude any exemption of any income derived from like property. — Regarding the record of experience as thus detailed, it is not surprising, that many, perhaps a majority, of economists, are ready to believe (as was stated at the outset, in this article), that there is no such thing as a science of taxation, and no definite rules for practical guidance adapted to all circumstances; and, despairing of coming to any more satisfactory conclusion, are willing to accept the maxim of M. Say, the celebrated French economist, that the best system of government finance is to spend little, and the best taxation that which is least in amount. Keeping steadily in view, however, the nature, object and scope of taxation as before defined, together with the acknowledged results of experience, and pursuing the investigation further, it is nevertheless the opinion of the writer, that certain conclusions can be reached which will commend themselves for acceptance as in the nature of principles and as infallible guides for administrative purposes. — *Nothing can not be Something for the purposes of Legitimate Taxation. And*

* If we assume 5 per cent. as about the average profit of money, land or other property in the United States, over and above all charges and taxes, then an exemption of \$600 would represent an accumulation yielding an income of \$12,000. If the exemption is raised to \$2,000, as it was at one time in the United States, then it would represent \$40,000.

as one of the first and most important steps that can be taken in such investigation, it is most desirable that all who wish to understand this subject should clearly comprehend, (and which, absurd as the averment may seem, comparatively few do now comprehend), that nothing can not be something; or, in other words, that *property is always a physical actuality*, which has become valuable or property, by some form of labor, and can not be created by mere paper documents, except to the extent of the value of the paper and the writing or printing upon it. In other words, a title to property, a representative of property, can no more be property, than a shadow can be a substance; and if this conclusion be true, then it would seem to follow, of necessity, that the act of making debts, bonds, verbal or written contracts, notes, book accounts, mortgages, warehouse receipts, titles, certificates of stock, or any form of salable or transferable rights, is not a creation or production of any new property, but simply an exchange, by contract or operation of law, of the rights and titles of parties in pre-existing property; and that any tax on any of these rights or titles is only another form of burdening the property which is the subject of the rights or titles. Enact such laws, also, in respect to taxing titles as we may, experience will prove that taxes can not be practically levied on imaginary things, or legal fictions, because it is some physical actuality, in the sense of embodied labor, that must, after all, and in the end, pay all taxes. If legislatures have the power of creating *flat* property, that is, imaginary or fictitious property, it is beyond their power to make it pay taxes, for nothing less than omnipotence can make something out of nothing.* On the other hand, let us consider, for a moment, the

* These views, it should be understood, are, however, heretofore to some of the best thinkers and writers on political economy. Some confuse themselves on the subject, by first defining property as anything that can be bought or sold, and then, since a title—as, for example, a deed—can be bought and sold, accept the inference that a title is necessarily property. But let us analyze this definition and assumption. We can, without doubt, sell and deliver a deed to a farm, but what is sold in such instances is the farm, including a right, a right to have dominion over it. But it may be rejoined, that a right of dominion is property. Let us, therefore, carry the analysis a little farther. If the farm in California is property in the state where it is, and where it is taxed, any right or title to the same farm, held in New York or England, be it in the nature of a deed, a mortgage, a partnership interest, or any other form of title, can not be the property; for the same thing certainly can not be property in two separate states and jurisdictions, and in two distinct forms and manifestations, at the same time. On the other hand, if it be assumed that the title to the farm is the property, and, as such, can be rightfully taxed where it (the title) is, then it stands to reason that the subject of the title, the farm in California, ought not to be also regarded as property, and taxed in New York or England. In other words, if the title to the farm is property, then the farm is not really in California at all (unless the owner of the title resides there), but goes out of that state in the pocket of the individual who walks off with the title to it. We have all heard of such concentration of meat that all that is valuable in an ox for food can be put into a quart can; but such a concentration of property as is here supposed is something much more remarkable; and admits of a man having a drove of oxen in

converse of this proposition, namely, *that titles are property, and, as such, ought not to be exempted from taxation*. If this is so, then it would seem to follow, that, by making titles, we can make property; and that when a man mortgages his farm for \$10,000, the community have ten thousand dollars' worth of real estate and ten thousand dollars' worth of personal property, where, before the execution of the mortgage, there was only the specified value of the real estate. Again, if the title is the property, then either the actuality is not property where it exists, or else we have two things occupying the same place at the same time. Credits and titles, of themselves, have no value, and, separated from the things they represent, they can not honestly be sold at all. Who will buy them? But we know the character of the men who will sell them; and that their representatives can always be found in a state's penal institutions.—“A contract,” says Ex-President Woolsey (Political Science, vol. i., p. 75), “does not create a right, but only transfers rights. A contract implies in each party a right to do that which the contract relates, and to pass over to another what is my own. If I have no right to use my labor according to my will, or have no property in a thing, I can not transfer the product of my labor, or what I have in my hands, to another. It is thus the exercise in a special case, for the benefit of another, of a right already existing. I can not make that the property of another, by contract, which is not mine already. Were it otherwise—were contracts a source of new power—it would be stronger than God.” This is a brief statement of the true nature of a contract or obligation, and a complete refutation of the popular theory that the creation of debts is a creation of property. Again, when attempts have been made to claim salvage for the recovery of bills of exchange, or other titles to property, from wrecks, the courts have decided that salvage in such cases is not allowable; and, therefore, have practically held that credits and titles are not property, but mere rights to property, and in the case of negotiable instruments, when destroyed by fire or otherwise, the right under the destroyed instrument still remains, and can be enforced in courts when identified. A clear comprehension, then, of the facts, that property is embodied labor; that property can alone suffice to pay taxes; that rights, titles and franchises are but the representatives of property; and that, having subjected the property to taxation, there is no sense or equity in again assessing its representative, will at once divest the problem of taxation from many embarrassments which now seem to invest it, greatly simplify it, and go far toward the determination of sound and fixed tax principles.—*What Constitutes an Exemption in Taxation*. A word here in reference to the popular idea that the exemption of any form of property is to grant a favor to those who possess

his hand, ten acres of woodland in his hat, a church with a steeple in one coat pocket, and a four-story brick block and a mill privilege in the other.

such property. An exemption is freedom from a burden or service to which others are liable; but in case of the exclusion of an entire class of property from primary taxation, no person is liable, and therefore there is no exemption. An exclusion of all milk from taxation, while whisky is taxed, is not an exemption; for the two are not competing articles, or articles of the same class. It is true, that highly excessive taxation of a given article may cause another and similar article, in some instances, to become a substitute or competing article; and hence the necessity of care and moderation in establishing the rate of taxation. We do not consider that putting a given article into the free list, under the tariff, is an exemption to any particular individual; but if we make the rate higher on one tax payer or on one importer of the same article than on another tax payer or importer, we grant an exemption. We use the word "exemption," therefore, imperfectly, when we speak of "the exemption of an entire class of property," as, for example, upon all personal property; for if the removal of the burden operates uniformly on all of such, then there can be no primary exemption. — *The Theory and Necessity of Infinitesimal Taxation not supported by either Reason or Experience.* If the above reasoning in respect to exemptions in respect to taxation be correct, it follows that it is not necessary, in order to burden equitably and uniformly all persons and property, to tax primarily all persons and property within the taxing district. But as this proposition is in direct opposition to popular theory (at least in the United States), appeal will first be made to the evidence of its truth, derived from the results of actual experience. It is a matter beyond dispute, that the universal, infinitesimal system of taxation is unsatisfactory and unjust, and that the more extensively and rigorously it is administered and applied, the more unequal and impracticable it becomes. On this point the proof already submitted is indisputable. On the other hand, the testimony is equally complete, that the more of simplicity we can introduce into a tax system, and the more the assessment can be restricted to a few articles, the more satisfactory the system becomes. There are places and countries where personal property is entirely, or in a great degree, excluded from taxation, as, for example, the cities of Philadelphia and Montreal,* and the countries of England and France, and where the burden of the expenses of the state is made to fall primarily and almost exclusively upon realty; and

the result is an absolute demonstration, "that a complicated and inquisitorial system of separate taxation of goods and chattels is wholly unnecessary, an obstruction to trade, an injury to production, an unnecessary invasion of private affairs, and a self-torment inflicted on land itself."—Great Britain, commencing several hundred years ago with a system which contemplated taxing everything, has gradually reduced her tax list to some six or eight articles or sources under the customs, and to an equally limited number under her excise and local systems; and, with every degree of concentration, the relief experienced by the whole population, and the impetus given to material development, has been all but universally acknowledged. In France, also, where the number of owners of real estate, in proportion to population, is greater than in any other country, the essential features of a concentrated system also prevail for local, and, to a limited extent, for general, taxation. And in the case of the United States, it is to be further noted, that the national government, except under the exigencies of a great war, has always recognized in her tax laws the desirability of simplicity and concentration; and that now, although the present system does not tax *directly* the one-fiftieth part of the property of the country, all parties are agreed that a further limitation of the sources of national revenue is most desirable. But it is curious to note, that while no sensible person entertains the idea that the taxes levied by the national government on spirits, fermented liquors, or tobacco, or upon any imported articles, are paid by the producer or importer, except so far as he is a consumer of the same, the exactly opposite doctrine appears to prevail in the United States in respect to the incidence of local taxation; and the principle which has constituted the basis of most of the state legislation on this subject seems to have been, "that whatever is not taxed directly is necessarily exempt."—Let us appeal next from the logic of practical experience to the logic of common sense. The theory of infinitesimal taxation, if fully and completely executed, must logically lead, not only to the taxation of every cent in value of every kind of property within the borders of every state, county, township or municipality, but it would require a regular system of custom house espionage, and an army of officers to levy and collect taxes, by a multiplicity of rates upon all goods or property introduced into each township or municipality. If, however, this is not done, what becomes of the vaunted idea, that equality of taxation requires that every particle of property should be subject to a direct burden? But, fortunately for the prosperity of communities, this idea of what is necessary to produce equality of taxation is fallacious, and it is likewise fortunate, that it can be demonstrated that this false system, when partially or fully developed, produces unmitigated evil and inequality.—*All Taxation ultimately and necessarily falls on Consumption.* Property is solely produced to supply human wants and

* In 1874 the real estate of Philadelphia was assessed at \$39,003,602, on an asserted full valuation. The personal property of the city subject to taxation at the same time, was returned at a valuation of \$9,464,873; and included horses, carriages, furniture, gold and silver watches. The system of taxation in Montreal, dominion of Canada, the same year, was as follows: one-fifth of 1 per cent. on the value of real estate; one-fifth of 1 per cent for school tax; one-twentieth of 1 per cent. on railway property; 7½ per cent. on rentals. In addition, there were water rates, and special taxes on insurance, telegraph, ferry and street railway companies, and on innkeepers, billiard tables, theatres, breweries, banks, brokers, &c., and licenses on grocers, butchers, exhibitions, dogs, etc.

desires; and taxes, like all other expenses which enter into the cost of production, must finally be sustained by those who gratify these wants or desires by consumption. Production is only a means, and consumption is the end, and the consumer must pay in the end all the expenses of production. The state is an active and important partner in all production. Without its assistance and protection, production would be impeded or wholly arrested. The soldier or policeman guards, while the citizen performs his labor in safety. As a partner in all the forms of production and business, the state must pay its expenses, *i. e.*, its agents, for their services; and its only means of paying are through its receipts from taxation. Taxes *legitimately* levied, then, are a part of the cost of all production, and there can be no more tendency for taxes to remain upon the persons who immediately pay them, than there is for rents, the cost of insurance, water supply and fuel to follow the same law. The person who wishes to use or destroy the utility of property by consumption to gratify his desires, or satisfy his wants, can not obtain it from the owners or producers with their consent, except by gift, without giving pay or services for it; and the average price of all property is coincident with the cost of production, including the taxes advanced upon it, which are a part of its cost in the hands of the seller. Again, no person who produces any form of property or utility, for the purpose of sale or rent, sustains any burden of legitimate taxation, although he may be a tax advancer; for, as a tax advancer, he is the agent of the state, and a tax collector from the consumer. But he who produces or buys, and does not sell or rent, but consumes, is the tax payer, and sustains a tax in his aggregate consumption, where all taxation must ultimately rest. In short, no person bears the burden of taxation, under an equitable, legitimate system, except upon the property which he applies to his own exclusive use in ultimate consumption. The great consumer is the only great tax payer.*—*Proportional Taxes on all things*

* On this subject the eminent French economist, Joseph Garnier, in his *Traité des Finances*, ch. v., says: "From the point of view of distributive justice and economic truth, and to attain an equitable apportionment of the public burdens, we must put the question: A tax being given, on whom does it fall in the last analysis? No absolutely satisfactory answer to this question, insoluble in its generality, has been given or could have been given. However, Ricardo, who made a profound study of taxation, thought that taxes, no matter of what kind, are always paid by the consumer, on his capital or on his income, the producer always making them enter into the cost of production; and employing his capital and his industry in other branches when he can not include the taxes he pays in such cost. James Mill likewise adopted the same opinion. This was Franklin's view also; he thought that the merchant always added the tax to his bill or invoice. It was likewise Adam Smith's idea, who, in passing, says: 'The tax is finally paid by the last purchaser or consumer.' [*Wealth of Nations*, edited by J. E. Thorold Rogers, vol. ii., p. 132.]—The physiocrats had been led to think that taxes finally fell, directly or indirectly, on the landed proprietor, to whom they thought the entire net product of production, which in the end is the only thing taxed, and which alone should be taxed by the legislator, comes back.—J. B.

of any given Class will be diffused and equalized on all other Property. The examination of the tax rolls in any state, city or municipality, will show that surprisingly small numbers of persons primarily pay or advance any kind of taxes. Thus, it is not probable that more than one-tenth of the

Say says that Ricardo may be right in the abstract, but that, in fact, the producer does not always succeed in making the consumer pay the tax, a part of which he (the producer) must bear himself. The French economist adds: 'This subject does not admit of an absolute opinion. There is probably no kind of contribution which does not fall on several classes of citizens.' According to him, therefore, the subjects taxed (*bases de l'impôt*) should be increased sufficiently to attain this end: that those producers who are not reached by one tax may be reached by another.—The views held by the physiocrats on production being incomplete and erroneous, their financial conclusion is no longer worthy of consideration. J. B. Say's conclusion is in harmony with those of Ricardo and Smith; but it is lacking in precision. That of Ricardo, if it be exact, should be amended thus: 'Taxes in general and *in the long run*, fall on the consumer.' And, indeed, in the face of the facts, it is difficult to admit, that this diffusion or transmission of burdens is made directly, immediately and without effort. If we may so express ourselves, Ricardo considers the phenomenon as if it were happening *in vacuo*, whereas, in reality, the tax, to find its natural or definitive incidence and to traverse the successive strata of society, needs a pretty long lapse of time, a thing which is effected only after many and complex repercussions. The burden weighs at first on certain classes of citizens; then, by degrees, it apportion itself among a greater number of tax payers, or among all tax payers, and by successive repercussions it becomes an integral part of the price of things, in such a way that the person who buys most things pays most taxes. At first view the tax seems paid, whereas it has only been advanced.—However, the solution of this question is not, we repeat, possible, as to taxation considered in general; it is possible, if possible at all, only if we consider the different kinds of taxes apart from one another, and according to their special assessment. It is necessary to consider apart their accidental and their permanent effects, their temporary and definitive effects. We must remark, also, that both for taxation and for the cost of production, the law of supply and demand is predominant. That law it is which permits, according to very variable causes and circumstances, the landowner, capitalist or workman to have the tax reimbursed to him by the leaseholder, the manufacturer, or the merchant, and which permits these latter to have themselves reimbursed, in turn, by the consumers; or which compels each of them to pay a part of the tax. It is, therefore, erroneous to affirm that the producer has himself always and equally reimbursed by the consumer. At the end of a period of time, the tax imposed on one or many categories of individuals is reperceived on other classes, and in the end *fiscal charges weigh on all the classes of the population*, even the taxes on the wealthy, which fall indirectly and in a certain proportion on the poor themselves, since for the labor of the poor there is less demand by the wealthy, whose saving or consumption the tax has curtailed.—It is an error to say of a tax that its weight divided *ad infinitum* becomes almost insensible to those who bear it. This would be true of one sole tax, but it is not true when there is question of several taxes; taxes may apportion themselves and repercuss as much as you will, *but they must be paid*, and they produce their natural effects none the less. Division, diffusion and repercussion are unfortunately not synonymous with evaporation. We can, therefore, formulate no general law as to the incidence, the repercussion or diffusion of taxes.—On this point there is among economists a great diversity of opinions and much hesitation."—Lorenz von Stein, in his *Finanzwissenschaft*, maintains that *all* taxes, and even the fines paid by criminals, finally become component parts of the prices of things, just as do the costs of production, and in the last analysis fall on the consumer. Etienne Laspeyres, in the article *Staatswirtschaft*, in Bluntschli's *Staatswörterbuch*, defends the same view. As far back as 1790 the Marquis de Cassas published a work, "The Absurd-

adult population, or about one-twentieth of the entire population of the United States, ever come in contact officially with a tax assessor or tax collector. It is also estimated that less than 250,000, or less than $\frac{1}{4}$ of 1 per cent. of the total population of the United States, advance the entire customs and internal revenue of the federal government. It is therefore apparent, that there must be some natural law governing the diffusion of taxes; and if the great mass of the community did not instinctively recognize the existence of such a law, or, to speak more practically, if they did not feel and certainly know, as it were by instinct, and not by education, that the higher the taxes in any state, community or country, the higher their food, fuel, clothing and rents, and the higher the cost of all production, then why should the ninety and nine of the mass of the people take any interest in the fiscal affairs of the state? And why, if only the few who see the tax collector are the ones who pay all, or the major part, of the taxes, is it not for the interest of the many that expenditures on the part of the state should always be as large as possible? Why not have largesses out of the public treasury as in the days of old Rome? Why not public amusements for the many at the public expense? Why not tax the very rich exclusively? Adam Smith undoubtedly first gave the clue to the real and true law when he says "that no tax can ever reduce for any considerable time the rate of profit in any particular trade, which must always keep its level with other trades in the neighborhood." In other words, "taxes and profits, by the operation of the laws of human nature, constantly tend to equate themselves. Man is always prompted to engage in the most profitable occupation and to make the most profitable investment. And since the emancipation from feudalism, with its sumptuary laws, legal regulations of the price of

labor and merchandise, and other arbitrary governmental invasions of private rights, individual judgment and self-interest have been recognized as the best tests or arbiters of the profitableness of a given investment or occupation. The average profits, therefore, of one form of investment, or of one occupation (as originally shown by Adam Smith), must for any long period equal the average profits of other investments and occupations, whether taxed or untaxed, skill, risk and agreeableness of occupation being taken into consideration.* Natural laws will, accordingly, always produce an equilibrium of burden between taxed and untaxed things and persons. We produce to consume, and consume to produce, and the cost of consumption, including taxes, enters into the cost of production, and the cost of production, including taxes, enters into the cost of consumption, and thus taxes levied uniformly on things of the same class, by the laws of competition, supply and demand, and the all-pervading mediums of labor, will be distributed, percussed and reperculated to a remote degree, until they finally fall upon every person, not in proportion to his consumption of a given article, but in proportion to his aggregate consumption. The capitalist bears no greater burden of taxation (and can not be made to bear more by any laws that can be properly termed tax laws) than the proportion which his aggregate individual consumption bears to the aggregate individual consumption of all others in his circuit of immediate competition; and as to his other taxes, he is a mere tax collector, or conduit, conducting taxes from his tenants or borrowers to the state or city treasury. A whisky distiller is a tax conduit, or tax collector, and sells more taxes than the original cost of whisky. A dealer in imported goods keeps on hand a stock of accumulated taxes—imposts, excises, state, city and local taxes; the farmer charges taxes in the price of his products; the laborer, in his wages; the clergyman, in his salary; the lender, in the interest he receives; the lawyer, in his fees; and the manufacturer, in his goods. A Bible printed by the Bible society is always in part loaded with a whisky and tobacco tax, paid by the printers, paper-makers and book-binders, or paid by the producers of articles consumed by these mechanics, and reflected and embodied in their wages and the products of their labor, according to the degree of absence of competition from fellow-mechanics who abstain from the use of these and other taxed articles. The traveler who stops at one of the great city hotels can not avoid reim-

ity of the Land Tax." demonstrated by showing that all taxes, no matter of what kind, ultimately become part of the prices of commodities.—In addition to the opinions of recognized economic authorities above noted by M. Garner, J. R. McCulloch, whose article on "Taxation," contributed to the Encyclopædia Britannica, James Mill pronounced "masterly," thus expresses himself: "The truth is, that every burden laid, directly or indirectly, on any article for which there is any considerable demand, falls ultimately on its consumers." ("Taxation and the Funding System," p. 17.) M. Thiers, as shown by an extract from his work, "Rights to Property," quoted in connection with this article by the author, was an unqualified believer in the diffusion theory of taxation. Adam Smith would also appear to have completely indorsed it, when he says, "No tax can ever reduce, for any considerable time, the rate of profit in any particular trade"—*i. e.*, all business—which must always keep its level with other trades in the neighborhood." And again, in discussing the taxes upon luxuries, he says, "such taxes, though they fall indifferently upon every species of revenue, and are paid finally by whoever consumes the commodities upon which they are imposed," etc. The reader will, therefore, notice that Mr. Wells' views on this department of taxation are substantially in harmony with those of Adam Smith, Ricardo, James Mill, M. Thiers, J. R. McCulloch, J. B. Say; they also found an earnest advocate in one of the soundest thinkers and shrewd practical observers America has ever produced—the late Isaac Sherman, of New York.—Ed.

* As applied to the wages of labor, the truth of this principle is equally incontestable. "The sewing girl performing her toilsome work by the needle at one dollar a day, the street sweeper working the mud with his broom at a dollar and a half, the skilled laborer at two and three dollars, the professor at five, the editor at five or ten, the artist and the songstress at ten or five hundred dollars a day, are all members of the working classes, though working at different rates. And it is only the difference in their effectiveness that causes the difference in their earnings. Bring them all to the same point of efficiency, and their earnings also will be the same." (W. Jungst.)

bursing the owner for the tax he primarily pays on the property; and the owner, in respect to the taxation of his hotel property, is but a great and effective real estate and diffused tax collector. And so all *proportional contributions to the state from direct competitors* are diffused upon things and persons in the taxing jurisdiction, by a uniformity as manifest as is the pressure upon water, which is known to be uniform in all directions." (Isaac Sherman.)* — Any primary tax payer, who does not ultimately consume the thing taxed, and who does not include the tax in the price of the taxed property, or its products, must literally throw away his money and must soon become bankrupt, and disappear as a competitor; and accordingly the tax advancer will add the tax in his prices, if he understands simple addition. When Dr. Franklin was asked by a committee of the English house of commons, prior to the American revolution, if the province of Pennsylvania did not practically relieve farmers and other land owners from taxation, and at the same time impose a heavy tax on merchants, to the injury of British trade, he answered, that "if such special tax was imposed, the merchants were experts with their pens, and added the tax to the price of their goods, and thus made the farmers and all land owners pay their part of the tax as consumers." — These and other like investigations and experiences would, therefore, seem to warrant the announcement and establishment of the following as great fundamental principles in taxation. Equality of taxation consists in a uniform assessment of the same articles or class of property that is subject to taxation. Taxes under such a system equate and diffuse themselves; and if levied with certainty and uniformity upon tangible property and fixed signs of property, they will, by a diffusion and repercussion, reach and burden all visible property, and also all of the so-called "invisible and intangible" property, with unerring certainty and

* The method in which taxation diffuses itself has been thus illustrated by M. Thiers, in his work "Rights to Property." "In the same manner," he says, "as our senses, deceived by appearances, tell us that it is the sun which moves and not the earth; so a particular tax appears to fall upon one class, and another tax upon another class, when in reality it is not so. The tax really best suited to the poorest member of society is that which is best suited to the general fortune of the state; a fortune which is much more for the possession and enjoyment of the poor man than it is for the rich; a fact of which we are never sufficiently convinced. But of the manner, nevertheless, in which taxes are divided among the different classes of the state, the most certain thing we can say is: That they are divided in proportion to what each man consumes, and for a reason not generally recognized or understood, namely, that taxes are reflected, as it were, to infinity, and from reflection to reflection become eventually an integral part of the prices of things. Hence the greatest purchasers and consumers are everywhere the greatest tax payers. This is what I call 'diffusion of taxation,' to borrow a term from physical science, which applies the expression 'diffusion of light' to those numberless reflections, in consequence of which the light which has penetrated the slightest aperture spreads itself around in every direction, and in such a manner as to reach all the objects which it renders visible. So a tax which at first sight appears to be paid directly, in reality is only advanced by the individual who is first called upon to pay it."

equality. All taxation ultimately and necessarily falls on consumption; and the burden of every man, under any equitable system of taxation, and which no effort will enable him to avoid, will be in the exact proportion, or ratio, which his aggregate consumption maintains to the aggregate consumption of the taxing district, state or community of which he is a member. — It is not, however, contended, that unequal taxation on competitors of the same class, persons or things, diffuses itself; whether such inequality be the result of intention or of defective laws, and their more defective administration. And doubtless one prime reason why economists and others interested have not accepted the law of diffusion of taxes as here given, is, that they see, as the practical workings of the tax systems they live under, or have become practically familiar with, that taxes in many instances do seem to remain on the person who immediately pays them; and fail to see that such result is due—as in the case of the taxation of large classes of the so-called personal property—to the adoption of a system which does not permit of equality in assessment, and therefore can not be followed by anything of equality in diffusion. Such persons may not unfairly be compared to physicists, who, constantly working with imperfect instruments, and constantly obtaining, in consequence, defective results, come at last to regard their errors as in the nature of established truths. — *Benefits of limiting Taxation to a few Classes of Things.* "By limiting the sources or number of primary taxes we limit the sphere of government and the number and sphere of officials. We limit the sources of official corruption, and we give strength to free institutions by leaving the distribution of taxes, in infinitesimal form, to individual judgment and individual enterprise and competition, the great motor forces in all free government, rather than to the acts of officials, which must all be more or less arbitrary, inquisitorial and offensive; and if in any degree effective, must be executed by espionage, oaths and domiciliary visits, which are not in harmony with the spirit of the age and of free government." — *Conclusion.* The subject admits of elaboration and illustration to a much greater extent; but the general conclusions to which all investigation seems to lead, and which in all or part may be worthy of being regarded as principles, may be collectively stated or recapitulated as follows: 1. The right to tax is inherent in every sovereignty, and rests upon necessity. 2. The right to impose a tax, if it exists at all, "is a right which in its nature acknowledges no limits." 3. The subjects of taxation are persons, property and business. 4. Equality of taxation consists in imposing an equal burden upon all subjects—persons or things—of immediate competition. When this principle is violated, the act of taking, or the enforced contribution, is no longer entitled to be considered taxation, but becomes at once arbitrary spoliation or confiscation. 5. "All subjects over which the sovereign

power of the state extends are objects of taxation, but those over whom it does not extend are, on the soundest principles, exempt from taxation." (Chief Justice Marshall, opinion United States supreme court.) The limitations of territorial sovereignty and the limitations of the taxing power are therefore coextensive. 6. Protection is the correlative of taxation; or taxes, under any government claiming to be free, are the compensation which property pays the state for its protection. "Taxation" without protection, is, therefore, a misnomer. Its proper designation is spoliation. 7. Legitimate taxation must be on account of and limited to public purposes; "and whatever governmental exaction has not this basis, is tyrannical and unlawful." (Cooley, "Principles of Constitutional Law.") 8. Every citizen should pay taxes, not in proportion to his ability to give, but according to what he ought to give; and what he ought to give can only be measured by the benefit he is to derive; or, as Adam Smith expressed it, "in proportion to the revenue which they (the citizens) enjoy under the protection of the state." 9. The burden or injurious effect of a tax on production or exchange is not to be measured by the ratio which the tax may bear to the gross value of the subject of taxation, but rather by the proportion which the tax bears to the profit that might result from undertaking a certain line of industry. 10. Property, in its true sense, as a subject for taxation, is always a physical actuality; and all experience proves that taxes can not be practically levied on imaginary things, or legal fictions, because it is some physical actuality, in the sense of embodied labor, that must in the end pay all taxes. 11. The exemption of any part of the property of the same class which is made the subject of taxation, is spoliation of that part which is discriminatingly burdened. On the other hand, the exclusion of an entire class of property is not an exemption. 12. Proportional taxes on all things of any given class will be diffused and equalized on all other property. 13. All taxation ultimately and necessarily falls on consumption, and the burden of every man, under any equitable system of taxation, which no effort will enable him directly to avoid, will be in the exact proportion, or ratio, which his aggregate consumption sustains to the aggregate consumption of the taxing district, state or community of which he is a member. — For practical guidance in devising or administering a system of taxation, intended to meet the wants of states or communities exposed to the competition of similar and competing organizations, the following rule or motto, proposed by Mr. Enoch Ensley, of Memphis, Tennessee, may be also regarded as in the nature almost of a tax axiom: "Never tax anything that would be of value to your state, that could or would run away, or that could and would come to you." — *Taxation Bibliography*. Economic literature in all languages is very deficient in simple, and at the same time clear and comprehensive, works on

the subject of the principles of taxation. No department of political economy, as stated at the commencement of this review, is more obscure or so little understood. Foremost in sources of information, to which the reader who desires to independently investigate is referred, is the chapter on *Taxation* in Adam Smith's *Wealth of Nations*. Apart from this, there is probably no one treatise, which any considerable number of economists are willing to accept as standard or authoritative, certainly in all departments. The best modern book, in the opinion of the writer, is J. R. McCulloch's work, *Taxation and Funding*, 8vo, London, 1845. This work, however, is out of print, and difficult to obtain, but it can be found in most large libraries. The following other works may be recommended or mentioned. *The People's Blue Book: Taxation as it is and as it ought to be*, by Chas. Tennant, 16mo, London, 1872. This book is very complete in respect to the tax laws of Great Britain and their administration; and also discusses, in a very readable and generally correct manner, the theory and history of taxation. *The Science of Taxation*, Leroy-Beaulieu, 2 vols., 8vo, Paris, 1877. This is the best work in any foreign language on taxation. *Taxation of Fixed Capital*, M. Menier, 16mo, Paris, 1877; English translation, London, 1880. *Sur la Propriété*, Thiers, Paris. The chapter on taxation in this work is a luminous exposition of the principle of diffusion of equal taxation. Garnier, *Elements des Finances*, Paris, 1862-5, and De Parieu, *Traité des impôts*, Paris, 1858, may also be mentioned. *Local Government and Taxation*, Cobden Club Essays, 8vo, London; a series of essays, presenting the best exposition of the existing systems of taxation in countries other than England and the United States—as Scotland, Ireland, Australia, Holland, Belgium, France, Russia and Spain. *The Taxation of the United Kingdom*, Baxter, 8vo, London. This work is out of print. It gives an analysis of British taxation, and discusses with great ability some of the most important questions connected with this subject. See also Noble's *The Queen's Taxes*, 8vo, London, 1870, and Dowell's *Sketch of the History of Taxes in England*, from the earliest times to the present day, vol. i., to the civil war of 1642, 8vo, London, 1876. — *Essays: First and Second Reports of the Commissioners appointed to revise the laws for the Assessment and Collection of Taxes in the State of New York*, David A. Wells, Chairman. As public documents these reports are now out of print. The first of these reports was republished by Harper & Bros., New York; and editions of both reports were republished in England and France. *The Taxation of Railroad Securities*, considered theoretically, and also with reference to actual experiences in the United States and Europe, by a Committee of State Railroad Commissioners, Charles Francis Adams, Jr., Chairman. *Rational Principles of Taxation*, by David A. Wells, Proceedings of the American Social Science Association for 1874. *Theory and Practice of Local Taxation in the United States*, do., At-

lantic Monthly, 1876; *The Reform of Local Taxation*, do., North American Review, April, 1876; *Are Titles and Debts Property?* do., Atlantic Monthly, September, 1877. *Twelve Letters on the Future of New York*, by Geo. H. Andrews, Commissioner of Taxes, 8vo, New York, 1877. *Taxation in Massachusetts*, by W. J. Minot, 8vo, Boston, 1877. *Exclusive Taxation of Real Estate*, by Isaac Sherman, New York, October, 1874. *The Tax Question: What should be taxed, and how it should be taxed*, by Enoch Ensley, Memphis, Tenn., 1873. *Taxation: A Plain Talk for Plain People*, by Jas. H. Canfield, 8vo, 1883, New York, published by the Society for Political Education. All of the above papers contain valuable information respecting the inequalities and character of the systems of local taxation in the United States. They can not all be easily purchased, but can usually be obtained for reference. For works expressing views antagonistic to those advanced in this article respecting the nature of property, and of credits and titles, the reader is referred to the works of H. D. Macleod, especially *Principles of Political Philosophy*, 2 vols., London, 1872; and to *Political Economy*, by Prof. A. L. Perry, New York, 18th ed., 1883.

DAVID A. WELLS.

TAXATION, National and Local. (See REVENUE, PUBLIC; TAXATION.)

TAYLOR, Zachary, president of the United States 1849-50, was born in Orange county, Va., Nov. 24, 1784, and died at Washington city, July 9, 1850. In 1808 he obtained a commission in the army as lieutenant, and in the war which followed he rose to the rank of major. At the outbreak of the Mexican war he held the rank of major general, and was in command of the army which advanced through Texas into northern Mexico and won a series of victories ending with Buena Vista. In 1848 he was the whig candidate for president, and was elected. (See WHIG PARTY, ELECTORAL VOTES.) His short term of office was marked by the sectional disputes on the subject of slavery which were settled in 1850. (See COMPROMISES, V.) The president's own plan of settlement was the admission of the disputed territories as states, but it was successful only in the case of California. See Fry's *Life of Taylor*; Powell's *Life of Taylor*; Abbott's *Lives of the Presidents*, 299; 2 Benton's *Thirty Years' View*, 737; 3 Von Holst's *United States*, 523; 3 *Statesman's Manual*, 1831 (for his messages). A. J.

TELEGRAPH. The electric telegraph, by annihilating time and space, is destined to play in the world a part analogous to that of steam. These two marvelous discoveries, by lending a helping hand to each other, have profoundly modified social relations, and we may, without exaggeration, assert that they are the beginning of a new era for humanity. The electric telegraph, which is still only in its infancy, has not yet

yielded all the results which it is destined to produce; but we may even now get an obscure glimpse of what they will be. In politics it simplifies diplomatic relations, by putting governments themselves, by means of dispatches—which follow one another, so to speak, minute after minute—in direct communication, and by doing away with the hesitation and perplexity of their agents abroad. Without doubt political questions remain none the less obscure and embarrassed on this account, but the different opinions formed, the new facts which arise, becoming known instantly to the states interested in them, may have for effect rapid decisions and effectual measures, which but for electricity might arrive too late. From the point of view of the security of governments, the electric telegraph is one of the greatest administrative forces, for it gives the authorities the means of knowing immediately what is taking place at the points the most remote from the centre, and of making their action felt there without delay. In criminal matters the telegraph is a powerful auxiliary of the police; it prevents the flight of the guilty party by shutting him up in its wire-work as in the meshes of a net. By the telegraph line a general-in-chief may be present on every square of the chess-board on which the terrible game called a military campaign is played, and he may keep in constant and direct communication with his lieutenants. Unfortunately the net-work of telegraphs does not long remain intact in times of war, for the destruction of lines is one of the first acts of hostility. However, in the Italian war (1859) a successful effort was made to organize a system of lines which the enemy could not reach: this was the *flying* telegraph, the apparatus of which, that is, the posts and the wires, put up rapidly by agile workmen, followed the different army corps, and assisted in every movement. Prussia made a noteworthy use of this system in 1870. — We consider the electric telegraph one of the most powerful means of civilization which has been given to man; and we are of opinion that its future was opened to it only the day on which it was placed within the reach of everybody. The telegraph, which up to that time, in Europe, had been only a mysterious agent in the hands of governments, became an indefatigable apostle of human progress. From the point of view of morals, it is scarcely necessary to point out the influence of the relations it established among all the nations of the globe, of its diffusion of light which tends to raise all nations to the same level, and to the community of interests by which it draws them nearer to each other, or unites them. From the politico-economic point of view, the results are still more striking. By saving the time formerly spent in negotiating commercial affairs, the telegraph has increased commercial transactions in an incalculable proportion. It furnishes, moreover, sure and rapid information which enables merchants to expedite in time to a distant point, goods, the demand for which is urgent. Lastly, it establishes, among all the ex-

changes and all the markets of the world, a solidarity which prevents or attenuates catastrophes. In a still other order of facts, what misfortunes the telegraph may prevent! In case of a conflagration, it calls assistance from all directions; in case of a flood it warns those who live on the banks of rivers of their impending danger; on railways it averts the most frightful accidents by its power of vastly surpassing in speed the utmost rapidity of steam. We here recall the influence of the telegraph on facts of the moral order, and its influence economic and material, for neither politics nor political economy can be indifferent to these results. The increase of enlightenment and wealth is advantageous, not to individuals only; that increase is an increase of force in which the state which has known how to develop wealth and enlightenment finds the elements of its power. And hence it is that the most civilized peoples, who are at the same time the greatest peoples, were the first to understand the necessity of extending their network of telegraphs as rapidly as possible.—In the United States the exploitation of telegraphic lines is still left to private industry. And so it was in England before the law of July 31, 1868 (31, 32 Vict., ch. 110), which authorized the government to purchase the telegraph. The great states of Europe have reserved to themselves the monopoly of the telegraph. Apart from the fiscal interest which urges governments to find new sources of revenue, there prevailed not long since in Europe a powerfully accredited opinion, that the telegraphic mode of correspondence should be reserved to governments. But since the introduction of railways and the immense movement of relations and affairs which has been the consequence of that introduction, the telegraph has been looked upon as the necessary complement of that new means of transportation, and European governments have considered, that, with certain guarantees, the use of telegraphic correspondence should be allowed to the public.*

EDMOND BOUQUET.

* Arstide Dumont wrote in 1854: "The use of the telegraph, once it has been popularized, is called to render to the production of wealth services which have some relation to those created by economic and rapid ways of circulation, since these services shorten time, that stuff of which life is made, and since, in every industry, they impress greater activity upon production, and, as a consequence, diminish the amount of unproductive capital, lower the amount of current expenses in business, facilitate exchanges, and abridge transactions of every kind.—But from another point of view, the telegraph is called to render much greater services to industry. If we suppose the net-work of telegraphs extended and popularized, not only over the entire surface of Europe, but over every civilized point of the world, a single day would be sufficient to exchange news between the most distant markets; thenceforth there would be none of those uncertainties which so frequently disturb commercial relations, and none of those rumors which facilitate stock-jobbing [?]. A sort of equilibrium would become established, and production would become more independent of the emotions produced by politics. Is it not true that if the electric telegraph had embraced, in the course of the year 1853, the Danubian provinces, Constantinople, St. Petersburg, Odessa; and that if it had been possible to exchange a dispatch, in one day, between these different points and Paris, France's public funds and industrial values would

TELLERS. (See PARLIAMENTARY LAW.)

TEMPERANCE MOVEMENT in the United States. (See PROHIBITION, POLICE.)

TEN-HOUR LAW. In the early years of the textile manufactures in this country, the working day was protracted to twelve, thirteen and sometimes fourteen hours. The progressive diminution of the hours of daily labor in the manufactories of Great Britain to eleven hours was followed by a demand for a similar reform in the manufactories of the United States. After the enactment of the English ten-hour law in 1847, this demand became more and more articulate. In 1853 the managers of all the manufacturing companies in Lowell, Lawrence and Fall River, voluntarily reduced the hours of labor of their operatives to eleven per day. No further reduction having been made during the twenty succeeding years, in 1874 Massachusetts enacted a law making ten hours the limit of the day's labor for all females and for all males under the age of eighteen years, employed in the textile industries. (Public Statutes of Massachusetts, chap. 74, secs. 4, 5) In Commonwealth vs. Hamilton Manufacturing Company, 120 Mass. Rep., 383, the supreme court held this act to be constitutional. C. C.

TENNESSEE, a state of the American Union. It originally belonged to North Carolina, whose boundaries extended indefinitely westward. In 1768 the country was opened to settlement by the treaty of Fort Stanwix, and a company of hunters, most of whom became settlers, was formed, June 2, 1769. Their settlements were on the Watauga, one of the headwaters of the Tennessee; and the inhabitants, framing a code of laws, signed by each person, became a body politic, the *Watauga*

have undergone fewer fluctuations? Kept constantly informed of what was happening, Frenchmen would have been less excited, and this would have prevented the ruin of a great many individuals.—Thus the electric telegraph facilitates the production of wealth in two ways: 1, by saving time and permitting a diminution in the amount of unproductive capital; 2, by establishing a sort of equilibrium between all markets, and of thus diminishing the influence of the uncertainty of politics on industry.—But if we consider the telegraph from the moral point of view, we believe that it has introduced into the world a revolution still more profound. If, in fact, the various continents are united, and they will be united in the course of this century [a prophecy fulfilled not very long after it was made]; if communication can be had in a few hours between London, Canton, New York, Calcutta and Paris, a new force will be added to the civilizing power of humanity, to the diffusion of enlightenment and to the radiation of good upon evil. The limits which peoples up will be blotted out, and peoples the most remote from one another acquire solidarity and unity. Men will emigrate more freely, for they will be no longer morally separated by any barrier. The superabundant population of Europe will feel less repugnance to transfer their activity to shores hitherto unknown; for, if they go even to the antipodes, they will not be, as formerly, remote from their country, their relations and their habits. This fear of remoteness has been hitherto a great obstacle to the spread of civilization. Some peoples are less subject than others to this species of nostalgia, and it is they who have accomplished the greatest things. The telegraph will tend more and more to remove that obstacle."

association. Their numbers and their spirit of independence were both increased by immigrants driven from North Carolina by the tyranny of the royal governor, Tryon; and conventions at Jonesborough, Aug. 23 and Dec. 14, 1784, formed a separate state government, variously called *Frankland* and *Franklin*, in its official documents. The constitution was ratified by popular vote; a legislature and a governor, John Sevier, were elected; and a civil war between the two state governments seemed imminent. The North Carolina party in Tennessee finally overthrew the Frankland government in May, 1788; and the North Carolina legislature passed an act of oblivion, and admitted Sevier as a senator. In 1790 North Carolina ceded Tennessee to the United States, stipulating that the inhabitants were to have all the benefits of the ordinance of 1787 (see that title), except that slavery was never to be abolished. The cession was accepted by act of April 2, 1790. A governor, William Blount, was appointed, and the territorial legislature met in February, 1794. A convention at Knoxville, Jan. 11-Feb. 6, 1796, framed the first state constitution, which was not submitted to popular vote. Under it, the state was admitted by act of June 1, 1796. — **BOUNDARIES.** The North Carolina act of cession describes Tennessee as the country within the chartered limits of North Carolina, and west of a line following the northeast and southwest line of the Iron, or Bald, Mountains. The northern and southern boundaries of Tennessee are therefore properly westward prolongations of the corresponding boundaries of North Carolina. The northern boundary, between North Carolina and Virginia, was run as far as the Holston in 1749, but from that point it was undefined. Feb. 2, 1820, commissioners from the two states, at Frankfort, agreed that the northern boundary of Tennessee was to vary slightly north from a true west line, from the Cumberland mountains to the Cumberland river, and then return to latitude 36° 30'. The western boundary is the Mississippi, the western boundary of the United States until 1803. — Knoxville was the capital until 1802. The capital was then changed to Nashville by the legislature, but has never been permanently fixed there by the constitution. The name of the state was given from that of its principal river. — **CONSTITUTIONS.** The first constitution, considered by Jefferson "the most republican yet framed in America," gave the right of suffrage to freemen over twenty-one, on six months' residence; provided for a house numbering not more than forty nor less than twenty-two, apportioned to the counties according to population; for a senate, one-third the number of the house, elected by districts; and for a governor—all elected by the people for two years; and for a judiciary, to be appointed and to hold office during good behavior; and indirectly legalized slavery, by providing for the enforcement of "laws and ordinances now in force and use in this territory," until altered or repealed by the legislature. — A new constitution was framed by a convention at Nashville, May

19-Aug. 30, 1834, and ratified by popular vote, March 5-6, 1835. The principal changes were a permission to increase the numbers of the house to seventy-five, until the population should reach 1,500,000, and thereafter to ninety-nine; the omission of certain property qualifications for holding office, which had become obsolete; and the extension of the right of suffrage to persons so nearly white as to be competent witnesses against a white man. In 1853 an amendment made the judiciary elective by popular vote, on a different day from state and county elections. In 1865 a convention at Nashville, Jan. 9-26, framed an amendment abolishing slavery, and a schedule, both ratified, Feb. 22, by a popular vote of 21,104 to 40. The schedule declared the ordinance of secession, and the military league of 1861, null and void; repudiated the rebel war debt; and established a severe test oath for voters, containing the following among other provisions: "That I ardently desire the suppression of the present rebellion; and that I sincerely rejoice in the triumph of the armies and navies of the United States, and in the defeat and overthrow of the armies, navies and all armed combinations in the so-called confederate states." — The present constitution was framed by a convention at Nashville, Jan. 10-Feb. 22, 1870, and was ratified by a popular vote of 98,128 to 33,872, March 26. It made very few changes, the principal ones being as follows: the legislature was given power to take away the right of suffrage as a penalty for conviction of infamous crimes, and to prohibit the intermarriage of whites and negroes, or persons of mixed blood to the third generation; slavery, and all laws recognizing the right of property in man, were prohibited; the governor was given the veto power; and homesteads, to the value of \$1,000, were reserved to heads of families, and exempted from sale under legal process. — **GOVERNORS:** John Sevier, 1796-1801; Archibald Roane, 1801-3; John Sevier, 1803-9; Willie Blount, 1809-15; Joseph McMinn, 1815-21; William Carroll, 1821-7; Samuel Houston, 1827-9; William Carroll, 1829-35; Newton Cannon, 1835-9; James K. Polk, 1839-41; James C. Jones, 1841-5; Aaron V. Brown, 1845-7; Neil S. Brown, 1847-9; William Trousdale, 1849-51; Wm. B. Campbell, 1851-3. Andrew Johnson, 1853-7; Isham G. Harris, 1857-62; Andrew Johnson, military. 1862-5; Wm. G. Brownlow, 1865-9; De Witt C. Senter, 1869-71; John C. Brown, 1871-5; James D. Porter, 1875-9. Albert S. Marks, 1879-81; Alvin Hawkins, 1881-3. — **POLITICAL HISTORY.** From the beginning of Tennessee's settlement, there has been a marked political division between East Tennessee, the mountainous region, and the more level country west of it. The former was first settled, and the Watauga association, and the strength of the state of Frankland, had their location in it. For a long time the country around Nashville was the only settled district outside of it. The intervening country was a wilderness, and emigrants to Nashville usually went down the Tennessee to the Ohio, and thence up the Cumberland to their destination.

