whigs, for a double reason: he was a pronounced adherent of Clay, whom Harrison had defeated for the presidency; and he was also a pronounced believer in state sovereignty, so that his nomination would gratify the nullification wing of the party. Harrison's sudden death left the whigs in control of congress, but without the two-thirds majority necessary to override the vetoes of a president who was far more closely in sympathy with the democratic party than with that to which he nominally belonged. The result was an almost immediate quarrel between the new president and his party, which was never healed. (See WHIG PARTY, II.; DEMOCRATIC PARTY, IV.; BANK CONTROVERSIES, IV.; TARIFFS; INDEPENDENT TREASURY; INTERNAL IMPROVEMENT; CENSURES; CORPORAL'S GUARD.) Some little effort was made at the end of his term of office to give him the democratic, or an independent, nomination for a new term; but it was a failure, and he retired from politics in 1845, having completed the annexation of Texas. (See ANNEXATIONS, III.) In 1861 he reappeared as president of the peace congress at Washington. (See CONFERENCE, PEACE.) On the outbreak of hostilities he became an ardent secessionist, and was a delegate from Virginia in the confederate congress until his death.—See Abbott's *Lives of the Presidents*, 274; Wise's *Seven Decades of the Union*. For the democratic view of his administration, see 2 Benton's *Thirty Years' View*, 211-631; 11 *Democratic Review*, 502 (at the beginning of his term); 16 *Democratic Review*, 211 (at the end). For the whig view, see Botts' *History of the Rebellion*, 75; 1 *Whig Review*, 334; 2 Colton's *Life and Times of Clay*, 355; Clay's *Private Correspondence*, 455-480. The most exact account is in 2 Von Holst's *United States*, 406. Tyler's messages are in 2 *Statesman's Manual*, 1337.

ALEXANDER JOHNSTON.

U

UNION, The (IN U. S. HISTORY), the title by which the national life of the United States of America is commonly expressed. The title necessarily implies that which is the unanimous choice of the American people, a federal system of states. It would not necessarily exclude the idea of secession, since a union may be either voluntary or involuntary; but it is notorious matter of history that the American Union was not voluntary, that it was compelled by the same pressure of common interests which still and more strongly holds it together, and that it therefore does exclude the idea of secession. (See NATION, STATE SOVEREIGNTY.)—The "Roman peace," which was enforced by the great republic and empire of ancient times around the Mediterranean, did not exclude exactions by proconsuls, to which an open war would sometimes have been preferable. The *Pax Americana*, which the Union enforces

upon the great and growing states of central North America, has no such drawbacks, and has been one great secret of the national prosperity. The great state of New York, stronger already in population than Sweden, Portugal, the Dominion of Canada, or any South American state, except Brazil, is surrounded by smaller states, Vermont, Connecticut, New Jersey, Delaware. But these last have no anxieties: no standing armies breed taxes and hinder labor; no wars or rumors of wars interrupt trade; there is not only profound peace, but profound security, for the *Pax Americana* of the Union broods over all. It seems probable that the steady doubling of population of the United States will, within the next century, force upon the states of Europe some similar or separately developed union for the same purpose. The free trade which is one of the benefits of the American Union, would then have a larger juris-

diction. Perhaps the poet's dream of "the parliament of man, the federation of the world," is not an impossibility; and that with it will come the era of universal peace and universal free trade.

UNION PARTY. (See REPUBLICAN PARTY.)

UNITED STATES NOTES. A brief sketch in reference to the bills of credit or treasury notes, issued by the government, by the colonies, and of the circulating notes issued by the banks previous to the adoption of the constitution, is given in the article on "Banking in the United States," in the first volume of this Cyclopædia. The committee appointed by the federal convention held in Philadelphia on May 14, 1787, reported, on Aug. 6, a draft of the constitution, which contained, in article thirteen, a clause giving qualified authority to the states to issue paper money, as follows: "No state without the consent of the legislature of the United States shall emit bills of credit, or make anything but specie a tender in payment of debt." This clause, after discussion, was finally so amended as to read as follows: "No state shall coin money; emit bills of credit, make anything but gold and silver coin a tender in payment of debts."—The eighth clause of the first section of the seventh article of the constitution as presented for the consideration of the convention, provided that "the legislature of the United States shall have power to borrow money, and emit bills on the credit of the United States." This clause, as embodied in the eighth section of the first article of the constitution as finally adopted, reads, "The congress shall have power to borrow money on the credit of the United States." The debate* on the question of striking out the words "and emit bills," is given in full for the reason that the subject of making bills of credit issued by the government a legal tender, is here for the first time discussed, and was not subsequently at any time, as far as I am aware, discussed at any length by congress, though it was twice presented for their consideration, until the legal-tender acts of 1862 were brought before congress for its consideration. "Mr. Gouverneur Morris moved to strike out, 'and emit bills on the credit of the United States.' If the United States had credit, such bills would be unnecessary; if they had not, unjust and useless. Mr. Butler seconds the motion. Mr. Madison: Will it not be sufficient to prohibit the making them a tender? This will remove the temptation to emit them with unjust views. And promissory notes, in that shape, may in some emergencies be best. Mr. Gouverneur Morris: Striking out the words will leave room still for notes of a responsible minister, which will do all the good without the mischief. The moneyed interest will oppose the plan of government, if paper emissions be not prohibited. Mr. Gorham was for striking out without inserting any prohibition. If the words stand, they may suggest

* Madison papers, vol. iii., p. 1343.

and lead to the measure. Mr. Mason had doubts on the subject. Congress, he thought, would not have the power, unless it were expressed. Though he had a mortal hatred to paper money, yet as he could not foresee all emergencies, he was unwilling to tie the hands of the legislature. He observed that the late war could not have been carried on, had such a prohibition existed. Mr. Gorham: The power, as far as it will be necessary or safe, is involved in that of borrowing. Mr. Mercer was a friend to paper money, though in the present state and temper of America, he should neither propose nor approve of such a measure. He was consequently opposed to a prohibition of it altogether. It will stamp suspicion on the government, to deny it a discretion on this point. It was impolitic, also, to excite the opposition of all those who were friends to paper money. The people of property would be sure to be on the side of the plan, and it was impolitic to purchase their further attachment with the loss of the opposite class of citizens. Mr. Ellsworth thought this a favorable moment to shut and bar the door against paper money. The mischiefs of the various experiments which had been made were now fresh in the public mind, and had excited the disgust of all the respectable part of America. By withholding the power from the new government, more friends of influence would be gained to it than by almost anything else. Paper money can in no case be necessary. Give the government credit, and other resources will offer. The power may do harm, never good. Mr. Randolph, notwithstanding his antipathy to paper money, could not agree to strike out the words, as he could not foresee all the occasions that might arise. Mr. Wilson: It will have a most salutary influence on the credit of the United States to remove the possibility of paper money. This expedient can never succeed while its mischiefs are remembered. And as long as it can be resorted to, it will be a bar to other resources. Mr. Butler remarked that paper was a legal tender in no country in Europe. He was urgent for disarming the government of such a power. Mr. Mason was still averse to tying the hands of the legislature altogether. If there was no example in Europe, as just remarked, it might be observed, on the other side, that there was none in which the government was restrained on this head. Mr. Read thought the words, if not struck out, would be as alarming as the mark of the beast in Revelation. Mr. Langdon had rather reject the whole plan than retain the three words, 'and emit bills.' On the motion for striking out, New Hampshire, Massachusetts, Connecticut, Pennsylvania, Delaware, Virginia, North Carolina, South Carolina, Georgia, *aye*—9; New Jersey, Maryland, *no*—2. The clause for borrowing money was agreed to, *nem. con.* Adjourned."—Nine states voted to strike out, and two states to retain. Virginia voted in the affirmative, and in explanation of his vote, Mr. Madison appended the following note: "This vote in the affirmative by Virginia was oc-

casioned by the acquiescence of Mr. Madison, who became satisfied that striking out the words would not disable the government from the use of public notes as far as they could be safe and proper: and would only cut off the pretext for a *paper currency*, and particularly for making the bills a *tender* either for public or private debts."—The constitution was adopted on Sept. 17, 1787, and three years thereafter, Hamilton, in his report of Dec. 13, 1790, on a national bank, said: "The emitting of paper money by the authority of government is wisely prohibited to the individual states by the national constitution; and the spirit of that prohibition ought not to be disregarded by the government of the United States. Though paper emissions, under a general authority, might have some advantages not applicable, and be free from some disadvantages which are applicable, to the like emissions by the states separately, yet they are of a nature so liable to abuse—and, it may even be affirmed, so certain of being abused—that the wisdom of the government will be shown in never trusting itself with the use of so seducing and dangerous an expedient."—Although notes of different forms were issued subsequently by the government at various dates, some of which were receivable for all dues payable to the government, no circulating notes were issued, which by the terms of law were made a full legal tender until the passage of the act of Feb. 25, 1862, which was nearly seventy-five years after the adoption of the constitution. — Some of the treasury notes, issued since the adoption of the constitution, and previous to the passage of the legal-tender act, were receivable for all dues to the government, and others not: some were payable at a fixed date, both with and without interest: some were fundable at any time after the date of their issue, others at a fixed date in United States bonds. — During the late civil war, treasury notes were also issued of all these different forms, and also notes payable on demand, receivable for all dues to the government, and others payable on demand, not receivable for duties on imports, or payable by the government for interest upon the public debt, but in every other respect a full legal tender to and by the government, and between the people in all payments. — No notes were issued from 1789 to 1812, a period of twenty-three years. Such notes were issued in the years 1812, 1813, 1814 and 1815, and at various dates from 1837 to 1847. They were again issued in 1857, and subsequently, in the years 1860, 1861 and thereafter. The periods for the issue of these notes may be summarized as follows: first, the war of 1812; second, the financial panic of 1837; third, the Mexican war; fourth, the financial crisis of 1857; and fifth, the war of the rebellion. It will thus be seen that there have been five emergencies in which congress, without any special constitutional authority, has seen fit to authorize such issues. The original debt had, at the beginning of 1812, been reduced from seventy-five millions to forty-five millions. — **TREASURY NOTES OF THE WAR OF 1812.** In 1810 it was found im-

possible to meet all of the annual reduction of the debt required by law from the sinking fund, and a temporary loan was authorized to make up the deficiency, which amounted to \$2,750,000. This loan was paid the next year. In 1811, however, recourse was had to a loan, and the one authorized by congress for that year was taken so slowly, that, in May, the secretary for the first time recommended the issue of treasury notes upon the following principle, viz.: "1. Not to exceed, in the whole, the amount which may ultimately not be subscribed to the loan: that is to say, that the amount received on account of the loan, and that of the treasury notes, shall not, together, exceed eleven millions; which limits, therefore, the greatest possible amount of treasury notes to less than \$4,900,000. 2. To bear an interest of 5½ per cent. a year, equal to 1½ per cent. per day on a hundred dollar note. 3. To become payable by the treasury one year after the date of their respective issues. 4. To be, in the meanwhile, receivable in payment of all duties, taxes, or debts, due to the United States." He did not propose that the notes should be fundable in the loan which they were intended to re-enforce. This recommendation of Secretary Gallatin was made in his letter of May 14, 1812, to Mr. Langdon Cheves, chairman of the committee of ways and means of the house, and, in conformity therewith, a bill was reported by that committee on June 12, 1812. — War was declared against Great Britain June 18, 1812. The failure of the loan was due to the fact that the money had to be borrowed from the very classes who had been opposed to the war: therefore, when the bill for authorizing treasury notes was put upon its passage on June 16, it met with much opposition. — It was argued, that the notes under the bill were not equal in value to gold and silver, and would not be received by the banks or the people, who were prejudiced against such government paper; that if issued they could not be redeemed, and would depreciate; that the measure would be subversive of public and private credit; that it was a confession of impaired credit; that to allow the notes to be deposited in banks and to accept bank paper in exchange was to depreciate the government's paper; that if issued, additional taxes should be imposed and set apart for the redemption of the notes, as in the case of the English exchequer notes; that the proposed notes were the same as the old continental money, and would depreciate in the same way. Others opposed the bill simply because they opposed the war or any preparation for it. In case war proved unavoidable the necessary funds should be raised by taxes and loans. The shortness of the time for which the notes were to be issued, was another objection. The public revenues would not meet the engagement, and engagements should not be entered into without a certainty of fulfillment. Taxes were necessary. It was a paltry expedient never suggested by Hamilton or Wolcott, and not even the spontaneous production of Gallatin; that the first

suggestion of the latter was to authorize a loan on such terms as would have insured its success. It was a humiliating spectacle to exhibit the government failing in negotiating its first war loan. — On the other hand, the supporters of the bill maintained that the notes would be received by the banks in the same manner as any good individual paper was received. The banks would give the government credit for them, and in return the government could draw gold and silver from the banks. The notes would be even more valuable to the latter than specie, as they could be kept as an interest-bearing reserve. They would have currency, being receivable in duties, taxes, and debts due the government, and, as interest accumulated, they would increase in value. In reply to the suggestions that money should be raised by taxes, it was stated, that when, previously, measures of that kind had been proposed, the opposition had refused to consent. The issue of treasury notes, bearing interest at $5\frac{1}{2}$ per cent. only, did not indicate bad, but rather good, credit. Individuals in good credit could not borrow at less than 6 per cent. There was no depreciation of government paper in exchanging the notes for bank paper, as the latter was ready money, while the former were payable one year after date. It was denied that the people had or would have any prejudice against treasury notes. They were not prejudiced against bank notes, and the proposed notes bearing interest had many advantages over bank paper. The proposed notes would be in no way inferior to exchequer bills: in fact, it was only want of credit that compelled the English government to set aside certain revenues to meet the latter. The treasury notes would have two advantages over exchequer bills; one, the superior credit of the United States; and the other, that they were receivable for taxes and public dues. They were also superior to public stocks, in that, while bearing interest, they also can serve as currency, the same as gold and silver, thus enhancing the medium of circulation. There was no resemblance between them and continental money. When the latter was issued, the government was dependent on the pledges of the several states for its revenues, but now its credit was above suspicion, its power to raise revenue complete, and its ability to pay its debts undoubted. War was unavoidable. Both loans and taxes would have to be resorted to. The proposed notes were nothing but a loan with extraordinary advantages, taking, however, but little from the circulating medium of the country. In many transactions they would have all the effect of money. While not secured by any specific fund set apart for their redemption, the entire duties and taxes of the year are indirectly pledged for this purpose, since they are receivable in payment of such duties and taxes. The revenues of the year were estimated at eight millions, and the proposed issue of notes was five millions only. The faith of the government was pledged for their redemption. That faith had never been violated. The resources of the government