In both the districts of the state the dominant principle was that of democracy, strengthened by frontier independence. The admission of the state was therefore resisted by the federalists in congress as long as prudence would justify resistance; and the new state was strongly democratic. All her officers were democrats, and her electoral votes were cast for the regular democratic candidates at every election until the disruption of that party in 1824-5. Personal influence was always the strongest point in state politics. William Robertson, in West Tennessee, and John Sevier and William Blount, in East Tennessee, held a commanding influence in their respective sections. About the time of Blount's impeachment before the United States senate (see IMPEACHMENTS, I.), he was elected to the state senate, and that body unanimously chose him as its presiding officer. While his own impeachment was in progress, he was himself presiding over a state impeachment trial. His return to the United States senate was only prevented by his death, in 1800. Sevier was state governor twelve years, the intermission of two years being necessary on account of his ineligibility for more than three terms in succession, and was then a congressman until his death. Before the last of these leaders had disappeared from the scene, all their influence had been concentrated in one man, Andrew Jackson. Before the war of 1812 his personal character for frankness and fearlessness had brought him many friends, but probably more enemies, in the western part of the state. His military services, and the success of Tennessee troops under his leadership, made him the autocrat of the state. When he was nominated for the presidency by the legislature in 1824, only twenty-five members ventured to vote against him; and only three of these were elected to the next legislature. The popular vote for president in the state, 1824-32, will show his popularity: 1824, Jackson 20,197, Clay 312, Adams 261; 1828, Jackson 44,090, Adams 2,240, 1832, Jackson 28,740, Clay 1,436. Many towns voted unanimously for Jackson. In one, it is said, a stranger, at the end of the election of 1828, found the inhabitants pursuing, with intent to tar and feather them, two of their number who had voted against Jackson, and so disturbed the unanimity of the town.—The state-rights element, which in various southern states became a part of the whig party (see that title) about 1832-4, was strongly represented in Tennessee. In 1835 it was strong enough to elect Cannon governor, and ten of the thirteen congressmen; and in 1836 the state's electoral votes were cast for Hugh L. White (see his name), the representative of this element. For the next twenty years the general rule of Tennessee politics was that there was a strong democratic majority in Middle Tennessee, from the Cumberland mountains to the Cumberland river, a slight whig majority in West Tennessee, and a strong whig majority in East Tennessee. In 1839 Jas. K. Polk had 54,680 votes for governor, and Cannon 52,114, but in the next two elections Polk was beaten by Gov. Jones by

about the same majority. Until 1856 the state's electoral votes were always cast for the whig candidates; and in 1844 Clay received 60,030 votes for president to 59,917 for Polk, a Tennessee candidate. From 1843 until 1853, five of the eleven congressmen were usually whigs; and from 1853 until 1855, six of the ten were of that party. In 1845 the democrats elected A. V. Brown governor; in 1847 he was beaten by Neil S. Brown, whig; in 1849 N. S. Brown was beaten by Trousdale, democrat; and in 1851 Trousdale was beaten by Campbell, whig; all by very small majorities. In state elections, therefore, Tennessee was exceedingly doubtful; but the general majority in the legislature must class it as a whig state.—On the dissolution of the whig party, its whole strength in Tennessee was turned into the "American" party. (See those names.) In 1855, for governor, Andrew Johnson, democrat, had 67,499 votes to 65,332 for M. P. Gentry, "American"; and the latter party carried the legislature. As secession and war grew more threatening, the feeling and vote in East and West Tennessee against both became stronger. In 1859 seven of the ten congressmen, all from these two sections, were elected by the "Americans"; but the democratic majority in Middle Tennessee was large enough to give Harris 71,539 votes in the state, to 59,867 for Robert Hatton, "American," and elect him.—Gov. Harris was an active secessionist, and to him is attributable the secession of the state in 1861. At the first appearance of trouble he summoned the legislature to meet Jan. 7, 1861, and consider the state's federal relations. The legislature passed a bill to call a convention, but at the same time submitted the question to popular vote. At the election, Feb. 9, East Tennessee gave 25,611 majority against, Middle Tennessee 1,382 majority against, and West Tennessee 15,118 majority for, a convention, and the convention did not meet. The first attempt at "coercion" (see SECESSION, III.) renewed the excitement. The legislature was summoned to meet again, April 25, but this time a more certain, though absurdly illegal, plan was followed. May 1, in secret session, the legislature authorized the governor to appoint commissioners to conclude a military league with the confederate states, and the league was ratified by both houses, May 7. It purported to agree, that, "until the state becomes a member of the confederacy," her whole force should be under the control of the president of the confederate states, "upon the same basis, principles and footing as if said state were now and during the interval a member of the said confederacy." Having thus invited confederate troops into the state, and authorized the governor to levy 55,000 state troops, the legislature completed the farce by submitting to popular vote, June 8, a declaration of independence and ordinance of secession. It is quite useless to argue about the right of a state legislature to make a treaty, or the power of a people to vote under military domination. It is only remarkable that so large a vote was cast against secession. In

East Tennessee the vote was 14,780 for, and 32,923 against; in Middle Tennessee 58,265 for, and 8,198 against; in West Tennessee 29,127 for, and 6,117 against; in the camps, 2,741 for, and none against; total vote, 104,913 for, and 47,238 against, secession. June 24, Gov. Harris, by proclamation, declared the state out of the union. The popular vote on June 8 had also ratified the confederate constitution. In the autumn, Gov. Harris was re-elected by a vote of 69,269 to 40,467 for Wm. H. Polk; but early in 1862 the advance of the federal forces drove him out of the state capital. — March 5, 1862, the senate confirmed the president's nomination of Andrew Johnson as military governor of Tennessee. He had been a democratic United States senator at the time of the secession; but had treated his state's action with great contempt, and gone on with his official work at Washington. In 1864 he made an unsuccessful attempt to reorganize the state government; and an equally unsuccessful attempt was made to organize East Tennessee into a separate state. In the following year Johnson was successful; the amendment to the state constitution, abolishing slavery, and the 13th and 14th amendments, were ratified; and the state was "restored to her former proper, practical relations to the union," by act of July 24, 1866. Wm. G. Brownlow, a radical republican, was elected governor; the legislatures were republican; and the electoral vote of the state in 1868 was cast for Grant by a popular vote of 56,628 to 26,129 for Seymour. — The first legislature, in 1865, passed an act to regulate the elective franchise, restricting it to 1, persons "publicly known to have entertained unconditional union sentiments from the outbreak of the rebellion to the present time"; 2, those who had since come of age; 3, persons of proved loyalty from other states; 4, federal soldiers; 5, loyal men who had been forced into the confederate armies; and 6, persons known to the election judges to "have been true friends to the government of the United States." It disfranchised ex-rebels of higher rank for fifteen years, and others for five years, and imposed on all voters the test oath before referred to. In the following year the test oath was made still more voluminous and stringent; it now contained 366 words. In February, 1867, disfranchisement was made a penalty for insurrectionary movements within the state, and negroes were allowed to vote. This latter step was proper under the constitution of 1834 (then in force), which gave the right of suffrage to every "freeman," without using the word "white." Disorder in the western and middle sections of the state now became very general. (See INSURRECTION, II.; KU-KLUX KLAN.) Laws were passed authorizing the governor to arm state guards (mostly drawn from East Tennessee), and to appoint commissioners of registration; and the governor interpreted the latter law as giving to these commissioners the appointment of election judges. Feb. 20, 1869, the governor proclaimed martial law in nine counties of Middle and West

Tennessee. — In the summer of 1869 the dominant party split, and Gov. Brownlow retired to the United States senate. Of the two candidates for the succession, Senter declared in favor of the removal of most of the disfranchisement laws, and received the democratic vote, Wm. B. Stokes, the radical candidate, received 55,086 votes, Senter 120,333; and both branches of the legislature were democratic. The revision of the constitution in 1870 followed; and until 1880 the democratic majority was very large, except in 1872. In that year Andrew Johnson ran as an independent candidate for congressman at large; Horace Maynard, the republican candidate, was elected over his two democratic opponents; and the democratic vote in the presidential election was 94,391 to 83,655 republican. One district in East Tennessee has steadily chosen a republican congressman; and in 1873-5, seven of the ten congressmen were republicans, owing to the democratic division of 1872. In 1881-3 there are three republican congressmen, two from the East Tennessee districts, and one from the Memphis district. — Since 1874 the debt has been the paramount feature in state politics. Most of it was contracted before the rebellion, to aid state railroads under internal improvement laws of 1851-2. The total amount in 1870 was \$41,863,406.69, with \$20,701,825.76 nominal assets, most of it in railroad bonds paying no interest. The war had reduced the taxable property of the state nearly one-half; it was very difficult to collect any taxes; and one of the first steps of the new democratic government in 1870 was to reduce taxation over one-half. Thereafter, payments of interest went by default, until in 1879 the net state debt was \$20,221,300 principal, and \$4,052,717 lapsed interest. In 1876 an arrangement to fund the whole debt at sixty cents on the dollar and 6 per cent. interest, commonly called "the 60-6 plan," was nearly agreed upon between the state and the bondholders. Since that time various plans of settlement have been proposed, named similarly from their percentage of total debt and of interest, and ranging from "50-4" to "100-3"; and a small number of voters have even favored total repudiation of the railroad debt. In 1880 the legislature passed a "50-4" bill for most of the debt, but it was submitted to a popular election, and rejected on a very light vote. In 1880 the whole election turned on the debt question. The republican convention nominated Alvin Hawkins for governor, and declared that all the debt should be paid; that any proposition from the bondholders for its decrease should be thankfully accepted, and that the democrats were responsible for the failure of the 60-6 plan in 1876. The greenback convention nominated R. M. Edwards, and repudiated all but \$2,025,000 of the debt. The "state-credit" democratic convention favored prompt payment on the best terms that creditors would accept, and nominated John W. Wright; but a part of the delegates seceded, nominated S. F. Wilson, and called for repudiation of the debt. The result of the election gave the state her first

republican governor since Senter, by the following vote: Hawkins, 102,969; Wright, 79,191; Wilson, 57,424; and Edwards, 3,641. The legislature chosen had fifteen democrats and ten republicans in the senate, and thirty-seven republicans, thirty-six democrats, and one greenbacker in the house; but the nominal representatives of both parties were so divided by the various plans that any agreement seemed impossible. In April, 1881, the legislature at last passed a "100-3" act, proposed by the creditors, making the coupons receivable for taxes; but in February following the state supreme court decided the law unconstitutional, on account of its coupon feature. — In addition to John Bell, Thos. H. Benton, Samuel Houston, Andrew Jackson, Andrew Johnson, James K. Polk, and Hugh L. White (see those names), the following have been prominent in state politics. John D. C. Atkins, confederate congressman 1861-5, democratic congressman 1873-83; William Blount, territorial governor 1790-96, and democratic United States senator 1796-7; Aaron V. Brown, democratic congressman 1839-45, governor 1845-7, and postmaster general under Buchanan; R. R. Butler, republican congressman 1868-75; George W. Campbell, democratic congressman 1803-9, United States senator 1811-14 and 1815-18, secretary of the treasury under Madison, and minister to Russia 1818-21; Wm. B. Campbell, whig congressman 1837-43, governor 1851-3, and republican congressman in 1867; Wm. C. C. Claiborne, democratic congressman 1797-1801, governor of Mississippi and Louisiana territories, and of the state of Louisiana; John Cocke, major general under Jackson in 1813-15, and democratic congressman 1819-27; Henry Cooper, democratic United States senator 1871-7; David Crockett, an eccentric whig congressman 1827-31 and 1833-5, killed in battle at Bexar, Texas, in 1836; John H. Eaton, democratic United States senator 1818-29, secretary of war under Jackson (see KITCHEN CABINET), governor of Florida territory 1834-6, and minister to Spain 1836-40; Emerson Etheridge, whig and "American" congressman 1853-7 and 1859-61, clerk of the house of representatives 1861-3, and thereafter one of the state republican leaders; Meredith P. Gentry, whig congressman 1839-43 and 1845-53, and confederate congressman 1861-5; Felix Grundy, democratic congressman 1811-14, United States senator 1820-38, and attorney general under Van Buren, 1838-40; Isham G. Harris, democratic congressman 1849-53, governor 1857-62, and United States senator 1877-89; John F. House, Bell elector in 1860, and democratic congressman 1875-83; Howell E. Jackson, democratic United States senator 1881-7; Cave Johnson, democratic congressman 1829-37 and 1839-45, and postmaster general under Polk 1845-9; James C. Jones, governor 1841-5, and whig United States senator 1851-7; David McK. Key, democratic United States senator 1875-7, and postmaster general 1877-80; Horace Maynard, "American" and republican congressman 1857-63 and 1866-75, state attorney gen-

eral 1863-5, minister to Turkey 1875-80, and postmaster general 1880-81; A. O. P. Nicholson, democratic United States senator 1841-3 and 1859-61 (see POPULAR SOVEREIGNTY); Bailie Peyton, whig congressman 1833-7; John Rhea, democratic congressman 1803-15 and 1817-23; John Sevier, governor of Frankland 1784-8, governor of Tennessee 1776-1801 and 1803-9, and congressman 1811-15; Frederick P. Stanton, democratic congressman 1845-55, and governor of Kansas as a territory 1858-61; Wm. B. Stokes, whig congressman 1859-61, major general of United States volunteers, and republican congressman 1866-71; Albert G. Watkins, whig congressman 1849-53, and democratic congressman 1855-9; W. C. Whitthorne, democratic congressman 1871-83; and Felix K. Zollicoffer, state comptroller 1845-9, whig and "American" congressman 1853-9, brigadier general in the confederate army, killed at Mill Spring in 1862. — There is no good history of modern Tennessee. See authorities under NORTH CAROLINA, JACKSON, ANDREW, and JOHNSON, ANDREW; 6 Bancroft's *United States*, 377 (Watauga association); 3 Hildreth's *United States*, 539 (Frankland); 2 Poore's *Federal and State Constitutions*; 2 Hough's *American Constitutions*; Haywood's *History of Tennessee* (to 1796); Ramsey's *Annals of Tennessee* (to 1800); Putnam's *Life of James Robertson*, and *History of Middle Tennessee*; Smith's *Historical View of East Tennessee* (1842); Carpenter's *History of Tennessee* (1854); A. ALEXANDER JOHNSTON.

TERM AND TENURE OF OFFICE. Term measures the period for which an office is conferred. Tenure marks the conditions upon which the office is held, whether for a fixed or for an indefinite time. The term of the president and the term of the postmasters he appoints are each for four years; but the tenure of the former can be severed only by the judgment of the senate upon an impeachment, while that of the latter exists only during the pleasure of superior officers. — Offices may be divided into three classes, civil, military and naval. In the two latter classes definite terms are now rarely found, though we read, that, among the Greeks, generals sometimes held supreme command only for the term of a day; and Roman consuls commanded armies during their short fixed terms of office. Military and naval officers, in modern times, almost invariably hold their offices, if not for indefinite periods, at least for periods determined in reference to probable efficiency of service. Yet, soldiers are generally enlisted for a defined term. (As to the tenure of military and naval officers, in the United States, see PROMOTION, REMOVALS FROM OFFICE.) — Civil offices may also be divided into three classes: legislative, judicial and executive. To properly pre-

sent the important considerations by which term and tenure should be determined in these three classes—in their whole range from the president to the highway surveyor, from the national chief justice to the town justice of the peace, from the federal senator to the village trustee—would require a space far beyond that accorded to this article. Few subjects within the range of political science have been so utterly neglected as that of the proper tenure of office, and none requires a more careful study. It is not perhaps possible to refer to any chapter where the subject is treated in even the most general manner. As a natural consequence, we find not only in different states, but in the same states at different times, for the same offices, terms of diverse lengths, and tenures of miscellaneous variety. The interests of factions and the ambition of leaders, rather than sound views of public interest, seem to have often determined both term and tenure. — On the one side, intense partisans tell us that parties can not be sustained without being able to give many places to which a long term or a stable tenure would be fatal; while, on the other, the most experienced and thoughtful citizens assure us that parties may trust to sound principles and good administration; repudiating the spoils and office mongering by which they say parties are only debauched and enfeebled. The reasons are almost obvious why the term and tenure most appropriate for one of these three classes would not be equally appropriate for the others. — 1. So far as judicial offices are concerned, the most important considerations have been presented in the article on JUDICIARY, ELECTIVE. And see REMOVALS FROM OFFICE. It may be added, however, that nowhere is well-trained experience more valuable than upon the bench. It not only promotes facility in the doing of the business of the courts, and clearness and consistency in the interpretations of the laws, but it develops that judicial frame of mind which is unperturbed by partisan excitements, and which commands the confidence of litigants. It can hardly be denied that the inexperience which short judicial terms have brought upon the bench has not only greatly delayed the administration of justice, but has greatly impaired public confidence in the courts of every grade. — 2. Turning next to the legislative department, we find decisive reasons why the terms of those elected to represent the people should not be long. These officers represent interests, opinions and policies which are constantly changing; and, at every phase, they have an equal claim to be represented in debate; and, if sound, to be expressed in statutes. Permanency of tenure on the part of legislators would obviously tend to defeat one of the great ends of representative government. Yet, so manifest have been the advantages of that wisdom and facility which come from experience in legislation, and so deep has been the sense of peril from incompetent legislators, that a great portion of these officers—notably senators, both state and federal—have been allowed to hold their places for terms during

which great changes of interests and opinions have taken place. And so strong has public opinion been in this direction of late that in many of the states, the terms of judges, senators, mayors, and school officers, as well as of various other officials, have been considerably extended within the last few years, perhaps nearly doubled since the reaction has become vigorous against the spoils system theory of rotation in office. Biennial sessions of the legislature in more than half the states are due to the same cause. — Despite these changes, the vast volumes of crude statutes—more than a thousand pages a year in a single state—have proclaimed the incompetency of the law makers; causing needless litigation, and making justice remote and uncertain. It will be in vain that a remedy will be sought in limiting legislative power by constitutional amendments. As the statutes become more intricate and official functions more complicated, with our growing wealth and population, there will more and more be a need of larger official experience and larger official terms—to be held under a sterner responsibility—for the supreme work of legislation. Some plan may perhaps be devised for securing more experience in state legislatures, by classifying members, while increasing their terms of office, after the analogy of the national senate. — But in the legislative department there are inferior officers, not elected by the people—the clerks and other subordinates of congress, state legislatures and municipal councils—who are in no sense representative, but are simply ministerial officers. Next to fidelity and natural capacity, the highest qualification for these places is experience, invaluable experience, in the discharge of their duties. These duties have no honest relation to party politics, or to majorities in legislatures, but are the same at all times and under whatever dominant party. The office of speaker is, within certain limits, an obvious exception. But the less he is a partisan the more fit he is for his duties. The constitution of the United States, like that of Great Britain, confers the power of selecting and removing these subordinates upon the legislative chambers, without restriction as to term or tenure. So it is also in the state legislatures. Who will deny that economy, efficiency, purity and dignity, in legislation, alike demand that those officials should hold their places so long as they fitly perform their duties, and that they should be made to feel it to be a disgrace to allow that performance to be influenced by partisan considerations?— Before the British spoils system was suppressed by the reforms made within this generation, there had been as demoralizing contests in the British parliament, over the appointment and removal of such subordinates, as have ever disgraced our congress or state legislatures. Now, holding during good behavior and efficiency, the selection of these officials in Great Britain is by methods with which no party interferes; and the discharge of their functions is treated as having no political significance. Parliament has now more time for its great work, and

its dignity is no longer impaired by ignominious contests about clerkships and doorkeepers. The most perfect representation, which in theory is sought, would be attained by the shortest practicable terms of office. Terms of six years for federal senators, of two, three and four years for state senators, of two and three years for governors, mayors and various other officers—as they now exist—can not be justified on the mere theory of representation. This theory is based on the right of the people *at all times* to have their interests and opinions reflected in the halls of legislation. But terms, even if for only a single year—the shortest we recognize—violate that theory. For the opinions of parties and individuals do not make an annual revolution, but often more frequently. When Rhode Island, following the example of Grecian republics, fixed the terms of her representatives at six months, and Connecticut added to those short terms semi-annual sessions of her legislature, each at a different place, for the more convenient and exact representation of the people; and when the factious spoils system spirit of Florence and other medieval republics reduced official terms, first to six, then to four, and finally to two months, they obviously enforced a term tending to a more exact representation than any now provided for in the United States. — Our longer terms for such offices are justifiable only on the assumption, which they proclaim, that the experience secured by longer public service is more valuable than any ideal exactness in representation. This is an important truth, as bearing upon the proper term of mere ministerial and executive subordinates. It is a truth which senators will do well if they do not longer forget, when they stand up in their places, in the fifth or sixth year of their terms—perhaps long after the majority in the state and legislature which they pretend to represent has been changed since their election—and, in the name of justice and sound policy, demand rotation, removals and short terms on the part of their own subordinates, who represent nothing but the unchanging need of having the constant volume of public work well done, and done in the same way year after year, whichever party is in power, and whatever policy prevails. — 3. The executive department is affected by more complicated reasons. To approve or disapprove legislative enactments is the highest function of governors and presidents. To that extent they are both legislative and representative officers. Next in importance is the duty of those officers to carry into action, in the conduct of executive affairs, the principles and policy which the people approved in their election. This, too, is in a sense a representative function. Much the same reasons, therefore, which require the terms of legislative officers to be short, apply also to presidents and governors; and, in a limited degree, they apply to mayors also. In fixing the term of the president at four years, under our constitution, considerations drawn from his representative function plainly prevailed—must we not say unwisely prevailed?

—to the extent that it made his term shorter than that of a senator. — The constitution *fixed the term of no officer in the executive department except that of the president and vice-president*. It created no department; yet says “the president may require the opinion in writing of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices.” Upon this narrow basis, and the precedents of the British cabinet, our cabinet has been reared; and while each of them are equally unrecognized in the constitution and laws (and with us the duty and responsibility are upon the president alone), the cabinet has been, in practice, in both countries, the great central council for advice in regard to all executive action. It is clear, therefore, that the heads of departments, who are to advise him as to his gravest duties, need to have faith in the principles and policy which the president is bound to enforce; and for that reason their tenure of office should depend mainly upon him. There may also be a few other executive officers—foreign ministers sent on special missions involving national policy would be examples—whose peculiar fitness will depend upon their sharing the views of administration, and in all such cases there should clearly be a tenure in the discretion of the president. — When we go below such officers, we come upon those who not only, upon the theory of the constitution and the laws, but from the very necessities of government, are required to obey legal instructions from those above them to whom they are directly responsible. Each head of a department is clothed by law with the authority and duty of directing the official action, subject to the constitutional power of the president, of all the subordinates of that department. Among all the eighty or more thousands of subordinates standing in graded ranks, from the department secretaries down past great collectors and postmasters to the customs service inspectors, the keepers of light houses and of signal and life-saving stations, there is not one who, according to the laws or sound policy, has any right of advice as to the policy or principles of an administration; not one for whom obedience to legal instructions is not a plain duty; not one whose political opinions are material for good administration; hardly one whose active participation in partisan politics is not a public detriment, tending to neglect of public business and the oppression of the citizen. The duties of these officers are in no sense representative. They are not called upon to act upon any political theory. They perform no duties that depend upon the triumph of political opinions or the success of any party. Whichever party comes into power, whatever party they belong to, their duties are the same. They have no right to regard the political or religious opinions of any citizen in their official action, or need to know them. They do not, like legislators, or town and village officials, meet to consider changing interests and fluctuating politics, but, month after month and year after year, they do, or they

should, steadily devote themselves to the same branch of that vast, unchanging public business which, from the smaller officers to the greater, moves on, like brooks and rivers, in an unbroken order and everlasting continuity. Unjustifiable as political indifference is in the citizen, the use of official authority and influence to coerce the action of the private citizen is not less indefensible. We may not, as was found necessary in England, for a hundred years, disfranchise those officials, but we should clearly see, and should make them *feel*, that they not only need not, but should not, as officials, interfere with party politics or regard political opinions as qualifications for their duties. — Before considering what should be the term and tenure of this vast body of federal officials—referred to in the national constitution as “inferior officers,” and to which a vastly larger number of state and municipal officials holding like relations should be added in our reflections—it will be well to notice some objections which stand in the way of treating the subject upon its own merits. It is declared that any term and tenure which prevents these officers being removed and their successors appointed at the pleasure of the majority, disastrously restricts the freedom and effectiveness of party action, and also deprives them of essential representation in the official life of the country. — The answer is not difficult. Under our institutions, parties are inevitable and salutary. Their great functions are to arouse, embody, sustain and carry forward a sound public opinion until it finds fit expression in statutes and executive action. Under these institutions the federal and state legislators, and all who govern in municipalities and towns, are selected by the vote of the majority, which, in itself, but too generally expresses the mere will of the dominant party. In the selection of mayors, governors and presidents, that party majority is still more potential. These two classes of officers, the one wielding all legislative authority, and the other all executive authority, in their united action exert all the power which our institutions give, or a free people can safely confer, for the representation and enforcement of their will. All of these officers may be, and in our practice they generally are, within their respective spheres, the trusted favorites of the dominant party, bound in the double allegiance of gratitude and dependence. Through these two classes of officers the adherents of the dominant party practically make, enforce and repeal laws and ordinances at pleasure, instruct and require obedience from all who hold subordinate positions under them, enforce all principles and guide all policy in obedience to which the vast affairs of the nation, from the light houses and the signal stations to foreign embassies, and the great departments, are conducted. Is not this enough? Have we ever suffered because parties have needed opportunities or influence greater than these? Is not here a sphere broad and grand enough, a power and opportunity dazzling enough, to inspire the patriotism and reward the zeal of any

party and of the noblest man who ever led any party in a great nation? Unless, therefore, it is claimed that a party, which can not gain or retain power by adhering to the spirit of the constitution and to common honesty and justice, may strengthen itself by using public authority to debauch and coerce the people—unless it can be shown that the term and tenure of “inferior officers” should, in the merely selfish interests of parties, be made brief and precarious, so that patronage and the appointing power may be conveniently prostituted as merchandise in the shambles of partisan politics—we may confidently declare that term and tenure alike of “inferior officers” should be determined quite irrespective of mere party considerations. — But let us not imagine, because these inferior officers are not representative and are not given large discretionary power, that their term, tenure or relations are not very important. The facts are quite otherwise. The creation of a term of four years for about 3,500 of these offices (to the history of which we shall refer), and the subjection of nearly all of them to a tenure of favoritism and partisanship, within the last forty-five years, contrary to the spirit of the constitution and to the practice of the early statesmen, while working a disastrous revolution in the measure of filling the executive departments, have also exerted a demoralizing influence upon parties and upon all official and political life. It was the short terms and the precarious tenure thus created which made it possible for great parties to levy the expenses of their campaign, under the name of assessments, upon the humbler officials in the executive service, and to compel them to do the most servile work. It was these political assessments which President Grant prohibited by executive order; which President Hayes declared to be either “a gross injustice to the officers or an indirect robbery of the public treasury”; which President Garfield declared to be “shameful,” and “the source of an electioneering fund which in many cases never gets beyond the pockets of the shyster and the mere camp followers of the party.” It has been these precarious tenures and the habit of removing worthy officials to make places for clamorous favorites and henchmen, which developed the disgraceful acts of patronage mongering and office brokerage, by reason of which office seeking has been made a sort of business, and vast numbers of supernumeraries have been foisted upon the public service. It caused President Garfield to declare “one-third of the working hours of senators and representatives to be hardly sufficient to meet the demands in reference to the appointments to office,” and that “with a judicious system of civil service, the business of the departments could be better done at almost one-half the cost.” In the debates preceding the passage of the civil service reform bill (of Jan. 18, 1883,) for the suppression of such abuses, Senator Dawes, of one party, declared that the existing system of office getting “destroys the congressman’s independence and makes him

a slave," and Senator Pendleton, of the other party, said, "It has debauched public morality and made Guiteau possible. It drives senators and representatives into neglect of their chief duty of legislation, and often makes the support of an administration conditional upon obtaining office for friends."—At the time of the formation of the federal constitution no human forecast could have taken the measure of such evils in our day. The few officials and the simple administration of the first decades hardly gave a hint of the varied complication and the vast official force we now have. There was \$2,000,000 of revenue the first year, under the constitution, against more than \$360,000,000 last year. Even as late as the administration of John Quincy Adams, the revenue was not one-fourth as much altogether as the surpluses now annually applied to the reduction of the national debt. The number of officers at the two periods is in about the same ratio. It is hence no matter for surprise that no adequate provisions are found in the constitution concerning the tenure of "inferior officers" in the executive service. The occasion for surprise is in the fact that with clearer lights, the later generations have created terms and a tenure which have greatly aggravated the consequences of the defects of the original constitution.—It is by no means an easy matter to decide with precision what would be the most useful tenure in the several parts of the executive service. Many considerations must be estimated, and a broad field of facts must be kept in view. We have only to consider the great variety of officials to see, that, to most of all the general rules we may lay down there must be some exceptions. The officers in the state department, for example, range from the secretary and the ambassadors to the consular clerks and the copyists. The department of the treasury has at Washington about 3,000 subordinates; to which must be added more than two hundred collectors of internal and customs revenue, the surveyors, the naval officers, the officers of the mints—and all their subordinates—the light house, the life saving, the hospital and the revenue marine services, and many more isolated officials. In the department of the interior there are the pension and patent office service, the land office, the Indian service, the bureaus of education and agriculture, and various other officers. The war and navy departments have civil subordinates of many grades, widely separated. More than 42,000 postmasters, with all their subordinates, and various others, with peculiar duties, of which the railroad and steamboat mail service and the complicated mail contract system are examples, are under the postmaster general. The department of justice, with its district attorneys, marshals and election supervisors and their subordinates, the officers of the District of Columbia and of the territories, are also to be added, before we get a general view of the vast number and variety of the officials under the executive.—The authority to appoint the higher officers, subject to confirmation by the sen-

ate, is given by the constitution to the president, with the power, as we have seen, in congress to vest the appointment of inferior officers in heads of departments. Beyond declaring that all civil officers shall be removed on impeachment and conviction of treason, bribery and other high crimes and misdemeanors, the constitution leaves the stupendous power of removal to mere implication. It has, however, been authoritatively decided, and the constant practice has been (save as qualified of late by the tenure of office acts), that the power of removal belongs to the president as an incident to the power of appointment. *The constitution provides no term*, and, otherwise than by implication, no tenure for any one of these inferior officers. And prior to a law of 1820, to which further reference will be made, no term or tenure was provided by law for any of them, with the single and peculiar exception of marshals. The tenure of usage had been that of combined efficiency and good behavior. (See REMOVALS FROM OFFICE, CONFIRMATION BY THE SENATE.) It was left for the politicians of later days to discover and to teach, that, to select public servants for their merits, and to retain them because they continued meritorious, are "un-American." That teaching has been the cause of a pernicious practice in its spirit.—Let us glance at the causes and progress of this great change as bearing upon terms and tenure of office. Aaron Burr early laid the foundations of the spoils system; and, with the aid of Van Buren, his most apt and distinguished disciple, that system had been made potential in New York, several years previous to 1820. It required short terms, and partisan tests for office. It demanded a tenure at the pleasure of the official superior, and required that superior to be a partisan leader. It made political opinions a ground of appointments and removals, and enforced servile obedience to chieftains on the part of all officials. Before 1820, Gov. Clinton, of New York, complained, in a message, "of an organized and disciplined corps of federal officials interfering in state elections." Tammany Hall was then becoming a political power. New York politics had already become so notoriously unscrupulous as to attract almost as much attention as during the present decade. Jackson, contriving how to reach the presidential chair, and affecting the character of a non-partisan, said to a New Yorker, "I am no politician, but if I were a politician, I would be a New York politician." Van Buren soon made him one.—The spoils system spirit, thus early reduced to practice in New York, was being slowly developed in other parts of the Union. The creed of the spoilsmen had not been avowed, but the men who were first to proclaim it were leading politicians before 1820. In that year, William H. Crawford, secretary of the treasury, was a presidential candidate, and Van Buren, who was to come into the senate in 1821—even then an aspirant for the presidency—was Crawford's supporter. They were unsurpassed for their skillful use of patronage. Both were able to

see that if the terms of the inferior officers were reduced to four years, there would be more patronage to dispose of, and an easier introduction of the New York system. — On April 20, 1820, about thirty days before the adjournment of congress, a bill, drawn by Mr. Crawford, was reported in the senate, which created a term of four years for district attorneys, collectors, naval officers, navy agents, surveyors of customs, paymasters, and for several other less important officers. Mr. Adams says the object of the law was to gain support for Crawford for the presidency. The officers thus subjected to the new term are said to have become "ardent Crawfordites." This was the first fixed term for any such office. The bill further declared that the holdings of all such officers whose commissions were dated Sept. 30, 1814, should expire on the day and month of their date next after Sept. 30, 1820. The expiration of other holdings was fixed for a year later. The bill was thus *retroactive*, and it made the terms expire on the eve of the presidential election. There was to be a presidential election in 1824, when Crawford and Jackson were to be leading candidates. How largely and promptly this change would add to the patronage of the treasury, where Mr. Crawford presided, need not be pointed out. — But these were hardly the most ominous provisions of the bill; for, taking the side of the partisan spoilsmen, against the approved doctrines of Madison, and the practice of every president, it declared that those officers "shall be removable at pleasure." Here was rotation legalized for the sake of rotation. Here was the first demand of surrender ever made upon the general government in the spirit of the New York spoils system. Here was practically a revolution in the term and tenure of office; an emphatic degradation of the standard according to which the fate of every one of these officers was to be determined. Without debate, in silence, suddenly, almost stealthily, this disastrous bill was carried through both houses. Mr. Adams, then secretary of state, says President Monroe signed the bill without perceiving its true character. The avowed reason, or rather the apology, for the new policy, was that it would remove unworthy officials; the speciousness of which appears in the facts that the tenures of all in office, worthy and unworthy alike, were, without inquiry, severed absolutely; and nothing but official pleasure was to protect the most meritorious in the future. There was no showing of delinquencies; no charge that the president could not or would not remove unworthy officials, not a word of discussion, not a record of votes, on this revolutionary bill! — But there were statesmen who foresaw the disastrous consequences. On Nov. 20, 1820, Mr. Jefferson, in a letter to Madison, said of the law that "it saps the constitutional and salutary functions of the president, and introduces a principle of intrigue and corruption which will soon leaven the mass, not only of senators, but of citizens. * * It will keep in constant excitement all the hungry cormorants for office; render them, as well as those

in place, sycophants to their senators, * * and make of them, what all executive directories become, mere sinks of corruption and faction. It must have been one of the midnight signatures of the president, when he had no time to consider or even to read the law." Madison replied in the same spirit. When Mr. Calhoun, then secretary of war, heard of the sudden passage of the bill, he declared it "one of the most dangerous ever passed, and that it would work a revolution." The dangerous consequences of the new policy began very soon to appear. Five years after the passage of the act of 1820, an able committee of the senate, with Mr. Macon at the head—who never aided a relative or henchman to an office—made an earnest report in favor of its repeal. But the spoils system had secretly made progress. Vain, indeed, was it to attempt to repeal a law which had already become a bulwark of the new system, in the spirit of which Jackson, the military hero of the day, and Van Buren, the partisan chieftain of New York and the greatest party manipulator of his time, were working together for the presidency. — So rapidly did the spirit of revolution advance, that Jackson's first message declared "rotation a leading principle in the republican creed." Ignoring the true rule that every man's claim upon office is in proportion to his fitness to fill it, the same message proclaimed the communistic doctrine that every man has an equal right to office; which, by his removals and appointments, was interpreted to mean, in practice, that no man but a partisan servile to himself had any such right which a president was bound to respect. Three years later, in 1832, Senator Marcy, in the senate of the United States, expounded the spirit of the new four years term spoils system in these memorable words: "When they [New York politicians] are contending for victory, they avow the intention of enjoying the fruits of it. If they are defeated, they expect to retire from office. If they are successful, they claim, as a matter of right, the advantages of success. They see nothing wrong in the rule that to the victor belong the spoils of the enemy." The new system was, therefore, simply this: no term for more than four years; the tenure, removals at pleasure; office and salaries the spoils of party warfare; rotation in order to give offices to as many servile partisans as possible; appointments and removals for political reason; the duty of the official to be an obedient worker for his party and a servile vassal of its managers. (For the practical effects of this revolution see SPOILS SYSTEM and REMOVALS FROM OFFICE.) — The attempt made in the senate in 1825 to repeal the law of 1820 was renewed in that body in 1835. Despite the weight of Jackson's administration against it, the repealing act passed the senate by a vote of 31 to 16, every distinguished name in the senate—Benton, Webster, Clay, Calhoun, Ewing, Southard and White, among them, except Buchanan of Pennsylvania, and Wright, of New York, those states then, as of late, being pre-eminently the "machine,"

"spoils system" states—being recorded in favor of the repeal. The senate had not at that time come very much under the vicious influence of patronage, or of the feudal code called "the courtesy," which have in late years been so disastrously potential in that body. There had been few officers to confirm. In the debate upon the repealing act, though several senators boldly avowed the barbarous creed of Marcy, Webster said the evil effects of the law of 1820 vastly predominated, and that he was for staying the plague. Mr. Clay declared "the tendency had been to revive the dark ages of feudalism." Mr. Calhoun stated, that "the law had taught officers that the most certain road to honor and fortune is servility and flattery." Mr. Southard declared that "it had tended to make office-holders servile suppliants, destitute of independence of character and manly feeling."—The partisan power which the four-years term had thus suddenly and vastly increased, aided by the prestige of Jackson's administration, and the forces marshaled for Van Buren's election to the presidency the next year, defeated the repealing act. The victory of the spoilsmen increased the pressure and strength in favor of extending short terms, which the partisan leaders demanded. They next laid siege to the postoffice department. The postal administration, which, when Washington became president, required only seventy-five postmasters, at the opening of Jackson's first term required about eight thousand. Practically, the tenure of postmasters had been during good behavior and efficiency, and there was no term fixed by law. The management of the postal service had been upon business principles, the postmaster general appointing and removing postmasters. There was no good reason for a radical change in that regard. Under such principles, Mr. McLean, as postmaster general under John Quincy Adams, had, with great satisfaction to the people, managed our postal affairs. He was not willing to enforce the new "spoils system" in his office; and for that reason Jackson hastened to remove him to the supreme court bench, and to put a more compliant and most inefficient officer in his place. It was very natural that the attempt should be made to extend the four-years-term theory to the postoffice. Every partisan manipulator wishing more offices for bribes, every politician desiring to be a postmaster, and every congressman seeking patronage, had an interest in favoring it. It would strengthen the four-years-term policy in the senate if a bill for enforcing it should contain provisions for increasing the patronage of senators by requiring postmasters to be confirmed by that body. Accordingly, in 1836—the year of Van Buren's election as president—a bill was passed, requiring that all postmasters whose compensation was one thousand dollars a year or upward, should be appointed by the president and confirmed by the senate, and that their term of office should be but four years. They were made removable "at the pleasure of the president."—It is not easy to decide who was most pleased with such a law,

the partisan managers whose spoils it greatly increased, the senators whose patronage it more than doubled, or President Jackson, to whose despotism it added many vassals. But what each gained was the common loss of the people; nor was there hardly a pretense that any public interest (unless a perpetual rotation of postmasters and a more universal proscription are in the public interest) would be served by this postal service revolution. Postmasters whose income was less than one thousand dollars were left to be appointed and removed by the postmaster general, and their original constitutional tenure was left unchanged, nor has a four years or other term ever yet been applied to them.—Thus were a great number of purely business offices deliberately brought within the range of political forces, subjected to senatorial confirmation, given a term which both suggested and facilitated their being made incentives and rewards of selfish activity, and a part of the spoils of partisan victory in every presidential election. Nor was this all. New grounds of difference between the senate and the president were thus created, and great strength was added to the growing power of patronage in that body, which in later years has enabled it to usurp and exercise a controlling and dangerous influence over the appointment and removal of all the principal officers of the government. Here was the beginning of a great and lamentable change in the character and influence of that body. Naturally, true statesmen have since had less influence in the senate. No legislation beyond these two acts of 1820 and 1836 was necessary to complete the partisan revolution in the politics and official life of the country. But various other administrative officers have since been given a term of four years; and it is worthy of notice that congress, disregarding the great distinction between legislative and ministerial functions, has almost never given an officer a longer fixed term than four years. It looks almost as if it had been a settled purpose to force every officer, by a fear of losing his office, to become a benchman of party leaders in every presidential contest.—Greatly as the country was alarmed by the manifest degradation of political life which the new system was causing, the great contest concerning slavery, becoming absorbing at this time, was fatal to any considerable effort for reform from 1835 to 1867, when Mr. Jencks brought the subject before congress. He prudently directed attention mainly to methods for entering the public service, rather than to term or tenure. It soon appeared that the first condition of success was fuller information among the people in regard to administrative affairs. For more than thirty years the methods of administration, the debates and the political literature of the country, had been misleading the people in the spirit of the "spoils system," and hardening them into acquiescing familiarity with its abuses. The new theory of short terms for the inferior executive officers had come by many to be regarded as an essential part of our original

institutions. The new tenure based on favor and partisan servility had been accepted by not a few as peculiarly and essentially republican. The evils they had caused or greatly aggravated were generally regarded as the inevitable drawbacks against the blessings of our liberal institutions. A generation had grown up which accepted the doctrine of rotation in the executive offices as a rule of justice, if not an evidence of liberty. A great portion of the patriotic and honest voters of the country had been induced to think that parties could not prosper (if, indeed, they could live) without a quadrennial opportunity of using the public offices as rewards and bribes, and the right, at all times, of forcing those who fill them to do the partisan work of politics. They were consenting that the government should be plundered as an enemy by each party that captured it. These short terms rest on the false and pernicious theory that the most salutary admonition for good official conduct, in an executive subordinate, is not a sense of direct responsibility to his superior, and a right and duty on the part of that superior to remove for good cause, but the certainty of going out at once when his political opponents succeed, and of going out very soon, in order to make a place for another, however faithfully he may serve the people. It hardly need be pointed out that every time that an efficient and faithful officer leaves his place at the end of his term, or is sent away for political reasons, proclamation is made to the people that the well doing of the public work is not what the government most seeks, but effective party workers and compliant tools of party managers. — It should be noticed that these four-years term provisions did not extend to the clerks or other inferior officers in the great departments at Washington, or to the subordinates of postmasters, of collectors, or of naval or other officers named in the statutes referred to. And, applying only to postmasters whose compensation was one thousand dollars a year or more, and who alone were made confirmable by the senate, the quadrennial terms extended to only about four hundred out of the eight thousand postmasters—or to one-twentieth of the whole number—in Jackson's time. Nor have these humbler postmasters, or any of their subordinates, or any of the subordinates of the internal revenue service, or any of the customs service clerks, yet been subjected to a four-years term. As to them the theory of the constitution still prevails. Even Jacksonian politicians dared not make four-years terms more comprehensive; only some politicians of our day propose that. Mr. Kasson, of Iowa, for example, offered a bill in the house of representatives, at the last session, creating a four-years term for such subordinates. — The collectors nominate, and the secretary of the treasury approves the selection of inferior officers in the customs service. The secretary removes them. The postmasters, within the limits of the appropriations, both employ and dismiss their own subordinates without any overruling authority being provided

by law. But when the heads of these offices and the prominent postmasters had been given the same four-years term as that of the president, the postmaster general, and the secretaries presiding over departments, and the rotation "spoils system" had become well established, the tenure of all such subordinates, and of the small postmasters as well, inevitably became almost as precarious, if their holding of office was not as short as that of their superiors. If a four-years term and a tenure conditioned on both the servility of the officer and the supremacy of his party, were best for the collector and the postmaster, why were they not best for their clerks? If best for the postmaster, whose compensation was one thousand dollars, why not best for him whose compensation was one hundred dollars, or only ten dollars? All over the country, from the postoffice doorkeeper and the custom house scrubbing woman, to the postmaster general and the secretary of the treasury, that term and tenure, by the force of such logic and the pressure of party leaders for spoils, tended to become universal. — When a statute of congress could be cited to prove the wisdom of removing a great postmaster to serve the ends of party in states and cities, how could a postmaster general resist the demands of the town and village politicians that the little postmasters should be selected and dismissed in order to serve the ends of little factions and cliques? And how could postmasters refuse to employ and dismiss their clerks upon a theory any less regardless of the public interests? It was the inevitable result of such a system that a servile partisan spirit, an intense, selfish political activity, forever meddling with the freedom of elections, forever bartering places for votes, and a consequent demoralizing neglect of the public business, were everywhere developed in the postal, not less than in the customs, service. Jefferson's prophecy was fulfilled. For the disastrous consequences which speedily followed, see SPOILS SYSTEM, REMOVALS FROM OFFICE. What sweeping and unprecedented removals for mere partisan reasons speedily followed the creation of a spoils system term and tenure, is well known. The name of Jackson is forever associated with merciless proscription and vicious rotation in office. That his system equally tends to keep the worthier classes from the public service and to draw into it scheming henchmen, debauched partisans, and bankrupt speculators, need not be pointed out. Why should an honest man of capacity and self-respect desire for its own sake an office in which to-morrow he may be the victim of a greedy faction of an electioneering secretary, and at best must reach the end of his term by the time he has learned his new business and forgotten his old? — Other effects injurious to the administration and politics of the country, either caused or greatly aggravated by these four-years-term statutes, have become too serious to be passed without notice. I refer especially to congressional patronage and the usurpation of the executive power by the senate in connection with confirma-

tions. When short terms were in theory made a sort of substitute for the discharge of the executive duty of removals for cause—when removals and appointments came to be based on political influence, and to be held to be a justifiable means of party aggrandizement—when, by the very language of an act of congress, not the welfare of the public, but “the pleasure of the president,” and (by analogy) of heads of departments as well—became the rule of action, what more natural than that members of congress should first promise places (in aid of their own election), and next demand them of the president and secretaries as a condition of supporting the administration in congress? That many members have stood above this form of bribery and coercion, and that the majority have but mildly participated in it, we may well believe; yet it has become an alarming evil, the grave perils of which no candid man will deny. A great proportion of all the appointments and removals in our public service have become a part of the perquisites and spoils of congressmen, and have tended to the degradation of official manhood, and to corruption and coercion at elections, in manifold forms. A single appointment which a congressman could control can be vaguely promised to and be made to influence a score of voters. (For the effects of these short terms and of the tenure of office acts upon the senate, see *CONFIRMATION BY THE SENATE.*)—As the law now stands, under the tenure of office acts of 1867 and 1869, no officer nominated, subject to confirmation by the senate, of which there are about thirty-five hundred, can be removed, except with the consent of the senate. During the recess of the senate the president may suspend such an officer, and the suspension will be effective until the end of the next session, subject to an agreement between the president and the senate in the meantime. The significance of this condition of affairs can not be mistaken. That great executive power of removal for good cause—the public, just, vigorous and uniform exercise of which is essential to all fidelity, to all economy, to all efficiency, and to every wholesome sense of responsibility, alike on the part of the superior officer who wields it, and the inferior officer who is subject to it—is apportioned and enfeebled. The greater part of it is handed over to a body acting secretly and through political majorities, the members of which neither have nor feel any direct responsibility for the working of the executive branch of the government. The president, constitutionally responsible for the faithful execution of the laws, can neither appoint nor remove any one of nearly thirty-five hundred of the higher officials through whom those laws are to be executed, without the consent of the majority, generally the political and perhaps the hostile majority, of the senate; if, indeed, he can make such removal or appointment without the consent of the senators of the state where an official delinquent defies executive authority. The tendency of such a system is to cause the wishes of sena-

tors to be potential, and their favor to be courted in the great departments, custom houses and post-offices, where their power should only be felt through independent criticism or stern investigation, to which their having favorites in office is almost sure to be fatal. Need it be pointed out that such a system tends to constant collisions or corrupt bargains between the executive and the senate? It teaches the people that partisan work and interests are the supreme standards for ministerial offices. It makes the senate as much an executive as a legislative body, its action tending more and more to impair the counterpoise and stability of our institutions. From such causes senators are more than ever before pressed by politicians of every class to make their action upon nominations and removals serviceable to the local interests of parties, factions and chieftains, whereby it has become equally unusual and difficult to make that action turn upon anything else. The struggles about the collectorship at New York and the case of Mr. Conkling are but examples of this tendency. Here again we see the sage prediction of Jefferson being fulfilled.—The same causes which have tended to make senators the partisan autocrats and patronage purveyors of their states, have drawn upon them a vast demoralizing solicitation for office. It has often made their elections scenes of intense strife and lamentable corruption. It has absorbed the time needed for their public duties. It has blinded them in clouds of adulation. It has made them unmindful of the higher sentiments of the people. It has caused the senatorial office itself to sink in public estimation. It made the late contest in New Hampshire possible. In estimating the control over state politics and elections gained by senators through their power to appoint and renew collectors and post-masters, it must be borne in mind that senatorial dictation may, and very generally does, extend to the selection and removal of the subordinates of those officers; so that senators (as Mr. Clay predicted in 1835) have very generally become feudal chiefs in the political affairs of their states.—A few days after President Grant's first inauguration, when every plausible excuse for retaining the tenure of office acts had ceased, the house, which has no share in confirmations, declared itself for the repeal of those tenure of office acts by a vote of 138 against 16. In his message of December, 1869, President Grant declared “those laws inconsistent with a faithful and efficient administration of the government.” A few days after that message, the house again voted their repeal by a majority of more than six to one, and in 1872, without a division, the house a third time voted their repeal. The senate was persistent for its courtesy and its usurped power. A majority of its members uphold them still, relentlessly exercising the authority they confer. In this policy Mr. Conkling was a leader, and fell under the rebuke of his own state.—Such is the situation in large measure caused, and in every particular aggravated, by short fixed terms and a precarious

partisan tenure. The period is not remote when, if these laws shall continue in force, the whole time of the senate will not be sufficient for confirming postmasters alone. We must consider the small proportion of the inferior officers to whom a four-years term has yet been extended, if we would comprehend the consequences of making that term universal. Of the about 3,500 now subject to it, about thirty-five are in the treasury department at Washington, more than one hundred are collectors, and about nineteen hundred are postmasters. The proposal to make that term general, according to the Kasson bill, is nothing less than this: that each one of the more than 75,000 other inferior officers shall either go out at the end of four years, or be kept in through as many successful contests of influence and favoritism. Does any candid man believe our institutions could stand such a strain? It is true that the example of a four-years term and a tenure by favor on the part of the most prominent of such officers here caused a great portion of those in the grades below them to be frequently changed. Yet it is a significant fact, standing in strong condemnation of a four-years term, that, despite such examples, the average periods of service in the lower offices, of late, at least, *have been two or three times four years*, and have been the longest where administration has been best and politics least partisan and corrupt. The average time of service of the more than 42,000 postmasters, whose term is not fixed by law, has probably been about ten years, at least, if we exclude postoffices established within that period; and that of the subordinates in the New York city postoffice, where Mr. James and his successor have enforced the competitive examinations with such admirable results, is unquestionably longer. It is believed that the average period of service of the inferior officers of the treasury department (and certainly of the state department) at Washington, is longer still. — We have only to look at the facts to see how disastrous would be the consequences of a four-years term in the great departments and offices. It would require about seven hundred changes, or successful contests for reappointment each year in the treasury department (more than at the rate of two every secular day); changes as frequent as the most barbarous partisan proscription has ever accomplished. A new appointment or a successful contest for a reappointment at the New York custom house every day of the year would be quite inadequate under such terms. If all postmasters were given a term of four years, there would be over ten thousand and five hundred changes or contests every year, or about thirty every day, to be dealt with; to which must be added one-fourth of all the subordinates in all the postoffices in the United States, and also all cases of resignation and removal for cause. If it be conceivable that an intelligent people can ever enter upon such changes, it is plain that there must be an additional postmaster general and secretaries with no other duty than that of working a vast machinery of rotation

and partisan warfare. Consider the effect of a four years' term upon the postoffice at New York. It would require between four and five times as many changes each year as have been annually made in the period during which its administration has been so greatly improved. Two new selections or reappointments every three days would not fill the places which such a term would vacate at that office. It is obvious that nearly or quite the whole time of a postmaster would be required to attend to them. — I have no space for tracing the effects of this short-term system in the offices of states or municipalities. It has contributed greatly to the perpetual and mischievous activity of parties and factions. Officers in cities and villages, whose duties have no legitimate relations with party politics, have been given short terms either in reckless thoughtlessness, or (apparently at least) for the mere purpose of creating annual or biennial prizes to be won in the low scramble of factions and bosses. It is not too much to say that at least the greater part of the political corruption of cities and of the fatiguing labors imposed on good citizens by reason of rotation in municipal offices would be superseded if the official tenure there was made what the public interests require. What can be more disastrous than the existing practice of giving the shortest of terms to heads of bureaus and the making of the tenure of them subordinate, dependent upon the triumph of a party, if not of a faction, or a demagogue, with whom that head is affiliated? — The salutary tenure for inferior executive officers, sanctioned by the constitution and enforced by all the presidents before Jackson, has also been approved by the last two presidents. "Let it once be fully understood that continuance in office depends solely upon the faithful and efficient discharge of duties, and that no man will be removed to make place for another, and the reform will be half accomplished," are words of the late president. (President Garfield's speech at Athens, Ohio, 1879.) In a letter to Secretary Sherman, dated Nov. 23, 1877, President (then collector) Arthur says: "Permanence in office, which of course prevents removal except for cause, and promotion based upon good conduct and efficiency, are essential elements of correct civil service." In his letter of acceptance as vice-president, he said: "The tenure of office should be stable. Positions of responsibility should, so far as practicable, be filled by the promotion of worthy and efficient officers." judgments which his messages have reaffirmed. These views imply that the right and duty of removal for good cause should remain unimpaired. They lend no sanction to a life tenure of office, which is quite inadmissible, or to any other tenure which does not make the common interest paramount to that of any office-holder, administration or party. One of the great objections to a short term is that it is treated as a sort of substitute for the discharge of the duty of removing the untrustworthy and the incompetent, whereby the moral tone, the discipline and the efficiency of the public service are alike degraded. The decisive ques-

tion as to an "inferior officer" remaining longer in the service should always be, not, Has he been in his place four years or any other number of years? but, Is he a good officer, who, if retained longer, will serve the people most usefully? — So far from life tenure, or a permanent tenure in the absolute sense, even being admissible, removals should be made for at least the following causes: 1, conviction of an infamous crime or one involving fraud or corruption; 2, facts showing that such crime has been committed; 3, the use of official authority or influence to coerce the freedom of citizens; 4, mental or physical incapacity for official work; 5, intemperance; 6, gross immorality or vices; 7, habitual inefficiency; 8, willful neglect of duty; 9, intentional disobedience to lawful instructions; 10, renunciation of allegiance; 11, acts of treachery or bad faith toward the United States. — There are yet other grave objections to these short terms. They were provided for a few of the higher offices, on the theory that a longer holding of executive places was a monopoly, and that a quadrennial rotation was republican justice, and essential to the healthy life of parties. The demand that the same term be extended throughout the service is in the spirit of its original creation. The fact that those holding under four-years terms have, as we have seen, retained their places for much shorter periods than those not subjected to such terms, proves that such terms cause the rotation which their champions favor. By reason of the simple facts that such terms are demanded, in the name of rotation and of the communistic theory that every man has an equal right to office, they make a sort of legislative proclamation of such doctrines. They apply alike to worthy and unworthy officials, and hence tell the people that every officer, no matter how pure and useful, should, on the ground of justice to those seeking office, leave his place at the end of four years. He is, in the spirit of such a law, if he stays longer, an odious monopolist, holding by favor what belongs to another. A law fixing a four-years term plainly says to the people that a ministerial officer should not hold his place either so long as he remains upright and efficient, or so long as his superior officer regards him as more useful to the public than an inexperienced man would be. It tells them, that, for reasons paramount to all such considerations, his service should end absolutely with the four years. These reasons—however partisan, communistic, or corrupt, as illustrated in practice—are, by the legislative, made imperative upon the executive. They are undeclared by the law, and are left to mere inferences to be drawn from practice. They are reasons, at once vague and mysterious, which plainly and equally disregard personal merit in the inferior officer displaced and the responsibility of his superior for good administration in his own department. These terms are an invasion by the legislative upon the executive. They suggest that the executive officer can not be trusted to decide how long the services of a subordinate are useful to the public—a power and duty which,

under the constitution, plainly belong to the executive. Such considerations will prevent short terms ever being regarded as legislation in the interest of efficient or economical administration. They will be regarded as the enforcement of a pretended system of justice in office holding—as an approval of increased patronage for parties, of diminished power in the executive over its own subordinates, of encroachment on the part of congress beyond the sphere of its responsibility, of more absolute dependence upon mere favor on the part of subordinates. Short terms are, in principle, a sort of invitation, even to the executive himself, to remove for reasons other than the good of the public service; for those terms are in substance a removal, every four years, of every person in the public service, not for any good or even any avowed cause, but utterly irrespective of the merits of those removed. They emphatically teach servility, by saying to every subordinate: "Your sole chance of holding beyond the four years depends on executive favor or partisan and congressional influence exerted for your reappointment. A peaceful holding is not to be a consequence of well doing. Look to favor and influence. Under the laws of your country, or by reason of any merit or usefulness they pretend to respect, you have no claim to stay an hour beyond the quadrennial period." Mr. Webster, in 1835, in urging the repeal of the four years term of 1820, covered the ground in these words: "The law itself vacates the office, and gives the means of rewarding a friend without the exercise of the power of removal at all." If official merit, in the estimation of the appointing power, is a good reason for continuing longer in office, why bring the holding to an end by a fixed term? The end of the term but refers that same question to the identical authority which would, except for the term, have decided it. If unworthy to decide when to remove for cause, is not the superior officer unworthy to decide when to reappoint for merit? — But the mischief of the four-years term law does not stop there. Every reason which can be urged in favor of a four-years term, can also be urged by party managers and scheming officials against reappointments at the end of those terms. For, how is rotation to be secured, how is each man any more certain to get his fair share of office under short terms, if all the good officers who ought not to have been removed are to be reappointed at the end of their terms? If there are not to be more changes under a four-years term than without it, if inexperience is not to be increased, and skilled servants whom the public has educated are not to be driven out, then what is the gain of the short-term law, upon the theory of its advocates? It would not cause rotation. It would give office to no more office seekers. Every patronage monger, every caucus manipulator, every shiftless office seeker of the land, every aspiring demagogue longing for more offices to pledge for votes, every unscrupulous chieftain seeking more callow officials to tax and more places to give as bribes, every in-

tense partisan believing that spoils are the strength of parties, and that rotation in office is a vital principle of republics, is not only in favor of a four-years term, but will insist on true Jacksonian proscription during that term. Can any argument be necessary to make it clear that every concession to such theories but intensifies and embitters the communistic, partisan and proscriptive spirit which they embody? If a four-years term should be provided in order to make more places for office seekers, then why, upon the same theory, should not terms be reduced to two years, or to one year? When, as of late, the ante-rooms at Washington are crowded with office seekers, and the tables of the secretaries are loaded with office-begging letters, why should clerks be allowed to monopolize their places for four long years, while these applicants are pleading for their share of the offices? The same reasons are just as good for bringing down the term even to two months, as we have seen was the fact in the Florentine and other Italian republics. We must reject rotation as a principle, or carry it to its legitimate results. If the best ability and character for serving the people, and the best and most economical administrators, be not the standard and the end recognized by law, then we can nowhere set them up against the claims of the communistic office seeker and clamorous patronage monger. — The proportion of federal officials to the population ranges from one in twenty-four in the District of Columbia, to one in 540 in Vermont, and one in 1,500 in Georgia. The average seems to be about one official to every 600 of the population, or one official to every 150 males and females with some competency for official duties. The greater number of postoffices in the northern states gives the larger ratio of federal offices there. That, as a rule, from five to fifty persons make a contest or claim for nearly every vacancy, is well known. Will this demoralizing office seeking be less, will the feverish and selfish activity of parties and factions which it stimulates and feeds be diminished, by giving a four-years term to 80,000 additional offices on the demand of politicians and office seekers who declare that every man has an equal right to office, and that a quadrennial rotation is but yielding to this right? Having, by proclaiming rotation to be a principle of republican justice, provided a place for one office seeker in fifty, shall we then be more or less able than before to resist the communistic demand of the other forty-nine office seekers? Will it tend to dissuade them from demanding removals without cause, or to make them better satisfied that senators hold for six years, and judges during good behavior? — It hardly need be pointed out, that terms fixed by law would advertise to parties, to every office seeker, and to the feudal lords of patronage, the precise dates of every vacancy. He must know little of office seeking, or of partisan methods for controlling appointments, who does not see that every approaching vacancy would be the subject of deliberate and mischievous bargains and combinations of influence for filling it. The

appointing power would be solicited for pledges, men of prominence would be pressed for recommendations, party leaders would be besieged for influence, every corrupt element and every pernicious activity of politics would be intensified beyond anything yet known. For, so long as a removal at an indefinite time must precede an appointment, there is a great uncertainty as to whether any vacancy will exist, and a concentrated effort by patronage mongers at a decisive moment is generally impracticable. The appointing power has some chance of self-protection. An inevitable vacancy for all places at a time known months or years before, would change all this. The potentates of patronage would wrangle over, bargain for and apportion every vacancy months before it happened. — It is not of course a certainty, if a short term shall ever be established for executive subordinates, that it will be a term of four years, though that is the partisan's favorite period. It may be a term of six or more years. A six-years term would have the advantage of keeping a considerable portion of the changes it would cause out of the period of the presidential election. But with that exception, every other objection urged against short terms would, in large measure, hold against a term of six years. There are obvious reasons why a six-years term would be preferable to one of four years, as there are why a term of ten or more years would be preferable to one of six years. And competent persons would doubtless be more likely to take an official place and to serve for a moderate compensation under a tenure of six years, than under one of four, for much the same reasons that they would still more incline to the public service for a moderate salary under a tenure having regard to merit, which would appeal both to their ambition and to their sense of safety. A four-years or a six-years term for a young man takes him from business experience at an important period of his life. It puts the man of family to expense in adjusting himself to his position. It offers to either only a dreary, admonishing uncertainty, little inviting to a person of prudence or capacity. When, after coming into the service at twenty or thirty years of age, a four-years training by the government as an accountant, an appraiser, a mail distributor, an officer at the mint, the assay office, or the treasury, has made the official skillful, well-informed, and valuable as a public servant, it is certainly desirable that he should remain at least two years longer; but would it not be yet more desirable that he should stay so long as he is the most useful man for the place? What good reason can be given for sending away a valuable official at twenty-six or thirty-six, on merely showing that he has served six years? Is it not plain, that, if the tenure and usage should say to him, "So long as you do your duty promptly and well, and maintain a good character, your means of living will not be taken away, nor your place given to another without good cause," he would be stimulated to fidelity in a degree unknown to him who can hold his place only time enough to learn

its duties and to look out for another? The government will never be most economically served, nor gain the best to serve it, while its officials are selected or treated as needy birds-of-passage, in mercy supported to-day, but told to find a place elsewhere to-morrow. Who will deny that any intelligent man will engage for a less salary and be more careful to do his work well, if he feels that fidelity and efficiency will protect him against being discharged without cause?—It may be insisted that the service would not, as a matter of course, end with the six years, but only terminate in case the incumbent should be held unworthy of reappointment. This theory plausibly presents a short term as a kind of substitute for removals. It contemplates, that, at the end of the service of every one of the more than 14,000 executive officers whose period would expire within each year under a six-years term, there would be a special inquest as to the official conduct of each, and a just judgment rendered. We need not dwell on the magnitude of such an undertaking, which makes it chimerical. If the facts which this theory assumes be true, viz., that during the previous six years the official superiors have been ignorant of the merits of their subordinates, such neglect would prove them unworthy to decide as to reappointments. If these merits and demerits have been known, year by year, no special inquiry will be needed. The unworthy will have been, or should have been, removed. Whose duty would it be, in any event, to conduct that inquiry and decide upon reappointments, except that of the identical superior officers whose yearly and daily duty it now is to keep themselves in that regard fully informed, and to make removals day by day whenever good cause exists? Since that obligation can not be increased, the change, if any, contemplated in official supervision under short terms, would seem to be one that would excuse its performance until the end of the term. Insufficiency, insubordination, neglect of duty for party work, and conduct—not absolutely infamous or criminal, perhaps—are to be overlooked during the term, because at its end there is to be a grand inquest. In other words, the moral and legal obligations of officials in the higher places, and the experience and discipline essential on the part of those in the lower places, are both alike to be reduced to short measure, as a part of the benefits of short terms. That this would please the office seekers, patronage mongers and partisans most clamorous for such terms, we need not doubt. On any other theory, or any just or defensible theory as to removals, it is plain that the unworthy would all be removed before the end of the six years, and that all those left at its expiration—whose terms would end—would be precisely those who would deserve a reappointment; which of course shows the term to be unavailing for any useful purpose. If, therefore, the officials having a duty of removal are to be trusted, the six-years or other short term is needless, and if they are not to be

trusted to make removals when they should be made, how can they be trusted to make reappointments at the end of the terms? Would they be improved for the duty of reappointment by a statute which would suggest that until the end of terms they should wink at the delinquencies of their subordinates? The better remedy than any short term would be to enforce far more sternly, and, if need be, by the aid of stringent legislation, the duty, declared by Madison, and implied in the constitution, to remove for adequate cause, and not to remove without it; and by fit reform methods (which can not be explained here), to take away the pressure, the threats and the corrupt persuasions which now make the proper discharge of that duty so rare and difficult. Under such a system the unworthy would be warned off as well as weeded out from the public service.—But let us not forget, that with fixed terms, either for six or ten years, it would be far more difficult to reappoint valuable servants than it would have been to retain them longer if no statute had taught the office seekers and spoilsmen the doctrine of rotation and removals without cause. It is unquestionably true, on the other hand, that an officer too cowardly to discharge his duty, to remove during a term, may more easily get excused by reason of a removal made by act of congress; and, so far as that kind of relief, which first encourages official neglect and then causes it to be forgotten, is an advantage, it must certainly be set to the credit of short fixed terms. With the duty of making removals for cause—which would of course embrace inefficiency by reason of age or any other cause—fitly discharged, we should hear little either of a life tenure, which is utterly indefensible, or of a tenure during good behavior merely, which is inadmissible. An inefficient official may exhibit only good behavior in the legal sense. Good behavior and efficiency combined, are the true basis of tenure for administrative officers. Who but the spoilsman, the partisan and the rotationist in theory—who but those who deny pure, economical and vigorous administration to be the supreme ends—will object to retaining a ministerial officer as long as he is the most useful man for the public service?—There are doubtless some who think—and, within very narrow limits, perhaps not wholly without reason—that short terms would impress upon the officials a new sense of responsibility in addition to that felt toward official superiors, a responsibility to public opinion. But to what kind of public opinion? The fact that the managers of small local administrations, open to the view of every one, in towns and villages, and that officers elected by the people, feel a wholesome responsibility to public opinion, is a natural source of delusion on the subject. If that sense of responsibility is reliable in the great officers, it would be a good reason why the 80,000 inferior federal officers should be elected rather than appointed—why, in short, the whole theory of the constitution should be abandoned. The greater parts of our

system would be indefensible. It is because such a theory is illusory; that, under our system, and under that of every civilized state, such officials are appointed and are governed by superior officers. The popular judgment can rarely decide, with intelligence, how far bad administration, in a great office, is due to the superior officer, or how far to his subordinates, who must obey the instructions. And for that reason all good governments have put the responsibility and duty of removal upon the superior—the president, the governor, and the mayor, whom the people elect, or upon the heads of departments, and hold them responsible for their subordinates. Every attempt by the legislature, through short terms, to substitute for the true responsibility to the executive and for the duty of removal, a new kind of responsibility, is therefore not only a legislative usurpation of executive functions, but is an effort not only repugnant to our constitution, but demoralizing in its tendency. The shorter the term of executive offices, the more difficult and unreliable would be the popular judgment. Make the term a year or a month, and will any candid man say that a popular judgment upon the official conduct of him who fills it could exist? What do the people know of the relative merits of any one of the thousands or hundreds of subordinates in a department? The worst administrations of later years—the corruption, partisan proscription, neglect of official duty in order to coerce elections, political assessments, the degradation of the public servants into the henchmen of chieftains and senators, the bartering of places for votes—have not been originated or most practiced by the more subordinate officials to whom a fixed term has never been extended, but have grown up and become most intolerable around the great custom houses and postoffices, at the head of which are officers holding for four years, confirmed by the senate and beyond removal, except by the consent of that body. If the many thousands of postmasters whose compensation is between five hundred and one thousand dollars a year, were given a term of four or six years, and were made confirmable by the senate, like the postmasters having a higher salary, I must think that not superior postmasters, but more active politicians, would be secured, and that new elements of vicious and feverish activity would be added to our municipal politics in every quarter of the Union. It would be no better, if postmasters were added to the excessive numbers of candidates in our municipal elections. The fate of every clerk and carrier would be involved in the election. Concerning most of these new confirmations, at best, there would be the same vigorous working of party machinery, and the same mischievous combination of selfish influences which now distract communities and vex congressmen in connection with the quadrennial appointment of collectors and postmasters of the higher grade. Few things are clearer in our politics than the fact that a large share of such confirmations are determined by

mere official favor or partisan interests. Rare indeed is it that the administrative capacity of the candidate is made a decisive or even a prominent issue. The case of Postmaster James, of New York, is the first instance in our history of the office of postmaster general being conferred by reason of the administrative capacity of the person appointed. — There are doubtless some who favor a term of years only by reason of an assumed difficulty in bringing about removals. That difficulty grows out of the *spoils*-system method of making appointments. The same pressure on the part of great politicians and members of congress which crowds the service with their unworthy favorites, keeps them there. The threats and pleadings which foist a brawny henchman, a bankrupt cousin, or a favorite widow, upon the national pay rolls, are repeated when the attempt is made to remove them. The competitive examinations now placed at the gates of the public service will not only exclude the unworthy, but they will bring in those who would have nothing but their superior merit to keep them there, and removals for cause will be easy. They have no influence to back them. And should any superior officer decline to remove for cause, he can be impeached, as Madison advised; for, when members of congress and chieftains can no longer put their favorites and relatives into the departments, they will no longer, as now, have an interest to prevent the arraignment of extravagance and imbecility in the executive service. British experience has confirmed the plain suggestions of reason on those points. — It has been suggested, that, since competitive examinations are very offensive to the partisans and spoilsmen whose patronage they suppress, the need of them in a measure might be superseded by short terms of office. The suggestion is not even plausible. The shorter the term, the greater the need of ability and business experience upon entering the service; and the greater, also, the need of thorough competitive examinations for selecting the most competent. If the period of service be long, even those incompetent at the start may be trained into usefulness at the public expense. But if the term be too short for such education, large capacity must be required at the start. Make the term only a month, and the public work would be arrested, unless the standard for admission should be greatly raised. While, therefore, competitive examinations could be made to mitigate some of the evils of short terms, such terms would make competitive examinations indispensable. — It is important to see clearly that the time when a person should leave the public service does not depend upon the manner of getting into it, but upon his usefulness therein, however he got there. Whether he got in by favor, pressure, or competitive examination, the question of his proper term or tenure is the same. Such examinations, and, indeed, nearly all the practical methods of civil service reform, except the demand for the repeal of the short term acts, relate to the means of get-

ting into the service, and to the abuses therewith connected. It is only the specious, unwarranted allegations of the spoilsmen, which declare a dependence of those methods upon a life tenure or long term of office. There is no such dependence. A great portion of the removals without cause are, however, made in order to create vacancies into which dependents or henchmen may be pushed. And, since, under competitive examinations, the place would be filled by whoever could prove himself the better man, this pushing would avail little or nothing, and for that reason unwarranted removals would rarely take place, as the experience of such examinations at the New York custom house and postoffice has clearly shown. While, therefore, such examinations would tend to make a tenure more stable by making powerless the corrupt forces which cause proscriptive removals, I repeat, that the need of applying these methods would increase with every reduction of the term of office and every enfeeblement of tenure. It is an utter misconception of the subject to claim that a permanent tenure of office is an incident of competitive examinations, or any further a consequence of them than this, that, securing the better man, they make it more easy and natural to keep such men as long as the public needs or desires them. — But, suppose short-term theories should now prevail; what would be the result in the near future? Population doubles in about thirty-five years, and officers increase yet more rapidly. Men now vote who may live to see more than 200,000,000 of people in the Union, and more than 400,000 federal officials. — Within little more than a decade, the life saving and signal service, the national board of health, the agricultural bureau, the bureau of education and the civil service commission have been added to the public service, and some of them may soon be departments. When there shall be 200,000 postmasters and 500,000 federal officers, there will still be but one president, but one senate, but one secretary of the treasury, but one postmaster general, unless we create others to fight off the office seekers and work a vast machinery of office filling. Shall we deliberately create an official term which will require the refilling of nearly 100,000 of these places every year, in addition to all those that may be made vacant by removals and resignations? Washington could not contain the office seekers and their backers who would swarm there. Could republican institutions long survive? — Another consideration connected with short terms must not be overlooked. They would greatly embarrass, if not defeat, any adequate system for promotion based on merit or experience. Four successive presidents, all the best administrators in the country, and every well-governed nation of the world, have insisted on promotions for merit, tested by experience, as essential to good administration. When, in his late message, President Arthur declared that "positions of responsibility should be, so far as practicable, filled by the promotion of

worthy and efficient officers," he affirmed a principle to which short terms are utterly repugnant, and the wisdom of which the best experience of the world affirms. These terms are an arbitrary interference by the legislative with the executive department, by reason of which, at a fixed time, and irrespective alike of the needs of the public service, of the merits of those who fill it, and of the wishes of those responsible for good administration, the good and the bad alike cease to serve the people. Every worthy officer is sent away—in substance, removed—without cause. Promotion for merit, on the other hand, is based on the theory that an officer is more valuable for his experience, and should, if otherwise worthy, be retained for that reason. Now, it is quite too preposterous for argument to pretend that such experience can be secured in the complicated affairs of government, if there is to be a quadrennial rotation. The very theory upon which such rotation is founded is but a declaration that the paramount aim of the government is not the most competent officers, is not to stimulate effort, and retain the skilled ability it has educated, but to give places to the greatest number of patronage mongers, and salaries to the greatest number of office seekers.— But it may be asked whether some evils may not attend constitutional tenure for "inferior officers"—a tenure during the coexistence of good behavior and efficiency—and whether some provision may not be wisely made for those who might leave the service poor and superannuated. We can not speak positively of the future. When evils from such a source shall be developed, then will be the time to meet them. At present, surely, there is not too much trained experience in the public service. It may be that the aptitude and inclination of our people for change of calling, and the facilities for saving and for securing employment in this country, will for many years prevent the need of legislation on such subjects, which in the old and densely populated countries, we know has existed. There will be ample time for action on such subjects years hence. It is not easy to understand an abuse which does not exist, or customary to legislate against evils which are only imagined. The first duty is to provide for bringing the most competent into the public service, and for suppressing patronage and the arbitrary removal of competent public servants. We do not refuse to cure the sick or arrest contagion, from a fear that the future may have an excess of population. Our business men have not, as a rule—though with increasing exceptions said to be advantageous to employ^{ers}—yet made provisions for those worn out by faithful labor in their employment; and whether the federal government can wisely be more paternal and humane is a question properly left to the future. Much may be said on both sides of it. Our pensions in principle, and our retiring allowance in the army and navy, and for federal judges, directly affirm the justice and utility of making provision for faithful officers worn out in the public service. After putting

out the flames and purifying the air of the national household, we can take ample time for improving its attractions. The older governments, generally, and Great Britain with marked success, have made such provisions. The British statutes, which give a retiring allowance only after ten years' faithful service, are by no means based on a theory of mere benevolence. They are justified not only as enabling the government to secure its servants at a smaller salary, but as contributing to their efficiency and fidelity in office; in fact, as being, on the mere score of economy and selfishness, a manifest gain to the public treasury. The salary and the allowance are thought to be hardly more than the salary would need to be, on the average or in the aggregate, but for the allowance upon retirement. This experience, extending over three-fourths of a century, is well worthy of our study whether we ever have occasion to make similar allowance or not. It will show us a royal and aristocratic government regarding the self-respect and comfort of those who, in humble places, serve it faithfully, with a care, dignity and regard for economy which are not quite universal in this great republic. — If it be suggested that such allowances befit the paternal care of a monarchy, but not the stern justice of a republic, let it be remembered that every subordinate in the British service who can receive them is by statute compelled to gain his place through superior merit disclosed in a stern, open, competitive examination, where neither blood, wealth nor influence avail anything; while it is only in this republic that a great officer or politician can privately force his blockhead son, his discharged housekeeper, his servile electioneering agent, or his bankrupt dependent, upon the public service. — Whenever the time may come, there are various ways of dealing with the subject: 1, we may fix an age beyond which "inferior officers" shall not remain in the service, thus sternly excluding dotage; 2, we may fix an age after which the salary shall rapidly decrease, which would prevent full payment for impaired capacity, as well as cause seasonable resignations; 3, we may pay a small fixed sum on retirement, after a prescribed period of meritorious service and before reaching a fixed age; 4, we may, on retirement any time after ten years of such service, continue to pay a certain proportion of the salary receivable at the date of retirement, which is the British system; 5, we may, after the official has reached a certain age or period of service, retain a percentage of his salary, to be paid on retirement, which will cost the government nothing and yet be a provision against want; 6, we may refuse to make any provision whatever on the subject, dealing with the public servants according to the severest theories of hostile interest and business relations; or, 7, if we shall find the executive or heads of departments refusing to remove in proper cases (after the repeal of the tenure of office acts and relief from party and congressional influence shall have restored to them a real liberty to do so), or if any

bad effects shall attend the restoration of tenure based on character and efficiency, it will be easy, if desirable, to establish a term of years, the length of which should be determined in the light of such experience, and not upon the "spoils system" theories which now prevail. Then if competitive examinations shall have been continuously enforced, there may be neither partisan interest nor prejudice enough left to embolden demagogues to seek popularity by denouncing as an "official class" those who, from whatever grade of life, have worked their way solely by superior merit, and who can hold their places only so long as they continue both upright and efficient. How can that be a class, into which no one can be born, which can be reached only by open competition of merit, through which nothing can be taken or transmitted, and in which no one can remain longer than he is freely retained because he is the best servant of the people? — We need, and, before the time for action shall arrive, we may expect, a more intelligent public opinion on the subject of office getting and office holding. Of what use to ask a legislator who believes in rotation, who holds a tenure of merit to be "un-American," who has promised ten clerkships to carry his last election, and demands a consulate and a postoffice to carry his next election—to consider the subject on the basis of the public interest? When we better comprehend that the real strength of parties is adherence to sound principles and the enforcement of good administration; when we are prepared to make capacity and character, and not influence and favoritism, the tests for admission to the public service; when the states as well as the nation shall have shown courage to suppress political assessment and the official coercion of elections, when we become convinced that promising places for votes is the worst form of bribery, and that the "spoils system" is as demoralizing to a party as it is disastrous and disgraceful to the country—then we shall see that to refuse to retain a public servant because he is faithful and efficient, is to refuse to protect the public welfare. Then, and possibly not till then, we shall be prepared to deal with our retiring public servants upon the grounds of justice and sound principles. Then we shall be able to give due consideration to what contributes to the honor, efficiency and economy of the public service, to what makes it attractive to a prudent man with a family dependent upon his salary, to what will give it a high place in public estimation, to what will invite to it young men of promise by assuring them that merit will be the condition, alike of stability and of promotion.

DORMAN B. EATON.