were ample beyond those of any other nation. Its sources of revenue were unimproved land, a productive agriculture, an extensive commerce, an enterprising people, and an unlimited right of taxation. The anticipated abuse of a privilege was no argument against its legitimate use. — The bill passed the house June 17, 1812, yeas 85, nays 41. It passed the senate June 26, and became a law June 30, 1812. By it the president was authorized to issue treasury notes to an amount not exceeding \$5,000,000. The notes were redeemable, at such places as were expressed on them, within one year of the date of their issue. They bore interest at the rate of $5\frac{1}{2}$ per cent. per annum from the day of issue, being one and one-half cents a day on a hundred dollar note, payable at the place where the principal was payable. They were signed by persons designated by the president, and the compensation of these persons was fixed at one dollar and twenty-five cents each for one hundred notes signed. They were countersigned by the commissioners of loans for the state in which the notes were respectively made payable. With the approval of the president, the secretary of the treasury was authorized to borrow money upon the security of the notes, and to pay them to such banks as would give the government credit for them at par. When the notes were paid to collectors of revenue and receivers of public money, the interest ceased on the day of payment. The commissioners of the sinking fund were authorized to cause the principal and interest to be paid when due, and to purchase them at not more than par, in the same way as they purchased other public securities, with a view of reducing the debt. They were made payable to order, transferable by delivery and assignment on indorsement by persons to whose order they were made payable. — The notes were made everywhere receivable for duties, taxes, and in payment of public land, at their par value with accrued interest on the day paid in. Penalties were imposed for counterfeiting them, and an appropriation made for the expense of printing and preparing the notes. — There was nothing in the law regulating the denominations in which they should be issued, but, as a matter of fact, none were issued of a denomination of less than one hundred dollars. — The largest amount authorized under this act, outstanding at any one time, was five millions. The notes authorized were all issued before the end of the year 1813, and were all redeemed during the year 1814. The secretary estimated that there would be a deficit of nineteen millions for the year 1813. Congress authorized sixteen millions of this amount to be obtained by loans, without the usual provision that the bonds should be sold at par, or specifying the rate of interest. The loan was placed with great difficulty, the sixteen millions authorized being obtained from the avails of \$18,109,377.43 of stock, bearing interest at 6 per cent. To supply the remainder, a bill was introduced into the house on Jan. 27, 1813, to authorize a new issue of treas-

ury notes. The bill was similar in its provisions to the act of 1812: the arguments for and against the measure, were, in the main, the same as those in 1812. The opposition complained that much favoritism had been shown in the dealings of the banks. It was alleged that among the banks granting credit, in return for the treasury notes deposited, as authorized by the law of 1812, were those acting as depositaries of public moneys derived from the deposits of collectors and public agents; that this very money so deposited by the government agents was again loaned to the government on the credit of treasury notes. On the other hand, it was urged that the use of banks as depositaries was unavoidable, and that, in any event, banks would receive incidental benefit from keeping government deposits. Even if a stock loan was substituted for treasury notes the money realized therefrom would be deposited with the same banks until required by the government. The bill passed the house by a vote of 79 to 41, and the senate by a vote of 17 to 9, and became a law on Feb. 25, 1813. — The greatest amount of notes authorized by this act, outstanding at any one time, was five millions: they were all redeemable by the first quarter of the calendar year of 1815, but at the close of that quarter only \$1,483,900 had been redeemed, and all of the remainder was not finally paid until the year 1820, although the greatest portion was called in by 1817. They were issued in denominations of not less than \$100. An act similar in all respects to that of Feb. 25, 1813, passed the house by vote of 83 to 48, and the senate without debate, on March 1, and was approved March 4, 1814. It authorized the issue of five millions of treasury notes, and of an additional five millions, which, if issued, was to be considered as part of a stock loan for the year, which was subsequently to be authorized. This loan for twenty-five millions was authorized on March 24 of the same year, and could only be placed at a large discount. An additional five millions was therefore issued in place of an equal amount of stock, making in all ten millions of treasury notes issued under this act. These notes were for the first time issued in denominations of less than \$100, notes of the denomination of twenty dollars being placed in circulation. The whole ten millions were issued previous to June 30, 1815. The policy of congress seemed to be to keep the authorized issue of treasury notes each year below the amount of the revenue of the year, or, if more was authorized, they were to be in lieu of, and to re-enforce, stock loans. — On Dec. 26, 1814, an act was passed which authorized the issue of \$7,500,000 of treasury notes in place of portions of the loans of March 24 and Nov. 15 not already placed, and three millions more for the expenses of the war department. These notes bore the same rate of interest and were for the same time as those of the act of June 30, 1812, and under this act, \$8,318,400 of notes were issued, a portion of which was in the denominations of twenties and fifties. — On Aug. 31, 1814,

specie payments were suspended except in New England. The accounts of the treasury department show that there were outstanding on Sept. 30, 1814, \$10,649,800 of treasury notes. Mr. Crawford was succeeded in October by Secretary Dallas, and the latter, in his report to the committee of ways and means on Oct. 17, 1814, says: "The condition of the circulating medium presents another copious source of mischief and embarrassment. The stock of specie was diminished by exportation, and would remain so withdrawn from use. The multiplication of banks had increased the paper currency so that it was difficult to calculate its amount, and still more difficult to ascertain its value. Bank currency was of no benefit since the suspension of specie payments, and there virtually existed no circulating medium common to all the citizens of the United States. The money transactions of private individuals were at a stand, and the fiscal obligations of the government labored with extreme inconvenience. Under favorable circumstances, the limited issue of treasury notes would probably afford relief, but they were an expensive substitution for coin or bank notes." He concluded by recommending the establishment of a national bank. This statement was called out by a report made by Mr. Eppes, chairman of the committee of ways and means of the house, on Oct. 10, 1814, in which, in order to secure the circulation of treasury notes, it was recommended that notes of small denominations should be issued, to be funded into 8 per cent. stock, payable to bearer, and transferred by delivery, receivable in all payments of public lands and taxes. The internal revenue taxes were to be pledged for payment of interest, and they were to be exchangeable for stock at 8 per cent, or redeemable in specie after six months' notice from the government. On Nov. 24, 1814, in a report to the committee to which a bill for establishing a national bank had been referred, Mr. Dallas mentions, as one of the means at the disposal of the treasury, the issue of treasury notes, "which none but necessitous creditors, contractors in distress or government agents acting officially were willing to accept." He also states that the act of Nov. 15, 1814, authorizing treasury notes to be taken in payment for subscriptions to loans, was passed too late; that the interest on the public debt had not been punctually paid, and that a large amount of treasury notes had already been dishonored. In a subsequent communication of Dec. 14, 1814, he said that the non-payment of treasury notes, and the risk of not paying the interest on the funded debt, were chiefly owing to the suspension of specie payments by the banks, and the consequent impracticability of transferring public funds from the place where they were deposited to the place where they were needed. The difficulty referred to in meeting the interest upon the public debt was in Boston. A state bank had large government deposits, and a draft was sent to meet the interest, upon Oct. 1, 1814. The state bank declined paying in coin or bank

notes, and the creditors refused to receive the treasury notes that were offered instead. After the suspension, the government was deprived of the use of specie, and as the banks in each state refused credit and circulation to the notes of banks in other states, no transfer of funds could be made to places where they were wanted to meet treasury notes: consequently the credit of these notes was lessened, and creditors refused to accept them in payment. On Nov. 12, 1814, Mr. Hall, of Georgia, introduced in the house a series of five resolutions to revive the credit of treasury notes. The second resolution provided that the notes should be a legal tender between citizens, and between citizens and foreigners, for all debts then due or afterward to become due, which the house refused

to consider by a vote of 95 to 42—more than two-thirds. These resolutions were evidently introduced as measures in opposition to the proposition for a national bank, and the other four resolutions were subsequently laid upon the table by a large majority.— On Jan. 30, 1815, a bill authorizing the issue of treasury notes was introduced in the house, and referred to a committee of the whole. The bill passed the house Feb. 11, and the senate Feb. 21, and was approved Feb. 24, 1815; it was the last of a series of five acts, commencing with that of June 30, 1812, the first four of which had authorized the issue of treasury notes bearing interest at the rate of $5\frac{1}{2}$ per cent. The following is the form of the large notes issued under this act :