TERRITORIAL WATERS are all waters within the jurisdictional limits set by international law to an independent state. Such waters* comprise: 1, inclosed waters, which are, first,

* Different writers use the terms jurisdictional waters, water territory, maritime territory.

rivers, lakes and other inland waters wholly within the boundaries of a state; second, if the boundaries of a state are rivers or lakes or other inland waters, unless one of the riparian states has a good title to the whole bed of the same, bounding non-navigable rivers to the middle of such streams, bounding navigable rivers to the middle of their deepest channel, and bounding lakes and other inland waters to the middle of the same; and third, ports, bays, straits, sounds or arms of the sea within (*intra fauces*) headlands belonging to the same state not more than two marine leagues apart; 2, uninclosed waters, or the open sea to the distance of one marine league outward from the line of low-water mark; and, when bays, straits, sounds or arms of the sea are inclosed by headlands belonging to the same state not more than two marine leagues apart, the open sea to a distance of one marine league outward from a line drawn between the two headlands. — The law relating to inclosed waters is well settled. The state inclosing them within its naturally extended territory has a right of ownership, as well as a right of jurisdiction, over them; and in order that the passageways of commerce and navigation may be subject to public authority and control, the title to the land under water, and to the shore below ordinary high-water mark, in navigable rivers and lakes (in England, and in states which have adopted the form rather than the substance of the English rule, tide waters) and in ports, harbors, bays, straits, sounds or arms of the sea inclosed as above described, is vested in the state for the public use and benefit. Although a state is entitled to exclusive jurisdiction both civil and criminal, over its inclosed waters, usage gives a concurrent criminal jurisdiction over offenses committed on foreign vessels in such waters to the states to which such vessels belong, and the state entitled to exclusive criminal jurisdiction will not exercise it in such cases, the parties being exclusively foreign, unless its authority is invoked, or unless the peace of the country is disturbed. — The law relating to uninclosed waters is not thoroughly settled. It is the historical result of the assertion by different states at different times of conflicting claims of ownership or jurisdiction over the same or different parts of the open sea. It is a compromise by which all states have practically abandoned the claim of ownership over any part of the open sea, upon the express or tacit assent of all the states that each state is allowed an artificial extension of its territory over the open sea adjacent to its coast, to such a distance as is necessary for its defense and security. — When modern international law had its rise, few parts of the sea were free from the claims of some European state. England asserted a right of ownership over the sea surrounding Great Britain as far as the coasts of neighboring countries; Spain declared its exclusive right to navigate the gulf of Mexico and the Pacific ocean; Portugal sought to bar the rest of the world from the gulf of Guinea and the Indian ocean; Venice claimed the Adriat-

ic, Genoa the Ligurian, and Denmark the North seas. Sailing without license upon some of these waters was prohibited under penalty of death, and forfeiture of all the offender's goods. Whether originating in capricious assertions of brute force or in substantial services done in policing these seas, many of which were then infested by pirates, some of these claims were so far admitted, that a right of control became established and was recognized by the payment of toll, the furling of flags and other salutes, from which even kings were not exempt. — From this right of control, as "a dissociation of the ideas of control and property was not then intelligible, the step to the assertion of complete rights of property was almost inevitable." During the sixteenth and seventeenth centuries assertions of proprietary rights based upon prescription, or discovery, or police services, or papal grant, over the open sea, were general, and were maintained with varying success. The physical impossibility of obtaining and keeping exclusive possession of any part of the open sea, the growth of commerce and the consequent recognition of the necessity of the free navigation of the ocean, led to a contest between the advocates of *mare clausum* and those of *mare liberum*, which was begun in 1609 by Grotius, and which was ended in 1824-5 by the complete abandonment of the last of these "vain and extravagant pretensions"—the claim of Russia to the Pacific ocean north of fifty-one degrees north latitude. It is now universally admitted that the open or high seas—the ocean and all connecting arms and bays or other extensions thereof not within the territorial limits of any nation—are not the subject either of property or of exclusive jurisdiction, and that the right to navigate these seas is common to all nations and their members, and can be abridged or renounced only by actual consent. — The first germs of the modern doctrine of uninclosed territorial waters are discoverable in a proclamation¹ of James I. of 1604, which contains the two principles which now limit territorial jurisdiction over the open sea, confining it, 1, to a reasonable distance, and 2, to a distance within which the state can prohibit violence. Grotius, while advocating the freedom of the open sea, admitted that portions of it might be occupied by the state possessing the adjacent land. Bynkershoek, in 1702, formulated the modern rule, which is based upon the necessity of securing peace and protection to the lives, property and industries of the subjects of states who live upon their coasts, and which extends the territorial waters of a state over so much of the open sea as can be defended from its coasts. This, according to Bynkershoek's formula, was as wide a belt of open sea as could be effectively commanded from the coast by cannon, a distance which subsequent writers fixed as one marine league, although to the present time it is often described as a distance of a marine league or as far as cannon shot will reach from the coast. To continental jurists this suggestion of Bynkershoek seemed to afford a

reasonable basis for the settlement of conflicting claims over the open sea, and, though widest disagreement regarding the extent of territorial waters continued for a century, the principle has gradually gained recognition that any control over the open sea to be valid must be effective. No mention of a marine league belt of territorial waters appears to have been made in any English court until 1801, and no exhaustive examination of the nature of the rights of a state over such waters, and their extent, was made in any English court till 1876, when a case arose (*The Franconia*)² involving the right of England to punish a foreigner for an offense committed while on a foreign vessel on a foreign voyage within a marine league of the English coast. The critical review of the opinions of authoritative writers upon international law, then made, showed that: 1. All these writers acknowledge the right of a maritime state to an extension of its territory, in a qualified sense of the word, over some portion of the adjacent sea beyond low-water mark; 2. Though there is found a great variety of opinion among these writers, as to the distance to which such maritime territory should be allowed, that distance varying (setting aside even more extravagant claims) from 100 to three miles, the present limit, not one of them puts such distance at less than three miles; 3. All the earlier writers, and many of the later writers, maintained, that within the zone of three miles the state had, without qualification, a proprietary as well as a territorial right, so that it might at its pleasure exclude foreign ships from passing along the same; but that others of the later writers contended that the state had a territorial, but not a proprietary, right over the zone, or that, at all events, the innocent use of the zone by foreign ships for the purpose of navigation could not without wrong be interfered with. (2 L. R., Ex. Div., 71, 122, 123.)²—But, as the opinions of publicists, even if there were no disagreement among them, are, at best, only secondary evidence of what international law is, the primary evidence of the fact which these writers assert—the existence of an international agreement to treat any part of the littoral sea as belonging to or under the control of the adjacent state—must be sought in treaties and usage. What these disclose is most authoritatively expressed in the opinion, delivered in the leading case above named, by the late Lord Chief Justice Cockburn, who said: “1. *Treaties*. It may be asserted, without fear of contradiction, that the rule that the sea surrounding the coast is to be treated as a part of the adjacent territory, so that the state shall have exclusive dominion over it, and that the law of the latter shall be generally applicable to those passing over it in the ships of other nations, has never been made the subject-matter of any treaty, or, as a matter of acknowledged right, has formed the basis of any treaty, or has ever been the subject of diplomatic discussion. It has been entirely the creation of the writers on international law. It is true that the

writers who have been cited constantly refer to treaties in support of the doctrine they assert. But when the treaties they refer to are looked at, they will be found to relate to two subjects only: the observance of the rights and obligations of neutrality, and the exclusive right of fishing. In fixing the limits to which these rights should extend, nations have so far followed the writers on international law as to adopt the three-mile range as a convenient distance. There are several treaties by which nations have engaged, in event of either of them being at war with a third, to treat the sea within three miles of each other's coasts as neutral territory, within which no warlike operations should be carried on. Again, nations, possessing opposite or neighboring coasts, bordering on a common sea, have sometimes found it expedient to agree that the subjects of each shall exercise an exclusive right of fishing to a given distance from their own shores, and here also have accepted the three miles as a convenient distance. Such, for instance, are the treaties made between this country and the United States in relation to the fishery off the coast of Newfoundland, and those between this country and France, in relation to the fishery on their respective shores; and local laws have been passed to give effect to these engagements. 2. *Usage*. The only usage found to exist is such as is connected with navigation, or with revenue, local fisheries or neutrality, and it is to these alone that the usage relied on is confined. Usage as to the application of the general law of the local state to foreigners on the littoral sea, there is actually none. No nation has arrogated to itself the right of excluding foreign vessels from the use of its external littoral waters for the purpose of navigation, or has assumed the power of making foreigners in foreign ships passing through these waters subject to its law, otherwise than in respect of the matters to which I have just referred. Nor have the tribunals of any nation held foreigners in these waters amenable generally to the local criminal law in respect of offenses.”—So far, then, as it is settled, the law applicable to uninclosed territorial waters is as follows: 1. The rights, whatever may be their description, of an independent state over such waters, are created by international law, and are evidenced by the assent of nations which “may be expressed by treaty, or the acknowledged concurrence of governments, or may be implied from established usage,” and in the absence of such proof of assent the opinions of writers on international law are relevant only as tending to show what claims* one independent state may exercise over such waters without interference from other independent states. 2. The rights of an independent state over such waters, so derived and so evidenced, are, first, a right of jurisdiction limited to the protection of its coasts from the effects of hostilities between other states which may be at

*“Territorial Waters Jurisdiction Act (1878),” 41 and 42 Vict., cap. 73, notwithstanding its preamble, is such a claim.

war, the prevention of frauds upon its customs laws, and the regulation of fisheries; and second, a usufructuary right to fisheries. Modern writers who affirm any proprietary right over uninclosed marginal waters unite in basing it upon the fact that the adjacent "state has admittedly an exclusive right to the enjoyment of the fisheries" in such waters. But this seems to be more accurately classed as a usufructuary right, for, if a state has any proprietary right over such waters, it would seem to have the exclusive right to set law over them, and to close them to foreign vessels, as it may close its ports, whereas it is universally admitted that foreign ships have a *jus transitus* over such waters. 8. The internationally valid exercise of the rights above enumerated by an independent state is limited to a distance of one marine league from low-water mark on its coast. — There are a few apparent exceptions to this rule. 1. Local pilot laws, which require that a pilot shall be taken on board all vessels entering certain territorial waters at a distance of more than three miles from the coast. Such laws are no real exception to the rule, being based upon the principle that a state has a perfect right to say to foreign ships voluntarily seeking its ports, that they shall not, without complying with its law, enter into its ports, and that if they do enter, they shall be subject to penalties unless they have previously complied with the requisitions ordained; whether these requisitions be, as in former times, certificates of origin, or clearances of any description from a foreign port, or clean bills of health, or the taking on board a pilot at any place in or out of its jurisdiction before entering its waters.³ Other local laws containing provisions affecting foreign ships, or foreigners within such ships, in respect to acts committed or omitted beyond the marine league belt, are referable to the same principle. 2. Customs laws and hovering acts, which authorize municipal seizures beyond the marine league. "It will not," says Dana,⁴ "be found that any consent of nations can be shown in favor of extending what may be strictly called territoriality, for any purpose whatever beyond the marine league or cannon shot. Doubtless states have made laws, for revenue purposes, touching acts done beyond territorial waters; but it will not be found, that, in later times, the right to make seizures beyond such waters has been insisted upon against the remonstrance of foreign states, or that a clear and unequivocal judicial precedent now stands sustaining such seizures, when the question of jurisdiction has been presented. The revenue laws of the United States, for instance, provide, that, if a vessel bound to a port in the United States, shall, except from necessity, unload cargo within four leagues of the coast, and before coming to the proper port for entry and unloading, and receiving permission to do so, the cargo is forfeit, and the master incurs a penalty (Act March 2, 1797, sec. 27); but the statute does not authorize the seizure of a foreign vessel when beyond the territorial jurisdiction. The statute may well be construed to

mean only that a foreign vessel coming to an American port, and there seized for a violation of revenue regulations committed out of the jurisdiction of the United States, may be confiscated; but that, to complete the forfeiture, it is essential that the vessel shall be bound to, and shall come within, the territory of the United States, after the prohibited act. The act done beyond the jurisdiction is assumed to be part of an attempt to violate the revenue laws within the jurisdiction. If foreign vessels have been boarded and seized on the high sea, and have been adjudged guilty, and their governments have not objected, it is probably either because they were not appealed to, or have acquiesced, in the particular instance, from motives of comity." Phillimore and Twiss both substantially agree with Dana, and hold that judgments affirming the legality of municipal seizures beyond one marine league could not have been sustained if the foreign state whose subject's property had been seized had thought proper to interfere, unless, perhaps, when that state had put in force or at least enacted, for its own benefit, a similar municipal law. 3. The waters in the centre of certain straits, gulfs and bays, which central waters lie outside the limit of a marine league from any of the adjacent coasts, are claimed to be territorial waters, and certain gulfs are in actual practice so treated. France appears to claim inlets whose entrance is not more than ten miles wide. England long claimed the "Queen's Chambers," these being waters within headlands as distant as Orfordness from the Foreland. The bay of Conception, in Newfoundland, which penetrates forty miles into the land, and is fifteen miles in mean breadth, was recently decided to be territorial water by the privy council. The United States claimed Delaware bay in 1793. "Of practice," says Hall,⁵ "there is a curious deficiency, and there is nothing to show how many of the claims to gulfs and bays which still find their place in the books, are more than nominally alive. It is scarcely possible to say anything more definite than that, while on the one hand it may be doubted whether any state would now seriously assert a right of property over broad straits or gulfs of considerable size and wide entrance, there is, on the other hand, nothing in the conditions of valid maritime occupation, to prevent the establishment of a claim either to basins of considerable area, if approached by narrow entrances, such as of the Zuyder Zee, or to large gulfs which, in proportion to the width of their mouth, run deeply into the land even when so large as the bay of Fundy, or, still more, to small bays, such as that of Cancale." — The United States, being an independent state, has the international rights and is under the international obligations above described, in respect to the open sea which washes its coast; but, being a federal Union, jurisdiction and ownership over these waters, as between its constituent members, are regulated, not by international law, but by the terms of that Union. Thus it has been decided⁶ that the article of the

constitution which describes the judicial power, and extends it to cases of admiralty and maritime jurisdiction, does not make a cession of territory or of general jurisdiction, so as to vest in the United States the shores of the sea, below low-water mark, and that whatever soil below low-water mark, within the ebb and flow of the tide, is the subject of exclusive property and ownership, belongs to the state within whose territory it lies, subject to any lawful grants to that soil by the state or sovereign power which governed its territory before the declaration of independence. Massachusetts, for instance, expressly asserts,⁷ that, "The territorial limits of this commonwealth extend one marine league from its seashore at low-water mark. When an inlet or arm of the sea does not exceed two marine leagues in width, between its headlands, a straight line from one headland to the other is equivalent to the shore line. The boundaries of counties bordering on the sea shall extend to the line of the state, as above defined." So the counties and towns in the state of New York which are bounded generally on Long Island sound, comprehend⁸ within their limits, for the purpose of ordinary civil and criminal jurisdiction, the waters between their respective shores and the exterior water line of the state. Subject, then, to the paramount right of navigation, the regulation of which in relation to foreign and inter-state commerce has been granted to the United States, each state owns⁹ the beds of all tide waters within its jurisdiction, unless they have been granted away, and may appropriate them, to be used by its citizens as a common for taking and cultivating fish, if navigation is not thereby obstructed. In like manner, the state owns the tide waters themselves and the fish in them, so far as they are capable of ownership while running. The right which the citizens of the state thus acquire is a property right, and not a mere privilege or immunity of citizenship, and a law of a state, as Virginia, prohibiting citizens of other states from planting oysters in the soil covered by her tide waters, is neither a regulation of commerce nor a violation of any privilege or immunity of inter-state citizenship. — See Phillimore's *Commentaries upon International Law*, vol. i., chaps. 4-8, Philadelphia, 1854; Kent's *Commentaries*, 12th ed., vol. i., pp. 26-36; Twiss' *The Law of Nations* (Time of Peace), London ed., 1861, chap. 10; Woolsey's *International Law*, 5th ed., secs. 56-63; Holland's *Jurisprudence*, pp. 297, 298; ¹ Twiss' *Arts. in Law Magazine*, 1877; ² *The Queen vs. Keyn*, 2 L. JAMES FAIRBANKS COLBY.

TERRITORIES (IN U. S. HISTORY). Before the American revolution the thirteen colonies were "territories" of the British empire: that is, they held much the same relation to the British empire that the present territories hold to the United States. They had many political privileges: they had assemblies of their own, which made their local laws, laid their local taxes, and paid their local officers; three of them until 1691, and two of them thereafter, elected their own governors (see MASSACHUSETTS, CONNECTICUT, RHODE ISLAND); and in very many respects all of them were self-governing commonwealths. But, whatever the colonies may have thought of the matter, in the view of the mother country these privileges had their basis in the continuing will of the British sovereignty. The king had no right, theoretically, to alienate permanently any of the prerogatives of the crown; and when his judges or his parliament advised him that any of the privileges which he had granted to the colonies were abused, or proved to be inherently vicious, it was his duty to revoke or alter them. Even a "charter," in this way of looking at it, had no inherent sanctity; it was no contract between king and people, but a grant by the king of privileges whose permanence was conditioned on the advantage of their results to the mother country. Connecticut had the privilege of electing its own governors down to the revolution; but the privilege had no solid basis than in Massachusetts, where it was revoked in the charter of 1691. Of course the colonies saw the matter differently. (See REVOLUTION.) But we are considering now only the view taken by the sovereignty in both cases; and from that point of view it is difficult to see any great difference between the status of the colonies under the British empire, and of the territories under the United States. Both had political privileges, but in both the continuance of the privileges was dependent on the continuing will of the superior, and on the advantages of the arrangement to the superior. The history of the territories of the United States will, it is confidently submitted, show the infinite superiority of the American over the British colonial policy. Indeed, its superiority has become so apparent that the British policy has of late years been radically altered in the direction of the American policy. — I. ACQUISITION. 1. *Under the Colonies.* Six of the colonies, New Hampshire, Rhode Island, New Jersey, Delaware, Pennsylvania and Maryland (see their names), had defined western boundaries; the other seven, Massachusetts, Connecticut, New York, Virginia, North Carolina, South Carolina and Georgia, had none, unless we may consider the Pacific ocean, assigned in the charters and grants of most of them, as a western boundary. There were some irregularities. The boundaries of New Hampshire were always exceedingly vague; and, though most of them were settled by convention with Massachusetts, the New Hampshire authorities asserted an indefinite claim to the territory to the west, to which New York long

opposed an equally indefinite claim. (See VERMONT.) New York, as it came into the hands of the English, consisted only of the strip of land on both sides of the Hudson river, which the Dutch had settled. To the north and west of Albany there was a vast extent of Indian territory, whose tribes had either been conquered by the Dutch or had made treaties with them. New York, therefore, claimed a sort of suzerainty over it, without any express grant from the king. The claim was in effect recognized by the king's proclamation of 1763, constituting the province of Quebec, and by the act of parliament of 1774, defining its boundaries: the two ran the boundary line between Canada (Quebec) and New York very much as at present. This really satisfied New York, and yet that colony, perhaps to call attention away from the vagueness of its acknowledged title, continued to assert a much vaguer claim to still further western territory. Massachusetts, Connecticut, Virginia, and the colonies to the south, were bounded west by the Pacific ocean in their grants. Virginia (see that state) asserted that her northern boundary ran northwest, instead of west, so that her territory was continually widening as it went westward. The boundaries of Maryland and of the western part of Pennsylvania conflicted with Virginia's claim, but Virginia yielded in these respects, for the purpose of establishing the rest of her claim. South Carolina had really been given a western boundary by the formation of the colony of Georgia, which cut off her further expansion to the west; but it was not yet known whether Georgia covered the whole western boundary of South Carolina, and the latter colony claimed that a narrow strip along the northern edge of its former territory still remained. If there was any such strip it was not more than a dozen miles wide. — The king's proclamation of Oct. 7, 1763, after constituting the new provinces of Quebec and the Floridas, declared it to be his "royal will and pleasure," as to the territory between them, "to reserve under our sovereignty, protection and dominion, for the use of the said Indians, * * * all the lands and territories lying to the westward of the sources of the rivers which fall into the sea from the west and northwest." This was clearly the establishment of a western boundary for all the colonies which had hitherto had none; and the ground of the establishment was as clearly the asserted right and duty of the king to modify his grants and charters, when their results proved to be injurious to the interests of the empire. The right was always denied by the colonies, and their resistance to it was one of the most powerful forces which led to the revolution; and yet, curiously enough, when independence was established, this very proclamation was asserted by the states which had original western boundaries as a valid assignment of a western boundary for the others. — Virginia hardly showed an enterprise in asserting western claims commensurate with their magnitude and importance. The first Virginia exploring party crossed the Blue Ridge in 1686; but

it was not until 1712, under Spotswood's administration, that the country beyond the mountains was reduced to possession. Before the middle of the eighteenth century, settlements had crossed the mountains. The organization of the Ohio company in 1748-9 was due to individual Virginia enterprise; but in the French and Indian war, which followed it (see WARS, I.), Virginia supported the company with her whole force. The place of the first struggles, though now in western Pennsylvania, was then supposed to be in Virginia. In 1774 Gov. Dunmore led the Virginia forces against the Scioto Indians, and compelled them to make peace; but his motives in the expedition were strongly suspected to be selfish. The settlement of Kentucky (see that state) was also due to individual enterprise; and its formal establishment as a Virginia county in 1776 was almost forced on Virginia by George Rogers Clarke, a Virginia surveyor resident in Kentucky. Clarke at once became the champion of Virginia's interest in the northwest. In 1778-9 he led a Kentucky force into Illinois, and conquered that territory and Vincennes, now in Indiana; and the whole was made the county of Illinois by the Virginia legislature. But little attempt was made by Virginia to incorporate the conquest; and at the time of the first cession in 1784 it is improbable that there was any Virginia government in Illinois. — North Carolina asserted her western claims with more energy and success. The first assertion was due to individual enterprise. The first settlement of Tennessee (see that state) was by hunting parties, and by persons who had found the disturbed state of North Carolina under the royal governor unpleasant. In 1776 their settlements were made "Washington district" of North Carolina; and, as settlements increased, other counties were formed. After the first session, in 1784, the Tennesseans revolted, and formed the state of Franklin, or Frankland; but North Carolina revoked her cession, and suppressed the Franklin revolt. The authority of the state was thus established from the Atlantic to the Mississippi. — Other colonies dealt in nothing but assertions. None of them made any practical effort to maintain their claim to territory beyond their present western boundary, with two exceptions. Connecticut made a long but finally unsuccessful attempt to oust Pennsylvania from a part of her territory (see WYOMING), and Massachusetts compromised her claims to the territory of New York. (See NEW YORK.) — 2. *Under the Confederation.* The essential importance of the western territory was as a bond for holding the states together during and after the revolution. The revolution was undoubtedly begun under a vague idea of separate state action in theory, with a controlling necessity for national action in practice; and the articles of confederation were carefully framed with the view of securing as much of the former and as little of the latter as possible. (See STATE SOVEREIGNTY; CONFEDERATION, ARTICLES OF.) So strong was the particularist feeling

in the different states that they were only held firmly together by the first flush of the war feeling; and as this influence relaxed, the tendency to disintegration grew more plainly evident. At first sight, the most powerful opposing force to this disintegrating tendency was the common commercial interest which grew up throughout the states (see FEDERAL PARTY); but the possession of the western territory was a more powerful, though more silent, force, for it reached states which the other force did not touch. If the western territory was to be retained and utilized, but two courses were open: to allow all the states to engage in a general scramble for it, in which each state should secure as much of its claims as it could enforce; or to accept it as national property, defend it by national force, and govern it by national authority. To allow the national bond to break altogether, through the default of the articles of confederation, would have had the former result; and in this instance, as in others, the prejudices of the people at last gave way to their common sense, and they chose the latter. But the process by which they were brought to this conclusion made up one of the vital issues of American politics from 1778 until 1784. — In the beginning congress seems to have had no notion that the western lands were national property. Among its measures to raise an army, Sept. 16, 1776, it promised grants of lands to officers and soldiers, but was careful to provide that the money necessary "to procure such lands" should be assessed upon the states like other expenses. Oct. 15, 1777, before the articles of confederation were proposed to the states, a motion was made in congress to add a provision that congress should be empowered to fix the western boundaries of the claimant states, and to divide the western territory into independent states; but only Maryland voted for it. Clarke's expedition to the Illinois country in 1778, and Virginia's sudden prospect of boundless territorial wealth, threw the apple of discord among the states. Heretofore the claimant states had been content to claim, without taking active steps to enforce their claims; and their extreme demand had been only the negative provision of the ninth article of confederation, that "no state shall be deprived of territory for the benefit of the United States." Ten of the states, all but New Jersey, Delaware and Maryland, had already ratified the articles; but most of them had ordered their delegates to propose alterations before signing. When the proposed alterations were considered in congress, June 22-25, 1778, it was found that Maryland proposed to alter the ninth article by empowering congress to fix the western boundaries of the claimant states; that Rhode Island proposed to alter it by empowering congress to sell crown lands within the states; and that New Jersey only protested against the article as it stood, as unfair to the non-claimant states. All amendments were voted down. Eight of the states signed the articles, by their delegates, July 9; North Carolina, July 21; and Georgia, July 24. New Jersey,

Delaware and Maryland refused to sign. New Jersey yielded first: her delegates signed the articles, Nov. 26, 1778, relying on "the candor and justice of the several states" for cessions of their claims. The Delaware delegate signed Feb. 22, 1779, protesting at the same time that his state was justly entitled to a share in the territory which had been won "by the blood and treasure of all." Maryland was now the only obstacle, but it proved for some time insuperable. Dec. 15, 1778, that state formally instructed her delegates "not to agree to the confederation," unless the ninth article should be amended as she had desired; and the letter of instructions demanded that the western territory "should be considered as a common property, subject to be parceled out by congress into free, convenient and independent governments, in such manner and at such times as the wisdom of that assembly shall hereafter direct." This seems to have been the first official proposal of that extension of the federal system which had been first suggested in 1777, probably also by Maryland, and which has been the secret of the success of the American policy. — Maryland held out for three years; and during that time the articles hung fire. At first her opposition threatened to provoke an explosion, for some of the claimant states seem to have been willing to break up the Union rather than surrender their claims. Dec. 19, 1778, Virginia formally offered to put the articles in force with any one or more states which should ratify them as they stood, so that Maryland at least would have been left out of the Union; and Connecticut agreed, April 7, 1779. But Maryland remained firm; and her firmness, and perhaps the discovery that Virginia's claim, if allowed in full, would neutralize those of the northern states, gradually turned the scale of opinion against Virginia. Feb. 19, 1780, New York led the way by empowering her delegates to agree to a western boundary, and relinquishing all claims beyond. The ceded territory was to be held for the use of "such of the United States as shall become members of the federal alliance," and for no other purpose. By this New York really gave up nothing, and gained a certain instead of a doubtful boundary. But the precedent was a promising one, and congress used it to pass a resolution, Sept. 6, 1780, "earnestly recommending" the other claimant states to follow New York's example, and "earnestly requesting" Maryland to ratify and sign the articles. This was followed, Oct. 10, by another resolution, in which congress committed itself to Maryland's proposed extension of the federal system, promising that the territory ceded should be "formed into distinct republican states, which should become members of the federal Union, and have the same rights of sovereignty, freedom and independence as the other states." From this line of policy congress has never swerved, and it has been more successful than stamp acts or Boston port bills in building up an empire. — In October, 1780, Connecticut offered to cede her claims, reserving a tract along Lake Erie.

Jan. 2, 1781, while Arnold was ravaging Virginia, that state offered to cede her claims northwest of the Ohio, on condition that congress would guarantee her possession of Kentucky and the larger part of Tennessee. Neither of these offers was accepted by congress, but the prospect was so encouraging, that Maryland at once empowered her delegates to sign the articles, and they did so, March 1, 1781. On the same day the New York delegates assented to the western boundary of the state, on condition that the same guarantee should be given to New York as to any other state. Thus the articles of confederation went into force without any real settlement of the territorial question, for the only cession likely to be accepted had amounted to nothing. — Oct. 30, 1779, congress had passed a resolution, against the votes of Virginia and North Carolina, recommending Virginia to close her land office and forbear issuing land warrants until the end of the war. Oct. 29, 1782, the persistent Maryland delegates moved that the cession of New York be accepted by congress, and the motion was carried against the vote of Virginia, North and South Carolina being divided, and Massachusetts having but one delegate and no vote. The purpose of this action was to get a fulcrum from which to operate on the claim of Virginia, and it was effective. The claim of New York to her own territory west of Albany was derived from her supremacy over the "Six Nations"; and this was now recognized by all the states. But the Six Nations had always asserted a general right by conquest to all the territory west of New York, Pennsylvania, Virginia and North Carolina. If this also were admitted, it also had passed to New York, and had been ceded by New York to congress; and the whole western territory was already national property, without the formality of a cession by Virginia or any other state. May 1, 1782, a committee had made an elaborate report to congress. It upheld the claim of New York to its full extent; considered the jurisdiction of the whole western territory, including Virginia's claim, to be already vested in congress by New York's cession of it; and recommended Virginia to make a new and full cession. Consideration of the report was postponed, but it was evidently high time for Virginia to cede the northwest territory absolutely and gracefully, if she desired to save Kentucky and her land warrants there. — The act of cession was passed by the Virginia legislature, Oct. 20, 1783, and the deed was executed by her delegates in congress, March 1, 1784. Under the circumstances, the terms accorded to the state were sufficiently liberal; the land titles of Virginia settlers were to hold good; the expenses of the state in conquering the territory were to be repaid to her; 150,000 acres were reserved for Clarke and his troops; and any deficiency in Virginia land warrants in Kentucky and Tennessee was to be made good in the northwest territory. The ceded territory was to be organized according to the federal policy which con-

gress had outlined in October, 1780. A supplementary act of cession was presented in congress, Dec. 30, 1788; but this was only to conform the original act to the terms of the ordinance of 1787. Virginia's cession was complete in 1784. — Massachusetts made an unqualified cession of her claims west of Niagara river, April 19, 1785, in accordance with an act of the legislature of Nov. 18, 1784. — Congress had not as yet accepted Connecticut's proffered cession, on account of the reservation of a tract extending from the Pennsylvania line 120 miles westward. But Connecticut had loyally accepted the award of congress against her in the case of Wyoming (see that title); and congress at last accepted her cession, May 26, 1786. April 28, 1800, an act of congress authorized the president to deed to Connecticut the title to this "western reserve," on condition that Connecticut should surrender all claim to its jurisdiction, and abandon any claim to the territory within the limits of New York; and the state fulfilled the conditions, May 30. — Aug. 9, 1787, South Carolina made an unqualified cession of her claims west of a line from the head of Tugaloo river to the North Carolina boundary. The actual cession was a strip of land about twelve miles wide. That portion of it which is now a part of Georgia was transferred to that state in part return for its cession in 1802. — The South Carolina cession closed the formal record of acquisitions of territory under the confederation; but there were two more cessions, which, though made under the constitution, were only belated completions of confederation arrangements. North Carolina ceded Tennessee in 1784; but, before congress could meet, and accept the cession, it was revoked on account of the anger it excited in Tennessee. Five years later, this feeling had disappeared. In December, 1789, the North Carolina legislature made another cession of Tennessee, which was accepted by act of congress of April 2, 1790. The North Carolina titles and military land warrants were to hold good, and the territory was to be organized as the northwest territory had been, "provided always, that no regulations made or to be made by congress shall tend to emancipate slaves." — Most difficulty was met in the case of the claims of Georgia, covering the present states of Alabama and Mississippi, north of parallel 31° and south of the South Carolina cession. It had been claimed by South Carolina, because the original grant to the Carolina proprietors covered the territory between parallels 31° and 36° west to the South seas. But the proprietors had transferred their rights to the king; the king had formed the colony of Georgia in 1732, and given to it the territory between the Altamaha river and the most northern part of the Savannah, westward to the South seas; and his proclamation of 1763 had annexed to Georgia the territory between the Altamaha and the St. Mary rivers. In 1787 the two states made a treaty at Beaufort, by which South Carolina obtained the territory afterward ceded by her, and Georgia the rest. Georgia took no steps

to cede her share to the United States, but made preparations to reduce it to possession. (See YAZOO FRAUDS.) April 7, 1798, an act of congress organized the territory of Mississippi (see that state), but it covered less than half of the present extent of the state. Its southern boundary was parallel 31; its northern boundary a line due east from the mouth of the Yazoo to the Chattahoochee. This territory had been annexed by the king to West Florida, and was claimed by the congress of the confederation as common property under the treaty of peace in 1783. Feb. 1, 1788, Georgia had passed an act ceding this part of the territory to the United States, on condition of being guaranteed the rest of her claims. This congress refused to do, July 15, 1788, and the session fell through. Spain, by the treaty of 1795 (see ANNEXATIONS, I.), abandoned all claim to this part of the territory, and the act of 1798 proceeded to organize it into a territory, in spite of Georgia's claims to it; but the same act authorized the appointment of commissioners to treat with Georgia for all her western claims. Madison, Gallatin and Lincoln were appointed commissioners; and the act of May 10, 1800, gave them full power to treat, provided that no money was to be paid by the United States except out of the proceeds of the lands ceded. April 24, 1802, the commissioners agreed upon an arrangement by which Georgia was to cede all her western claims, and receive in return the proceeds of not more than 5,000,000 acres, or \$1,250,000. Previous titles were to hold good; and slavery was not to be prohibited in the new territory. The agreement was confirmed by the Georgia act of June 16, 1802, and the act of congress of March 3, 1803; and the ceded territory was added to Mississippi territory by act of March 27, 1804. A provision in the cession for the extinguishing of Indian titles in Georgia by the United States gave some further trouble. (See CHEROKEE CASE.)—3. *Under the Constitution.* This branch of the subject is treated as a separate article: ANNEXATIONS.—4. *Right of Acquisition.* It must be evident that there was an essential distinction between the acquisitions of territory under the confederation and under the constitution. In the former case, the so-called "acquisitions" were not really acquisitions at all, and Maryland's position was correct. The territory in question had been conquered by national force, and the nation's title to it had been recognized by the international recognition of its boundaries. The "acquisitions" were merely the removal of the cloud on the title which came from the troublesome claims of the states. Under the constitution, the acquisitions were real acquisitions of originally foreign soil.—But, in either case, the mere holding and organization of the territory into inchoate states is fatal to the notion of an absolute sovereignty in the states. We may call the nation any question-begging name we will, federal alliance, confederacy, or what not: but it is a nation if it can hold and organize territories, and in due process of time and increase of strength it will be

prepared to vindicate its right to existence and respect against all comers. And, on the other hand, if we do not recognize the United States as a nation, it is altogether impossible to locate any basis for the right to acquire, hold or organize the territories. Under the confederation, congress had no right to exercise any power not expressly granted to it; and the power to acquire, hold and organize territories is conspicuous by its absence. "All this has been done," says the "Federalist," "and done without the least color of constitutional authority." Under the constitution, congress was, it is true, empowered to "dispose of and make all needful rules and regulations respecting the territory belonging to the United States." (Art. IV., § 3); but all respectable authorities agree that this provision referred only to the territory *then* (1787-8) "belonging to the United States," and gave no power to make future acquisitions. It might fairly be argued, that, when new acquisitions *were* made, the power above stated applied to them, as then "belonging to the United States;" but the power to acquire is not there. It is the inherent characteristic of a sovereignty, as it is of the individual person, and in neither case requires a permit by charter. It is clearly stated in a resolution proposed by the Maryland delegates, Sept. 13, 1783, that "the United States are vested, as one undivided and independent nation, with all and every power and right exercised by the king of Great Britain over the said territory;" though only Maryland and New Jersey voted for it. There is but one way to evade this conclusion, by the supposition of a temporary suspension or informal alteration of the organic law. Some such idea is advanced by Judge Taney, in his Dred Scott opinion, when he holds that the states had a right to accept a "cession of territory for their common benefit, which all of them assented to;" and by Jefferson (see ANNEXATIONS, I.), in supposing that his unconstitutional acquisition of Louisiana could be condoned by general popular acquiescence. But neither of these will do. The former lacks the essential confirmation of the facts in the case. The dates on which the cessions were accepted by congress have been given above, and a reference to the journals of congress under those dates will show the reader that there was not one cession to which "all of the states" assented. The New York cession was accepted against the vote of Virginia, with two states divided; the Virginia cession against the vote of New Jersey, with South Carolina divided; the Massachusetts cession with New York divided, and the Connecticut cession against the vote of Maryland, with four states divided. The only doubtful one is the unimportant cession of South Carolina, as to which there is no record of the vote. Thus, the various cessions were not accepted by a unanimous agreement of sovereign states, but by an actual, though hardly recognized, national power. Judge Taney was bound to imply unanimity, but his conclusion falls with his innuendo. Jefferson's view is a rank distortion of the national idea, disguised as ultra

democracy; and it shows the proneness of man to dress in familiar garments, and re-baptize with a more welcome name, an unwelcome fact to which he can no longer shut his eyes. Jefferson would have been the first to reject the notion that a strong popular majority, regardless of state lines, can rightfully set aside, even for a time, the organic law; yet here he extends the idea to a permanent alteration, rather than countenance the idea of a national power in internal affairs. The truth seems to be, that, without the recognition of such a power, the acutest man must be puzzled to explain the right to acquire territory; and that the acquisition of territory is itself the boldest exercise and assertion of national power. —

II. ORGANIZATION OF TERRITORIES. The organization of the territories of the United States has a double object: to provide for good government while the population is sparse; and to encourage their development into self-governing commonwealths, and their incorporation into the federal system, as rapidly as possible. This latter point is the peculiar feature of the American colonial system. — The organization of the territory northwest of the Ohio, from which have since been formed the states of Ohio, Indiana, Illinois, Michigan and Wisconsin, has been considered elsewhere. (See ORDINANCE OF 1787.) It is sufficient to say here that the government was at first vested in a governor and judges, appointed by congress until 1789, and by the president thereafter; that they were empowered to form a code of laws for the territory, by selection from state statutes; that congress retained a negative on their acts; but that, when there should be 5,000 male inhabitants in the territory, they should have a legislature of their own, congress still retaining the veto power. For a long time, a territory with a complete legislature was called a territory of the first class, and others territories of the second class. There are now only territories of the first class, and two unorganized territories (Indian territory and Alaska). — For the territories within the original limits of the United States, the ordinance of 1787 was the model. As the successive territories were carved out of the northwest territory, the fundamental provision of the organizing act was that "there shall be established within the said territory a government in all respects similar to that provided by the ordinance of congress, passed on the 13th day of July, 1787, for the government of the territory of the United States northwest of the river Ohio, and the inhabitants thereof shall be entitled to and enjoy all and singular the rights, privileges and advantages granted and secured to the people by the said ordinance." The organizing act for Wisconsin, in 1836, was the first of these which was very elaborate. In the cases of Tennessee and Mississippi, south of the Ohio, the organizing acts were like the corresponding acts for northern territories, excepting that section of the ordinance of 1787 which forbade slavery; but in the organization of Alabama, in 1817, the ordinance of 1787 is not referred to, unless it is

included in the provision that all laws then in force in the territory of Mississippi should remain in force until otherwise provided by law. — In the organization of the territories acquired under the constitution, and hence beyond the original limits of the United States, it has been necessary to follow a more elaborate scheme of organization than that of the original territories. The first act in relation to Louisiana, in 1803, was simple enough. It merely empowered the president to appoint all civil, military and judicial officers of the new territory, to define their duties, and to support them with the army and navy of the United States. It was in effect the establishment of a military despotism over Louisiana, and may suffice as an example of the extent to which the sovereign power of the United States over the territories might go, if a wiser policy were not the rule. In this case the despotism was only intended to be temporary; and in the following year the territory was properly organized. As this was the model regularly followed afterward, it may be as well to itemize it. 1. The governor was to be appointed by the president for three years, to be the executive, to pardon offenses against territorial laws, and to relieve offenders against laws of the United States until the president could act. 2. The secretary was to be appointed for four years, to record territorial acts, and to send copies of the governor's acts to the president every six months. 3. The governor and a legislative council of thirteen members, appointed annually by the president, made up the territorial legislature; and its acts were to be sent by the governor to congress, through the president, and, if vetoed by congress, were to be void. 4. The judges were to be appointed for four years (see JUDICIARY, VI.); but trial by jury, *habeas corpus*, the privilege of bail, and moderate and usual punishments were secured to the people. 5. Specified laws of the United States were declared to be in force in the new territory. This was really a territory of the second class. When Missouri was formed in 1812, it was as a territory of the first class. Its legislature consisted of a governor, a legislative council, and a house of representatives. The representatives were to be elected by the people; they were to nominate eighteen persons, and out of these the president was to appoint the legislative council of nine. In all cases the territory was to elect a delegate to congress, who was to have the privilege of debate, but not of voting. (See HOUSE OF REPRESENTATIVES.) In second-class territories the delegate was regularly chosen by the legislature; in first-class territories, by the people. In minor points, as in the term of office-holding, boundaries, etc., there were constant variations; but the general system has been as above. — It will easily be understood that such a system exerts, from the beginning of population, a steady pressure toward the exercise of political power by the people; and that it is so self-governing in its action that it can correct the dangers of early border lawlessness, while it gives

more and still more power to the people as the population becomes fixed and settled. At the same time the land system of the territories, next to be referred to, has been steadily operating to increase, fix and settle the population. The two, working together, inevitably result in the natural and simple development of states. In this manner nineteen territories have been transformed gradually into states. A list of the ratifications or admissions of the thirty-eight states (1883) is elsewhere given. (See CONSTITUTION, I.) Of these, the first thirteen were original states. Of the remaining twenty-five, four were formed out of other states, Vermont, Maine, Kentucky and West Virginia; one, California, was admitted as a state before it was possible to organize it as a territory; one, Texas, was annexed as a state; and the remaining nineteen are the fruits of the territorial system. In the process of transformation, it has been usual, since the admission of Ohio, that congress should pass an "enabling act," authorizing the people of the territory to form a state government; but this has not been regarded as a *sine qua non*, since the absolute power of congress to admit or reject the state is a sufficient safeguard. (See FLORIDA, IOWA, KANSAS, MICHIGAN.)—There are now, (1883) eight organized territories, all of the first class, Arizona, Dakota, Idaho, Montana, New Mexico, Utah, Washington and Wyoming; two unorganized territories, Indian territory and Alaska; and the district containing the national capital, the District of Columbia, governed directly by congress or its agents. (See the names of these territories.) All of the organized territories are inchoate states; Dakota has already applied for admission; and, unless peculiar circumstances interfere in the case of Utah (see MORMONS), it will probably not be long before the United States will have no organized territories.—It is impossible within reasonable limits, to give the historical geography of the territories, for the changes in their boundaries and areas have been very numerous. For these the reader is referred to the map prefixed to the second volume of Hough's work, cited below, and to the analysis in Walker's statistical atlas of the United States.—III. LAND SYSTEM. (See PUBLIC LANDS.)—IV. SLAVERY IN THE TERRITORIES. The prohibition of slavery in the northwest territory is elsewhere given (see ORDINANCE OF 1787); it held good in spite of efforts to evade or abrogate it. (See INDIANA, ILLINOIS, SLAVERY.) In organizing Tennessee and Mississippi territories, it was provided that the article of the ordinance prohibiting slavery should not be enforced; and in organizing Alabama the same thing was done in effect by continuing the laws of Mississippi territory. No act of congress ever established slavery in a territory. In the new acquisitions, in Louisiana and Florida, the territorial organizing act practically allowed slavery by continuing former laws; and the same thing was done in Missouri and Arkansas by continuing the former laws of Louisiana and Missouri. The struggle of 1820

(see COMPROMISES, IV.) ended the extension of slavery by this system, and established a line north of which slavery was prohibited. For further security, all the privileges of the ordinance of 1787 were guaranteed to the people of Oregon territory in 1848; and the same thing was done in effect with Iowa territory in 1838, and Minnesota territory in 1849, by guaranteeing to them the privileges of Wisconsin territory, which came under the ordinance. No such provision was in the Kansas-Nebraska act (see that title) in 1854.—The acquisition of new territory from Mexico brought up a new series of difficulties. (See WILMOT PROVISION.) California took care of herself by coming in as a free state. Utah and New Mexico were organized without mention of slavery; but, when their territorial legislatures passed laws practically recognizing slavery, it was not possible to unite both houses of congress in vetoing them, and they held good. Nevertheless, when the territories of Nevada, Colorado and Dakota were organized, during the early months of 1861, there was no mention of slavery therein, and the system of slavery had the benefit of the decision in the Dred Scott case. (See that title.) Finally, in 1862 (see WILMOT PROVISION), slavery was abolished in all territories then held or to be acquired.—See (I.) ALEXANDER JOHNSTON.

TEXAS, a state of the American Union, and the only one which was, before its admission, an independent state, with powers to make war, peace and treaties, send and receive ambassadors, etc. It was at first a part of New Spain, or Mexico, the American claim upon it having been abandoned by the Florida treaty with Spain in 1819 (see ANNEXATIONS, II.); and it participated in the successful revolt against Spanish authority. Jan. 31, 1824, Mexico framed a federal constitution, which went into force Oct. 4. Its fundamental idea was like that of the United States, except that it established the Roman Catholic as the state church, and forbade the use of any other form of worship. March 11, 1827, the "state of Coahuila and Texas" framed a state constitution, patterned after that of the nation in every respect, except its 13th article, as follows: "In this state no person shall be born a slave after this constitution is published in the capital of each district, and six months thereafter, neither will the introduction of slaves be permitted under any pretext." — American adventurers had already begun to enter the more thinly populated district of Texas, pretending to be good Catholics, and paying little attention to the abolition of slavery. April 1-13, 1833, in convention at San Felipe, they formed a new state constitution, more closely American in design, introducing trial by jury, universal suffrage, and the right of petition; but it was never recognized by the central government. When Santa Anna's new Mexican government, Jan. 31, 1835, undertook to abolish the state governments and transform them into departments, as in France, Texas rebelled. A convention at Austin, Oct. 17 - Nov. 13, 1835, framed a provisional government, and adjourned to Washington, March 1, 1836. On the next day after reassembling, it made a declaration of independence, on the ground that Santa Anna had overthrown the Mexican government and established a military despotism, and that the compact between Texas and Mexico had thus been broken. (See SECESSION, II.) Before its final adjournment, March 17, it had framed a constitution for the republic of Texas. The house of representatives was to be chosen annually, and the senate for three years; and the president was to be chosen by popular vote for three years, but was not immediately re-eligible. "All persons of color, who were slaves for life previous to their emigration to Texas, and who are now held in bondage, shall remain in the like state of servitude." Congress could pass no laws to free slaves, or prevent immigrants from bringing them into the republic. Free negroes were not to be allowed to become or remain inhabitants; and slaveholders could not free slaves, unless with the consent of congress, and on condition of sending the freedmen out of the republic. Under this constitution Texas maintained her independence, which was recognized by the various commercial nations. The story of her annexation to the United States is elsewhere told. (See ANNEXATIONS, III.) — **BOUNDARIES.** The eastern and northern bound-

ary of Texas was fixed by the Florida treaty of 1819 with Spain. (The line will be found under ANNEXATIONS, II.) This line was confirmed by treaty of Jan. 12, 1828, with Mexico, and April 25, 1838, with Texas. The southeastern boundary was natural, the gulf of Mexico. The northwestern and western boundary was a matter of far more difficulty. Volumes have been written to prove that Texas, under the French Louisiana claim, to which the United States succeeded in 1803, and which the United States abandoned in 1819, extended westward to the Rio Grande; and that its reannexation, in 1845, should cover the same territory. All this argument seems needless. After the establishment of the republic of Mexico, the western boundary of Texas was entirely a matter of internal decision in Mexico. The "state of Coahuila and Texas" extended to the Rio Grande; but the national existence of Texas was as much a secession from Coahuila as from Mexico, and the western boundary of the republic of Texas never extended beyond the Nueces river. It is true that the Texan congress, Dec. 19, 1836, defined the western boundary of the republic as the Rio Grande to its head, and thence due north to latitude 42°, about the latitude of Boston. But such a paper declaration, whether it extended to the Nueces, the Rio Grande or the isthmus of Panama, was evidently of no force unless successfully supported by arms. It was so supported, and the authority of Texas was extended up to the Nueces, but never beyond; and the effort to carry Texas jurisdiction beyond, the Mier expedition, was a pronounced failure. Nevertheless, President Polk, in 1846, assumed authority to order the American forces into the disputed territory, and thus brought on the Mexican war. (See WARS, V.) At the end of the war the federal government was in a most embarrassing position. To acknowledge the full claims of Texas would have been to add to her enormous territory the present territory of Arizona, and a large part of Kansas and Colorado; to deny them would have been a confession that the whole nominal cause of the war was fraudulent. Feb. 11, 1850, Texas formally reaffirmed her boundary of 1836. Sept. 9 (see COMPROMISES, V.), congress proposed the following northern and western boundary for Texas. latitude 36° 30' from longitude 100° west to longitude 103° west; thence due south to latitude 32°; thence due west to the Rio Grande, and down that river to the gulf of Mexico. Texas was to cede all claims outside of the boundary to the United States, and the United States to pay to Texas \$10,000,000 in 5 per cent. bonds, to run fourteen years. Texas accepted the proposition, Nov. 25, and the boundary was settled. — The joint resolution of March 1, 1845, consenting to the annexation of Texas, stipulated that "new states, of convenient size, not exceeding four in number, in addition to the said state of Texas, and having sufficient population, may hereafter, by the consent of said state, be formed out of the territory thereof." Such consent was given by the

convention of 1866, but was not made use of by congress at the time. It is now practically impossible to obtain any such consent from the state; and its size must remain undiminished until the development of separate interests within it shall produce a division naturally. — CONSTITUTIONS. The first constitution of the state was framed by the convention at Austin, July 4 - Aug. 27, 1845, which on its first day accepted the proposition of annexation made by the United States. The senate was to be chosen for four years, by districts; and the representatives, chosen for two years, were apportioned to the counties according to population. The governor was to be chosen by popular vote, to serve two years, but not to be eligible more than two terms in succession. The capital was to be Austin until 1850, and was then to be fixed by popular vote. Judges of the supreme court were to be appointed for six years, removable on address of two-thirds of each house. The slavery provisions of 1835 were retained; but trial by jury was reserved to slaves accused of crimes of a higher grade than petit larceny. The constitution was ratified by popular vote Oct. 13, and the state was admitted by joint resolution of Dec. 29, 1845. The first legislature met Feb. 16, 1846, and the governor was inaugurated three days after. Popular vote in 1850 fixed the capital at Austin, where it has since remained. — A convention at Austin, Feb. 10 - April 2, 1866, amended the constitution by substituting for the slavery provisions an abolition of slavery. "African slavery, as it heretofore existed, having been terminated within this state by the government of the United States by force of arms, and its re-establishment being prohibited by the amendment to the constitution of the United States." By ordinances the rebel war debt was repudiated, and the legislature was forbidden to assume or pay any part of it; the ordinance of secession was declared null and void, and "the right of secession, heretofore claimed by the state of Texas, distinctly renounced"; and consent was given to the division of the state. The action of the convention was ratified by a light popular vote, June 25. — A reconstruction convention at Austin, June 1 - Aug. 31, Dec. 7, 1868 - Feb. 6, 1869, framed a state constitution, which was ratified by popular vote Nov. 30 - Dec. 3, 1869. Its first section declared its purpose to be "that the heresies of nullification and secession, which have brought the country to grief, may be eliminated from future political discussion"; and to this end it declared the constitution of the United States, and laws and treaties made and to be made in pursuance thereof, to be the supreme law. It abolished slavery and forbade the importation of coolies; gave the right of suffrage to males over twenty-one, on one year's residence; made the number of representatives ninety, and of senators thirty, both to be chosen by districts; extended the term of the governor to four years, of supreme court judges to nine years, and of district judges to eight years. Persons disqualified to hold office by

the 14th amendment were disfranchised. The ordinance of secession and the rebel war debt were declared null and void from the beginning. The state was readmitted to representation by act of March 30, 1870, on the fundamental condition that the constitution should never be so amended as to deprive any class of citizens of the right of suffrage, of the right to hold office, or of school rights, as there secured. — The present constitution was framed by a convention at Austin, Sept. 6 - Nov. 24, 1875, and ratified by popular vote, Feb. 17, 1876. Its principal changes were the substitution for the first section of a declaration that "Texas is a free and independent state, subject only to the constitution of the United States"; the change of numbers to ninety-three in the house and thirty-one in the senate; the reduction of the governor's term to two years; and the provision of separate schools for white and colored children, but with impartial privileges to both. — GOVERNORS. J. P. Henderson, 1846-7; Geo. T. Wood, 1847-9, P. H. Bell, 1849-53; Edward M. Pease, 1853-7; H. G. Runnels, 1857-9; Sam Houston, 1859-61; Francis B. Lubbock, 1861-3 Pendleton Murray, 1863-5; A. J. Hamilton, military governor, 1865-6; J. W. Throckmorton, 1866-7; Edward M. Pease, 1867-70; Edmund J. Davis, 1870-74; Richard Coke, 1874-6; Richard Hubbard, 1876-9; Oram M. Roberts, 1879-83. — POLITICAL HISTORY. Until the close of the rebellion, there was never any real opposition to the democratic party in the state. All the governors, congressmen, United States senators and state officers were democrats. In 1856 the popular vote for the Fillmore electors reached 33 per cent. of the whole; with this exception the democratic popular vote in presidential elections was always during this period over 70 per cent. of the whole. Even in local politics the extent of the state's territory was an insurmountable obstacle to the rise of any real political interest. Even in 1861 there was very little political contest. The opposition to the dominant secession party was merely a variety of secession feeling. It was represented by the governor, Houston, and desired mainly the return of Texas to the position of an independent republic, and fresh acquisition of territory on the side of Mexico. With this design the governor for some time refused to summon a special session of the legislature for the purpose of calling a convention. The confederate states party then issued a private call for a convention, to meet Jan. 28, 1861; the governor yielded, and summoned the legislature for Jan. 21; and that body legitimized the convention, stipulating that any ordinance of secession should be submitted to popular vote. The ordinance of secession was passed, Feb. 1, by a vote of 166 to 7, ratified by a popular vote of 34,794 to 11,235, Feb. 23, and went into effect March 2. The convention, March 20, declared the seat of Gov. Houston vacant. March 23, the constitution of the confederate states was ratified. — Until 1863 there was a steady influx of slaves from other southern states; after July 4, 1863, Texas and Louisiana were

isolated from the rest of the confederacy by the opening of the Mississippi. The close of the rebellion found Texas with an increased black and a decreased white population. June 17, 1865, A. J. Hamilton was appointed military governor, and under his control the convention of 1866 was held and the revised constitution adopted. The "conservative," or democratic, party nominated Gov. Throckmorton, who was elected by 48,631 votes to 12,051 for E. M. Pease, republican. The new legislature, almost entirely democratic, refused to ratify the 14th amendment, and requested the withdrawal of federal troops from the state. In 1867 the reconstruction acts took effect. March 19, Maj. Gen. P. H. Sheridan took command of the department. He almost immediately became dissatisfied with the state government, and removed Gov. Throckmorton July 30, and most of the other state officers Aug. 29, replacing them by republicans. Aug. 29, Sheridan was superseded by Gen. Hancock, who soon came into collision with the new governor, Pease. The latter distrusted the state courts, and wished to have criminals tried by military commission, which Hancock declined to allow. July 28, 1868, Gen. J. J. Reynolds took command of the state. — The provisions of the reconstruction acts for registration and voting had reduced the democratic party to a nullity. In the dominant party there were two factions. The radical republicans, headed by E. J. Davis, wished to maintain the disfranchisement of ex-rebels, and to divide the state. The conservative republicans, headed by the former military governor, Hamilton, opposed both of the leading features of the radical programme. The latter naturally received all the support which the democrats could give them. The convention of 1868-9 was stormy throughout, and at its final adjournment Davis and Hamilton became the opposing candidates for governor. Davis was elected, and the radicals also obtained a plurality in the legislature over both the conservatives and the democrats. — The new legislature authorized the governor, under specified conditions, to declare martial law, and organized a state police force. In 1870, during the sitting of the legislature, martial law was accordingly declared in three counties, and on one of them a penalty of \$50,000 was imposed and collected. The legislature protested against this action; the democrats and conservatives united to oppose it; and in the autumn elections they secured three of the state's four congressmen. In 1873 the republican party of the state was finally overthrown. For governor, Richard Coke had 85,549 votes, and Davis 42,663, and the democratic majorities for other officers were equally heavy. Jan. 5, 1874, the state supreme court declared the law unconstitutional under which the election had been conducted. Gov. Davis therefore refused to give up his office, and appealed to President Grant for federal troops to support him. They were refused, for the reason that the governor had signed the election law, had run for office under it, and should now submit to

the result of the election. He then desisted from opposition. Since that time the state has been overwhelmingly democratic in all elections. In 1880 the vote for governor was 166,303 for Roberts, democrat; 64,372 for Davis, republican; and 33,670 for Hamman, greenbacker. In 1882 there were twenty-nine democrats and two republicans in the state senate, and sixty-eight democrats, seven republicans, six independents, and two greenbackers in the house. One of the state's six congressmen, 1879-83, is a democratic greenbacker. — Among the political leaders of the state have been the following, all democrats unless otherwise specified: Richard Coke, governor 1873-7, United States senator 1877-83; David B. Culberson, congressman 1875-83; Andrew J. Hamilton, congressman 1859-61, military governor in 1862, provisional governor 1865-6; Morgan C. Hamilton (elder brother of the preceding), radical republican United States senator 1870-77; John Hancock, district judge 1851-5, congressman 1872-7; Sam Houston (see his name); David S. Kaufmann, representative and senator 1839-45, congressman 1846-51; S. B. Maxey, confederate major general, and United States senator 1875-87; Roger Q. Mills, congressman 1873-83; John H. Reagan, congressman 1837-61, confederate postmaster general 1861-5, congressman 1875-83; Thos. J. Rusk, secretary of war of the republic 1836-8, chief justice 1838-42, and United States senator 1846-56; Gustave Schleicher, congressman 1875-9; James W. Throckmorton, one of the seven voters against secession in 1861, governor 1866-7, congressman 1875-9; Lewis T. Wigfall, United States senator 1860-61, confederate states senator 1862-5. — See authorities under ANNEXATIONS, III. ALEXANDER JOHNSTON.

THIRD ESTATE. The *Tiers État* in French history. Few political pamphlets made so great a noise as that published by the Abbé Siéyès in 1789, at the moment when France had elected the constituent assembly, and which can be summed up in the following terms: "What is the third estate? Everything. What has it been in the political order up to the present moment? Nothing. What does it ask? To be something." *

* The third edition of this pamphlet has this note: "This work, written during *les Notables* of 1788, was published in the first days of January, 1789."

There are three grave errors in these words. In the France of 1789, the third estate was not everything. In the political order previous to 1789, the third estate, far from being nothing, was daily becoming greater and more powerful. What M. Siéyès and his friends asked for it in 1789 was not that it should become something, but that it should be everything. That the third estate was not everything is proved by the revolution of 1789, which was its victory. Whatever may have been the weaknesses and faults of its opponents, it had to struggle greatly to overcome them, and the struggle was so violent that the third estate was decomposed in the struggle, and paid dearly for the triumph which it won. Let the reader compare to-day the pamphlet of the Abbé Siéyès with the work of Léonce de Lavergne on the provincial assemblies under Louis XIV. (*Assemblées provinciales sous Louis XIV.*), and he will see in the light of contemporary documents, that if the third estate was not everything in 1789, it was much, enough indeed to become free and preponderant without destroying everything that was not the third estate. Excessive pretension arouses intractable resistance. The Abbé Siéyès did not tell all that the third estate was in 1789, nor what its flatterers wished it might be. What his words contain is not the truth of things, but a revolutionary lie. — To take French history in its totality and through all its phases, the third estate was the most active and most decisive element in French civilization. Considered from the social point of view, and in its relations with the various classes which have lived together on French soil, what has been called the third estate progressively extended and raised itself, and first greatly modified and then decidedly rose above the others. If we look from the political point of view, and follow the third estate in its relations with the general government of France, we shall find it at first an ally during six centuries of royalty, laboring incessantly for the ruin of the feudal aristocracy, and putting in its place a single power, a pure monarchy, very near, in principle at least, to absolute monarchy. But as soon as it gained this victory and accomplished this revolution, the third estate sought a new one; it attacked the single power which it had so much contributed to establish, and it undertook to change the pure monarchy into a constitutional one. Under whatever aspect we may consider it, whether we study the progressive formation of French society, or that of its governments, the third estate is the most persistent and most powerful of the forces which presided over French civilization. — This fact is unique in the history of the world. We recognize in the destinies of the principal nations of Asia and of ancient Europe, nearly all the great facts which have agitated that of France; we find the mingling of various races, the conquest of one people by another, profound inequalities between classes, and frequent changes in the forms of government and the extent of power. But nowhere do we see a class appear which, beginning in a very

low estate, weak, despised, almost imperceptible at its origin, rising by a continual movement and laboring without interruption, gaining strength from time to time, acquiring successively all that it lacked, wealth, enlightenment, influence, power; changes the nature of society, the nature of the government, and at last becomes dominant to such a degree that one may venture to call it the country itself. More than once in the history of the world the external phenomena of this or that political society have been the same as these mentioned here, but the similarity is merely apparent. In India, for example, foreign invasions, the passage and settlement of various races on the same soil, were frequently repeated; what was the result? The permanence of castes was not affected thereby; society remained divided into distinct and almost immovable classes—no invasion of one caste by another, no general abolition of the rule of castes by the triumph of one of them. After India take China: there also history shows many conquests similar to those of Europe by the Germans; there also, more than once, barbarous conquerors settled in the midst of a conquered people. What was the result? The conquered almost absorbed the conquerors, and immobility remained the ruling characteristic of the social condition. In western Asia, since the invasion of the Turks, the gulf between the victors and the vanquished could not be bridged over; no class of society, no event of history, had the power to abolish this first effect of the conquest. In Persia similar events have taken place; different races have struggled and mingled; they attained nothing but invincible anarchy, which lasts for centuries without change in the social condition of the country and without a prospect of developing a civilization. — Leaving Asia, we turn to Grecian and Roman Europe. At the first glance, we seem to find some analogy between the progress of these brilliant societies and that of our own; but the analogy is merely apparent; there also we find nothing resembling the third estate and its history. The only fact which has appeared, to ingenious minds, somewhat similar to the struggle of the bourgeoisie of the middle ages against the feudal aristocracy, is the struggle between the plebeians and patricians of Rome; they have been sometimes compared. The comparison is altogether false. The struggle between the plebeians and patricians of Rome commenced in the infancy of the republic; it was not, as in France in the middle ages, the result of a slow, difficult and incomplete development of a class for a long period, very much inferior in power, in wealth and in credit, which gradually grows in extent and prominence, and at last engages in a real struggle with the highest class in the state. Niebuhr has proved, in his "History of Rome," that the struggle of the plebeians against the patricians was a consequence, and, as it were, a prolongation, of the war of conquest, the effort of the aristocracy of the cities conquered by Rome to share in the rights of the conquering aristocracy. The plebeian families

were the principal families of the conquered populations; placed, by defeat, in an inferior position, they were none the less aristocratic families, formerly powerful in their city, surrounded by clients, and capable, from the first moment, of disputing power with their conquerors. There is nothing in this like that slow, obscure, painful labor of the modern bourgeoisie emancipating itself with great labor from the bonds of servitude, or a condition bordering on servitude, and employing centuries, not to dispute political power, but to win a civil existence. The more we examine the more we see that the French third estate is a new fact in the history of the world, and one which belongs exclusively to the civilization of modern Europe. — Not only is this fact new, but it has an altogether special interest for France. Nowhere has the bourgeoisie, the third estate, had a destiny so great, so fruitful, as that which fell to it in France. There were communes in all Europe, in Italy, in Spain, in Germany, in England, just as in France. Not only were these communes everywhere to be found, but the communes of France were not those which, as communes, played the greatest rôle in history under that designation and in the middle ages. The Italian communes gave birth to glorious republics; the German communes became free sovereign cities, which have had their own history, and exercised much influence on the general history of Germany. The communes of England allied themselves to a part of the feudal aristocracy, and formed, together with it, the ruling house in the British parliament; and in this way played, at an early period, a powerful part in the history of their country. The French communes, in their period of activity under this name, were very far from rising through such political importance to this historical rank. And still it is in France that the population, the communes, the bourgeoisie, were developed most completely, most efficiently, and ended by acquiring, in general society, the most decided preponderance. There have been communes in all Europe; there was really a third estate only in France; and the revolution of 1789, surely the greatest of European revolutions, was the work of the third estate. — Since the outbreak and through all the vicissitudes, liberal or illiberal, of that mighty event, it is a commonplace unceasingly repeated, that there are no longer any classes in French society, but simply a nation of thirty-seven millions of persons. If it is meant by this that there are no longer privileges in France, that is to say, special laws or particular rights for certain families, certain estates, or certain occupations, and that legislation is the same, and movement perfectly free for all through all the degrees of the social scale, it is true; unity of legislation and similarity of rights are the essential and characteristic feature of civil society in France; an immense and excellent fact, new in the history of human societies. But under the rule of this fact, within this national unity and civil equality, there exist evident diversities, nu-

merous and considerable inequalities, which the unity of legislation and the similarity of civil rights neither prevent nor destroy. Among owners of real or movable property, land or capital, there are rich and poor; there are large, medium and small landowners. The great landowners may be less numerous and less wealthy, the medium and small may be more numerous and more powerful than formerly; that does not prevent the difference from being real, and great enough to create, in the social order, conditions profoundly different and unequal. In the professions called liberal, which live by their science and intelligence; among lawyers, physicians, scholars and literary men of every kind; some rise to the first rank, attract business and success, acquire fame, wealth and influence; others satisfy the wants of their families and the demands of their position with difficulty; others yet vegetate obscurely in distress, almost without employment. In other walks of life, in which labor is chiefly material and manual, there are also varieties and inequalities of condition: some, by intelligence and good conduct, accumulate capital and enter into paths of ease and advancement; others, either unintelligent or indolent or disorderly, remain in the narrow and precarious conditions of existence depending on wages alone. In all the extent of French civil society, in the midst of labor as well as property, the diversity and inequality of conditions appear, or continue, and co-exist with the unity of legislation and the similarity of rights. — How could it be otherwise? Let all human societies be examined, in all places and times: whatever be the variety of their origin, of their organization, of their government, of their extent, of their duration, of the kinds or degrees of their civilization, three types of social condition will be found in them all, always the same in essence: 1, men living from the income of their landed or movable property, from land or capital, without seeking to increase it by their own assiduous labor; 2, men occupied in working and increasing by their own assiduous labor, real or personal property, land or capital, which they possess; 3, men living by their daily labor, without income from land or capital. And these diversities, these inequalities in the social condition of men, are not accidental facts, or peculiar to a given age or country; they are universal facts produced naturally in every human society, under circumstances and under laws differing most widely from one another. — These facts exist in our time and among the French, as they have in other times and places. Modern society in France includes, and will not cease to include, social situations profoundly different and unequal, whether they be termed classes or not. What redounds to its honor is this, that privilege and immobility are no longer attached to this diversity of conditions; that there are no longer, among Frenchmen, special advantages legally granted to some, and inaccessible to others; that all paths to advancement are open and free to all; that personal merit and labor have, in the career

of men, an infinitely greater part than was theirs formerly. The third estate of the old régime exists no longer; it has disappeared in its victory over privilege and absolute power; its heirs in modern society are the *middle classes*, as they are called to-day; but these classes, inheriting the conquests of the third estate, hold them on new conditions as natural as they are imperative. To protect their own interest, as well as to perform their public duty, they must be both conservative and liberal; they must, on the one hand, attract and rally to their standard the remnants of the upper social circles which have survived the fall of the old régime, and, on the other, accept fully the upward movement which the whole people are taking. Nothing could be more natural than that the third estate of the ancient régime in its intercourse with the aristocratic classes was, and long remained, uneasy, suspicious, jealous, even envious; it had rights to obtain and conquests to make; to-day the conquests are made, the rights are recognized, proclaimed, exercised; the middle classes have no longer a motive for disquiet or envy; they may rely on their dignity and their power. With respect to the lower classes, their situation is not less happy; no barrier separates them from the higher; who can say where the middle classes begin, and where they end? They were formed in the name of the principles of common rights and general liberty; they are recruited, and draw new forces continually from the sources whence they came. To maintain the common rights and liberty of all, against the retrograde follies of absolute power and privilege, on the one hand, and, on the other, against the mad pretensions of leveling and anarchy, is now the two-fold mission of the middle classes, and is for them the sure means of retaining preponderance in the state, in the name of the interests of all, of which they are the truest and most efficient representatives. (Compare *BOURGEOISE, SOCIALISM.*)

GUIZOT.

TIE. (See *PARLIAMENTARY LAW.*)

TILDEN, Samuel Jones, was born in New Lebanon, Columbia county, N. Y., Feb. 9, 1814. He spent a year at Yale, was graduated at New York university in 1838, was admitted to the bar in 1841, and in 1845 was elected to the assembly. There he took sides with the radical wing of the democratic party, the barnburners (see that title); but when they were forced into national politics as the free-soil party, he retired to the practice of the law. He was little heard of in politics until after the rebellion was suppressed, when he became chairman of the democratic state committee. In this position he came into flat antagonism with the Tweed ring of New York city in 1869-70, and took a leading part in the ring's overthrow in 1871. In 1874 he was elected governor by the democrats, and in this position attacked and overthrew the canal ring of western New York in 1875. He had now become so widely and favorably known that

in 1876 his party nominated him for president. It was finally decided (see *ELECTORAL COMMISSION*) that he had received but 184 out of 369 electoral votes, and was not elected. His supporters have never accepted this decision as morally binding, and have always insisted, that, if Hayes was president *de facto*, Tilden was president *de jure*; that the commission's conclusion was reached by so applying legal rules as to exclude necessary testimony; and that the action of the returning boards was so confessedly corrupt that the commission did not dare to examine it. Some one, during the pendency of the case, seems to have concluded that the returning boards were so corrupt that there would be no moral wrong in bribing them to act correctly; and the congressional committee, the so-called "Potter committee," which afterward investigated the election, discovered a great mass of cipher telegrams, which, when deciphered, proved to be negotiations for the purchase of the returning boards. Mr. Tilden denied all knowledge of any such negotiations; but, though none of the telegrams were traced directly to him, all of them were fathered upon persons so nearly connected with him, by marriage or close political confidence, that the whole affair has proved an insuperable barrier to Mr. Tilden's further career. To the standing democratic charge that he had been defrauded of his election, it enabled the republicans to reply that he had only failed in the effort to defraud Hayes of his election. Both parties were thus content to argue from their own premises; and neither ventured to bring the counter-charges to a direct issue in 1880 by renominating the candidates of 1876. See *Cook's Life of Tilden*; *Proceedings of the Electoral Commission*; 125 *North American Review*, 1, 193 (Black's and Stoughton's articles); 27 *Nation*, 217, 250.

ALEXANDER JOHNSTON.

TIMES-SPIRIT, The. (See *ZEITGEIST.*)

TOMPKINS, Daniel D., vice-president of the United States 1817-25, was born at Searsdale, N. Y., June 21, 1774, and died on Staten Island, N. Y., June 11, 1825. He was graduated at Columbia in 1795, was admitted to the bar in 1797, was state supreme court justice 1804-7, and democratic governor of the state 1807-17. His service as governor was marked by great sacrifices of his personal credit in maintaining the federal government during the war of 1812. He thus became so deeply involved in debt that the latter part of his life was passed most unhappily. See 1, 2 *Hammond's Political History of New York* (index); *Jenkins' Lives of the Governors of New York*, 159.

A. J.

TON-KIN. (See *TONQUIN.*)

TONQUIN (*TONG-KING* or *TUN-KIN*). This northern province of the empire of Annam, in the Indo-Chinese peninsula, occupying the lower basin of the Hong-kiang (Red river) derives its geo-

graphical and commercial importance from its easy access into the rich Chinese province of Yunnan. The Hong-kiang is practically a navigable stream, and the three southern provinces of China, Kwang-tung, Kwang-si and Yunnan border on Tonquin, which has a coast sufficiently accessible. Added to these advantages, its salubrity, and its resources of grain, timber and the precious metals, make it a most desirable acquisition for a European power anxious to extend its possessions in the east, or to magnify abroad prestige lost at home. The most valuable part of Tonquin is the delta near the sea formed by the four mouths of the Red river, near or in which are situated the chief towns of the province. These are Ha-noi, the capital, Nin-hai, Hai-phong, Bac-nin, Nam-bin and Min-bin. The climate is much healthier than in the two lower provinces of Annam, Cochin China or Saigon, the thermometer in December falling to 41°. The season from April to August is intensely hot, and the heavy rains are accompanied by storms and typhoons, when the Red river overflows its banks, and spreads a fertilizing flood over the country, which afterward produces heavy crops of rice and other cereals. The delta is intersected by a multitude of watercourses both natural and artificial. The chief exports are rice, sugar, cotton, spices and varied tropical products, but the manufactures are restricted mainly to gongs and articles inlaid with mother-of-pearl. In religion, the mass of the natives are devotees to a form of Buddhism much corrupted by local superstitions; the literati are Confucianists. Their language, reduced to writing by the French missionaries, is a dialect of archaic Chinese, purely monosyllabic, and with a very limited range of articulation, depending for its variety upon tones, which modify and multiply the meanings of each vocable. In ethnology, the Tonquinese are descendants of tribes of southern China, that are mentioned in the ancient chronicles as people with the big toe noticeably large. They have a well-marked physiognomy and anatomical structure, in which personal beauty or grace of movement is not conspicuous. Until about the tenth century of our era, Tonquin (Chinese, *tong*, east, and *king*, capital, eastern capital; the name of the chief city, in distinction from Si-king, or western capital of Cochin China) was ruled by princes or governors of Chinese origin, but since 960 A. D. the country has been practically independent, though ever acknowledging China as suzerain, and regularly paying tribute. Tonquin, until near the close of the eighteenth century, was the dominant state of the Annamese empire, but since that time, it has formed one of its three great political divisions, and the dynasty founded in 1803 A. D. by Gya-long by French assistance reigns still at Hué, in Cochin China, the central state. — Christianity was first introduced by refugees from Japan as early as 1615, and in 1624 the French Jesuit priests began proselyting labors, which, with assistance later from Spanish Dominicans and French Lazarists, have, in spite

of numerous bloody persecutions resulted in a roll of converts numbering, in 1854, 500,000. Severe persecutions since that time have greatly reduced these figures. The murder of several French priests and a Spanish bishop led to the Franco-Spanish intervention of 1858. During the century of intercourse with France, these various "revolts" of the Annamese and subsequent negotiations have usually resulted in the gain of fresh slices of land and new commercial privileges. France sends her Jesuits, or secular priests, first, and the brandy and "civilization" follow at the cannon's mouth. The treaty of 1874 gained her the six southern provinces of Cochin China, opened the port of Ha-noi, in Tonquin, to foreign trade, and guaranteed free transit from the sea to Yunnan. As usual with European powers in dealing with Asiatic nations, the French compelled the acceptance of their tariff; and custom house officers were duly installed at Haiphong and Ha-noi (called also Ke-cho, or the market). Owing to the unsettled state of the interior, caused by the ravages of the "Black Flags"—whether allies, invaders, or paid mercenaries of Annam, does not clearly appear—the Red river was not opened even in 1882, seven years after the treaty, and even the French settlement at Ha-noi was in danger. As a precautionary measure, the Saigon authorities dispatched re-enforcements to their nationals at the capital of Tonquin. The local mandarins, interpreting this as a menace, closed the Ha-noi citadel, and concentrated their forces. The French, taking alarm, resolved to precipitate the crisis, and on April 23, 1882, began to bombard the citadel (which, nearly a hundred years before, had been laid out by French engineers), and carried it on the 26th by assault. They then proceeded to administer the custom house for the benefit of the French treasury. Meanwhile China had not been an indifferent spectator of French aggression carried on under cover of protecting her citizens. When the treaty of 1874 was communicated to China and the other powers, the government of Peking protested against its provisions as an invasion of her suzerain rights, and formally gave notice that Annam was still her vassal, and whatever affected her international relations was of deep concern to the Chinese government. Since her reconquest of Ili, or Chinese Turkestan, which secured its formal retrocession from Russia, China has reaffirmed and in some cases enforced her ancient claim of suzerainty upon her vassals. That over Corea and Riu Kiu as against Japan, and perhaps the United States, in the case of Corea, is still unsettled. But her interest in Annam, both as neighbor and tributary, as manifested by military preparations, was so great, that the French evacuated the citadel at Ha-noi, though they fortified their settlement. In making a sortie May 24, 1883, the French commander, Riviere, and a number of his men were killed. The government at Paris at once resolved that France would "revenge her glorious children," and on May 26 declared war against China's

vassal. (See also *RIV KIU, and COCHIN CHINA.*) — LITERATURE. WM. ELLIOT GRIFFIS.

TRANSPORTATION, Means of. 1. History.

The Romans had an admirable system of roads, and a highway legislation not unlike that now prevailing in France. But in the middle ages both the roads and the law were suffered to decay. Such ways as there were formed part of the property through which they ran; and when the ownership passed into the hands of a feudal lord, he obtained property rights over the road. But as the central government grew in power in various states of Europe, from the sixteenth to the eighteenth century, it also laid claims to rights over the roads; first in the form of a right to levy tolls; much later in undertaking to build roads, and maintain them under its own control. Throughout the continent the road taxes were oppressive and the highways extremely bad; in this last respect there was some slight improvement in the eighteenth century. A thorough reform was instituted in France by the revolutionary legislation, culminating in the decree of 1811, and further systematized in 1836, providing for public roads free from tolls, and supported by the nation, department or commune, according to the sphere of their importance. Similar legislation was carried out during the same period in other parts of the continent. In England the course of events had been different. The roads had always been recognized as the king's highways. They were maintained by the parishes under parliamentary legislation. (For details see "Edinburgh Review," April, 1864.) The experiment of tolls was cautiously tried; turnpike trusts were introduced at the beginning of the last century with tolerable success. The important acts of parliament in the present century have been those of 1835 and 1862; by the latter the care of roads has been in many cases taken out of the hands of individual parishes and made the subject of the united action of much larger districts. The early American system was modeled upon that of England—especially so in New England; in other parts of the country the county controlled the roads, even when they were maintained by separate communities. Turnpikes were first organized about the end of the last century. They had much more the character of private enterprises than in England, although public bodies often subscribed to the stock. This system was developed throughout the north; south of the Potomac it took no root. (For a variety of details see American State Papers, xx.,

866-915.) National appropriations for roads date from the beginning of the century. The chief work of this kind was the Cumberland road; for the expenditures on this and other projects see Am. State Papers, xxi., and House Committee Report, 1835-6, III., 850. The crisis of 1837 put a stop to most of this work; and the subsequent development of railways caused it to be forgotten. — For a detailed history of canals and railways, see the articles under those headings. In a system of internal navigation—canals, combined with river improvements—France took the lead. The development of the canal system in England and America was almost simultaneous with that of turnpike roads. In England the most important canals were built toward the close of the last century; they were the result of private enterprise far more than were the turnpikes. The period of canal building in America was a generation later, the first third of the present century. In railroad building England, of course, took the lead, followed by Belgium and Germany. Most of the continental governments would have preferred to develop their railways as state concerns, after the analogy of their roads; but from the financial burdens which this would involve they shrank either at the outset (Prussia), or before the system was carried through (Austria and many others). Only in France was the analogy tolerably well maintained, at least as regards the matter of railroad construction. England and America were of course hampered by no such precedents. — We have thus far spoken of means of transportation only in the narrower sense of ways or roads over which the goods must pass. The transportation agencies yet remain to be considered. As long as these were but the individual cart and ship, their consideration might be neglected; but in their modern organization as express company, steamship company, postoffice, telegraph company, or, above all, railroad company in its relation as carrier, they form the all-important part of our subject. Most of these have been treated under separate headings, so that we need not enter into their origin and history. The railway appears under a double aspect as road and as agency. Many mistakes of public policy were at first made by treating it after the analogy of a highway pure and simple. It may be considered either as a road operated solely by a particular company, or as a company having sole right to operate a particular road. The same distinction may be made with the telegraph; but it is in that case obviously of less importance. — 2. *Economic Results of Improvement in means of Transportation.* The direct results have been at once increase in rapidity and decrease in expense. In the history of each separate means of transportation these two changes have gone hand in hand. Take, in the matter of roads, the French statistics, which are in more available form than those of other countries. If we compare the returns of the swiftest public means of conveyance on the main French roads in 1782, 1822 and 1848, respectively, we find

that the average speed had more than doubled in the first interval, and had increased by one-third in the second interval; while the prices per kilometre were, at the respective dates, 4 cts., $3\frac{1}{2}$ cts., $3\frac{1}{4}$ cts. of our money. And this reduction is the more remarkable because of the increase of general prices going on at the same time. Even where the tolls seemed to increase, as with the English turnpike system, the amount saved by diminished wear and tear, increased loads, etc., really produced the same result of lowering the cost of carriage. So in the canal system of different countries; as the facilities were improved, not merely was there a diminution of the traction expenses on that ground, but there was also usually a gradual abandonment of the attempt to make the tolls pay interest on what the canals had originally cost. In the case of the transportation agencies, the facts are still more striking. To take an instance from the history of shipping: By the study of the prevailing winds, systematized by Maury about the middle of this century, the speed of sailing vessels on many frequented routes was nearly doubled, and the expense of carriage thereby greatly diminished. Fifty years of constant improvement in postal facilities have been marked by a reduction of postal charges to less than one-fifth what they were at the beginning. There has been the same kind of improvement and reduction in the steamship and railway service. — When it comes to the substitution of one means of transportation for another—steam instead of sail, railways instead of waterways—the progress is less direct. We generally find in the first instance increased rapidly secured at an advanced price; then the price begins to diminish, and ultimately may fall below that of the more primitive means of conveyance. When ocean steamships were first introduced, it was not supposed that they could ever compete with sail for the carriage of ordinary freight, even on the most frequented routes. The first indications of real competition being felt in this respect were the unsuccessful efforts to employ sailing vessels with the auxiliary screw. Then came the gradual withdrawal of sail from the business on shorter routes with the most regular communication, to ply on the longer and less frequented ones. But each improvement in ocean steamers gives an additional advantage in competition and diminution in the cost of carriage. The substitution of the screw for the side-wheel, the use of compound engines, are sources of unmixed saving; the enormous increase in the size of the steamers, even when they are run in a manner that seems to involve extravagant waste of coal, increases the net carrying capacity yet more; so that the amount of coal burned per ton carried is under favorable circumstances least on the new boats. The excess of freight rates by steamers, as compared with those by sail, varies from 100 per cent. down to almost nothing: essentially the same relation as subsists between railroads and directly competing canals. — Railroads, soon after their first introduction,

proved themselves more than a match for any competition from wagon roads; and things have now gone on so far, that, according to the census returns of 1880, the five to ten mills which it generally costs the farmer to haul a *bushel* of wheat a mile by wagon, is a higher rate than he has to pay per *ton* per mile by railroad. Or, to put the same results in another way: in most of the wheat regions it would not pay to grow grain which had to be hauled twenty miles by wagon; in some regions the limit of wagon hauling is as low as ten miles. But the competition between railroads and canals has taken shape more slowly. It was at first thought to be impossible on any terms; and great was the indignation of the New York legislature when the Central railroad first attempted it as against the Erie canal. Then came the gradual abandonment of the attempt to make canals pay interest on their construction expense; and this seemed constantly to keep them beyond the reach of railway competition on those terms. But the successive railroad improvements, both in engineering and in management, culminating in the wonderful substitution of steel rails for iron, and the enormously increased loads thus rendered possible, have produced such astonishing results in the past fifteen years, that no one would venture to predict what might come in fifteen years more. Since 1870, along with the great improvements in efficiency of service, freight rates have fallen as much as 50 per cent., and the end of the movement does not seem to be yet reached. — The indirect results of these changes are so far-reaching that we can do little more than enumerate them. The most immediate effect of cheapened transportation is to increase the distance at which it is possible for producer and consumer to deal with one another. To the producer it offers a wider market, and to the consumer more varied sources of supply. Which party obtains the chief benefit of the change is determined by the special conditions of each particular case. On the whole, its operation is more uniformly beneficial to the consumers, as a class, because its temporary advantage for the producers so often leads to over-production. But, in any event, it results in doing away with a large part of the variations in price between different localities. The price is made, not in a local market, but in the world's markets. In the case of less bulky manufactured products, these differences almost disappear, except as they are due to artificial obstructions. In agricultural products, they are on a vastly smaller scale than ever before. And not the least important point where this leveling effect is felt, is in the rent of agricultural land in England, and similarly organized countries. Nearness to market was not long ago a main advantage of high-priced land; now it has to contend on tolerably equal terms with competing land five thousand miles away. — To comprehend the full meaning of this change, we have only to look at books on industrial organization, published in the early part of this century. The limits from which a

large city could draw its various supplies were closely defined by distance. Fresh vegetables and fruits could only be produced for it within the narrowest circle; and successive circles of ground were almost necessarily devoted to different products, according to their different availability for transportation. Now, any improvement by which products could be profitably transported to a greater distance, led to a redistribution. It was no longer location which determined the business to be carried on in a particular spot, but natural advantages more or less independent of location. The market garden might be placed at a greater distance from the city, if by so doing a more fertile spot was secured. The factory might be located far away from the raw material, if other business inducements made it desirable. In short, the whole system of division of labor advanced to a new stage. Not only was each man employed for what he could do best, but he was given a chance to work in the place where he could do it best. And this change made itself strongly felt in international relations. Even the barriers raised by high protective tariffs hardly avail to counteract the effect of reduced freights. It is perfectly possible that a country with a high tariff to-day should be less isolated by this than it would have been a few years ago by the mere cost of transportation with no tariff at all. It is the railroad and the steamship that determine where a new business shall be developed, quite as often as the government policy. The grant of special rates and privileges to shippers is nowadays the most efficient kind of protection. It is this quickening and cheapening of transportation that have given such stimulus in the present day to the growth of large cities. It enables them to draw cheap food from a far larger territory, and it causes business to locate where the widest business connection is to be had, rather than where the goods or raw materials are most easily procured. And the perfection of the means of communication, the postoffice and the telegraph, intensifies the same result. With this growth of city life, and partly in consequence of it, comes the increased gain of large producers at the expense of small producers. With it comes organized speculation, and its attendant results, good and evil; with it comes the development of enormous wealth in the hands of a few individuals, not to speak of the less distinctively economic results which attend the life of a great city. — 3. *State Control.* It is just because these indirect results are so far-reaching that the question of government control of transportation agencies has attained its present importance. In the earlier systems, all this settled itself. The parishes, towns or counties took up the matter of roads, because it had become a pressing want, and there was no other power to supply it. If a private company was ready to build a turnpike, its help was welcome, and there was no fear of its becoming too great a power in the community. Again, in the very different case of the postoffice, the matter was taken up by the state, partly as a

source of revenue, partly as a means of making its presence and authority felt; not on broader grounds of public policy, as a protection to the citizen against the imposition of less responsible agencies. The navigation act of 1651, whatever its defects, has the merit of being the first systematic attempt to control a branch of transportation on grounds of public policy, looking toward its indirect economic and social effects. For some time it remained almost the only one; the systems of roads and canals formed but local or partial exceptions. But, about the year 1840, the simultaneous development of the postal service, the telegraph and the railroad, made it necessary for the state to assume some definite attitude upon the question of management or control of these agencies. The postoffice presented the fewest difficulties. The machinery was in the hands of the government, the people were accustomed to its working; it was only in a subordinate section of the business, the parcels post, that there was really any doubt, and there it was settled on grounds of convenience, or left to settle itself for the time being with the liability of change afterward. The matter was not so clear in the case of the telegraph; state management would require new expenditure, and a new organization, involving many officials. But it was decided affirmatively throughout the continent of Europe; and England, after trying private telegraphy for a long time, changed to a system of government ownership in 1869; so that the United States has for fifteen years stood almost alone in this matter. It was the question of state railroads that involved the most doubt; and it is the harder to trace its exact history from the fact that so many states had no thoroughly fixed policy on the subject. The general course of events in continental Europe may be summarized as follows: In the first instance, the governments were in favor of state railroads, and proposed to develop such a system; afterward they felt the financial difficulties of the undertaking, and turned their attention to the encouragement of private enterprise in this field by various forms of subsidy; then, thirdly, as the railroad power became established, they found it no longer a question of supporting, but of controlling, it; and, finally, they came to look upon state railroads as a source of financial strength, rather than weakness, and to return to their original plan of state ownership. In the United States we have felt only the second and third of these periods; and in neither case has our general policy been so fixed as in Europe. We had a time of indiscriminate encouragement of railroads by land grants and municipal subscription; we are having a time of indiscriminate attempts at control by special legislation in various states. England alone has been free from these strong changes of public policy; whatever encouragement or control there has been was confined within the narrowest limits. — Any attempt to do justice to the arguments on either side is quite beyond the scope of an article like this; and we conclude

this part of the subject by quoting from two writers, representing quite different views, their opinions as to when state ownership of transportation agencies is desirable. —The first is from Ad. Wagner, of Berlin, a decided advocate of state management; he considers that there are strong reasons for it, 1, when the efficiency of the service requires wide and uniform extension over the whole country and international communications (postoffice, telegraph; somewhat less so in the case of railroads); 2, when the service involves anything like a monopoly, legal or actual (railroads, telegraphs); 3, when it requires constant repetition of the same services, according to fixed schedules, in such numbers as to involve the existence of a large body of officials; 4, when the cost may be lessened by combining a variety of services at small stations (letter and parcels post, railroad stations and telegraph offices); 5, when the service in private management can only be secured by subsidies on a large scale; 6, when it is necessary on grounds of public policy that the service should inure uniformly to the benefit of the whole people. These principles, he concludes, enable us to speak decisively in favor of state management in the case of letter post and telegraph, more reservedly in the case of parcels post and railways; in the matter of navigation they justify it only in exceptional cases. On the other hand, W. Stanley Jevons, writing an impartial opinion, but as an Englishman, averse to great extension of government activity, states the conditions favorable to state management as follows ("Meth. of Soc. Reform," p. 279): "1, when numberless wide-spread operations can only be efficiently connected, united and co-ordinated in a single, all-extensive government system; 2, when the operations possess an invariable routine-like character; 3, when they are performed under the public eye or for the service of individuals who will immediately detect or expose any failure or laxity; 4, where there is but little capital expenditure, so that each year's revenue and expense account shall represent, with sufficient accuracy, the real commercial conditions of the department." Of these principles the fourth is one of the highest practical importance, which must be considered in discussing any schemes of state management; and one which under a government like that of the United States at present, must generally be decisive. — 4. *Principles of Management: Rates.* Transportation agencies in private hands will of course be managed on business principles, that is, they will charge all the traffic will bear. It seems at first sight as if non-competitive points were thus left entirely at the mercy of railroad managers. Practically, however, this danger is checked by two important limitations. In the first place, the competition of different localities in the same market is such that if one railroad charges rates arbitrarily higher than its competitors, it renders it impossible for the localities along its route to ship goods at a profit, and will quickly destroy its own traffic; secondly, ex-

orbitant rates may induce the building of a parallel railroad; and however ineffective such roads generally prove after they are built, the prospect of one in the future has the tendency to keep rates down. Moreover—though this is but an indirect consideration—such local rates are almost entirely paid out of rent, and show their chief effect in the value of real estate. The dangerous kind of discrimination, and one which can not be too strongly reprehended, is that which makes special rates for different individuals, doing the same kind of business in nearly the same place. Such discrimination furnishes the most effective argument in favor of some kind of state control. At points where a railroad competes with a water route or with another railroad, through rates may fall as low as the actual cost of hauling, apart from any fixed charges, or, in the case of a war with rates, may temporarily go even lower. But wars of rates do not give shippers the advantage which might seem likely to accrue. They lead to what has been described as the worst form of discrimination, that between different individuals in the same place. They cripple the efficiency of the service, and the possibility of healthy competition. Take as an extreme case of a similar effect, the routes from California to Nevada, where the railways came in competition with wagon roads. They lowered their rates until the teams were driven out of the service, and then raised them to a monopoly figure. The ordinary railroad war does not go so far as this, but it works in the same direction. The history of the different attempts to control this matter by enforced publicity of management, direct provisions concerning, or limitations of dividends, with their varying success, does not come within the scope of this article. The principles here applied to railroads of course hold good of other transportation agencies. — But in the case of state management, the rates need not be thus arranged on purely business principles. The state has the choice of four systems: 1, gratuitous service; 2, payment of expenses, partial or complete; 3, business profits; 4, monopoly rates as a source of special revenue. The fourth of these was the prevailing view up to the end of the last century; it has since been abandoned. The first is now mainly exemplified in the case of roads, and some few waterways, where the want and use are so general, and the expense comparatively so slight, that there is no injustice in taxing the community to defray the cost of the service. Cases may also arise where the collection of tolls produces so slight a revenue that the advantage of free service to the community quite outweighs it. Most of the free canal arguments come under this head. But for the great majority of instances the choice is between the second and third principles; it is a question of tolls vs. profits. Canals and letter post have been managed under the former principle; the telegraph stands on the border line; while parcels post, railroads and shipping, in so far as they have been owned by the state, have been mainly managed as business

enterprises. The theoretical principle would seem to be, that such agencies under state management should just pay expenses. If they do more than this, it may constitute an especially undesirable tax. But the whole question is so complicated with the problem of remunerating invested capital on the one hand, and of freeing the community from the exactions of individuals on the other, that we can make little use of this principle. Practically it may be said that the state undertakes certain services, in transportation as well as elsewhere, in which it would be impossible to obtain a business profit at any rates (thus postal service on unfrequented routes); and it undertakes others where the main charges are so fixed that additional use of the facilities is all but unattended with additional cost (canals; letter carriage). In both of these cases the principle of tolls has great advantages. On the other hand, there are certain services which the government performs in more or less direct competition with private individuals, as the parcels post or the railways of Belgium and Germany; there are yet others whose acquisition has loaded the state with a special bonded debt, or other fixed obligations. It is doubtful policy for the state to assume ownership on these conditions, especially the latter. But if matters are in this condition the attempt to obtain profits from the business seems to be generally the wisest course, and often the only admissible one. — E. Sax, *Verkehrsmittel*; Wagner, *Finanzwissenschaft*; Foville, *La Transformation des Moyens de Transport*.