ONE HUNDRED DOLLARS	ONE HUNDRED.	100	A. N. 1782.	<p><i>100. United States Treasury Department.</i> October 1, 1815.</p> <p style="text-align: right;">DESIGN</p> <p><i>The United States promise to receive this note for One Hundred Dollars, with interest from the date hereof at 5 & $\frac{1}{2}$ per cent per annum, in all payments to them, or to issue, on demand six per cent stock, for the principal and interest thereof to Joseph Delafield, or order, agreeably to the Act of Congress of the 24th of February 1815.</i></p> <p style="text-align: center;">Interest per day $1\frac{1}{2}$ cents " per month 45 cents " per year \$ 5.40 cents</p> <p style="text-align: center;">E Pluribus Unum</p> <p>Countersigned: <i>T. D. T. Tucker</i> Treasurer</p> <p style="text-align: right;"><i>Samuel Clarke</i> <i>Earnest Fox</i></p> <p style="text-align: right; font-size: small;">In behalf of the United States</p> <p style="text-align: center;">DESIGN</p>	100	ONE HUNDRED.	ONE HUNDRED DOLLARS
---------------------	--------------	-----	-------------	---	-----	--------------	---------------------

Endorsed on the back: "Pay the bearer, Jos. Delafield."

This act authorized the issue and reissue of treasury notes to an amount not exceeding twenty-five millions upon principles essentially different from those governing prior issues. These notes might be of any denomination: if of a denomination less than \$100, they were designated as "small

treasury notes," were payable to bearer, and bore no interest; if of a denomination of \$100 or upward, they were payable to order, transferable by indorsement, and bore interest at the same rate as those of \$100 and upward previously authorized. The "small treasury notes" were of this form:

FIVE DOLLARS.	FIVE DOLLARS.	5	N ^o 8483. E Pluribus Unum.	<p><i>5. Receivable everywhere by the United States.</i> <i>in payment of duties, taxes and public lands.</i></p> <p style="text-align: right;">DESIGN</p> <p style="text-align: center;">Treasury Department</p> <p style="text-align: right;">March 25 1815.</p> <p><i>The United States promise to receive this note for Five Dollars in all payments to them or to fund the amount at seven per cent interest, on request, agreeably to the Act of Congress February 24, 1815.</i></p> <p>Countersigned: Register of the <i>Joseph House, Treasury.</i></p> <p style="text-align: right;"><i>J. W. McLeary</i> In behalf of the <i>C. A. Cobville, United States.</i></p>	5	FIVE DOLLARS.	FIVE DOLLARS.
---------------	---------------	---	---------------------------------------	---	---	---------------	---------------

These notes were not chargeable upon the sinking fund, as in the case of the first three acts of the series, nor were they payable out of any money in the treasury not otherwise appropriated, as in the previous act of Dec. 26, 1814, but rested entirely upon the provision making them fundable into stock. The principal and interest were not payable at any specified time, but the notes were everywhere receivable in all payments to the United States. The act reduced the pay of those signing the notes to seventy-five cents for each one hundred notes, and also provided that treasury notes of previous issue should be fundable into 6 per cent. stock. The holders of the small treasury notes could exchange them at pleasure, in sums of not less than \$100, for certificates of funded stock bearing interest at 7 per cent. The treaty of peace was signed on Dec. 14, 1814, but the news reached Washington a few days only before the passage of the bill, which, although a war measure, was carried through, inasmuch as it was considered necessary to the regulation of the disordered finances of the country. The whole amount of treasury notes, absolute and contingent, which was authorized by these five acts, was \$60,500,000, of which amount \$36,680,794 was issued. The following table exhibits the amount issued under each act :

Under act of June 20, 1812.....	\$ 5,000,000
Under act of Feb. 25, 1813.....	5,000,000
Under act of March 4, 1814.....	10,000,000
Under act of Dec. 26, 1814.....	8,318,400
Under act of Feb. 24, 1815—\$100 notes..	\$4,969,400
Under act of Feb. 24, 1815—small treasury notes.....	3,392,994
	8,362,394
Total amount issued.....	\$ 36,680,794

— Although the treasury notes of 1815 of small denominations originally issued, amounted to only \$3,392,994, the law made them fundable into 7 per cent. stock, payable after Dec. 31; and as the notes were reissuable, they were, under various exigencies, again and again paid out, until the whole amount of the 7 per cent. stock, issued for the purpose of funding them, amounted to \$9,070,386. On account of the high rate of interest of these bonds, the small treasury notes were in demand, and a small amount was sold at a premium of 4 per cent., and \$1,365,000 at a premium of \$32,107.64, or about 2½ per cent. The secretary, in his annual report for 1815, says: "The treasury notes, which were issued under act passed previous to Feb. 24, 1815, were, for the most part, of a denomination too high to serve as a current medium of exchange; and it was soon ascertained that the small treasury notes, fundable at an interest of 7 per cent., though of a convenient denomination for common use, would be converted into stock almost as soon as they were issued."* The notes of \$100 and upward, though fundable into 6 per cent. bonds, were depreciated from 8 to 10 per cent. below bank notes, which bore no interest, but were redeemable in specie. —

* Report of the Secretary of the Treasury, 1815, p. 26.

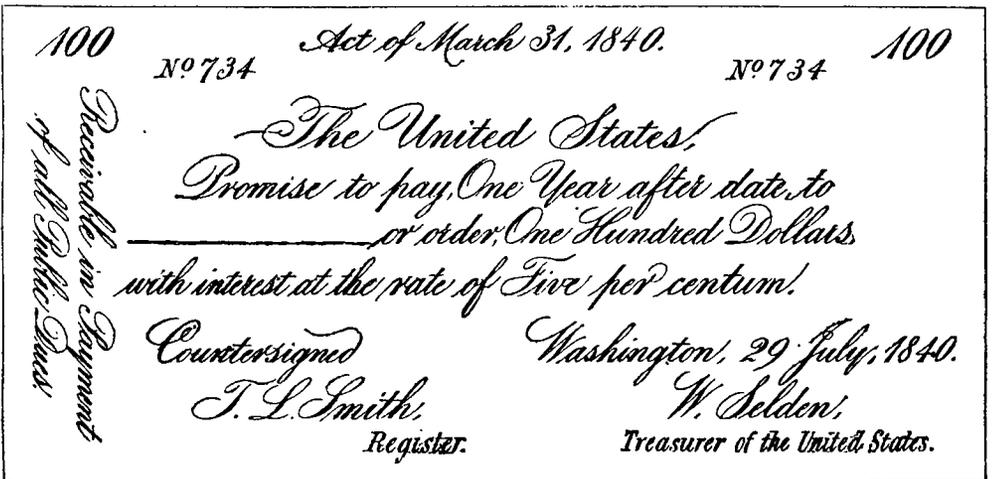

In recapitulation, it may be stated that the treasury notes of the period of the war of 1812 were issued under five acts of congress, as stated in the table. The notes of the first three acts were made chargeable to the sinking fund—those of the last two, not; those of the first two acts were in denominations of not less than \$100; those of the next two were not less than \$20; and those of the last act were in denominations of 3, 5, 10, 20, 50, 100 dollars and upward. Those of the first three acts were not originally fundable into stock, but were made so by the act of Nov. 15, 1814, and by the subsequent act of Feb. 24, 1815. The notes of the acts of Dec. 26, 1814, became fundable by the act of Feb. 24, 1815, but those of the last-named act were fundable by the terms of their authorization. The notes of all the acts but the last were made payable one year from the date of their issue; those of the last act were payable at no fixed date. All of these notes (with the exception of the small treasury notes, which were without interest) bore interest at the rate of 5½ per cent. None of these notes had any legal-tender quality, and congress, without debate, rejected the only proposition for giving them this quality. The denominations, except in the case of the small notes of 1815, were too large for purposes of circulation, and the inducements for funding these were so great that they could not be used for that purpose. As long as the banks redeemed their notes in specie, treasury notes appear to have kept at par, but when specie payments were suspended, they began to depreciate, and appear to have been kept from great discount by the funding acts of Nov. 25, and Feb. 24, 1815. It is said, "that of eighty millions of loans negotiated by the government during this period, the avails were only thirty-four millions, after deducting discounts and depreciations." (See FINANCE.) After the close of the war, in December, 1814, these notes were rapidly funded. — TREASURY NOTES OF THE PERIOD OF THE FINANCIAL CRISIS OF 1837. In anticipation of a large surplus, congress, by act of June 23, 1836, provided for the distribution of a large amount of government money among the states in proportion to their representation in the senate and house of representatives, and three installments, amounting in all to \$27,063,430, were so distributed. (See U. S. SURPLUS MONEY, DISTRIBUTION OF, AMONG THE STATES.) In the meantime, about May 1, 1837, specie payments were suspended, owing to the great depression in commercial circles. An extra session of the 25th congress was called in September of the same year. The charter of the second bank of the United States had expired on March 4, 1836, and on June 23, 1836, congress had passed an act authorizing and regulating the deposit of public moneys in state banks. No action was taken during the extra session toward rechartering the bank of the United States. The distribution of the fourth installment to the states was, however, postponed, but the secretary was prohibited from calling for any of the money already distributed without special author-

ity from congress, which has not, up to the present date, been given. — The revenues for the year (1837) were from six to ten millions short of the expenditures. The public funds already deposited with the states were unavailable, and there was another installment to be deposited on Oct. 1. The secretary recommended the withholding of this installment, and, in order to supply currency, an issue of treasury notes, the small denominations to bear no interest, and the large with interest. — A large party in congress were in favor of rechartering the bank of the United States. The advocates of treasury notes urged the issue principally upon the ground of necessity, there being no currency upon which the government could rely to make and receive payments. Many were in favor of a substitute to be issued by the proposed new bank of the United States. A bill was presented and passed by the senate. When it came to the house, objection was made that it was a money bill, which the senate had no constitutional right to originate. This point was not discussed, but the committee of ways and means presented their own bill, by which the issue of ten millions in treasury notes was authorized. The bill encountered much opposition, particularly from those in favor of authorizing a new bank, but passed the house on Oct. 9, 1837, by a vote of 127 to 98, which was a strict party vote. In the senate, the next day, Mr. Benton moved to make the lowest denomination of notes \$100, instead of \$50, as provided in the bill. He presented strong objections to the issue of treasury notes. Nothing but the fact that the government must otherwise stop for want of funds, would induce him to vote for paper money in time of peace. He particularly objected to the policy of reducing the denominations of paper currency. It was the most dangerous feature of the system, and would drive all specie from circulation. Mr. Clay spoke in favor of Mr. Benton's motion, and characterized the whole measure to be, to all intents and purposes, a great bank experiment, and alluded to the inconsistency of issuing, in time of profound peace, ten millions additional notes after decrying the banks for enlarging their circulation. Mr. Webster favored Mr. Benton's motion. It was lost by a vote of 25 to 16. The bill then passed by a vote of 35 to 6, both Mr. Benton and Mr. Webster voting for it, and Mr. Clay against it. This bill authorized the issue of treasury notes to an amount not exceeding ten millions, and in denominations not exceeding fifty dollars. The interest was not to exceed 6 per cent.; and they were to be payable, principal and interest, after one year from date, and were, for the first time, signed by the treasurer and countersigned by the register. They were to be issued in payment of the debts of the United States to any creditor who would receive them, and were to be receivable in payment of all debts and dues to the government. They were not reissuable, and the authority to issue terminated Dec. 31, 1838. The ten millions authorized were issued by Secretary Woodbury previous to July 1, 1838. About two millions

were issued at the nominal rate of interest of 1 mill per cent.; three millions at 2 per cent.; and over four millions at 5 per cent. On account of the low rate of interest upon a large portion of the notes, the object for which they were issued, namely, to supply a circulating medium, was thwarted, for they were soon presented in payment of taxes, and over five millions were retired before the whole amount had been issued. — At the end of 1837 the secretary estimated that the balance in the treasury for July, 1838, would be \$34,187,000, of which \$28,101,644 was due from the states, \$1,100,000 due chiefly from insolvent banks, and \$3,500,000 from other banks, payment of which was postponed. These sums, and the bullion fund in the mint, reduced the estimated available balance in July, 1838, to about one million. This estimate was nearly correct, for congress was advised by the president, in May, 1838, that only \$216,000 of available funds remained in the treasury. There were several propositions in the house, one of which was a bill for authorizing loan certificates, which should be a legal tender to public creditors, but not receivable for dues to the government. The question of the legal tender was not discussed. Mr. Cambreleng, of New Jersey, from the committee of ways and means, reported a short bill, authorizing the issue of treasury notes to the amount of the issue of October, 1837, which had been redeemed and canceled. The interest upon the issues already made under the laws of 1837 had been too small, and they had been immediately paid into the treasury when due. There were gratifying signs of a revival of prosperity. The northern banks had resumed specie payment sooner than expected. This he ascribed to the firmness of the president in refusing to allow dues to the United States to be paid in notes of banks not paying specie. He referred to the passage of the free banking act of New York as a presage of sound banking in future. He also urged the necessity of providing notes to enable the treasury to meet its payment. The objections to the bill were much the same as those urged in the debate during the previous session, though they were presented with more force and completeness, particularly by Mr. Caleb Cushing. He said that such issues were bills of credit not warranted by the constitution; that they were based only upon the faith of the government; that such measures were considered of doubtful and dangerous character by all the friends of democratic institutions; and that Madison and others had always been opposed to the issues of government paper founded not on funds or specie, but only upon faith or credit, and only consented to its expediency in remarkable exigencies. Experience had shown, that whatever interest they might bear, whether 1 mill or 6 per cent., they would not be above the value of the notes of good banks. It was said, that, if the United States under the constitution could issue these bills, so could the states. They were the same as continental money, although bearing interest. Much of the currency

issued by the states, during the revolution, denominated bills of credit, bore interest. Chief Justice Marshall's definition of bills of credit was, "paper issued by the sovereign authority, and intending to circulate as money." These notes are issued by sovereign authority, and intended to circulate as money. They operate unequally, and afford no general relief: they are below par in New York, and at 5 per cent. premium in Charleston. The bill was amended to obviate some technical objections, and finally passed by a small majority, 106 to 99, on May 16, 1838. It came up in the senate on May 18. Wright of New York, Benton, Calhoun, Brown and Talmadge were in favor of it. Webster, Clay, Crittenden and Preston were on the other side. The discussion took a wide range, involving the causes of the condition of the treasury, and the constitutionality of the issue of treasury notes. It passed by a vote of 27 to 13, and was approved on May 21, 1838. Nearly five millions were issued within one month after the passage of the bill, which showed conclusively the pressing needs of the treasury. Under the previous acts of October, 1837, and May 21, 1838, the authority to issue treasury notes expired on Jan. 1, 1839. The whole issue was not to exceed ten millions, and the latter act permitted the reissue of those paid in. — The whole amount which had been issued to December, 1838, was \$15,709,801.01, and bore at different rates interest as follows: \$6,888,809.60 bore interest at 6 per cent.; \$4,280,273.72 bore interest at 5 per cent.; \$2,784,844.73 bore interest at 2 per cent.; and \$1,755,881.96 bore interest at 1 mill per cent. There had been redeemed, up to the same date, \$7,955,250, leaving \$7,754,560 outstanding.