ARTHUR T. HADLEY.

TREASON (IN U. S. HISTORY). Under the confederation there was no such legal offense as treason against the United States, since there was no such thing as allegiance to the United States. (See ALLEGIANCE, I.) Treason and allegiance had reference only to the state. A remnant of this feeling made the definition of treason, when it was first introduced into the convention of 1787, Aug. 6, consist in "levying war against the United States, or any of them, and in adhering to the enemies of the United States, or any of them." The clause was fully debated, Aug. 20, and changed to its present form. (See CONSTITUTION, Art. III., § 3.) But all the debaters professed themselves dissatisfied with it. Gouverneur Morris acutely pointed out the fact, that "in case of a contest between the United States and a particular state, the people of the latter must be traitors to one or the other authority." But a motion to give congress the "sole" power to define the punishment of treason was lost, five states voting for it, and six against it. Seldom has the omission of a single word had more momentous effects. In this case it left to congress and the states, as almost all the speakers acknowledged, a concurrent power to punish for treason; and so it enabled a seceding state to offer to its minority a choice between treason against the state and treason against the United States. Had the vote been six states to five for the insertion of the word, the state sov-

ereignty and secession arguments would hardly have been worth the trouble of refuting. — Had the constitution given to congress the "sole" power to define the punishment of treason, the states would have been remitted, for protection against such domestic disturbances as Dorr's rebellion (see that title), to a simple law against seditious assemblages; and the protection would have been efficient. As it is, most of the states have inserted in their constitutions a provision that "treason against the state of — shall consist only in levying war, etc.," following the constitution of the United States. These provisions have always been practically *in nubibus*: there has hardly been a case of indictment for treason against a state, excepting the action of Rhode Island in the Dorr case, and that came to nothing. But they fostered the idea of allegiance to a state, and thus carried into secession the multitude who disliked secession, but dreaded to commit treason against the state. — At the end of the rebellion there were no prosecutions for treason. It has been roundly asserted that the reason for this was the consciousness of the government of the United States that it had been illegally suppressing a misnamed rebellion, that treason could only hold against a state, and that Jefferson Davis and his associates had committed no crime and engaged in no treason, in any sense known to the constitution or its framers. Those who so argue forget that Mr. Davis, at least, was no prisoner of war; that his surrender was unconditional and in a territory under military occupation; and that, if there had been any such impotent spite against him as this theory assigns to the government, a drum head court martial and a file of men would quickly have made it patent, treason or no treason. The fact seems to be that his escape was due entirely to lack of spite. The collapse of the rebellion had been too complete to allow of spite. The nation stood aghast as it realized the thoroughness of its work; and its controlling impulse was to efface as rapidly as possible all evidences of the conflict. Treason trials would have been a festering sore in the body politic, and they were avoided. — There can be no doubt that this policy was just, as well as wise. For seventy years before 1860, men who did not realize the full force of what they said had been boasting of the "voluntary" nature of the union, in contrast with the effete despotisms of Europe. (See NATION.) The nation's long *laches* in asserting its paramount authority in the last resort gave Jefferson Davis and his associates an exemption from the animus of treason which can never be claimed again. All men have now had fair warning, as Jefferson Davis had not in 1860, that the Union is not "voluntary," so long as the nation is determined to maintain it; and that any attempt to break it up is treason to the United States, even if it is obedience to a state. It might be that a future rebellion would be suppressed with a similar generous forbearance from ultimate vengeance; but the chance is an uncommonly small one. — The act of April 30,

1790, made death the penalty for treason, as defined in the constitution, on conviction by "confession in open court, or on the testimony of two witnesses to the same overt act." It also made fine and imprisonment the punishment of misprision of treason, the concealment of it. For seventy years this act was sufficient. There were few trials under it, the principal one being that of Burr (see his name); and these were practically failures. In 1861 an act was passed making conspiracy to oppose the laws or seize the property of the United States a high crime, but this was punishable only by fine and imprisonment. The act of July 17, 1862, provided, that, if any person should thereafter commit the crime of treason against the United States, his slaves, if any, should be declared free, and he himself should suffer death, or fine and imprisonment, at the discretion of the court; that any one convicted should forever be incapable of holding office under the United States; and that it should be the duty of the president to seize and apply to the use of the army the property of six classes of leaders of the rebellion, who seem to have been considered *prima facie* guilty of treason. There were, finally, no southern prosecutions under it. Davis and others were indicted, but never brought to trial. The few prosecutions were in northern states. — See Story's *Commentaries*, §§ 1290, 1790; *ib.*, § 1795 (for law cases); Whiting's *War Powers* (10th ed.), 95; the state sovereignty view of treason is in Bledsoe's *Is Jefferson Davis a Traitor?* and "Centz" 's *Republic of Republics*, 413 foll., (see also index under *Treason*); *Indianapolis Treason Trials*; for the indictment against Davis see Schuckers' *Life of Chase*, 534; the act of April 30, 1790, is in 1 *Stat. at Large*, 112; the act of July 17, 1862, is in 12 *Stat. at Large*, 589.

ALEXANDER JOHNSTON.

TREASURY DEPARTMENT. This is the most extensive and complex of all the departments of the United States government. Established by act of Sept. 2, 1789 (1 *Stat. at Large*, p. 65), the department of the treasury has grown from a little office with a few clerks, to a vast establishment employing no less than 3,400 officers at Washington, with numerous bureaus, and with branches, fiscal, marine and miscellaneous, all over the country. The secretary of the treasury is head of the department, and is one of the seven cabinet officers (salary \$8,000). The law requires that he shall be a person not interested in the business of trade or commerce. He is required to digest and prepare plans for the revenue and public credit; to prescribe forms of keeping public accounts; to make reports annually, and specially, when called upon, to congress, as to all matters pertaining to his office; to superintend the collection of the revenue; to grant all warrants for moneys issued from the treasury in pursuance of appropriations made by law; and to perform all such duties connected with the finances of the United States as are required by law. The multi-

farious business transacted under control of the treasury department has been greatly expanded within the past twenty years. It embraces the management of the national debt, the national currency and coinage, the supervision of the national banks, the internal revenue system, the customs revenue, the commercial marine of the United States, the light house system of the country, the survey of the coast and the interior triangulation of the United States, the inspection of steam vessels, the life-saving service, and the marine hospitals. There are two assistant secretaries of the treasury (salary, \$4,500 each), either of whom may be designated as acting secretary in the absence or inability of their chief, and between whom is divided the responsibility for the great variety of current business and correspondence which does not by law require the signature of the secretary. The routine work of the secretary's office is distributed among eight divisions (each under a chief at \$2,500 salary, and employing about 400 clerks in all). The accounts for all receipts and disbursements by the United States, or any of its officers, are by law examined in the office of some one of the six auditors of the treasury (salary \$3,600 each). The first auditor (58 clerks, etc.) has charge of all accounts in the civil service, custom houses, judiciary, public debt, etc. The second auditor (157 clerks, etc.) settles all accounts connected with the army (except as follows, under the third auditor), bounties and Indian affairs. The third auditor (171 clerks, etc.) adjusts accounts of the quartermaster general, engineer corps, commissary general, unpaid pensions, war claims, etc. The fourth auditor (48 clerks, etc.) adjusts all accounts connected with the navy. The fifth auditor (30 clerks, etc.) has charge of the internal revenue accounts, diplomatic and consular, and state department accounts, the census, etc. The sixth auditor (295 clerks, etc.) settles all accounts relating to the postal service. All the above accounts, when audited, go to the first or second comptroller of the treasury (salary \$5,000 each) for re-examination. The first comptroller (58 clerks, etc.) must countersign all warrants issued by the secretary, revise the accounts of the first and fifth auditors, examine drafts and requisitions for salaries, etc. The second comptroller (70 clerks, etc.) examines and certifies accounts received from the second, third and fourth auditors. The commissioner of customs (salary \$4,000, 31 clerks, etc.) revises and certifies the revenue accounts, and all matters connected with the marine. The register of the treasury (salary \$4,000, 148 clerks, etc.) has charge of the account books of the United States, showing every receipt and disbursement: he registers all warrants drawn by the secretary upon the treasurer, signs and issues all bonds, United States notes, and other securities, and has charge of the tonnage or shipping accounts, and the entire registry of vessels in the United States. The comptroller of the currency (salary \$5,000, 89 clerks, etc.) supervises the entire national bank

system of the country. This important office was created in 1863. The comptroller is charged with the execution of all laws relating to the issue and regulation of national currency secured by United States bonds; he has a seal of office, commissions and employs bank examiners, assumes control of any national banks becoming insolvent, appoints receivers therefor, makes an annual report to congress upon the condition, resources and liabilities of the national banks, and compiles statistics of other banks, banking companies and savings banks. The director of the mint (or, more properly, mints) of the United States (salary \$4,500, 14 clerks etc.) is the head of a treasury bureau established in 1873, and has charge of all mints and assay offices, making annual reports to congress on the coinage of the country, the yield of precious metals, and collateral subjects. The commissioner of internal revenue (salary \$6,000, 293 clerks, etc.), an office established in 1862, superintends the assessment and collection of all duties and taxes imposed by the laws providing internal revenue. The states and territories were divided into numerous collection districts during the war, for assessing and gathering the excise and stamp duties upon spirits, tobacco, etc., but the collectors of internal revenue were reduced by executive order in 1883, to eighty-two. The solicitor of the treasury (salary \$4,500, 15 clerks, etc.), though an officer of the department of justice, has special charge of legal measures to prevent and detect frauds upon the revenue, having charge of all suits involving money in which the United States is interested, except those arising under the internal revenue laws, which are in charge of the solicitor of internal revenue. He also has charge of the secret service employes engaged in detection of counterfeiting and other frauds on the government. The chief of the bureau of statistics (salary \$3,000, 36 clerks, etc.) is charged with the annual reports on commerce and navigation, internal commerce, etc., and publishes annual, quarterly, monthly and occasional reports, embodying the latest statistical information as to imports and exports, immigration, shipping, etc. The superintendent of the coast and geodetic survey (salary \$6,000, 156 clerks, etc.) has charge of the survey of the coasts and rivers of the United States, publishing annual reports, tide-tables, sailing directions, and maps and charts. The supervising surgeon general (salary \$4,000, 17 clerks, etc.) is charged with the marine hospital service and the fund for the relief of sick and disabled seamen. The supervising architect of the treasury department (salary \$4,500, 93 clerks, etc.) is charged with preparing designs and plans for all public buildings erected by the United States for custom houses, United States courts and post-offices, and the supervision of the same. The supervising inspector general of steam vessels (salary \$3,500, 5 clerks, etc.) administers the steam-boat inspection laws, with the aid of a board of inspectors. The superintendent of the life-saving service (salary \$4,000, 23 clerks, etc.) supervises

the organization and employes of the coast service for the protection of life and property, and prepares the statistics of marine disasters. The chief of the bureau of engraving and printing (salary \$4,500) has charge of the engraving and printing of all bonds, treasury notes, national bank notes, certificates, internal revenue stamps, etc., of the United States. This great establishment occupies a separate building constructed especially for its uses, and employs about 1,200 hands. The treasurer of the United States (salary \$6,000, 277 clerks, etc.) receives and keeps the moneys of the United States, and disburses them only upon warrants drawn by the secretary of the treasury, and duly recorded. He is also charged with the custody of all public moneys in the sub-treasuries at New York and eight other cities, acts as agent for redemption of national bank notes, is trustee of the bonds of the United States, and custodian of Indian trust funds, besides having entire charge of the payment of interest on the public debt. The immense vaults and strong-boxes of the treasury are all in the custody of this officer. — As will be seen from the above outline, the multifarious business of the fiscal system of the United States is widely and carefully distributed through a series of responsible officers, appointed by the president and senate, who give bonds for the faithful discharge of their duties. The system of keeping and adjusting accounts is very thorough and systematic, and the checks and safeguards for the protection of the public money so thoroughly organized by distribution among many responsible heads, as to render any wrongful disbursement very difficult, if not impossible. — The treasury department occupies a very large freestone and granite edifice, containing 195 rooms, constructed after the Ionic style of architecture, the cost of construction having been \$6,000,000. It was in this department that the employment of women as government clerks was first introduced in the year 1863, and several hundred of that sex are now employed in the various departments at Washington. — The following is the complete list of secretaries of the treasury from the beginning of the government, with their terms of office:

1. Alexander Hamilton.....	Sept.	11, 1789
2. Oliver Wolcott.....	Feb.	2, 1795
3. Samuel Dexter.....	Jan.	1, 1801
4. Albert Gallatin.....	May	14, 1801
5. George W. Campbell.....	Feb.	9, 1814
6. Alexander J. Dallas.....	Oct.	6, 1814
7. William H. Crawford.....	Oct.	22, 1816
8. Richard Rush.....	March	7, 1825
9. Samuel D. Ingham.....	March	6, 1829
10. Louis McLane.....	Aug.	2, 1831
11. William J. Duane.....	May	29, 1833
12. Roger B. Taney.....	Sept.	23, 1833
13. Levi Woodbury.....	June	27, 1834
14. Thomas Ewing.....	March	5, 1841
15. Walter Forward.....	Sept.	13, 1841
16. John C. Spencer.....	March	3, 1843
17. George M. Bibb.....	June	15, 1844
18. Robert J. Walker.....	March	6, 1845
19. William M. Meredith.....	March	8, 1849
20. Thomas Corwin.....	July	23, 1850
21. James Guthrie.....	March	7, 1853
22. Howell Cobb.....	March	6, 1857

23. Philip F. Thomas.....	Dec. 12, 1860
24. John A. Dix.....	Jan. 11, 1861
25. Salmon P. Chase.....	March 7, 1861
26. William Pitt Fessenden.....	July 1, 1864
27. Hugh McCulloch.....	March 7, 1865
28. George S. Boutwell.....	March 11, 1869
29. William A. Richardson.....	March 17, 1873
30. Benjamin H. Bristol.....	June 4, 1874
31. Lot M. Morrill.....	July 7, 1876
32. John Sherman.....	March 8, 1877
33. William Windom.....	March 5, 1881
34. Charles J. Folger.....	Oct. 27, 1881

A. R. SPOFFORD.

TREATIES. A treaty is an agreement, league or contract between two or more nations or sovereigns, formally signed by commissioners properly authorized, and solemnly ratified by the several sovereigns or the supreme power of each state. — *Historical View.* This is the modern definition; in the ancient world, treaties were not so much contracted as they were dictated. A conqueror with an army at the gate of a capital was perfectly able to settle the terms by himself, and he would stay there until he had satisfactory pledges that the terms would be carried out. The treaty of peace of Antalcidas, B. C. 387, is a good instance. Tiribazus, with the Persian fleet in the Hellespont, summoned deputies from the Greek states, and read terms of peace as follows: "King Artaxerxes thinks it just that the cities in Asia and the islands of Clazomenæ and Cyprus should belong to him. He also thinks it just to leave all the other Grecian cities, both small and great, independent, except Lemnos, Imbros and Scyros, which are to belong to Athens, as of old. Should any parties refuse to accept this peace, I will make war upon them, along with those who are of the same mind, both by land and sea, with ships and with money." No parties refused to accept it. Very often, too, the conquered had to pay down so much gold or so many slaves or ships, by way of earnest; at the treaty made by the Romans, B. C. 190, Antiochus, just defeated at Magnesia, had to cede Asia Minor, to pay 1,500 talents within twelve years, and to give up his elephants, ships of war and even some guests at his court. This was a typical treaty of those days. Occasionally, however, even then, the treaty was more of a contract than this, and settled and defined the relations of states among each other; the peace of Callias, B. C. 371, which settled the independence of the various Grecian states, and the terms on which they were to exist between themselves, was as much a manifestation of international law as many of the modern congresses have produced. Heffer has traced the history and growth of this branch of international law very clearly and briefly, and it may be useful before proceeding with the subject, to insert here his historical view of the matter, from the times we have alluded to until when Talleyrand, Nesselrode, Castlereagh, Bernstadt and Metternich, with other lesser lights, in 1814-15, formed a parliament to balance off the powers of the world against each other with the closest care. — Treaties, together with the negotiations which precede them, are the most fruitful

source of international law; they, and the spirit which leads to their enactment, show on what points nations and governments are in accord. — In the ancient world, treaties were almost the only manifestation of any common principle of law. Nevertheless, they present little interest; they rarely go beyond the narrow circle of the needs of the moment. Sometimes they show us the misfortunes of the conquered; sometimes their object is the conclusion of a long or short armistice; occasionally also the establishment of business relations, or even that of a kind of *dikēodosie* founded on reciprocal rights. The treaties concluded between the states, or rather between the princes, of the middle ages, offer still less of interest. The state itself was then only an agglomeration of private affairs and needs: the prince disposed of peoples and countries as he would of his own fields. The feudal lords and the church alone enjoyed a certain protection which they in their turn accorded to others, and yet that was often insufficient. — From the fifteenth century the turning point comes; a jurisprudence of political treaties begins to be formed, which is closely connected with the first steps of a European state-craft, and reflects in it the general spirit of later times. Innumerable treaties were concluded at that period, which often only wore a temporary mask for the true intentions of the parties, and which were rarely taken seriously. They would break them after a little with the same ease, to replace them by treaties of alliance with the enemies of those who had just been their allies. Where-ever there might be any spoil to gain or share, each rushed to seize his part (*le système copartageant*, it was called). Marriages and dowries played a minor but very considerable part in the treaties of those days. With the religious struggles of the sixteenth century higher interests began to be considered. At first they were discussed within the states, but the movers of international politics soon began to try to profit by these religious struggles, without any scruples for the interests of any particular religion. In this sixteenth century the politics of commerce obtained a preponderating influence over the general affairs of Europe; especially after the insurrection of the united provinces against the Spanish monarchy, for the sake of colonial interests, the scene of war was changed to the most distant parts of the world. — The first half of the seventeenth century is filled with the bloody slaughters of the holy wars, to which the congress of Westphalia put a final end. This was the congress where the diplomacy of the great powers celebrated a triumph. Its work on this occasion was for a long time a source of pride, but nevertheless, like a new Pandora, there escaped from its casket many gifts which were to be sources of distress. However, the treaty of Westphalia was to form the firm foundation of the *status quo* and of the balance of power of Europe, and at the same time it is the line of demarkation between an ancient and modern system of diplomacy. Up to that

time in treaty negotiations diplomacy had relied on rights which were at least apparent to every one; after the treaties of Munster and Osnabruck its object was much less the re-establishment of rights which had been violated; it regulated matters more according to political rule, and in so doing destroyed many rights which had been established by the older methods. At the conclusion of the peace of Westphalia there comes, as if directly in consequence of it, a restless state of international policy, directed, sometimes to the acquisition of material advantages, sometimes to maintain the political equilibrium which had been re-established at the price of so many sacrifices. The policy of intervention is at its height, and with it the usage of European congresses and combinations. Governments find themselves perfectly free now that the *états généraux* have been suppressed. The Hague becomes the neutral green-room of the diplomatic struggle; it is the place where the cards are dealt, and where each tries to finish the game; a place where adversaries engaged outside in mortal struggles can meet each other freely.—During the eighteenth century, or up to the French revolution, the international jurisprudence of Europe continues to present a system of political combinations, whose chief aim is to prevent as much as possible any threatening preponderance in the general equilibrium, unless the fortune of war or of circumstances throws one of the parties at the mercy of others. This arrangement of political affairs gave rise to a nerveless and colorless diplomacy, which pursues above everything the preservation of the *status quo*. But this conciliatory spirit disappears in its turn after the partition of Poland is effected, and after the revolution's success is assured. The victorious revolution dictates its treaties, the conquered are obliged to submit on account of their momentary needs. *Senatus consulti*, or simple manifestoes, announce to Europe what alterations are taking place in their midst. Then the Napoleonic policy arises, and treaties from the beginning of our century up to 1814 circle around it, either to strengthen it or to prepare that secret coalition which, when transformed into open resistance, created the political web of 1815. The preservation, and, when it is necessary, the alteration, of this web, was for a time the end of monarchical congresses and of ministerial conferences with their declarations and protocols, until the pentarchy was broken up by the energy of peoples and of governments jealous of their independence. The great business of European diplomacy, which only affected, sometimes in an indirect way, the public questions of the day, were in the second half of the last century the maritime rights of neutrals, and in our century at first the Napoleonic system on the continent, then the suppression of the slave trade, and finally, the commercial union of Germany, the international emancipation of trade, navigation, arts, literature and labor.—The rough division may, therefore, be made, that, in the ancient world, treaties were usually for peace after a war, and were

dictated rather than contracted; in the middle ages, treaties were often ostensibly contracted for statesmanlike objects, but were never meant to be kept. "Each treaty plants the seeds of a new war." As Machiavelli says (*Del Principe*, 1532), "A prudent prince will not and ought not to observe his engagements when it would operate to his disadvantage, and the causes no longer exist which induced him to make them." Spinoza, another later writer, whose words, like those of Machiavelli, apply to the period we are speaking of, says very much the same. (*Tract. Theol. Polit.*, cap. iii.) Of course these words apply to very modern times also, but in a less marked degree. Ever since the publication of the works of the early jurists, Gentilis and Grotius, the current has been setting in the other direction, and now the question rather is, how to enforce a treaty, than how to break it. The growth of the popularity of the principle of arbitration in the last ten or twenty years perhaps marks the commencement of a fourth period. (See ARBITRATION.)—*Theoretical View.* For the history and discussion of the ideas and theories concerning treaties, we may refer to the works of writers on international law. Most of the questions dealt with even in so late writers as Wheaton and Lawrence are now practically settled as much as the older ones of Grotius and others, such as, whether a Christian nation can make a treaty with an infidel power. We may briefly allude to one or two questions on which different views are still sometimes expressed. Do treaties expire in case of a war or change in government in which either of the contracting parties is interested? To which the text books answer, treaties are of two kinds: 1. Transitory conventions, which are perpetual in their nature, so that, being once carried into effect, they subsist independent of any change in the sovereignty and form of government, and, although their operation may in some cases be suspended during war, they revive on the return of peace without any express stipulation. Such are cases of cession, boundary or extension of territory, or those creating a permanent servitude in favor of one nation within the territory of another. Exceptions to the latter class are such cases as a telegraph treaty, in which special war provisions are always inserted, which bind neutrals as well as belligerents, though perhaps in a different way. (Fischer's *Die Telegraphie und das Völkerrecht*, Leipzig, 1876.) 2. Treaties so called, or *fœdera*, of friendship, commerce, etc., expire of course when, first, either party loses existence as a perpetual state; second, the internal constitution is so changed as to render the treaty inapplicable, as concluded in view of a particular constitution, as when, by the French revolution, the French form of government was changed; third, war arises between the contracting parties; and fourth, by limitation of the treaty itself.—But under whichever of these two heads the treaty falls, if, while a treaty is in force, a right vests under it, the expiration of the treaty can not extinguish that right. "The treaty had its full

effect the instant a right was acquired under it; it had nothing further to perform; and its expiration or continuance afterward was unimportant." (U. S. Supreme Court, in reference to the treaty of 1800 with France.)—Treaties are, in general, subject to very many of the rules to which contracts are subject. When a question arose between England and the United States as to the boundary line between this country and Canada, the question turning on the interpretation of certain treaties that had been entered into, England submitted to the emperor of Germany, the arbitrator, the following rules of interpretation for treaties, which are very similar to the rules of interpretation that might have been submitted in the case of a contract: 1. The words of a treaty are to be taken to be used in the sense in which they were commonly used at the time when the treaty was entered into. 2. In interpreting any expressions in a treaty, regard must be had to the context and spirit of the whole treaty. 3. The interpretation should be drawn from the connection and relation of the different parts. 4. The interpretation should be suitable to the reason of the treaty. 5. Treaties are to be interpreted in a favorable rather than an odious sense. 6. Whatever interpretation tends to change the existing state of things at the time the treaty was made, is to be ranked in the class of odious things.—The antecedent conditions on which the validity of a treaty depends are also very much the same as in the case of a contract: the parties must be capable of contracting, the agents must be duly empowered, the object must be lawful and possible, there must be a mutual consent, etc. Another condition is often inserted in the text books, that the parties must give their consent freely, or must be so situated that the consent of both may be regarded as freely given, but it is difficult to see how this can be so.—Another question arose especially concerning the declaration of the treaty of Paris, with respect to the effect of the flag on enemy's goods. Are, for instance, the United States bound by it? All other countries of importance have adhered to the rule there laid down, except the United States, and some foreign writers have considered the United States bound by this general uniformity of opinion. But we do not see any good reason for this view, and probably a foreign court would hesitate before applying the doctrine where an American was a party before it.—Treaties are classified in a good many different ways. A note in Mr. Hall's book on international law (Oxford, 1880), sums up this matter briefly: "Most writers devote considerable space to a classification of treaties. Vattel, for example, divides them into equal treaties, by which 'equal, equivalent or equitably proportioned' promises are made; unequal treaties, in which the promises do not so correspond; personal treaties, which expire with the sovereign who contracts them; and real treaties, which bind the state permanently. De Martens arranges them under the heads of personal and real treaties, of equal and unequal alli-

ances, and of transitory conventions, treaties properly so called, and mixed treaties. Of these last, the first kind, being carried out once for all, is perpetual in its effects; the duration of the second, which stipulates for the performance of successive acts, is dependent on the continued life of the state and other contingencies; and the third partakes of both characters. Heffter divides them into, 1, constitutive conventions, which have for their object either the constitution of a real right over another's property, or some obligation to give or to do or not to do something (*e. g.*, treaties of cession, establishment of servitudes, treaties of succession); 2, regulating conventions for the political or social affairs of nations and of their governments (*e. g.*, treaties of commerce); 3, treaties of alliance. Calvo distinguishes treaties, with reference to their form, into transitory and permanent; with reference to their nature, into personal and real; with reference to their effects, into equal and unequal, and simple and conditional; finally, with reference to their objects, into treaties of guarantee, neutrality, alliance, etc. It is not very evident in what way these and like classifications are of either theoretical or practical use." "Treaties included among those which have been supposed to express principles of law, appear to be susceptible of division into three classes: 1, those which are declaratory of law as understood by the contracting parties; 2, those which stipulate for practices which the contracting parties wish to incorporate into the usages of the law, but which they know to be outside the actual law; 3, those which are, in fact, mere bargains, in which, without any reference to legal considerations, something is bought by one party at the price of an equivalent given to the other." (Hall.)—It has now been practically settled, that, whatever powers an agent may have been given, a treaty must be ratified by the sovereign or proper authority before it can be considered as binding. Usually the crown or supreme power of the land is the treaty-making and treaty-ratifying power, but in England especially, and to a certain extent in some other countries, any treaty involving money matters has to be passed upon by the popular assembly, and, as a general rule, where any decided step is about to be taken by treaty, the opinion of parliament is first obtained, though, perhaps, informally.—In Sweden the king makes peace in conjunction with the senate.—In Germany the executive has power to make war, but, when offensive, only with the consent of the *bundesrath*; it has power to make peace in all cases. By article 11 of the constitution (*reichs-verfassung*), the executive has the power to make treaties with the limitation that the consent of the legislature is necessary when the provisions refer to subjects under the power of the legislature. These are as follows: Article 4. Foreign commerce and intercourse, colonization and emigration, financial system, weights and measures, patents and copyrights, rights of assembly, post and telegraph, sanitary police, laws of contract and private law, commercial law, railroads, settlement, residence and citi-

zenship of different states, military system. These are the powers which the different German states reserve to themselves the right to deal with, and, therefore, no treaty can be made concerning any of them without permission from the legislature. — In France, by article 9 of the constitution (*Lois Constitutionnelles*, July 16, 1875), the president may declare offensive war with the consent of the legislature. By article 8, the president is to negotiate and ratify treaties alone, unless they involve questions of peace, commerce, finance, status of persons and rights of property of Frenchmen in foreign countries, cession of territory by or to France; in these cases the consent of the legislature is necessary. — In the United States the makers of the constitution tried a new method of enforcing a treaty by enacting, that all treaties should be considered as the supreme law of the land, and providing for their ratification by the senate. But another clause gives the house of representatives control over all foreign commerce and other matters often dealt with in treaties. By section 8 of article 1, of the constitution, "The congress shall have power—1. To lay and collect taxes, duties, imposts and excises * * *; 3. To regulate commerce with foreign nations, and among the several states and with the Indian tribes; 4. To establish a uniform rule of naturalization * * *; 10. To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations." Now, these are all of them matters also dealt with in treaties which are to be entered into and ratified (by section 2 of article 2) by the president, "by and with the advice and consent of the senate, provided two-thirds of the senators present concur." And such treaties are also, by the constitution, to have the same force and effect as if they were the supreme law of the land. The treaties on the above and other subjects often, therefore, in their provisions, come into conflict with the laws of congress, especially with those in connection with commercial subjects, which usually spring from the house of representatives, and an interesting series of questions has in consequence been brought before our courts. To take one recent case out of many. By article 4 of a treaty between the United States of America and his majesty the king of Denmark, concluded at Washington, April 26, 1826, and thereafter duly ratified and proclaimed, and renewed by article 5 of the treaty entitled "Convention between the United States of America and his Majesty the King of Denmark, for the discontinuance of the Sound Dues," concluded at Washington, April 11, 1857, and thereafter duly ratified by the senate, and proclaimed, and which is still in full force and effect, it is provided that: "No higher or other duties shall be imposed on the importation into the United States of any article, the produce or manufacture of the dominions of his majesty the king of Denmark, * * than are or shall be payable on the like articles, being the produce or manufacture of any other foreign country." By article 1 of the treaty entitled "Convention between the United States

of America and his Majesty the King of the Hawaiian Islands," concluded at Washington, Jan. 30, 1875, and thereafter duly ratified and proclaimed on the part of the United States, and to carry which into effect the necessary law has been duly passed (Aug. 15, 1876) by the congress of the United States, and which is still in full force and effect, it is provided as follows: "The United States of America hereby agree to admit all the articles named in the following schedule, the same being the growth and manufacture, or produce, of the Hawaiian islands, into all the ports of the United States, free of duty." The schedule following said article includes: "Muscovado, brown and all other unrefined sugars," of grades therein mentioned, and all "syrups of sugar-cane, melado and molasses." Certain merchants having imported such goods from Denmark, claimed that the aforesaid articles imported were, under and by virtue of the aforesaid treaty with Denmark, entitled to be admitted into this port free from the payment of any duty whatsoever, for the reason that "like articles, being the produce or manufacture of (any) a foreign country," to wit, the Hawaiian islands, are, pursuant to the treaty with that country, admitted into all the ports of the United States free of duty. The collector of New York collected duties on the goods, and the merchants, having paid under protest, brought suit against the collector to recover the money. Judge Wallace, in the United States circuit court, decided in favor of the collector, chiefly on the ground, apparently, that congress may annul or repeal a treaty, as far as it is municipal law, provided its subject matter be, under the constitution, within the legislative jurisdiction of congress, and that in this case there had been such a repeal of the clause in question by implication, by the tariff legislation of congress. As Judge Curtis says, "If an act of congress should levy a duty upon imports, which an existing commercial treaty declares shall not be levied, so that this treaty is in conflict with the act," the later act of congress "gives the rule of decision in a judicial tribunal of the United States, in a case to which one rule or the other must be applied." This rule is well established, now, in our courts. See other cases, such as, *Ropes vs. Clinch*, 8 Blatchford, 304; *Cherokee Tobacco*, 11 Wall, 616; *Gray vs. Clinton Bridge*, *Woolworth*, 150. — Take another case, one analogous to which has recently arisen: Suppose the United States, by treaty with another country, takes away from its own residents or citizens, in certain cases, some constitutional right, such as trial by jury; are the American courts in those cases estopped by the treaty from seeing that such right is not withheld from those under its jurisdiction? The other country would probably expect us to fulfill our treaty, but the courts would probably hold that even the supreme law of the land was to be governed by our constitution. These considerations lead us to the last division of our subject, the enforcement of treaties and the growth of the powers of courts of justice in that

regard. — *Enforcement of Treaties.* The following distinctions may perhaps be usefully made in connection with this part of the subject. After the sovereign or supreme power of a state has entered into a treaty obligation, its fulfillment or enforcement usually comes under the jurisdiction and control of the sovereign or head of the nation himself, by or with the aid of one of three powers of the land: 1, the legislature or council of state; 2, the army and navy department; or, 3, the law and courts of justice of the country. Consequently, while the different obligations of treaties are theoretically enforceable by the nation itself, they may for practical purposes be said to be under the control of one of the above mentioned departments. The executive and legislative branches have control of such clauses in treaties as deal with peace or war, cession of territory or of money, of guarantee, neutrality or intercourse. The head of the army or navy in action is almost wholly in charge of the humane and moral clauses of modern treaties, such as those which deal with aid to the wounded, etc.; and of truces and cartels, and other laws of war, and of railroad and telegraph or cable treaties, so far as the war clauses are concerned. The judicial power is responsible for the carrying out of naturalization and extradition treaties, commercial engagements, the laws of prizes, some of the effects of treaties concerning war and peace, such as the rights of seizure, embargo, blockade, etc., and the clauses of treaties which affect the rights of citizens and foreigners in their individual and private capacity. — The distinction as to what classes of treaties come before the courts, is pointed out by the late Chief Justice Marshall, in the case of *Foster vs. Neilson* (2 Peters, 314): "Our constitution declares a treaty to be the law of the land. It is consequently to be regarded in courts of justice as equivalent to an act of the legislature, whenever it operates of itself, without the aid of any legislative provision. But when the terms of stipulation import a contract, when either of the parties engages to perform a particular act, the treaty addresses itself to the political, not the judicial department, and the legislature must execute the contract before it can become a rule for the court. * * This seems to be the language of contracts, and if it is, the ratification and confirmation which are promised must be the act of the legislature. Until such act shall be passed, the court is not at liberty to disregard the existing laws on the subject." That is, a treaty is a contract, and before the courts can accept a treaty as the supreme law of the land, for them to enforce, it must, by the action of congress, be changed from a contract into a law, unless, as another judge says, "the treaty itself gives a rule of law in respect to private rights, capable of execution without the aid of further legislation, and operating directly upon the interest which is the subject of the judicial inquiry." And if the treaty does not come within either of these rules, that must be decided by the courts, too; therefore, especially in this coun-

try, the power of the courts, whether used positively or negatively, in the enforcement of treaties and their obligations, is very great. — In *Ware vs. Hylton*, 3 Dallas, 199, certain Virginians owed money to some Englishmen in 1774. In 1777 the legislature passed a law to sequester British property, providing that Virginian citizens owing money to English subjects might pay the same to the Virginian government and get a discharge for their debt. The debtors in this case took advantage of this act. In 1783 a treaty was entered into between the United States and Great Britain, by the fourth clause of which it was agreed "that creditors on either side shall meet with no legal impediment to the recovery of the full value, in sterling money, of all *bona fide* debts heretofore contracted." The supreme court held, reversing the decision of the lower court, that the treaty of the United States annulled the law of Virginia, and gave the right to the Englishmen to recover their debt. — In the case of the *United States vs. The Schooner Peggy*, 1 Cranch, 103, a French ship had been captured and condemned as a prize by the United States circuit court of Connecticut in 1800. A writ of error was prosecuted to the supreme court, and before the hearing a treaty was entered into between the United States and France, one of the clauses of which was to the effect that property captured and not yet definitely condemned should be mutually restored. The court held that the sentence of the circuit court was not definitive, and ordered the prize to be restored. The court said: "In mere private cases between individuals a court will and ought to struggle hard against a construction which will, by a retrospective operation, affect the rights of parties, but in great national concerns, where individual rights acquired by war are sacrificed for national purposes, the contract making the sacrifice ought always to receive a construction conforming to its manifest import." — *Chirac vs. Chirac*, 2 Wheaton, 112, is a decision as to the effect of treaties on the title to real property, and decided, among other points, what we have already seen, that a treaty providing for the rights of subjects of one country, claiming lands by inheritance in another, is perpetual in its effect. If it expires by lapse of time, any right that has previously arisen in consequence of its existence is not extinguished by its expiration. "The treaty had its full effect the instant a right was acquired under it; it had nothing further to perform; and its expiration or continuance afterward was unimportant." — The *United States vs. Watts*, 14 Federal Reporter, 130, is an extradition case, where the United States had extradited the defendant for having committed one offense, tried him for it, and then proceeded to try him for another. The court discharged the prisoner, after examining both the executive and legal authorities on the question. Mr. Hamilton Fish, the secretary of state, had contended that the receiving power has the right, if so inclined, after having tried the extradited person on the charge on

which he had been surrendered, with a *bona fide* intent and effort to convict him on that one charge, to try him for any other offense of which he may have been guilty. (Messages and Documents, Dep. of State, May, 1876.) Lord Derby denied this, and the United States court in this case agreed with Lord Derby, saying: "It results as a necessary consequence of the duty imposed on the courts to respect and obey the stipulations of a treaty as the supreme law of the land, that they are also charged with the duty of determining its meaning and effect, and this duty they must conscientiously and fairly perform, even though the construction they feel compelled to give to it should differ from that given to it by the political branch of the government." — The cases we have mentioned are typical instances from our reports as to how our courts have enforced various provisions of treaties, even against the apparent interests of their own country and countrymen, and many other similar cases might be cited, both from our own and from the European law reports. — From the times of Sir Leoline Jenkins (1625–84) the English admiralty courts have been very determined, in prize cases, in seeing that justice was done in all cases where foreigners were concerned, even where the foreigners were allies of a hostile country. Sir William Scott, in maintaining, later, this tradition of his court, gave a great impetus to the enforcement of international law, especially in following and observing the treaty rights of neutral or other foreigners. We may note one instance, taken at random from the English reports, the case of *The Fama*, 5 Robinson, 106, which was as follows: In 1803 some goods in a ship sailing from New Orleans to Havre de Grace were seized by an English vessel, England then being at war with France. By the treaty of Idelfonso, 1796, Louisiana had been ceded to France. The New Orleans merchant claimed that the treaty was a secret treaty, and had not yet been carried into effect by the handing over of Louisiana to the French, wherefore it still remained a Spanish possession, and he should have restitution. Sir William Scott agreed to this view of the matter, and decided that the national character of a place agreed to be surrendered by treaty, but not actually transferred, continues as it was under the character of the ceding country, and ordered restitution by the English captors to the New Orleans merchant. All of which shows that the courts of law in civilized nations are the most effective enforcing agencies for treaties between nations, as for contracts between individuals, and that their jurisdiction is rapidly growing, and trenching on our next class. The next class of sanctions for treaties are those of the executive. They are to be employed where, as Livy says, "they are made by the command of the supreme power, and whereby the whole nation is made liable to the wrath of God if they infringe it." And the wrath of God or the fear of man is still about all that causes their fulfillment when either country would rather break them. The jurists of

all ages have tried to find some way in which these national treaties could be enforced, and they have appealed, to a great extent in vain, to the better feelings and aspirations of monarchs and popular assemblies. The methods, other than physical force, employed by nations to enforce a treaty obligation, have been: 1. The performance, by way of ratification, of religious rites and ceremonies, or the use of threats or influence by officers of different religions. In ancient times all treaties were entered into with the most sacred religious rites, and if these or any other formalities were left out, the treaty was not considered binding. But this kind of sanction only caused an obedience to the letter of the treaty, as, to use an extreme instance, when Antiochus stipulated in a treaty to give up half his fleet to the Romans, and Labeo carried that clause into effect by sawing every ship belonging to the monarch into two. The power of religious threats in the enforcement of treaties has been best exemplified in the case of the Roman church. By the use of excommunications and interdicts that church often was able to cause international agreements to be carried into effect, when one side of those who had entered into the agreement endeavored to draw back; but the selfishness with which the church used this power, and the power it also claimed and exercised of releasing princes from treaty obligations, neutralized all the good effect on international morality it might otherwise have caused. The ratification of a treaty was a very solemn affair, transacted in some great cathedral, in the presence of all the pomp and power of the church and of the nations involved. The ambassadors who had drawn up the treaty would there in due form solemnly touch the cross, the holy evangel, and the holy letters, and swear by their honor to observe and carry out fully, really and in good faith all the articles that were contained in the treaty. (Peace of Munster, 1648.) The most modern example is perhaps the alliance between France and Switzerland in 1777, which was solemnly confirmed by the oath of the contracting parties in public in the cathedral of Soleure. The emperor of Germany was addressed always as *semper Augustus*; the king of France, as most Christian; the king of Spain, as most Catholic; the king of England, as defender of the faith; the king of Portugal, as most faithful; and the king of Hungary as his apostolic majesty. 2. The handing over of territory, money or hostages, as a pledge for the fulfillment of a treaty, was also a means much used in ancient times, and it was successful so far as it went. It has gradually fallen into disuse, except as regards the occupation of territory. The last occasion on which hostages were given, was at the treaty of Aix la-Chapelle, in 1748. 3. There remain the methods by which third parties are made or become responsible for the carrying out of a treaty; such as armed intervention, mediation, arbitration or guarantee. These methods, leaving arbitration out of consideration, are found to be of little use at the

present time. The third country, on the one side, is likely to have the weight of any interference neutralized by a third power interfering on the other side. There are probably no countries with which the great powers of Europe have not at some time or other in their history entered into a treaty of guarantee, and most of these treaties have not expired. Lastly, we come to those conventions between nations and clauses in treaties which practically have to be left to the enforcement, if at all, of the commanders and officers of any conflicting forces. The "modern rules of war," as they are called, as relating to the treatment of the wounded and of prisoners, as to the use of railroads or telegraphs, as to truces or neutrals, and blockades or searches, must be left, in the nature of things, to the discretion and judgment of the officers who are in command at the time, and they are not only responsible to their own country but to many other countries both in indirect and direct ways. At the Brussels conference of 1874 the project of an international convention on these matters was proposed, but was not effected. The conference expressed some general views on the rules which should govern occupation of a hostile country by a military force, the treatment of prisoners, aid to the sick and wounded, etc. The presence of foreign military and press representatives with a modern army, must be noted as one of the greatest influences in matters falling under this head. There are certain treaties, however, which neither the efforts of law courts nor the commands of authorities, which are, as we have seen, the only two sanctions of treaties, can ever hope to enforce. These are treaties made by a nation with some alien and weaker nation living in its midst. From the treaties of Rome with Latium, Spain with the Moors, and Germany with the Bohemians, down to the treaties of England with Ireland or India, and the United States with the Chinese and Indians, treaties have only been used as one means of extermination and violence. Perhaps there never was a series of treaties between two peoples so systematically entered into for the purpose of breaking as those between the United States and the Indian tribes of North America. They were considered at first as independent nations capable of entering into treaties, but in 1871 congress passed an act to the effect that they were not nations capable of contracting with the United States by treaty; since then, the term convention has been used, but the name has made very little difference. The contracts have been uniformly broken. The law courts, where appealed to, have almost invariably, as far as possible, endeavored to enforce the rights of the Indians, but the jurisdiction necessary has usually in these cases been given by law to officers of the army or agents of the executive who have usually sided, either openly or through lack of positive action, with the immigrating violators of the public faith. — A recent writer, Mr. Hall, (in his "Rights and Duties of Neutrals," p. 7), says he "does not discover any ground for the claim (of

treaties) to exceptional reverence. They differ only from other evidences of national opinion in that their true character can generally be better appreciated," and he proceeds to attack them from the point of view of international law, as misleading and useless. On the other hand, other writers on international law have almost universally considered treaties as the principal "constituent part" of their subject. Possibly, as Napoleon the Great said, they are very often "Forms which, however necessary to disguise the dependence of weak states, prove, in the case of strong ones, only a desire to deceive," especially in the case of those which we have called national treaties. Whichever of these views may be correct, we have seen that treaties have always played an important part in the history of the world, and that their usefulness to the general progress of mankind has always increased more when enforced and fulfilled than when broken — *Authorities*. The works on INTERNATIONAL LAW are also authorities on our subject. Besides the authorities given under that head in volume II. of this work, we may add the works on *International Law* of Twiss, Westlake, Ward, Hall, Woolsey and Sheldon Amos. The last edition of Heffter, 1881; the *Rights and Duties of Neutrals*, Hall, London, 1874; the *International Law* article (Prof. E. Robertson) in the *Encyclopædia Britannica*; Mrs. Jackson's *Century of Dishonor*, New York, 1882; and the congressional and departmental reports of various Indian commissions on that branch of the subject; Fischer's *Die Telegraphie und das Völkerrecht*. Leipzig, 1876, on that branch. The following is a list of the collections of treaties which have been made: *The Argument and Proceedings at the Geneva Arbitration*, 1873; Manning's *Law of Nations*, edition Sheldon Amos, London, 1875; *International Commercial Law*, Leone Levi, London, 1863. Also the following compilations of treaties and matters relating thereto: Calvo, *Recueil des Traités*; Moreuil, *Recueil des Traités diplomatiques*, 1853; Jean Dumont et T. Rousset, *Corps Universel Diplomatique du Droit des Gens ou Recueils des Traités de Paix, d'Alliance, etc.*; Barbeyrac (Jean), *Histoire des anciens Traités jusqu'à Charlemagne*; Saint Prest (J. Y.), *Histoire des Traités de Paix du 1^e Siècle*; *Négociation secrètes touchant la Paix de Munster et d'Osnaburg*; Martens (George Frederic de) *Recueil de Traités d'Alliance, de Paix, de Treue, de Neutralité, de Commerce, etc.*, 1761-1808; also a supplement; M. le Comte de Garden, *Histoire générale des Traités de Paix*; Koch, *Histoire Abrégée des Traités de Paix depuis la Paix de Westphalia*; Rousset, *Supplement to the Corps Universel of Dumont*; Wenk (F. A. G.), *Codex Juris Gentium Recentissimi*, Leipzig, 1781; Robinet, *Dictionnaire Universel*, 32 vols., 1787; Schmauss (J. J.), *Corpus Juris Gentium*, 1730. EUSTACE CONWAY.