The authority to reissue expired with the year. — On Jan. 1, 1839, there was a large amount of notes in the treasury, which continued to grow larger until March 2, 1839, when an act was passed, extending the authority to reissue until June 30, 1839, providing the whole amount outstanding did not exceed ten millions. In December, 1839, Secretary Woodbury reported that at no time had more than ten millions been outstanding, and that the amount outstanding was less than the amount due from suspended banks, and from the Pennsylvania bank of the United States, to the government, and that the principal and interest on the treasury notes had always been promptly paid when desired. A bill was subsequently presented by Mr. Jones, chairman of the committee of ways and means. Amendments were offered with the object of making it imperative that the notes should bear interest at not less than 2 per cent., and to make them negotiable and transferable only by indorsement, in the same manner as bills of exchange: the first to prevent the issuance of notes at the nominal rate of 1 mill per cent., or one-thousandth of 1 per cent., per annum, and the second to prevent their circulation as money, and both to cure, as was alleged, the constitutional difficulty. The whigs refused to vote, leaving no quorum. On March 24, 1840, the house continued in session from ten o'clock until five p. m. of the next day. Finally, when the house adjourned, the consideration of the bill was fixed for the following Friday, and on that day—March 27, 1840—it finally passed the house by a vote of 25 to 8. It passed the senate on March 30, 1840, and was approved the following day. The following is the form of a \$100 note issued under this act:

— On each end of the reverse were printed the figures 100. Under this act the issues amounted to \$7,114,251. Notes were to be redeemed sooner than one year, if the condition of the treasury would admit, and at any time within the year, after sixty days' notice. — The secretary, in his report for 1840, states, that treasury notes had been

at par during the year, although never bearing interest higher than 5½ per cent.,* and subject to payment after sixty days' notice. To meet the wants of the treasury, a treasury note bill was introduced, and passed congress on Feb. 15, 1841. This law authorized an issue of notes, in the ag-

* Finance Report, vol. iv., p. 354.

gregate, of \$10,000,000, one-half to be issued in payment of amounts due and payable prior to March 4, 1841, and the remaining \$5,000,000 in payment of amounts due and payable after that date. In all, \$7,529,062 were issued under act of Feb. 15, 1841. — In the fall of 1840, Harrison had been elected president to succeed Van Buren, but died April 4, 1841. He was the representative of the whig party, which had, since the year 1837, so bitterly opposed the issue of treasury notes. Mr. Ewing of Ohio was appointed secretary of the treasury by President Harrison. In his report to congress at its special session of May 31, 1841, he said that, from Jan. 1, 1837, to March 4, 1841, the expenditures of the government had exceeded the revenues by over \$31,000,000. Of about twenty-six millions of treasury notes issued under the acts from Oct. 12, 1837, to Feb. 15, 1841, inclusive, all but about six millions had, as claimed by Secretary Woodbury, been issued in anticipation of revenues, or upon the basis of existing debts due to the United States, leaving about six millions outstanding when the new administration came in. Mr. Ewing estimated that the deficit in the revenues for the year 1841, after meeting the current expenses and redeeming the treasury notes then outstanding and to be issued, would be \$12,088,215, which he considered to be the amount of the public debt. He objected to the issue of treasury notes, and recommended a loan redeemable after eight years or upon six months' notice by the government. — A bill was introduced by Millard Fillmore, chairman of the committee of ways and means, on June 24. It provided a loan, payable after Jan. 1, 1856, with interest at 5 per cent., and authority was given the secretary to purchase the bonds out of any surplus in the treasury. It was objected that the loan was unnecessary, and that it was the commencement of a scheme to organize a national bank. The debate was bitterly political. It was urged, that as this was an administration measure the loan should be paid within the term of the administration. This point was foolishly conceded, but the rate of interest was raised to 6 per cent. As thus amended the bill became a law on July 21, 1841. The reduction of the length of the loan from eight to three years, together with the proviso that no stock could be sold below par, destroyed the usefulness of the measure, and less than one-half, or only \$5,672,076, of the stock was sold, which was about equal to the amount of treasury notes outstanding. — On Sept. 13, 1841, Mr. Ewing was succeeded by Secretary Forward of Pennsylvania. The policy of the administration was changed by the death of the president. The repeal of the independent treasury act Aug. 13, 1841, which had been authorized at the close of the Van Buren administration, was about the only point gained by the Harrison administration, and this repeal practically left the treasury to be managed by those who were unfriendly to the policy of the whig party. — A bill for the issue and reissue of treasury notes was introduced into the house by Mr. Fillmore, Jan. 5, 1842. Among other proposed

amendments which were rejected, was one by Mr. Benton, heavily taxing all bank circulation, especially small notes. The bill became a law Jan. 31, 1842. Under it the amount authorized to be outstanding at any one time was limited to five millions, but the total amount issued and reissued was \$7,959,994. The subsequent act of Aug. 31, 1842, authorized the issue and reissue of treasury notes, provided the amount outstanding at any one time should not exceed six millions, and under it notes to the amount of \$3,025,554.89 were issued. — All of the notes issued since the act of Oct. 12, 1837, were issued payable either one or two years after date, chiefly for one year. These notes were continually falling due and embarrassing the treasury. Eleven millions of such notes were to fall due during the year 1843, and accordingly another bill was introduced by Mr. Fillmore, providing for the reissue of such notes as should be redeemed before July 1, 1844. The bill became a law on March 3, 1843. — The treasury notes outstanding on the dates named from November, 1837, to March, 1843, are shown in the following table:*

MONTHS.	1837.	1838.	1839.	1840.
March		\$6,518,904.65	\$6,552,946	\$2,176,981
November	\$53,723.83	8,009,760.01	3,394,180	4,664,200
			1841.	1842.
March		\$5,393,094.00	\$8,539,115	\$11,656,387
November		7,371,705.00	10,039,056

— John C. Spencer succeeded Walter Forward as secretary of the treasury, on March 3, 1843, and was himself succeeded, on June 15, 1844, by George M. Bibb. Under the act of March 3, 1843, Mr. Spencer issued about \$850,000 treasury notes. Each note on its face promised to pay, one year after date, fifty dollars, with interest at the rate of 1 mill per \$100 per annum. On the back of each note was indorsed, "This note will be purchased at par for the amount of principal and interest thereof, on presentation at either of the Depositories of the Treasury in the City of New York." These notes, which were issued at the nominal rate of interest of one thousandth of 1 per cent. per annum, and by the indorsement made payable on demand, were considered by congress an evasion of the act under which they were issued, and the committee of ways and means were instructed, on Jan. 15, 1844, "to inquire and report whether the notes lately issued by the treasury department, bearing a nominal interest and convertible into coin on demand, and now forming part of the circulating medium of the country, are authorized by the existing laws and constitution of the United States"; and the report of the committee, which also contains a letter of the secretary, giving his views on the subject, is interesting from the fact that it contains the principal constitutional arguments against the issue of paper money by the government.† —

* Page 186, 3d Session, 27th Congress, Appendix. Speech of Woodbury.

† Report No. 379, 28th Congress, 1st Session, H. of R.

During the second session of the 27th congress, after the veto, by President Tyler, of a bill to authorize the organization of a bank of the United States, the president recommended the passage of a bill for the issue of exchequer bills of not less than \$5 in denomination, which notes were to be signed by the treasurer of the United States, and countersigned by the president of the board of exchequer, and redeemable in gold and silver on demand at the agency where issued. This bill, which was prepared at the treasury department, did not become a law, and it was claimed by the committee that the notes issued by Secretary Spencer were in most respects like the exchequer notes proposed in this bill. The principal difference was, that while the exchequer notes were to be in denominations as low as \$5, without interest, the notes issued were of denominations not less than \$50, and bore a merely nominal rate of interest. It was claimed by the committee that the constitution authorized the government to borrow money, but not to issue bills of credit; that borrowing money implied the paying of interest for the money borrowed; that interest-bearing treasury notes payable at a future day were a temporary loan, not designed to circulate as money, and could properly be issued; while notes bearing no interest and payable on demand were bills of credit, and could be issued only in violation of the constitution. — From March 3, 1843, until July 26, 1846, no new issues of treasury notes were authorized. From 1837 to 1844 treasury notes amounting to \$47,002,900 were issued under eight different acts, of which \$46,216,935.82 were redeemed by the close of 1845. The lowest denomination for any one note was \$50, but where new notes were issued in place of old ones the accrued interest was often added. The amount authorized to be originally issued by these several acts was thirty-one millions. The remainder consisted of reissues. — The following table exhibits the amount of treasury notes issued each year, under different acts of congress, from Oct. 12, 1837, to March 3, 1843, from which it will be seen that the total

amount issued was \$47,002,900, all of which was sold or issued at par. Interest varied from 1 mill per cent. to 6 per cent., and the amount authorized was fifty-one millions.

—TREASURY NOTES OF THE PERIOD OF THE MEXICAN WAR. On July 1, 1844, the public debt of the United States amounted to \$24,748,188, and consisted principally of stocks not payable until the lapse of ten and twenty years.* The 5 per cent. stocks payable in ten years, were at a premium of 106, and the 6 per cent. stocks payable in twenty years, at a premium of 116. The secretary estimated that the revenue under the tariff of 1842 would yield a much larger amount than was necessary. Accordingly, congress, in July, 1846, passed a bill amending the tariff and reducing the duties on imports. In the meantime, during the year 1845, difficulties with Mexico, owing to the annexation of Texas, rendered war inevitable, and on May 13, 1846, war was declared. Secretary Walker estimated, that, if the war should continue for a year, there would be a deficiency of more than twelve millions; and, in order to meet this deficiency, a bill was reported from the committee on ways and means, which, with some additions, embodied the provision of the act of Oct. 12, 1837, as to treasury notes, and that of April 14, 1842, as to a loan. The following is the form of a \$100 note issued under this act :

* Report of Secretary Bibb, 1844.

100	No 4220	<i>Act of July 22^d 1846.</i>	No 4220	100
<p><i>The United States</i></p> <p><i>Promise to pay, One Year after date, to</i></p> <p><i>or order, One Hundred Dollars,</i></p> <p><i>with Interest, at the rate of Five % per centum.</i></p>				
<p><i>Countersigned.</i></p> <p><i>R. H. Gillet,</i></p> <p><i>Register.</i></p>				
<p><i>Washington, 5, Dec. 1846.</i></p> <p><i>W. Selden,</i></p> <p><i>Treasurer of the United States.</i></p>				
<p><i>Receivable in Payment of all Public Debts.</i></p>				

The principal of the notes was fundable into 6 per cent. bonds, redeemable after Dec. 30, 1867, and this privilege was extended to the holders of notes issued under previous acts. Reissues were authorized, but the amount of stock and notes, at any one time, was not to exceed twenty-three millions. The right to issue treasury notes, under the act of July 22, 1846, was extended by the fifteenth section to the period fixed by these acts, and on the same terms, but the issue, under this section, was not to exceed five millions. \$12,371,150 of these notes were issued previous to July 1, 1847, and \$11,956,950 additional notes were issued during the next fiscal year. The whole amount of issues and reissues under the act was \$26,122,100, all of which were either sold or paid to public creditors at par. The rate of interest of the notes was 5½ and 6 per cent., and United States 6 per cent. bonds, chiefly for the purpose of redeeming these notes, were issued under the same act, amounting to \$28,230,350.—The treasury notes issued under the act of Jan. 28, 1847, were all retired, with the exception of about \$200,000, previous to July 1, 1850, and no additional treasury notes were authorized, until the passage of the act of Dec. 23, 1857. Secretary Cobb, in his report for that year, estimated that the receipts would exceed the expenditures, but said that the financial revulsion which had caused the banks to suspend specie payment in October of that year, had also caused a large part of the dutiable merchandise to be stored without payment of duty, where it could remain under the law for three years, although it was probable that a considerable portion would be withdrawn and the duties paid previous to that date. Meanwhile, means should be provided for meeting the de-

mands upon the treasury, and he recommended that authority should be given to issue treasury notes "for an amount not exceeding twenty millions of dollars, and payable within a limited time, and carry a specified rate of interest." A bill, in accordance with the suggestion of the secretary, was introduced into both houses of congress on Dec. 18, 1857. It passed the senate on the following day, by a vote of 31 to 18, and the house on the 22d by a vote of 118 to 86, and was approved on the following day and became a law. The bill provided for the issue of notes payable in one year from date of issue to an amount not exceeding twenty millions. \$6,000,000 were to be issued at a rate of interest not exceeding 6 per cent. The remainder was to be sold after public advertisement of not less than thirty days, at their par value, for specie, to the bidders offering to take them at the lowest rate of interest, not exceeding 6 per cent. The interest upon the notes was to expire, after maturity of notes, upon sixty days' notice from the secretary, of his readiness to redeem such notes; they were to be issued in denominations of not less than \$100, and were to be signed by the treasurer and register; they were receivable in payment of all dues to the United States. The whole amount authorized was issued, and the amount of issues and reissues, in all, was \$52,778,900. The interest upon these notes was as follows: \$6,323,600 at 3 per cent.; \$985,000 at from 3¼ to 4 per cent.; \$688,000 at 4½ per cent.; \$10,055,700 at 4¾ per cent.; \$4,532,500 at 4¾ per cent.; \$7,533,900 at 5 per cent.; \$8,204,500 at 5½ per cent.; \$3,514,100 at 5¾ per cent.; and \$10,941,600 at 6 per cent. The following is the form of a 3 per cent. \$100 note issued under this act:

NOTES.	Act.	Rate of Interest.	Interest ceased at—	Principal	Interest.
Treasury Notes, 1846.....	Prior to 1846.	1 mill to 6 per cent.	Various dates from 1838 to 1844.	\$62,525	\$2,688 06
Treasury Notes, 1846.....	July 22, 1846.	1 mill to 6 per cent.	Various dates in 1847 and 1848.	5,900	200 60

—The table given at foot of page 971 exhibits the different kinds of treasury notes outstanding on February 1, 1884, which were issued from the organization of the government to the date of the passage of the act of March 2, 1861.