TREATIES, Fishery. At the close of the revolutionary war, in the negotiations which preceded the treaty of Sept. 3, 1783, one of the most

important questions discussed had reference to a definition of the privileges of fishermen, citizens of the United States, in the waters of British North America. Their right to fish on the Grand Banks or in the gulf of St. Lawrence, or elsewhere in the open sea, could not, of course, be denied, but it was claimed that they should not fish in British waters, or land in British territory to dry or cure their catch. At that time the methods of our fishermen were different from those now in use. The resources of our own coast were little understood, and the greater part of the New England fishing fleet resorted every summer to Labrador, Newfoundland, and the gulf of St. Lawrence, where they fished near the shores, making a harbor usually every night, always in threatening weather, and curing their fish upon the rocky shores, before loading them into the vessels for final home transportation. It was therefore important that they should retain as many as possible of the privileges enjoyed by them before the outbreak of the revolution. A compromise was finally agreed upon, and by the terms of article III. of the treaty of Paris (Sept. 3, 1783), it was arranged that the people of the United States should have liberty to fish on such parts of the coast of Newfoundland as British fishermen could, and also on the coasts, bays and creeks of all other of their Britannic majesties' dominions in America; and to dry and cure fish in the bays, harbors and creeks of Nova Scotia, the Magdalen islands and Labrador, so long as they were unsettled, or after their settlement if they could secure permission from the inhabitants or proprietors. By this treaty they were excluded simply from their former privilege of drying fish on the coasts of Newfoundland, Prince Edward island and Cape Breton. — The war of 1812 suspended for a second time the privileges of our fishermen in British waters; and when the question of their readjustment was brought up, strong petitions were made by the British colonists against a renewal of the privileges of 1783. — At the first meeting of the commissioners assembled at Ghent to draw up the articles of peace, it was announced "that the British government did not intend to grant to the United States gratuitously the privileges formerly granted * * for purposes connected with the fisheries." They argued that the claim of an immemorial and prescriptive right to these privileges was untenable, and that the rights which the inhabitants of the United States had possessed when British subjects, could not be continued to them after they had become citizens of an independent state. After much discussion the subject was dropped, and the treaty of Ghent (Dec. 24, 1814) contained no reference to the fishery question. The governors of the British colonies were now instructed to exclude our fishing vessels from their harbors and coasts, and the naval officers stationed in that district received orders to resist all encroachments. The result was the capture of several of our fishing vessels on the charge of trespassing in British waters. — In 1818 commission-

ers from the two countries met in London to settle amicably disputed points in connection with the fisheries, and their deliberations resulted in the signing of the convention of Oct. 20, 1818. By the terms of the first article of the convention it was provided that subjects of the United States should have forever the right to take fish of every kind on the southern, western and northern coasts of Newfoundland, on the shores of the Magdalen islands, and on that of Labrador, from Cape Jolly northward, and to dry and cure fish in any of the bays, harbors and creeks of these regions, except the Magdalens, so long as they should remain unsettled. The United States renounced any claim of right to take, dry or cure fish on or within three marine miles of any British territory not mentioned in the specifications above. American fishermen were, however, to be admitted to all harbors for shelter, repair of damages, purchasing wood or obtaining water. In order to secure the observance of this treaty our government issued to its fishermen a notice warning them against violation of the provisions of the first article of the above mentioned convention, a copy of which was annexed to the circular. — In 1847, in consequence of a petition addressed to the queen by the Canadian parliament, negotiations were opened for the establishment of reciprocal free trade between the United States and Canada. In exchange for reciprocity in trade with the United States in all natural productions, such as fish, wheat, timber, etc., access was offered to the fisheries of all the colonies, except Newfoundland, which refused consent. Some years were consumed in fruitless effort, and it was not until June 5, 1854, that the reciprocity treaty was signed, the senate of the United States confirming it August 3. By this treaty the fishermen of the United States gained a right to fish on all the coasts of British North America, while British fishermen gained access to the waters of the United States north of Cape May (latitude 36°); the salmon and shad fisheries were reserved for the exclusive uses of the subjects of each country; certain rivers and mouths of rivers, to be determined by a commission to be appointed for that purpose, were also reserved. The treaty also contained numerous provisions to secure and regulate free trade in certain articles of commerce. The treaty was to remain in force for ten years, after which it could be terminated upon a year's notice by either party. The commission to designate the places reserved to each country occupied years in deliberations, the results of which were so insignificant that they do not deserve discussion in this connection. — The reciprocity treaty terminated March 17, 1866, in consequence of notice given by the United States, notwithstanding efforts on the part of Great Britain to secure its renewal. The provisions of the treaty of 1818 were now revived, and continued in force until 1871, a period of fifteen years, during which there were constant clashing and uncertainty. American fishermen were at once warned that their right to fish in British

waters would terminate on the 17th of March 1866. It was subsequently decided, however, that during 1866 vessels from the United States should be allowed to fish in all provincial waters upon the payment of a nominal license fee to be exacted as a formal recognition of right. This privilege was continued for four years. In 1870 it was, however, discontinued, owing, it is claimed by the British government, to the failure of our fishermen to provide themselves with licenses, a claim which was to a certain extent, I have no doubt, a true one. During the year 1870 a considerable number of American fishing vessels were seized by British and provincial vessels, and forfeited — It now became necessary for the two governments again to meet the question squarely, and to this end was appointed the joint high commission, which met in Washington, Feb. 27–May 8, 1871, and from whose deliberations resulted the treaty of Washington. Articles XVIII. to XXV. inclusive, and XXXII. and XXXIII. of the treaty of Washington appertain to the fisheries. By the provisions of these articles citizens of the United States are allowed to take fish of every kind except shell fish along the shores of Canada, and British subjects have equal rights on the coast of the United States north of latitude 39° north, the shad, salmon and other river fisheries being excluded, and some trifling local exceptions in the treaty of 1854 being confirmed. Article XXI. provided for free trade between Canada and the United States in all fishery products save fish of inland lakes and rivers, and fish preserved in oil. It was the theory of the makers of this treaty that the United States was in all particulars the chief beneficiary, and it was consequently provided in articles XXII. and XXIII. that “inasmuch as it is asserted by the government of her Britannic majesty that the privileges accorded to the citizens of the United States are of greater value than those accorded to the subjects of her Britannic majesty,” a commission should be appointed to decide upon the amount of compensation which should be paid by the government of the United States for the privileges to them accorded. The commission referred to met in accordance with the provisions of the treaty, at Halifax, N. S., and was in session from June 15 to Nov. 23, 1877. Its members were Mr. Maurice Delfosse, at that time Belgian minister at Washington, Sir Alexander T. Galt for Great Britain, and Hon. Ensign H. Kellogg for the United States. The record of its sessions may be found in 3495 printed pages of the “Documents and Proceedings of the Halifax Commission,” vols. i. –iii., Washington, 1878. The entire lack of reliable statistics of the fisheries was of course fatal to the cause of the United States, the great mass of irrelevant and contradictory testimony given by fishermen and others summoned before the commission being nearly equally unconvincing and confusing on each side. Canada presented the so-called “official statistics” of its fisheries printed for ten years or more in the reports of the

minister of marine and fisheries: these at the time appeared valid and valuable, though the charges since published by Prof. H. Y. Hind show that their accuracy is far from being unimpeachable.* The decision of the case rested entirely with the neutral member of the commission, Mr. Delfosse, who without doubt based his action not upon the testimony presented, nor the facts otherwise accessible to him at the time, but upon certain considerations of diplomatic expediency, based upon the previous treaty relations of Great Britain and the United States. He adjudged to Great Britain the sum of \$5,500,000, to be paid by the United States in exchange for alleged privileges granted to its fishermen in British waters. This sum was paid in 1878, and the terms of the treaty having been thus fully complied with, the fishermen of the two countries entered upon a mutual participation of fishing territory for a period of twelve years. — The only important difficulty occurring under this treaty was in January, 1878, when several Gloucester vessels, taking in cargoes of frozen herring at Fortune Bay, N. F., were attacked by the people of the vicinity, their nets cut up, and the crews driven away from the shore. This proceeding was manifestly an interference with American rights under the treaty, and the claim that local laws were being transgressed was quite untenable, such laws being annulled by the treaty. Such was the view taken by the British government, and damages to the amount of £15,000 were awarded, to be divided among the injured herring vessels, the total amount of claims being \$105,305. — The present treaty terminated July 4, 1881, and notice having been given by the United States, its provisions will be invalid after the same date in 1883, when, unless some new arrangement be made, our privileges in British waters will be limited as before, and Canadian fish will no longer pass into our markets free of duty. — It is impossible in this place to discuss at length the advantages and disadvantages of the existing treaty. They may, however, receive passing allusion. The advantages to the United States were supposed to be twofold: 1, the right to buy bait in provincial ports; 2 participation in the inshore mackerel fishery of the gulf. The first is scarcely worth considering by treaty makers. The advantage to the bait seller is equally as great as to the buyer. Many provincial ports are dependent for livelihood upon trade with American fishing vessels, and only the most short sighted policy on the part of Canada and Newfoundland can exclude the only purchasers from their markets, for every vessel visiting one of their ports expends from \$50 to \$200. The second “advantage” strangely enough lost its value simultaneously with its acquisition. For half a century previous to the past decade the

* Prof. Hind's charges of intentional falsification of fishery statistics by the British authorities so widely published, are not sustained by evidence, and should not be entertained for a moment. The hundreds of errors which he has pointed out are evidently the result of inattention on the part of the responsible persons, and of childish incompetency on that of the clerks employed in their preparation.

mackerel fleet of New England was engaged for at least half the season in fishing in the gulf of St. Lawrence, and sometimes several hundred sails at one time were in close proximity to, if not within, the

three-mile line. The general adoption of the purse seine resulted in a complete revolution in the mackerel fishery, as is shown in the following table, kindly furnished by Major D. W. Low, of Gloucester :

YEARS.	No of Vessels in Gulf.	Catch in sea-packed Barrels.	Shrinkage in same, one-eighth.	Packed Barrels.	Value when sold in U. S., per Barrel; packing off.	Total value in U. S. of whole catch when sold.	No. of Barrels caught inside 3-mile limit, liberal est.	Value in U. S. of Mackerel caught within 3-mile limit, liberal est.

Yearly average catch per vessel 288 barrels. * Average price per barrel.

The number of vessels and their catch in sea-packed barrels, up to 1880, is from British sources, with exception of catch of 1878 and 1879, which is from reports of Boston fish bureau; 1880 and 1881 was from United States fish commission. The vessel in the gulf in 1882 was the schooner Yankee Lass, of Boston. The market value of some of the mackerel was increased by scraping and messing them by the labor of the crews, *extra labor*. The cost of catching the mackerel was much greater than the price obtained, making an aggregate loss to those engaged in it. G. BROWN GOODE.

TREATIES OF THE UNITED STATES.

Nov. 29, 1775, the continental congress appointed a committee of secret correspondence, charged with the duty of corresponding with the friends of the colonies in other parts of the world. March 3, 1776, this committee instructed Silas Deane to go to France, and ascertain from M. de Vergennes "whether, if the colonies should be forced to form themselves into an independent state, France would enter into any treaty or alliance with them for commerce, or defense, or both." Sept. 17, 1776, congress adopted a plan of a treaty to be proposed to the King of France. This plan embraced the following political ideas : 1. Equality with natives in the payment of duties or imposts, and the enjoyment of privileges, immunities, and exemptions in trade, navigation and commerce. This was not incorporated in any treaty actually concluded by the United States until after the peace of 1814. 2. Equality between France and the United States in colonial export duties. 3. Exemption from the *droit d'aubaine*. 4. That on the surrender of contraband of war by the commander of a vessel taken on the high seas in time of war, the vessel shall be allowed to proceed on its voyage. 5. That each party may capture goods the property of citizens of the other when found in enemy's ships in time of war. 6. That vessels and property rescued from pirates shall be restored. 7. That the ports of each shall be open to the prizes of the other without payment of duties,

but shall not be open to the prizes of the enemies of the other. 8. That if a war breaks out, citizens of one power, residing as merchants in the dominions of the other, may have time to close their business and remove their properties. 9. The citizens of neither power can take out letters of marque against the other in time of war. 10. Citizens of each may trade with enemies of the other in time of war in articles not contraband, and free ships shall make free goods except as to articles contraband. 11. Vessels of either coming into ports of the other, and not wishing to break bulk, shall not be obliged to do so, in the absence of cause for suspicion. 12. Merchant vessels of one power on the high seas may be visited by vessels of war of the other for the purpose of examining their sea letters and passports. If these are found correct the cargoes can not be examined. The draft also contained several provisions respecting the contemplated alliance with France. — On Feb. 6, 1778, two treaties were concluded in Paris with France : a treaty of alliance, and a treaty of amity and commerce. The treaty of alliance contained the usual provisions in regard to mutual action in time of war and in making peace, and, in article xi., a mutual territorial guarantee, which afterward became a subject of contention. France guaranteed to the United States the whole of their possessions : the United States, in return, guaranteed to France its then present possessions in America, and such as it might acquire by a treaty of peace. The treaty of amity and commerce was somewhat less liberal than that proposed by congress, and contained the most favored nation clause. — Oct. 8, 1782, a treaty of amity and commerce was concluded with the Netherlands ; April 3, 1783, a similar treaty with Sweden ; Jan. 20, 1783, an armistice with Great Britain, followed on Sept. 3, 1783, by a definitive treaty of peace with that power ; Dec. 10, 1785, a treaty of amity and commerce with Prussia ; January, 1787, a treaty of peace and friendship with Morocco ; and, Nov. 14, 1788, a consular convention with France. — These several treaties, con-

cluded prior to the adoption of the constitution, are remarkable for the directness and freedom from doubt with which they assume sovereign powers to be in the central government: as in 1, the restraints upon duties, charges and fees in the ports of the several states; 2, the prohibition of the exaction of the *droit d'aubaine* in the states; 3, the permission to aliens to own and dispose of real estate anywhere in the United States; 4, their right to reside and do business in the states on an equality with natives; 5, their right to worship after their own faith; 6, the right of foreign consuls to exercise judicial functions in the several states over the estates of their countrymen deceased; 7, their right to exercise police over vessels of their nationality in American ports, to arrest the officers and crews of the vessels, and to try and determine all disputes between them. They are also remarkable for humane provisions respecting the treatment of prisoners of war, and the exemption of women, children and non-combatants from the hardships of war, which have not yet been universally accepted. — The treaty of peace with Great Britain recognized valuable fishing rights on the Grand Banks, in the gulf of St. Lawrence, and in the bays, harbors and creeks of Nova Scotia, the Magdalen islands and Labrador, as belonging to the citizens of the United States in common with subjects of Great Britain. — When Washington became president, he found the northern frontier of the United States occupied by British military posts: at Detroit, at Mackinaw, at Buffalo, at Niagara, at Oswego, at Point au fer, at Dutchman's point, and even in the interior of Ohio. On the south, Spain had established a station at Natchez, and was pushing forward to Vicksburg under pretense of a treaty with Indians claimed to be independent. Both were intriguing with the Indians, evidently believing that the United States must disintegrate, and desiring, as nearest neighbors, if not next of kin, to obtain in the dissolution as much as possible. In this state of things the French revolution broke out; England took up arms against France; and Spain, on May 25, 1793, joined England. Meanwhile France, through an injudicious and irritating envoy, was making trouble for Washington, by attempting to fit out privateers for French use, and to rekindle the dormant feeling of hostility to England. In addition to a hostile occupation of our frontiers, England was seizing and confiscating our nascent commerce under pretenses that had no right but that of force. Washington was pressed to cast the fortunes of the United States on the one side or the other of the great struggle. In this emergency he sent John Jay, the chief justice of the United States, to London, as a special envoy. Nov. 19, 1794, Jay concluded the treaty which has since borne his name. It provided for the withdrawal of the British garrisons; for the settlement of some disputed points in the boundaries; for a joint commission to determine what payments should be made by the United States to Great Britain on account of the

claims of British creditors; and for another joint commission to determine what payments should be made by Great Britain to the United States on account of illegal captures. It reasserted the power of the federal government over the subject of land titles in the states, made provision for consulates, contained a provision (the first one) as to the extradition of persons charged with crime, and provisions for regulating commercial intercourse. It contained no disavowal of the arbitrary principles which Great Britain had asserted, no provisions that free ships should make free goods, and it granted to Great Britain the privileges for her vessels of war and prizes which France enjoyed under the treaty of 1778. This treaty was disclosed by a senator. Its publication created an intense excitement, which lasted until the appropriations for carrying it into effect had passed a subsequent congress. I think it is the judgment of history, that, with all its shortcomings, it was a wise measure. We came out of the war of independence poor, with a great debt, with a depreciated paper currency emitted by the states and emitted by authority of Congress, with a paralyzed business, and with a narrow ribbon of population along the shores of the Atlantic, of uncongenial pursuits, with great difficulties of communication, and with no common historical traditions prior to the war. With the greatest difficulty the aversion to a stronger central government was overcome. The constitution started its operation in time of peace, among a people a large minority of whom, if not an actual majority, was averse to it. Jay's treaty secured a certainty of a longer time of peace for it to take root and grow. If we had not concluded that treaty, we might have been bound in honor to go to war with England at that time. I can not see what the result of such a war would have been: but I can see that by putting off taking part in the great struggle for eighteen years, we secured precious time for the people to become accustomed and attached to the new form of government: and on this I found my opinion that the measure, however intrinsically defective, was a wise turning point in our history. — Partly in consequence of the conduct of Genet, partly in consequence of our refusal to abide by the guarantees of the treaty of 1778, and partly in consequence of the conclusion of Jay's treaty, a diplomatic rupture took place with France, accompanied by acts of hostility on the high seas. Congress, on July 7, 1798, enacted that the treaties and consular convention with France were no longer regarded as obligatory. This state, neither of war nor of peace, was terminated by a treaty in 1800, which was followed, in 1803, by three conventions: one for the cession of Louisiana, with a provision putting the commerce of France on the footing of the most favored nation in the ceded ports; one providing for the mode of payment of 60,000,000 francs to France by the United States and one providing for the further payment by the United States of 20,000,000 francs to citizens of the United States who had

claims against France. The claims excluded from participating in the division of this sum, constitute what are known as the French spoliation claims.— These treaties were assailed at the time of their conclusion, both on account of the acquisition of Louisiana, and of their not providing for the payment of the spoliation claims. Without expressing an opinion on the latter point, on the broader question I may say that history fully justifies the wisdom of a measure acquiring for us the mouth of the Mississippi. Jay's treaty and these treaties had a marked influence on the political history of the country. They mainly contributed to wrest the federal government from the hands of those who favored the adoption of the constitution, and place it in the hands of those who opposed it. They thus converted a jealous and astute oligarchy in the south from opponents into supporters of the new form of government, and made it their interest to preserve it during the long years that they held power. When the day of change at last came, the constitution had ceased to be an experiment. It had traditions in the national heart deep enough to protect it.— One other treaty of this period, the treaty of Oct. 27, 1795, with Spain, has survived to this time, and proved serviceable in recent political history. It contained agreements not to embargo the vessels or effects of citizens of either power in the territories of the other, and that, when arrested, persons should be prosecuted according to the ordinary forms of law, and have the right to employ agents and attorneys, and to have access to them. In the recent insurrection in Cuba, the insurgents had on their side everything to appeal to our sympathies. They were colonists, contending for self-government; humane men, contending against brute force; abolitionists, struggling against the re-establishment of slavery. Persons, said to be citizens of the United States, were seized and imprisoned without law, and denied access to counsel. Their properties were embargoed, and their incomes sequestered. The treaty of 1795 gave us means of relief without resort to force; and afforded the government of the peninsula an opportunity of yielding to our demands without risk of revolution or of being upset. It requires but little imagination to conceive the evil effects upon the United States of a war resulting in the conquest of Cuba, and its admission into the Union subject to the conditions of the constitution as affected by article XV. of the amendments.— The Napoleonic wars swept away all our commercial treaties, except the treaty of 1795 with Spain. The Dutch subsequently contended that the treaty of 1782 with the Netherlands survived, but the American government contended otherwise successfully. Peace was concluded with Great Britain by the treaty signed at Ghent, Dec. 24, 1814. This treaty contained provisions for settling some parts of the boundaries that were in dispute, and a declaration against the slave trade; but it was silent on the subject of impressment and change of allegiance, and of the rights in the fisheries. On the latter point, a cor-

respondence between John Quincy Adams and Lord Bathurst ensued. The former contended that the United States received their interest in the fisheries on the division of the British empire at the peace of 1783, and, therefore, could not be deprived of it by the abrogation of all treaties caused by a war. The latter maintained that the rights of the United States depended upon the existence of the treaty, and fell with its abrogation. This view was practically maintained. The treaty was criticised because it did not contain an abandonment of the right of impressment. This could not have been obtained from Great Britain; but the right has never been enforced since the maritime successes of that war, and is now practically as dead as if it had been abandoned in the treaty. The same commissioners concluded a commercial treaty with Great Britain, which was in force four years by its terms, and was subsequently extended ten years, and then expired of its own limitation. In that treaty, it was for the first time agreed that no higher or other duties or charges should be imposed in any of the ports of the United States on vessels of another power, than those payable in the same ports by vessels of the United States; that the same duties should be paid on the importation into the United States of any articles, the growth, produce or manufacture of a foreign power, whether such importation should be made in vessels of the United States, or in vessels of that power, and that in all cases where drawbacks were or might be allowed upon the re-exportation of any goods, the growth, produce or manufacture of either country respectively, the amount of the drawback should be the same, whether the goods should have been imported in American vessels, or in vessels of the foreign power. These provisions have often since been inserted in treaties.— In 1818, a convention was concluded at London for the definition and regulation of the fisheries, and also for the further settlement of disputed boundaries; and a joint occupation of the country west of the Rocky mountains was agreed to. The rights conceded to the United States fishermen by this convention are decidedly less than those conceded by the treaty of 1783, and are expressed in language which has given rise to much contention, the United States contending that it gives the right to fish within the waters of the bay of Fundy and other similar waters, and Great Britain contending otherwise. The treaty was negotiated, on the part of the United States, by two eminent diplomatists, but can not be regarded as a satisfactory solution of a question which is, in fact, difficult of solution. I shall refer later to modifications that have been made in it. The third article, which provided for the joint occupation of the territory west of the Rocky mountains, was, in 1827, extended indefinitely, with a privilege to each to give twelve months' notice of a purpose to abrogate and annul it. The United States gave this notice during President Polk's term. The two powers then concluded the treaty of June 15, 1846, adopting the 49th parallel

as their line to the middle of the channel separating the continent from Vancouver's island. It is to be regretted that the Oregon boundary question became entangled in party politics. The great Irish emigration began soon after the settlement of 1846; and the discovery of gold in California carried the stream of population to the shores of the Pacific. We had everything to gain by delaying the settlement, if it was to be done by compromise, as it actually was. But while slavery existed, there was a strong interest to prevent the extension of free territory, and a settlement was forced which can not be called far-seeing or statesmanlike. — The treaty with Spain of Feb. 22, 1819, closed a long series of diplomatic discussions relating to the boundaries between Louisiana and Florida, to condemnations of American vessels by French consuls within Spanish territories, to the suspension of the right of deposit at New Orleans prior to the acquisition of Louisiana, and to the fitting out, within the United States, of expeditions against Spain in aid of the revolutionary colonists. By the treaty the United States adjusted its southern boundary by the acquisition of Florida, and by an agreement as to the line from the gulf of Mexico to the Pacific; and each party made a general renunciation of claims against the other. As there was little population in Florida, and no settled institutions and form of civilization differing in spirit and in language from that prevailing in the United States, the measure was statesmanlike. It also tended to prolong the rule of the south, which eventually operated, as already explained, to increase the chances for the permanency of our institutions. — The congress of Panama, convened on the suggestion of Bolivar, aimed to secure military, political and commercial alliances. It failed in all, partly for reasons which make all such attempts quixotic, and partly in consequence of the existence of slavery in some and not in others of the powers. An account of the treaties of the United States would be incomplete without an allusion to the failure of this the most ambitious attempt at negotiations. We did, however, conclude separate treaties of amity and commerce with most of the American states of Spanish or Portuguese origin. — In 1817 congress framed for the first time a general navigation law, restricting importations to vessels of the United States, or to vessels of the country of the origin of the goods. We find the marks of this legislation in subsequent commercial treaties, in the provision that whatever kind of produce, manufacture or merchandise of any foreign country could be, from time to time, lawfully imported into the United States in their own vessels, might also be imported in the vessels of the other power. — The extending commerce of the United States also induced the revival of some of the powers respecting our vessels in foreign ports, and foreign vessels in our ports, and disputes of seamen and deserters, which had been conferred upon consuls by Jefferson's convention of 1788 with France. These important provisions were for many years inserted in treaties

of commerce. In 1853 Mr. Everett, as secretary of state, negotiated a purely consular convention with France; and, since then, the custom has been to treat of these subjects in special conventions.—During the administration of Gen. Jackson, great progress was made in adjusting private claims growing out of the French revolution. Claims conventions were made with Denmark, the Two Sicilies and France. This policy of solving private international questions by arbitration is well settled in the United States; and was the subject of comment in the French chamber of peers as early as 1831, when the Baron de Barante, discussing the French claims convention of 1831, said of the United States, "Lorsqu'on viole à leur égard les règles de la neutralité, ils ne font pas la guerre. * * Faire rendre justice à leurs citoyens est donc un de leurs premiers devoirs; et en cela, ils sont plus à imiter qu'à blâmer. De sorte que, sans éclater en hostilités, ils se plaignent, produisent patiemment leurs réclamations; et quand le jour arrive où l'on a besoin de leur bienveillance, ou leur amitié pourrait être à rechercher, ils profitent de l'occasion, et font solder les créances privées, dont on contestait ou retardait paiement." — During the administration of President Tyler the northeastern boundary, about which there had for many years been a dispute with Great Britain, which more than once threatened to come to blows, was finally settled by yielding to Great Britain a considerable part of the territory of the state of Maine. The same treaty introduced the policy of joint efforts for the suppression of the slave trade, and contained the only agreement which had then been made, since Jay's treaty, with any power for the surrender of persons charged with the commission of crime. Since then, extradition treaties have been made with most of the powers with which we have diplomatic relations, and the catalogue of crimes upon which the treaties operate has been much extended, as will be seen by comparing the list of crimes in article II. of the treaty of June 13, 1882, with Belgium, with that contained in article X. of the Webster-Ashburton treaty. — During the administration of Mr. Polk two important political treaties were made. The first placed our commercial relations with China on a treaty basis, and gave us the right of extraterritorial jurisdiction within defined limits. The second terminated the war with Mexico by a treaty which annexed California to the United States. The influence of the latter upon the fortunes of the country was instant and decisive. The influence of the former upon the destinies of China is beginning to be apparent. — During the same administration the first international postal convention was concluded. As early as 1787 France invited the United States to make such a convention. In the reorganization of the government the scheme fell through, and sixty years elapsed before a postal treaty was made. In the course of another thirty years the system was vastly improved, and has become universal. — The same administration concluded with New Grenada a treaty whereby

the United States agreed to guarantee the neutrality of the isthmus of Panama, and the rights of sovereignty and property of New Grenada therein. The United States invited Great Britain in 1849 to join in this guarantee. No answer was given to the invitation; but in April of that year the treaty known as the Clayton-Bulwer treaty was concluded. This treaty has given rise to more questions than it contains articles. Before ratifications were exchanged, a question arose whether it should apply to the Belize. Then discussions were had about the canal to which it should apply, and at the end of two years it was settled that it should apply to the Hise grant. Then Great Britain for some years tried to evade its operation upon the Mosquito Indians. Then it had prolonged negotiations with Nicaragua, Costa Rica and Honduras, in order to dispose of the Indians. By this time the rebellion broke out, and the interest of the United States in the question was suspended. The grant of canal franchises to the French company revived interest in it. Then the United States proposed to abrogate most of the treaty, which Great Britain declined. Then the president, in 1882, informed Great Britain, that the treaty having been made with a view to the construction of a canal under the Hise grant, and the same having become impracticable for causes for which Great Britain alone was responsible, the United States did not regard the treaty as longer binding. The policy of making this treaty has been much questioned; but it certainly dispossessed Great Britain of an important military, naval and political position on the isthmus, at a time when the relative strength of the two powers was very different from what it is now; and, as construed by the United States, it contains no continuing engagements to embarrass us. Judged by these results the measure was wise. When the question was slumbering after a rest of over twenty years, it was revived by the proposition to abrogate the treaty. In spite of the distinguished names supporting that act, I can not but regard it as unwise. The question was not at that moment what is called "a burning question"; it could have rested, perhaps, for many years, before a solution would have been necessary; and meanwhile the relative strength of the two powers was every day changing in our favor. — In President Pierce's time the adhesion of the United States was asked to the declarations of the congress of Paris, and answer was made that the president proposed to add to the first proposition the words "And that the private property of the subjects or citizens of a belligerent on the high seas shall be exempted from seizure by public armed vessels of the other belligerent, unless it be contraband." This was not acceded to. When the Franco-German war broke out, the French minister notified the secretary of state that in the war France would conform to the declaration of Paris; and the German minister notified him that private property on the high seas would be exempted from seizure by vessels of war, without regard to reciprocity. — During the same presi-

dential term a treaty was concluded with Great Britain for reciprocity in the free admission of certain enumerated articles between the United States and what is now known as the Dominion of Canada, and for the common enjoyment of the British inland fisheries by both peoples. I can not but regard this as a wise and statesmanlike treaty, which would have led to a nearer political connection with Canada. The war, however, enabled some Canadians to show a spiteful feeling toward us, to which congress responded by the abrogation of the treaty. Since that day Canada has been drifting away from the United States in legislation and policy. — The United States are founded upon the right of persons at their own election to abandon an old allegiance and acquire a new one. Yet this principle did not receive the formal adhesion of any other power until Feb. 22, 1868, when the naturalization treaty with the North German Union was signed. Since then, similar treaties have been entered into with Bavaria, Mexico, Baden, Württemberg, Hesse, Belgium, Sweden and Norway, Great Britain, Austria-Hungary, Ecuador and Denmark. The principles recognized in these treaties are, that an agreed term of residence in the new country is necessary before the change of allegiance will be recognized by the old; and that a resumption of residence in the old country without intent to return may be taken to be an abandonment of the acquired citizenship. — The same period saw a series of agreements made for the protection of trade marks. This arrangement has been made with Russia, Belgium, France, Austria-Hungary, Germany, Spain, Great Britain and Brazil. — The close of the war left questions pending with Great Britain growing out of captures by vessels of war fitted out on British territory; and claims by Great Britain against the United States on behalf of British subjects injured in their persons or properties by the forces of the United States. There were also differences growing out of alleged interferences with the fishermen of the United States. There was, too, a difference in the construction of the treaty of 1847 for settling the northwestern boundary. That convention required the line, after leaving the mainland, to proceed to the middle of the channel which separates the continent from Vancouver's island, and thence southerly, through the middle of said channel and of Fuci's strait, to the Pacific ocean. There were three channels: the Rosario to the east, the Douglass in the middle, and the Canal de Haro to the west. Both parties agreed that the Douglass was not the main channel. Great Britain claimed the Rosario as that channel; the United States the Canal de Haro. The treaty concluded at Washington on May 8, 1871, was intended to determine all these questions. It provided for a tribunal of arbitration at Geneva for the settlement of the Alabama claims, and laid down three rules for the government of the tribunal, which the two powers agreed to communicate to other powers. It arranged for a claims commission to sit at Washington and de-

cide upon the British claims. It agreed to restore the fishermen of the United States to the rights enjoyed under the abrogated reciprocity treaty, for a term of years for a limited reciprocal commercial arrangement, and the payment of a sum of money to be determined by a joint commission, to sit at Halifax. It provided for common enjoyment of the waters of the lakes and canals; and it referred the settlement of the boundary dispute to the arbitration of the emperor of Germany. In due time these questions were disposed of in the manner provided by the treaty. The decisions, so far as they were adverse to the United States, have been the subject of criticism here; and so far as they were adverse to Great Britain, of criticism there. My own judgment is, that, without dwelling upon details, the prestige and influence of the United States, and the respect in which it was held in other parts of the world, were decidedly increased by this treaty, and by the proceedings which took place under it. — During President Hayes' term the treaty with China was modified so as to allow the United States to regulate, limit or suspend the coming of Chinese to the United States or their residence here, but not to absolutely prohibit it. Congress exercised this power to the extreme limit allowed by a liberal construction of the treaty. During the same term a convention was proclaimed which had been concluded during the presidency of Gen. Grant, providing for the establishment of an international bureau of weights and measures; and a convention was concluded with the emperor of Morocco and the principal powers of Europe for the purpose of better defining the right of protection of Christian powers in that Mussulman kingdom. — In President Arthur's time the United States have acceded to the international convention for the amelioration of the wounded in armies in the field; and a general treaty of friendship and commerce has been concluded with Madagascar. — The collection of treaties made in 1873, and revised in 1876, contains, in all, 255 instruments. Twenty-nine have since been added to it. Of the whole 284 some have become entirely obsolete, others in part so, either through their own limitation, by agreement of parties, by notice given by one party to terminate, by absorption of the contracting party into another nationality, by effect of war, or by act of congress. A reference to the notes to that collection will give information in detail on these points. — A treaty made under authority of the United States is, under the constitution, in common with laws made in pursuance of the constitution, the supreme law of the land. It is subject to the constitution, and is inoperative when conflicting with it. It overrides all state laws in conflict with it. It overrides all laws of the United States in conflict with it and anterior to it; but, within the territory of the United States, and in its operation upon officers of the United States, it is controlled by laws enacted by congress after its conclusion. For municipal purposes it ceases to be law; internation-

ally the duty of observing it is not weakened by municipal law. — One thing more is to be remarked. Our treaties in two languages, with powers not using the English language, have rarely been the subject of contention as to construction. On the other hand, we have made few treaties with Great Britain, with which we use the English language in common, the construction of which has not been more or less in dispute. — During the revolution, and up to the adoption of the constitution, it was the custom to make the agreements of the United States with Indian tribes in the form of treaties. This practice was continued under the new form of government. The constitution, by declaring treaties already made, as well as those to be made, to be the supreme law of the land, has adopted and sanctioned the previous treaties with the Indian nations, and consequently admits their rank among the powers which are capable of making treaties. Nevertheless, such treaties are not the treaties which form the subject of this article.

J. C. BANCROFT DAVIS.

TRENT AFFAIR, The (IN U. S. HISTORY). In the autumn of 1861 the government of the confederate states (see that title) sent J. M. Mason and John Slidell as commissioners to Great Britain and France respectively. They ran the blockade to Havana, and there embarked on an English merchant steamer, the "Trent," for St. Thomas, on their way to England. About noon of Nov. 8 the vessel was stopped in the old Bahama channel by the United States steamer "San Jacinto," Capt. Wilkes, and the commissioners were taken out of her and transferred to Fort Warren, in Boston harbor, as prisoners. — Capt. Wilkes' act was warmly approved by the people of the United States; but he had nevertheless transgressed the neutral rights for which the United States had always contended, and he had undertaken to put in force the right of visitation and search which the United States had found insufferable when it was claimed by Great Britain. (See EMBARGO.) The United States government therefore disavowed his action, and surrendered the prisoners to Great Britain. There was, however, a residuum of American ill-feeling toward Great Britain because of the British government's officious preparations for an improbable war. Before giving the United States any opportunity for explanation or disavowal, the British ministry prepared troops and transportation for Canada, forbade by proclamation the exportation of arms and munitions of war, and instructed Lord Lyons, its minister at Washington, to withdraw from the United States unless the prisoners were set at liberty and an apology tendered within a time "not exceeding seven days." — See *Diplomatic Correspondence* for 1861-2, and authorities under REBELLION, as 2 Draper's *Civil War*, 540.

ALEXANDER JOHNSTON.

TUNGUSIC RACES. (See TARTAR.)

TURKEY. (Turkish, *Dowlet el Othmanié*, or Ottoman Rule, also *Othmanié vilayeti*, or Ottoman provinces. Ottoman Empire and Sublime Porte—*sublimine porte*—are the two phrases used in treaties. Through Asia and in most Mohammedan communities, as well as through Moslem history, the Turkish dominion is *El Roum* and its head *Sultan el Roum*, in allusion to his succession to the lower Roman empire.) The term Turkey is in general limited to the territory directly occupied by the Turkish empire, a territory in which Turks constitute probably less than one-twentieth of the population, and the term Turkish empire is in general confined to the government carried on by this small fraction of the population. Under this government, a number of races preserve a distinct organization, tribal, ecclesiastical or territorial, and the territory recognized in treaties as the Turkish empire, the government carried on by the Turks and the races inhabiting Turkey, must be carefully distinguished in the study and discussion of this subject. The territory of the Turkish empire consists of the four provinces in Europe immediately subject to the porte; the organized province of eastern Roumelia, the autonomous but tributary state of Bulgaria; the two provinces of Bosnia and Herzegovina, "occupied and administered" by Austria; the Asiatic provinces, including two in Arabia, directly subject to the Turkish government; the tributary principality of Samos; the autonomous administration of Crete; Cyprus, occupied, subject to fixed charges, by Great Britain; Egypt, whose relations are discussed elsewhere under that title; and the single African province directly subject to the porte, Tripoli. The extent of this territory and its population is, from the lack of statistics, extremely indefinite. The following statement can not be considered more than approximate:

Turkey in Europe:	Kil. Car.	Pop.
Immediate possessions.....	165,438	4,490,000
Eastern Roumelia.....	35,901	815,946
Bosnia and Herzegovina (occupied by Austria).....	61,065	1,158,440
Sandjak of Novi Bazar.....		
Bulgaria (tributary).....	63,973	1,998,983
	326,376	8,681,400
Turkey in Asia:		
Immediate possessions, including Ara- bian provinces.....	1,889,055	16,182,900
Samos.....	406	40,069
	1,889,523	16,152,969
Turkey in Africa:		
Tripoli (province).....	1,038,350	1,010,000
Egypt (dependency).....	2,987,000	17,577,000
	4,020,350	18,587,000
Turkish empire.....	6,236,350	43,291,000
Immediate possessions.....	3,067,350	21,683,000
Dependencies.....	3,148,400	21,758,000

In Europe the area, undetermined, of the sandjak of Novi Bazar, with a population of 168,000, is still under Turkish administration, although

a part of Herzegovina. In Asia the only portions of Arabia under the organized control of the Turkish government are the two vilayets of Habesh, or Hedjaz and Yemen, and the Haram (sacred) containing Mecca. These contain a population of 1,296,845. In Egypt the figures given above exclude Kordofan, Darfur and several provinces in the Soudan having a territory of 1,000,000 square miles, and a population of 10,800,000, whose successful revolt in 1883 renders their distant connection with the empire doubtful. Servia (48,950 kil. car; and 700,211 pop.) and Montenegro (9,030 kil. car.; 236,000 pop.) were dependencies up to the treaty of Berlin. — The boundaries of Turkish territory, exclusive of appanages, are the product neither of geographical lines nor ethnical divisions; but of a long series of treaties, of which the last and most important is the treaty of Berlin, signed July 13, 1878. Under this treaty the northern boundary of European Turkey still includes Bosnia and Herzegovina, which, with the exception of the sandjak of Novi Bazar, are for all practical purposes Austrian. Serbia next bounds Turkey to the Danube, and the space between this river and the Balkans is occupied by the tributary state of Bulgaria, with the exception of the Dobrudja and the additional territory lying north of a line drawn from Silistria on the Danube to the Black sea, south of Mangolia. The Black sea, the Bosphorus, the sea of Marmora, and the Hellespont and the Ægean, constitute the remaining boundaries of Turkey in Europe until Greece is reached. The present boundary between the two countries was determined by an international boundary commission acting under the Berlin treaty, but following the line determined upon at the Constantinople conference in 1831. Instead of the original line from the mouth of the Kalamas to that of the Salymbria river, the new boundary, which ceded 265 geographical miles, or two-thirds the area under the original award, starts from Kara Derwent, on the gulf of Salonica, follows the southern ridge of the Olympus, passes south of Messova, and reaches the Adriatic by crossing the valley of the Arta, of which Greece receives two-thirds. The Adriatic forms the western boundary of Turkey, except where the Berlin treaty gave Montenegro (Czernagora) an approach to the sea by ceding Antivari. The 1,814 square miles constituting the previous area of Montenegro were also enlarged by adding from Herzegovina the districts of Banzani, Rudine, Nicsic, Duga, Piva, Drobu-zak, Yezera, Kolashin and Saranci, 1,167 square miles, and from Albania, Spuz, Podgoritza, Zab-lyak, Plava Gushigne, Antivari and Krazina, 661 square miles; in all, 1,828. Turkey in Asia has natural sea boundaries on the north and west, while Arabia in a sense bounds it on the south. Its eastern boundary begins, under the Berlin treaty, at Makialos, on the Black sea, and, running southeast in an irregular line, rejoins the old boundary just beyond Kaghizemann. This ces-sion to Russia included Batoum, Kars and Arda-

han, of which the last is the only place with a population of 5,000. An additional tract one-third as large, including Bajazet, ceded by the treaty of San Stefano, was retained by Turkey, its possession greatly improving its strategic line about the headwaters of the Euphrates. At the same time the new boundary between Turkey and Persia, by ceding to the former the town of Kotovi, gave a Russian ally control of the headwaters of the Araxes. The Turkish sovereignty over Arabia is practically limited to Mecca, Medina, their port Jiddah and Yemen, a large tract in the interior extending to the Persian gulf being under independent control, while the desert region between Arabia proper, Syria and Mesopotamia, maintains a precarious independence. Turkish authority is also limited in Armenia, where the powers have a treaty right of interference; in the pashalic of Lebanon, a tract eighty-seven miles long, which can only be governed by the porte through a Christian pasha, satisfactory to the powers supporting the French occupation in 1861; in eastern Roumelia an autonomous province south of the Balkans, also governed by a Christian pasha; in Samos, an independent tributary principality; in Crete, an autonomous province; in Cyprus, under British control; and, as already mentioned, in Bosnia and Herzegovina. These limitations sufficiently indicate the intricate nature of the sovereignty enjoyed by the sultan, whose character is more clearly conveyed by the indefinite native term "Ottoman Rule" than by any exact term. — The ethnical character of the Turkish empire is the result of successive conquests, which have associated widely different races without uniting them in a common political society, or amalgamating them by ties of blood and intermarriage; a circumstance which explains much in the arrested development of Turkey. The European territory of the empire is inhabited by Indo-Europeans, Slaves and Greeks, with (probable) remnants of aboriginal tribes in Albania. The islands of the Ægean, Asia Minor, and the mountains which connect its central plateau with the Caucasus, are, in the main, inhabited by Indo-European races, Greek, Armenian and Kourdish succeeding each other from west to east. Syria and the great plain to the east is, in general, inhabited by races Semitic in origin, whose blood grows purer toward the south. The one notable exception is in Irak-Arabia, the borderland between Persia and the southeastern extremity of Mesopotamia, where a strong Indo-European element appears. Scattered over this entire area, but growing infrequent in the south and rarely occurring in European Turkey, are nomadic Tatar tribes still living in the black tents of the steppes. The government of the realm is in the hands of a comparatively small body of "Turks," the descendants of the original Tatar invaders, of prominent and leading families, which adopted the religion of, and were incorporated with, the conquerors, at varying intervals during the 700 years ending with the eighteenth century, and of the constant acces-

sions to this ruling class from captives in war, or the steady draft made for 500 years (1300-1800) on the male children of subject races. The Moslem and Christian creeds have maintained one great division in the empire, language has done more, and the great difficulties of communication have maintained separate and distinct some populations almost pure in race and blood. But these influences have all been so modified by time and conquest, the great solvents of race, that a complete change in character without an alteration in form has often taken place, not unlike that occurring in a pseudomorphic crystal. A "Turk" may be one or two generations removed from a pure Hellenic descent, a "Greek" have none but Slave blood in his veins, and a "Bulgarian" be the descendant of a peasant proprietor of the Roman period. — Statistics in regard to racial and religious divisions in the empire are mere estimates. It is probable that about one-third of the population of European Turkey is Mohammedan, most estimates agreeing at this point. In Asiatic Turkey the Mohammedan population constitutes the larger portion; but the usual estimate which gives it seven-eighths of the total is an exaggeration. Over thirty years ago Ubcini, who placed the total population 50 per cent. too high, gave the number of Armenians at 2,400,000, Greeks 2,000,000, Kurds 1,000,000, Slaves 6,500,000, and Arabs 900,000; while frequently quoted, these figures are mere approximations. If the term Ottoman or Turk is limited to the ruling class, the Turks constitute an extremely small fraction of the whole. If it is extended to the large Turkish-speaking population of Asia Minor and Armenia, and the smaller fraction using the same language in European Turkey, it includes nearly all the Moslem population in these divisions of the empire. But, while Turkish came to be the Mohammedan tongue in the region long occupied by the Seljuks, and first conquered by the Turkish sultans, the line of the caliphate dominion can still be traced by the prevalence of Arabic as the Moslem tongue among the races, chiefly Semitic, south of the Taurus, which checked the Arab advance. Greek is the familiar tongue of the seacoast of Asia Minor, which remained in Byzantine hands long after the interior was occupied by Turkish. In European Turkey, Greek and Greeks are superseded in the interior by Bulgarian. Eastern Roumelia, lying south of the Balkans, has 573,560 Bulgarians, 174,700 Turks, 42,659 Greeks, 19,549 Gypsies, 4,177 Armenians and 1,306 Jews. In Thrace and Macedonia this proportion would be reversed. The Armenians and Kurds, comparatively recent Turkish conquests, indicate the purity of their stock by the use of their own language. The empire contains, besides the races already named, in Europe, Albanians (Skipetars), Zingari, a mixed Slave-Greek race, and small settlements of Ukraine Tatars and Circassians. In Asia, besides the leading races of Ottomans, Arabs, Armenians, Greeks and Kurds, there are Druses and Maronites

in Mount Lebanon, Yezidis, the fire-worshippers of Mesopotamia, and large wandering Turkoman tribes on the plateau of Asia Minor, to which the Circassian immigration of recent years has added a new element. While modern Turkish law affects to regard all these races as Ottoman subjects, each has retained its individuality, the larger divisions manage their own internal affairs, and scattered communities and districts maintain a separate existence of their own. — Over this diversified territory and these still more heterogeneous races, the Turkish government is superimposed, obtaining its original authority by conquest and the high administrative ability of early sultans. This power has been retained in the lack of any subject peoples equal alone to rebellion, and through the early policy which early incorporated the natural leaders of the local races among the conquerors. Historically the successor of the Parthian empire, like it the result of an invasion from central Asia, and more successful in organizing an army than in civil sway, the Turkish rule leaves behind it no civil monuments but buildings constructed by Greek and Semitic architects. The circumstance that the Turkish invaders adopted the Mohammedan religion has profoundly influenced the policy of the empire; but it has no more changed the character of its rule than the like adoption of the local cult of China has altered the essential character of the Machu conquest, or left it other than an invasion encamped in a palace. Politically the empire of the sultan is divided, in part by geographical conditions, and in part by race and language, into certain grand divisions, accepted in discussions of the eastern question, and familiar in its diplomatic correspondence; but these divisions are undefined and have no administrative significance. Turkey in Europe is divided in its eastern half by the Balkans into Bulgaria and Roumelia, the latter having an eastern and western division, and covering, in the extension given it by Turkey and the treaty of San Stefano, Thrace and Macedonia. Albania occupies the remainder of European Turkey. Asiatic Turkey is divided, after the same loose fashion, into Anatolia, or Asia Minor, Armenia, Kurdistan, Mesopotamia, Syria, and the triangular plain between, usually assigned to Arabia on maps, but in all senses part of the empire. These divisions, used much more frequently in foreign discussion of the empire than its actual divisions, correspond very closely in use to the "north," "south," "Pacific slope," "west," "northwest," as employed in the United States; convenient but by no means exclusive, and often misleading, divisions. The only territorial divisions having a political and administrative significance, are vilayets, provinces or governments general, closely analogous to the French department, and governed by a wali; sandjaks, *arrondissements* governed by mutessarifs; kayas, cantons, governed by karmakours; nahies, townships, towns or communes, governed by mudirs; and lastly villages, which in European Turkey have as their head a kodja bashi, and in Asiatic

Turkey a kahya, usually of local selection. — Of these divisions the vilayet is the successor of the Byzantine thema, whose boundaries many existing vilayets follow, and the sandjak is generally the representative of one of the ancient military fiefs, which, under the earlier sultans, were ruled by a semi-independent and hereditary bey, who furnished a contingent of troops, generally horse. Shortly after the conquest of Constantinople, the Byzantine province was adopted as the new unit of administration, the sandjaks being grouped for this purpose under the government of a wali, or prefect, as the word is used in Arabic history. The practical result of this difference between the origin of these two divisions, is, that the vilayet is often bounded by an artificial or official line, while the sandjak, particularly in European Turkey and in the mountainous regions of Asiatic Turkey, represents a natural and historical division of territory. The sandjaks of European Turkey, whose arrangement in vilayets has not been permanent since the treaty of Berlin, are Monastir Korytya, Prisrend, Urhkul and Debra in the vilayet of Monastir, Jannina, Prevesa, Argyro Kastro Berat and Trikala, the vilayet of Jannina; Salonica Seres and Drama, vilayet of Salonica, Adrianople, Rodosto and Gallipoli, vilayet of Adrianople. The old sandjaks of Phillipopolis and Slivno constitute eastern Roumelia and Rutschuk, Tultiha, Varna, Tirnova and Widdin, Bulgaria. Novi Bazar and Scutari are sandjaks under a separate administration. The vilayets of Asiatic Turkey, nineteen in number, have remained unchanged through a long period. Constantinople, rather a metropolitan district than a vilayet; Brusa; Aidin; Kastamuni (Paphlagonia); Angora (Bozok); Konieh (Iconium), or Karamania; Adana (Cilicia); Sivas (Cappadocia); and Trebizond (Pontus and Colchis); make up Asia Minor. Erzerum and Kharput cover Armenia and part of Kurdistan. Part of the latter is to be found in the vilayets of Diarbekir and Mosul. Mosul also extends into Mesopotamia, whose southern portion is the vilayet of Baghdad. Syria is divided into Aleppo and Syria proper, with its capital at Damascus. The islands of the Ægean and Rhodes make a separate vilayet, as did Cyprus. Crete ranks as a European vilayet. The two Arabian vilayets are Hedjaz and Yemen, or Habesh, and Hedjer, or the Haram. Tripoli is also a vilayet. In the above summary, the classical division corresponding most closely to the vilayet is given. These administrative divisions originated, however, like the entire framework of Turkish administration, in the Byzantine empire. The Byzantine thema and vilayet are substantially the same unit, and their respective boundaries closely correspond. Asiatic Constantinople corresponds to thema Optimaton, with its eastern end curtailed by early Turkish conquest; thema Opsikion is Brusa; Aidin, thema Thrakesian, the Turkish administration still preserving the division which consigned a part of the seacoast to the same government as the adjacent islands. Themata Anatolikon and Ki-

byrrhaioton are substantially Konieh, Seljuk conquests having extended the original coast line of the southern province and including Lake Tchölli on the northeast. Adana differs little from thema Seleukeias. Various causes have united to modify the Euxine provinces, and their relation to the Byzantine divisions is less apparent. The short-lived empire of Trebizond determined the littoral vilayet of that name, and Kastamuni, Angora and Sivas are the survivals of independent sultanates, as are in all probability Kharput, Erzerum and Diarbekir. South of this point the administrative divisions of the caliphate exercise their influence on the political geography of Turkey. — *Government.* The Turkish government is an absolute despotism, tempered by the democratic equality of Moslem law. A standing army, a most unusual resource in oriental history, has supported it from an early period. Its administration has followed Byzantine models, and the loose character of its conquest led to the large grant and exercise of local government and administration among subject races. Only within a recent period has an organized bureaucracy been attempted, and with but partial success. The adoption by a Tartar conquest of the forms of a Semitic caliphate, modified by European (Roman and modern) administration, fills the political forms of the Turkish rule with contradictions which render a coherent statement difficult. — The three strands of Turkish administration, civil (legislative, judicial and administrative), military and religious, all run back to the sultan, whose titles sufficiently express his relation to each. As "Caliph of the Prophet of God" and "Emir el Moumenien," (Commander of the Faithful), he is the spiritual head and military commander of Moslems. In one capacity he has the right to interpret the Koran and Moslem traditions, and is hence at the head of Moslem law. In the other he has a claim upon the military service of Moslems, two capacities further supported by the fact that he is "Guardian of the Sacred Places," not *de jure* but *de facto*, and is hence employing his spiritual and temporal powers in protecting Moslem rites. This control in addition gives him a predominant influence over the three chief sources of Moslem doctrine, in the sheriff of Mecca; the sheikh-ul-islam at Constantinople, his spiritual deputy; and the mosque of Akkbar at Cairo. The reigning prince of the house of Othman is, in addition, in his own right, "Khan," that is, prince of his tribe; "Sultan of Sultans," and "Ruler of the Two seas and Two lands which make up the Ottoman realm, by the right of the sword." In theory, therefore, the sultan is the prescriptive head of his Moslem subjects under Moslem law, and the absolute ruler and conqueror of other races in his dominions. Nor, however modified by treaties or obscured by European administration, does this distinction ever altogether disappear. — Legislative authority vests absolutely in the sovereign as caliph and sultan, spiritual and temporal prince. Turkish law itself is divided into two

great divisions, the *sheriaât*, or spiritual law, and the *kanouni* (rules), or temporal law. The former is derived from the Koran, the traditions of the prophet, and the decisions of his immediate successors. In theory, this law is fixed and immutable; but, as the only supreme authority in its interpretation is the spiritual deputy of the sultan, and ten centuries have accumulated in addition contradictory rescripts, or *fetva's*, the sheriaât can be accommodated in practice to any exigency. *Stare decisis* is, however, imbedded in Turkish law in the phrase "The gates are here closed," and Turkish, like all Moslem jurisprudence, is full of instances of judicial resistance to an absolute monarch. The kanouni is the act of the prince *proprio motu*, like the constitutions of civil law, after which it is modeled, and from which it is directly derived. Codified by Ibrahim Halebi (of Aleppo), under the reign of Solyman I., the *multequa* bears at every turn the influence of the Justinian code, and is a laborious attempt to unite in one the civil legislation and judicial decisions of the Moslem law. It remains the final authority in Turkish courts, but has been modified by the Hatti Sherif of Gulhaneh (Nov. 3, 1839), in which the Sultan Abdul Medjid declared equal rights; Hatti Humazoun, 1856, in which religious liberty was enacted; a penal code, 1840; a commercial code, copied from the French, 1840, etc. In the contradictory progress of recent years, these have been greatly multiplied by a maze of decrees. Besides the Moslem law, the subject races are, for many purposes—marriage, divorce, legacies, larcenies, lesser offenses, and cases relating to ecclesiastical benefices and succession—under their own canon law. The principle of exterritoriality extends over foreigners resident in Turkey, the jurisdiction of consular courts; each administering the municipal law of its origin. — The sheikh-ul-islam is the ultimate judicial authority of the empire, his *fetvah*, in the form of an answer to a case stated, deciding all administrative and judicial issues. The ancient courts of the empire (sheri courts) consist of the high court of appeal (aryodaci), divided into two chambers (soudours), presided over by the *cadi-asker* of Roumelia, or European Turkey, and the *cadi-asker* of Anatolia, or Asiatic Turkey, each having the jurisdiction indicated. Subordinate courts exist for each of the *mevlievets*, or grand judicial districts, which include several *kayas*. These judicial divisions do not correspond with the vilayet and sandjak, being less in number and differently arranged. Constantinople and Mecca are the first two, and the other divisions of the empire are arranged in three classes. The organization of the three series of courts is the same, consisting of a *cadi*, judge, varying in rank, but always a *mollah* who pronounces the decision; a *mufti*, who expounds the law; *naibs*, or deputies; and *kiatibs*, or notaries. Appointments to all judicial positions are annual, revocable, and divided according to rank between the sultan, sheikh-ul-islam, *cadi-askers* and lower judges. The distinction between civil and criminal law is

not observed in the courts; corruption exists in all, and the practice is of the loosest description. Judicial positions are filled from the ulema, or learned men, graduates of schools (*medrerrehs*) connected with the mosques. Judicial salaries are paid out of a tax on suits. "Mixed" civil and penal tribunals for the trial of cases between Ottoman subjects and foreigners, and between Moslems and Christians, exist in the capital and seaports on the French model, with a court of cassation (*Mekhem'eh e Temyzi*) at Constantinople. — In the civil administration of the empire the sultan is the final source of authority and appointment, acting through his personal representative, the grand vizier, an office abolished during the brief period of constitutional reform under Midhat Pasha, but restored, with some loss of position, on the abolition of the paper constitution of 1878. An elaborate administrative organization on European models, succeeding in some instances to analogous departments under the old régime, furnishes ministries of foreign affairs, war, marine, artillery, interior affairs, justice, finances, commerce and agriculture, public instruction, religious tenets, public works. Of these, the foreign affairs corresponds to the *reis effendi* of earlier history, the subordinate title indicating the superior position in all foreign relations claimed by the sublime porte up to a very recent period, while the circumstance that the "dragoman," or interpreter of the ministry, fills as important a position in practical negotiations as the minister, in its way illustrates the long period in which the Turkish government refused the use of any language but its own in diplomatic negotiations. The minister of war is the successor of the *seraskier*, whose office, while distinct, in warlike reigns was always held by the grand vizier. The minister of marine succeeds the *capitan pasha*, a title by a familiar blunder often appearing in European history as a name. The minister of artillery remains the solitary survival of the ancient superiority of Turkey in this weapon. The other ministries are of European origin, with the exception of the religious tenets, organized as one of the reforms of Mahmoud II. The ministries holding these portfolios are organized on the French model in a council of state, or "divan," under the presidency of the sultan, or of a special minister appointed for the purpose. There is, besides, a privy council and a "senate," the successor of the old imperial "Medjliss," in which the subject races were and are represented, membership in which it would be difficult to define; but both the vizier, the *sheikh-ul-islam* and the leading pashas, with the heads of the six nations, sit in it. The remaining organization of the government needs no remark save that the polyglot character of the empire has given a disproportionate importance to the bureau of rescripts and translation, the *calamizeh*, and it has for fifty years furnished the ablest Ottoman administrators the few among their number enjoying special training. High appointments have, from time immemorial, been

made from among the personal attendants of the sultan and the pashas, caprice governing the selection. — Provincial administration in vilayets is committed to the wali, assisted by a *defterdar*, book-keeper, who has charge of the finances, a *mektoubji*, secretary, and subordinate officers. A local *medjliss* (council), including these officers, local dignitaries, the heads of the local Christian communities, and others, sits in each vilayet, and constitutes a popular body, whose influence varies with the vigor of the imperial administrator. The *sandjak* and *kaya* are each similarly organized. The governor of a vilayet is always, and the head of a *sandjak* is generally, known as a pasha. Down to mudirs, administrative officers are non-residents, and always Moslems, save where treaty regulations require Christian appointees in Lebanon and eastern Roumelia. Remnants of local self-government exist everywhere in the *medjliss*, the organization of villages, the management of internal affairs by particular wards or districts, many of the latter having enjoyed a rude autonomy from immemorial times. Trade-guilds, *esnafs*, in every city settle disputes and regulate trade customs, practically administering a very considerable body of commercial law. — Autonomous institutions, civil and ecclesiastical, are allowed to each Christian sect, and the Israelites. Turkish administration recognizes seven "nations" (*milleti*) or communities: the Greek, Armenian, Uniate Armenians, Latin (Catholic), Protestant, Bulgarian and Israelite. The first of these communities was organized by the *berat*, or writ of investiture, granted the Greek patriarch of Constantinople by Mahmoud II., in 1453. In 1875 the Bulgarian church, previously a part of the Greek church, was organized under an *exarch*. The Greek, Bulgarian and Armenian are national churches. The Uniate Armenians are a small body united in faith to the Roman Catholic church. The Latin church, besides lesser bodies, includes the Maronites of Lebanon and the Chaldeans of Gebel Tour and Mesopotamia. The Jacobite or Syrian church in the latter region has also of late years received civil recognition. Besides being ecclesiastical bodies, these sects all constitute civil corporations whose head is the spiritual primate only in the case of the Greek church and Uniate Armenians. The Protestants have a civil head, the Jews are represented by a chief rabbi, and the civil representative of the rest is the archbishop, resident at the metropolis, who in the Armenian church is also a patriarch. Each of these sects is organized for civil purposes, with a synod at the capital, and is divided into dioceses and parishes. Its authorities collect the capitation or military exemption tax (*kharadj*), and certain traditional dues for their own maintenance. Their courts regulate subjects usually under the jurisdiction of canon law, inflict punishments for petty offenses, and once settled all civil cases to which suitors of the same faith were parties. Where a village or town is composed of a single sect, the larger share of internal administration falls to the hands of its

authorities. The Protestant communities scattered over Turkey, the fruit of American missionary labor, are organized as democracies, with annual meetings for the election of officers. — Independent of all other branches of the government stands the seraglio, a state, not a domestic, institution, not merely the residence or the family of the sultan, for the Turkish empire has had no ruling family in the European sense, but the imperial household. Unlike most Moslem sovereigns, the early Turkish sultans recognized no distinction as wives and concubines between the women of their harem. The harem thus formed, probably a survival of ancient tribal practice, was reorganized after the conquest of Constantinople, under Byzantine influence. Its body-guard was uniformed in a dress copied from the Varangar garb, its chief posts were given to eunuchs, who first become conspicuous in Turkish affairs after this date, and the sacrosanct character of the Moslem harem received the protection of an elaborate and minute organization and ceremonial foreign to oriental ideas, but which has had an extraordinary power in consolidating and rendering permanent in influence palace intrigue. In the seraglio, the mother of the sultan, validè sultana, has taken the place of the empress in Byzantine history. Its chief functionary is the kishlar agha, chief of eunuchs, an officer whose personal relations with the sultan give him a rank next after the grand vizier, and an influence often transcending his. The commander of the household troops is generally the commander-in-chief of the army. Moslem succession and inheritance passing the oldest male of the family, collateral branches were in the earlier history of the reigning family carefully eliminated, thus keeping the succession in the direct line. During the last fifty years, this practice has been abandoned, and the succession has passed from brother to brother and uncle to nephew, while collateral lines begin to appear. The khans of Crimean Tartary, now the Russian Crimea, claim a descent from Othman, and are the only cadet branch of the royal family. The women of the seraglio during the last three centuries have been recruited from Circassian tribes, which have furnished the other leading harems of the capital. This circumstance has united the seraglio and the other great households in a web of feminine kindred, acquaintance and intrigue, often overlooked by the foreign observer, but deeply influencing the daily current of affairs. — *Finance.* The Turkish fisc has never lost the stamp of conquest. An oppressive octroi, imposed on all the traffic of walled cities, supports the charges of local government. Its rates vary, its amount is unknown; and while it is collected by imperial officers, the receipts are absorbed and expended in each province. The imperial government levies a kharadj, the capitation tax, on all Christian males for exemption from military service; tithes on all produce; the vergbi, a tribute or tax on produce or receipts, a quasi income tax; sheep tax; a tobacco *segie*, salt, stamp, excise, fish-

eries, registration, forests, with a large number of lesser taxes. Of these taxes the first three are early Moslem taxes, and the sheep tax is probably the survival of a tax levied by the khan in the pastoral stage of the tribes by which the empire was founded. It is still levied in theory, not as a tax on the sheep, but as rental for pasturage. The kharadj existed unchanged in name and character under the caliphate. Its average in 1883 was twenty-eight piasters, the levy per head varying from fifteen to sixty piasters. Collected at times by Turkish officers, koldjis, and again by the heads of subject communities, in 1834 and 1850 the duty of collecting this tax was, after a rude census, definitely made over to the authorities of each "nation." The vergbi appears to be derived from the inscribed tribute levied on conquered provinces by the caliphs, and is a tax on the income from real and personal property, varying greatly in amount in different provinces, and often falls upon property from which tithes are also collected. The tithes are a tenth in kind of all produce, collectible before a sale can be effected by the peasant or proprietor. By a privilege conferred by Constantine, confirmed by Mahmoud II., but in recent times modified, the inhabitants of the capital are free from taxation. Imperial taxes were farmed under the Byzantine government, and the practice was continued by the Turkish conquerors. In 1695, Mustafa II. extended the annual leases of the revenue to life grants. In the last fifty years the Turkish government has repeatedly assumed the immediate collection of its revenues, and as regularly let them again to meet present necessities, past extravagance, or to secure loans. — Expenditure, receipts and indebtedness are alike vague in Turkish finance. The unit of account is the piaster (4.4 cents, or 22½ centimes), a coin originally of the value of the Spanish dollar, which 200 years of depreciation have reduced to its present value. The Turkish lira, or pound (£T=100 piasters) is the usual unit in debt statements. At the opening of the Crimean war, the revenue of the empire, for a number of years, had fluctuated from £T6,500,000 to £T7,500,000. The expenditure, from this period until the financial collapse of the empire in 1874-5, was all of the revenue and as much more as could be raised by loans and the issue of a paper currency. At this time the nominal receipts were £T22,552,200, and the expenditure £T23,143,276, deficit £T591,076. The actual average receipts, 1872-6, were £T18,190,000. The paper budgets for 1880-81 (1295-6, H.) give the receipts as 1,615,584,000 piasters; expenditures, 1,914,876,359; deficit, 299,292,359 piasters. The items are as follows:

	RECEIPTS.	Piasters.
Land revenue tax.....	225,000,000
Exemptions from military service.....	46,000,000
Tithes.....	500,000,000
Customs.....	180,000,000
Sheep tax.....	165,000,000
Tobacco.....	100,000,000
Various receipts.....	96,983,000

Receipts—Continued.	
Real estate.....	5,900,000
Forests.....	6,070,000
Salt works and mines.....	72,309,000
Post.....	6,300,000
Telegraphs.....	15,700,000
Receipts from ministry of marine.....	36,505,000
Receipts from ministry of war.....	28,500,000
Ordnance.....	4,009,000
Sanitary administration.....	5,135,000
Tribute from Egypt.....	76,500,000
Tribute from Eastern Roumelia.....	24,000,000
Other tributes.....	13,372,000
Various products.....	8,991,000
Total Receipts.....	1,615,584,000

EXPENDITURES.	
Foreign debt.....	209,647,961
Domestic debt.....	39,812,441
Floating debt.....	241,863,946
Civil list appanage.....	86,497,324
Senate.....	2,406,019
Chamber of deputies.....	6,593,981
Council of state.....	1,890,400
Audit office.....	1,066,640
Prime minister and his personal accounts.....	2,291,364
Judicial.....	15,061,848
Restitutions.....	575,000
Administration.....	52,704,152
Prisons.....	8,790,680
Post and Telegraphs.....	24,959,098
Various expenses.....	619,300
Ministry of foreign affairs.....	19,810,232
Ministry of justice.....	32,809,850
Ministry of public instruction.....	8,100,093
Ministry of public works.....	10,330,004
Ministry of commerce and agriculture.....	15,163,720
Administration.....	25,212,359
Indirect contributions.....	36,631,640
Verghi.....	21,718,702
Sheep tithes and taxes.....	49,698,016
Ministry of war.....	536,304,944
Ministry of marine.....	81,154,650
Grand master of artillery.....	86,144,487
Religious endowments.....	33,573,414
Pensions and reliefs.....	62,552,851
Extraordinary expenses.....	1,703,915,116
Total Expenditures.....	1,914,876,359

Turkish budgets are, however, the vaguest approximations. The territory ceded in 1878 and 1881 returned 13 per cent. of the revenue of the empire. The rest has been greatly disorganized, and its revenue can not be placed at over £T16,313,006. Of this the tributes return (omitting Bulgaria) £T1,143,720, the six revenues ceded the bondholders, tobacco, salt, stamps, excise, fisheries and silk, £T1,983,416; and customs, £T1,992,800. The other leading items are: tithes, £T5,000,000; verghi, £T2,250,000; sheep, £T1,650,000; kharadj, £T460,000. Of the expenditures one-third has for some years gone to the army, the only branch of the government whose claims receive even partial attention. The "civil list," which is little more than the sultan's personal expenditure through the seraglio and other channels, has for years been from \$3,000,000 to \$4,000,000. — The Turkish debt shares the uncertainties of all Turkish finance. The standing army, organized by Mahmoud II. at the opening of the century, enabled the government to collect

taxes in all parts of the empire, and greatly increased the revenues. This met the enlarged expense of European reforms in the army; but at the opening of the Crimean war foreign loans began, and by 1875 these had reached a nominal capital of £240,000,000. Fourteen issues were made in this period, beginning at 80 and ending at 43½. One of £5,000,000 in 1855 was secured by the guarantee of France and England, and the tribute from Cyprus has been sequestered for its benefit by Great Britain, while the first, for £3,000,000, was secured by the Egyptian tribute, whose balance went to the loan of 1855. During the thirty years in which Turkey paid its interest, every conceivable expenditure was met by issuing current obligations; these were regularly consolidated, a foreign loan obtained at usurious rates, and the old process resumed. At home, forced loans in the shape of irredeemable paper money (caimés) were also raised. In 1875 the empire announced that for five years the interest would be paid, half in cash and half in 5 per cent. bonds. Interest ceased altogether before this period was over, and Turkey remained among the defaulting states until the iradé of Dec. 20, 1881, reduced the debt from a nominal capital of £252,801,885 to £106,437,234, and the interest to 4 per cent. Up to August, 1883, £63,149,663 of the consolidated debt had been reissued. The Turkish government proved reasonably faithful to its share of the agreement, but Servia, Bulgaria, Montenegro and Greece have failed to contribute to the share of the debt allotted to them. The revenues set apart to meet debt obligations yielded £T2,283,624 during the first fourteen months, Jan. 1, 1882 – Feb 28, 1883. Meanwhile the Turkish government has continued to add to its floating obligations, which, in August, 1883, were £T28,000,000. This is certain to precipitate another collapse, as the annual deficit is not less than £T7,000,000. — *Land Tenure.* The fee under Moslem law vests in the state. Upon conquest, believers, *i. e.*, converts to Islam, are allowed to retain occupancy of their lands (known as tithable) upon payment of a tenth of the produce; non-believers pay a tribute tax levied either on the soil or on the produce, and when originally inscribed varying from one-half to one-eighth. Lands held under these tenures have steadily diminished in amount, and constitute the only freehold estates known. They are divided into two classes, according to the character of the fee, whether complete (mulk) or charged with various burdens (memluk), and pay a tax on transfer or succession. Besides city freeholds, large estates of agricultural lands granted for special services or held by descent from local overlords belong to this class. A third class of freehold (mehkemé) arose apparently from judicial sequestration. This can be mortgaged by two witnesses, the other freehold only by registry. Waste lands revert to the state, and lands belonging to religious foundations, or devoted to civil uses, aqueducts, bridges, etc., pay no tithes. The first circumstance has resulted in the ownership of

large tracts by the state, and the second in the extensive transfer of realty to religious trusts, constituting vakouf lands. Estimates make three-fourths of the land in the empire of this character. While probably true of city realty, this is not true of agricultural lands, which are held in village ownership in all parts of the empire. The vakouf lands arise from two sources: state grants (sarai), and the transfers of private persons (kasamain). State grants are, in general, absolute and perpetual. Private transfers are of two classes: customary or stated (aadet), and legal (sheriah). The one is a nominal transfer, occupancy remaining in the grantor, the grantee receiving a ground rent, calculated, by a legal fiction, as interest on the purchase money, often also nominal. Upon the failure of male heirs in the direct male line, these grants revert to the mosque. The administration of vakouf property was assumed by Mahmoud II., but without obtaining the revenue anticipated. Repeated propositions to sequester the vakoufs have been made; but the government has never ventured further than plans. State lands consist chiefly of miri and waste (adiyet) lands. There are besides the private domain of the sultan, fiefs attached to particular offices, military fiefs, etc., most of which have reverted to the state and been added to the miri. This, which figures in all Turkish land schemes, is land whose revenue belongs to the public treasury. Large tracts of this land have been let from time to time, and much of it is held on perpetual leases, which are open to sale or inheritance, reverting to the state on the suspension of cultivation. Local customs greatly modify land tenure, and few definite statements are true of the entire empire. Land in Bulgaria and Roumelia is in small holdings, in Thrace and Macedonia in large estates. Village ownership obtains in southern Turkey in agricultural lands, as well as in many parts of Asia Minor and Armenia, where, however, the ownership of tracts by beys still extends over large areas. — *Trade, Tariff and Products.* Commerce with Christian nations was conducted in the sixteenth century under a 5 per cent. impost tax, which was reduced to 3 per cent. in behalf of England, and this capitulation was confirmed and extended in 1675 and in 1831. In 1861, commercial treaties with Great Britain and France, obtained by other nations, including the United States, placed export duties at 8 per cent., raised import duties from 5 to 8 per cent., and reduced the transit duties from 3 to 1 per cent. These treaties were denounced in 1883, the porte proposing to substitute specific for ad valorem duties—in no case higher than 20 per cent.—suppress transit duties, provide a warehouse system, and require all duties to be paid in gold. About one-fourth of the commerce of Turkey is with Great Britain. Turkish exports consist chiefly of grain, wool, opium and native manufactures. The exports and imports for a series of years are given in the following table:

YEARS.	Exports.	Imports.
	Piasters.	Piasters.
1873-74.....	207,621,881	445,576,303
1874-75.....	215,698,001	416,653,563
1875-76.....	241,129,046	390,824,124
1877.....		324,899,618
1878-79.....	1,069,488,742	828,586,480
1879-80.....	1,931,403,524	863,209,246

At Smyrna, the second seaport of the empire, one-third of the imports consist of domestics, of which two-thirds come from Great Britain. The remainder of the imports consist of miscellaneous manufactures. Of the exports, figs, opium, valonia, (acorns), black and red, and raisins, in nearly equal shares, make up one-half of the exports from year to year. Silk cocoons, sponges, wool and rugs constitute from 15 to 20 per cent. of the exports. — In 1876 the wheat crop of Turkey was placed at 80,000,000 bushels, and the total cereal crop at 100,000,000. The tobacco crop in 1875 was estimated at 77,880,000 pounds, and valued at \$5,985,600; and in 1881 the crop was placed at 82,500,000 pounds. One-half of this is grown in European Turkey, and by far the most valuable in Roumelia, in and about Cavala, Macedonia; nearly a fifth being in the latter district. The average production of attar of roses, nearly all of which is produced on the southern slope of the Balkans, is 3,470 pounds, the crop varying from 6,000 pounds in 1866, to 1,700 in 1872. The mohair (tiftik) clip in Angora was 35,000 bags in 1880 and 30,000 in 1881, about 6,000,000 pounds. The herds producing it are estimated at 600,000 head. The importance of Turkish products rests rather upon their possibilities, than their accomplishment. In grain, in wool, and in cotton, as well as in coal and copper, it is capable of adding heavily enough to the world product to make it a serious rival. — The mineral resources of Turkey are known to be large, but are practically untouched—the solitary exception being the copper mines of Arghana. By Turkish law all mines and mineral deposits are the property of the state, to which all land reverts on the discovery of mineral treasures. All grants of mines for working require their surrender to the state after a certain period, with plant and working tools complete. Work can be resumed only upon the purchase of the equipment from the government at a valuation fixed by the administration of mines, whose engineers add to the oppressive legal restrictions of the government the vexatious interference of half-educated men. The most important mineral deposits of Turkey are the coal fields of the Heraclea basin, on the Euxine coast of Asia Minor, 150 miles from the Bosphorus. They are 450 square miles in extent, estimated to contain 60,000,000 tons, and are probably much larger, as the Kooslov vein is from three to eighteen feet thickness, and worked with ease in horizontal runs. During the Crimean war this region supplied the allied fleet. Tests showed the coal bituminous, to be equal to Newcastle, free from

slag, and firing rapidly. At present 33,000 tons are raised annually, and delivered at Constantinople at \$4.08 per ton. Constantinople, in the six years 1875-80, imported 1,205,935 tons of coal from England. An extremely rich deposit of carbonate of copper at Kebban Maaden, in the Arghana district, north of Diarbekir, has been worked for centuries, and is still mined under government supervision, supplying interior Turkey with the copper universally used for domestic utensils. Chrome is mined at Dag Ardi, Brusa vilayet, and near Salonia, the average output in each place being 3,000 tons. Emery is mined near Smyrna, manganese near Trebizond, argenticiferous lead near Erzeroum, Akdar Maaden, in Castamuni, and near Kaiserizeh. Antimony is shipped in small quantities from Chios. Many other mineral deposits are known to exist, some of which were worked in ancient times, but none are now utilized. — *Transportation.* The roads of the empire are in a primitive state, but are in better condition in European than in Asiatic Turkey. In the latter a wheeled vehicle is rarely seen away from the coast, and the roads are tracks worn by caravans. The mail is carried on horseback by relays of horses after a system which has come down unchanged from the *cursus publica* of the Roman and Byzantine empire, and the *tezkerah*, or official permit to use these relays for private travel is analogous to the *diploma* issued under the Roman empire for the same purpose. During the French occupation a road was built from Beirut to Damascus, and a diligence line is run on it. Telegraph lines, 17,048 miles in length, connect the larger cities and the capital under government management. By special convention, the Anglo-Indian government leases for its own purposes a line connected with the land line and cable in the Persian gulf. — European Turkey contained, in 1881, 988 miles of railroad, built by the Oriental Railways company, at \$57,600 per mile, the capital of the company being \$158,400,000 nominal, the actual money value of the shares as allotted being 45 per cent. of their par value. The lines built and open for traffic since 1875, with the exception of the Banialuka and Doberlin, are as follows:

	Miles.
Constantinople & Bellova.....	351
Adrianople & Dedeagatch.....	92
Salonica & Mitrovitzka.....	226
Adrianople & Zamboli.....	115
Banialuka & Doberlin.....	64
Varna & Rutschuk.....	140
Total.....	988

Asiatic Turkey has 250½ miles of railroad, in three lines, of which the first and most important was built by an English company at a cost of \$10,665,675. It is (1883) being extended to Sevdikini, 38 miles. These lines are as follows, the last being government property:

	Miles.
Smyrna & Aidin, and branches.....	83
Smyrna & Cassaba, and branches.....	106
Scutari & Ismidit, and branches.....	59½
Total.....	250½

Constantinople contains 13½ miles of tramways (city horse railroads), and they are to be found in Smyrna, Sidon, Jaffa and other cities. — *History.* The Turkish empire arose in western Asia Minor, and had nearly reached the western limits of its European conquest before it moved eastward. The first signs of the empire appeared in the ebb of the invasions of Genghis Khan and his sons, whose advance seems to have received a check on the plateau of Asia Minor, after having swept away the minor Seljuk sultanats which divided between them what is now Asiatic Turkey. It is still doubtful whether Ertogul, the father of Othman, founder of the line, is more than a tribal hero, and the legends which assign Othman a Commenian ancestor in Byzantine story, and trace his descent from the tribal progenitor in central Asia, Kara Koum, probably express the historic fact that a rule of Tartar origin, arising in a tribe which for at least 200 years had been familiar with the civilization of Asia Minor, took its earliest form under Byzantine influence. In Turkish history Ertogul is the tribal hero, Othman (1299-1326) the founder, and Orkhan (1326-60) the organizer of the new monarchy. His tent-door became the sublime porte, his army was made up of a disciplined infantry and an enrolled cavalry, not a feudal militia. Orkhan crossed the Bosphorus, and the Turkish rule was established in its present European limits by the battle of Kassova (1356), when the defeat of Bajazet I. (1389-1402), on his eastern frontier, midway in Asia Minor, by Tamerlane, would have destroyed the Turkish empire had it been an Asiatic power. In the next three reigns, the power of the empire was further extended in Europe, and crowned by the conquest of Constantinople (1453) by Mohammed II. (1451-81). — The oriental conquests of Selim I. (1512-20) and the assumption of the title of caliph carried the empire to its present Asiatic limits, and worked a profound change in its character. The next of the line, Suleiman I. (1520-66), the lawgiver of the dynasty, showed this at every turn. His mosques were Arab mosques, his code was drawn by an Aleppan, and the reorganization of the empire showed like influences. The Turkish rule was now at its widest, extended and stretched from northern Hungary to central Persia, from southern Russia to Egypt. The Turkish infantry remained the best in Europe; but Lepanto (1571) showed that its fleet was weak, and it never regained full mastery of the sea, although it still acquired one island after another, Murad IV. (1623-40) falling between weak and brutal sultans (1574-1623), and a drunkard, Ibrahim (1640-49) gave Turkey its last eastern conquests, reaching Tabreez. The fortunes of the empire were again retrieved in Europe by the able succession of Köprülü viziers (1646-90), but no personal ability could prevent the consequences of a disaster like the siege of Vienna (1683), and the peace of Carlowitz (1703) definitely closed the era of Turkish conquest. — Through the middle of the eighteenth century, Mahmoud I. (1730-54) deferred the ad-

vance of Russia by an alliance with France and western Europe, as Abdul Medjid (1839-61) did through the middle of the nineteenth century. Catharine II. resumed the Russian advance in the last century, and the peace of Kutchuk Kai Nardji (1774) and Jassy (1792) established the dependent position of Turkey. Mahmoud II. (1808-39) gave the empire a new lease of life by organizing a standing army, which enabled the empire to reconquer its Asiatic possessions, parceled among overlords who owned a slight allegiance. With the exception of Ibrahim Pasha, no oriental rebel has since been able to hold his own against the sultan. Against Europe, the porte remained powerless. The revolt of Greece (1821-9), Servia (1815-29), Roumania (1861), the treaty of Adrianople (1833), and other successive treaties, ending with the treaty of Berlin (1878), have reduced the empire to its present limits.

TALCOTT WILLIAMS.

TYLER, John, president of the United States 1841-5, was born in Charles City county, Va., March 29, 1790, and died at Richmond, Va., Jan. 17, 1862. He was graduated at William and Mary college in 1806, was admitted to the bar in 1809, and served in the state legislature 1811-16 and 1823-5, in the house of representatives 1816-21, as governor 1825-7, and as United States senator 1827-36. All this time he had belonged to the extreme southern state-sovereignty school of politicians, and had quarreled with Jackson when the latter had undertaken to suppress nullification (see that title) in South Carolina. With the rest of this school he went into the conglomeration of factions, which, about 1836, took the name of the whig party (see that title), and in the election of that year received 47 votes for vice-president. In 1840 he was nominated for the vice-presidency by the