—TREASURY NOTES OF THE PERIOD OF THE CIVIL WAR. The total public debt on June 20, 1860, was \$64,769,703.08. The outstanding treasury notes issued under act of June 23, 1857, were \$19,690,500. The amount of treasury notes outstanding, issued under acts previous to that date, was \$105,111.64. The act of June 22, 1860, authorized a loan of twenty-one millions, at a rate of interest not exceeding 6 per cent., to be reimbursed within a period not more than twenty years, and not less than ten years. The money was to be used in the redemption of treasury notes, and to replace any amount paid to the treasurer in such notes for public dues. Under this authority, proposals were invited by Secretary Cobb, on Sept. 8, 1860, for ten millions of this loan, which amount was "ample to meet all the treasury notes that would fall due before Jan. 1, 1861." In his report for Dec. 4, 1860, he says: "The rate of interest was fixed at 5 per centum per annum, under the conviction that the loan could be readily negotiated at that rate, for, at that time, the 5 per cent. stock of the United States was selling in the market at the premium of 3 per cent. The result realized this just expectation, and the whole amount offered was taken, either at par or a small premium." Before, however, the time had arrived for payment on the part of the bidders, political complications arose, which affected the credit of the government so unfavorably, that the amount realized was but \$7,022,000, the subscribers of \$2,978,000 having failed to make good their subscriptions. The secretary stated, that, in the present condition of the country, capitalists were unwilling to invest in United States stock at par, and recommended a repeal of so much of the act of June 22, 1860, as authorized the issue of the additional stock, and asked for authority for the issue of treasury notes for the same amount, "to be negotiated at such rates as will command the confidence of the country." He recommended that the public lands be unconditionally pledged for the ultimate redemption of all the treasury notes which it may become necessary to issue, and suggested, "that there should always exist in the department power to issue treasury notes for a limited amount, under the direction of the President, to meet unforeseen contingencies. It is a power which can never be abused, as the amount realized from such source can only be used to meet lawful demands upon the treasury. No secretary of the treasury, or president, would ever exercise it, unless compelled to do so by the exigencies of the public service. On the other hand, it would enable the government to meet, without embarrassment, those sudden reversions to which the country is always liable, and which can not always be anticipated. I have already stated that provision should be

made at once to relieve the treasury from its present embarrassment, produced by the causes referred to. To do this, congress should authorize the issue of an additional amount of treasury notes, not less than ten millions of dollars: with this means the department would be enabled to meet all lawful demands upon it for the present. The extent of the financial crisis, through which the country is now passing, can not now be determined, and until it is better known, no policy can be recommended of a permanent character." — Secretary Cobb resigned on Dec. 10, but the act of Dec. 17, 1860, was passed in compliance with the suggestions contained in his report. The pledge of the proceeds of the public land was not given in the act, and one of the reasons for withholding such legislation was, that it would interfere with the passage of the homestead bill, which was then under consideration. The act authorized the issue of ten millions of treasury notes in denominations of not less than \$50, redeemable in one year from the date of issue, with interest at the rate of 6 per cent., but the secretary was authorized to issue such notes after advertisement at the lowest rate of interest offered. Of these notes, five millions were offered to subscribers. The bids were opened Dec. 28, and only \$500,000 were taken at 12 per cent. It was important to negotiate the loan in order to meet the interest on government bonds upon Jan. 1. The remainder of the loan was subscribed by the banks in New York, previous to that date, at 12 per cent. Gen. John A. Dix was appointed secretary of the treasury on Jan. 11, and bids for the remaining \$5,000,000 were opened on the 19th, and the notes awarded at the average rate of 10½ per cent., as follows:

\$ 10,000.....	at 8½ per cent.
30,000.....	9 "
10,000.....	9½ "
140,000.....	9½ "
67,000.....	9½ "
721,000.....	10 "
265,000.....	10½ "
543,000.....	10½ "
1,267,000.....	10½ "
1,947,000.....	11 "

\$5,000,000 Total. Average, 10½ per cent.

The whole ten millions were issued, redeemable at the expiration of one year from date, bearing interest as follows: \$70,200 at 6 per cent.; \$284,500 at rates varying from 6 to 10 per cent.; \$1,027,500 at 10 per cent.; \$3,688,700 at rates from 10 to 12 per cent.; and \$4,840,000 at 12 per cent. Additional offers bearing interest, ranging from 15 to 36 per cent., were declined. The amount of treasury notes outstanding on Dec. 1, 1860, previous to the passage of this act, was \$14,599,700, of which \$42,600 was payable in 1859, \$3,133,400 in 1860, and \$11,423,700 in 1861. Of these notes, \$8,684,200 bore interest at 6 per cent., and the remainder at lower rates. — Secretary Dix, in a letter to the chairman of the committee of ways and means, dated Jan. 18, 1861, says: "Within the last few days the amount of overdue treasury

notes presented for redemption has exceeded the power of the treasurer to place drafts for payment on the assistant treasurer at New York, where the holders desire the remittances to be made; and an accumulation of warrants, to the amount of about \$433,000, has accrued on this account in the treasurer's hands, which he has been unable to pay." He also says: "That notice issued on the 18th ultimo invited proposals for the exchange of five millions of dollars for treasury notes, and offers at 12 per cent. or less were made only to the amount of \$1,831,000; offers to exchange \$465,000 for notes bearing interest at rates varying from 18 to 36 per cent. were also received. The offers at 12 per cent. and less were accepted; those above that rate were rejected. The remainder of the five millions offered was soon thereafter taken at 12 per cent., and the whole amount was pledged to the payment of over-due treasury notes and other pressing demands on the treasury. * * During the last quarter, about eight millions of treasury notes were redeemed, which, with the two and one-half millions redeemed since the first instant, make ten and a half millions. The amount received from the loan, a small fraction above seven millions, threw upward of three and a half millions of these notes on the other resources of the treasury for redemption. This is one of the principal causes of the delay and difficulty which have recently existed in providing for other demands of public service." So low had the credit of the government fallen, through the political agitations and troubles just previous to the war of the rebellion, that he closed his communication by calling attention to the fact, that, "there are deposited with twenty-six of the states for safe keeping, over twenty-eight millions of dollars belonging to the United States, for the payment of which the promise of these states is pledged by written instruments on file in this department. The annual statement of receipts and expenditures for the year ending June 30, 1860, represents this amount as part of the 'balance in the treasury' on that day. * * I refer to this final resource as an available one, should the public exigencies demand it. It is not doubted that the greater portion of the amount so deposited would be promptly and cheerfully paid should an exigency arise involving the public honor or safety. If, instead of calling for these deposits, it should be deemed advisable to pledge them for the repayment of any money the government might find it necessary to borrow, loans contracted on such a basis of security, superadding to the pledged faith of the United States that of the individual states, could hardly fail to be acceptable to capitalists."—During the following month the act of Feb. 8, 1861, was passed, which authorized a loan not exceeding twenty-five millions of 6 per cent. bonds, the avails to be used in the payment of current expenses, for the redemption of outstanding treasury notes, and to replace in the treasury such amounts as had been paid in treasury notes. Of this loan, bearing 6 per cent. interest, and having twenty

years to run, \$18,415,000 was issued, at an aggregate discount of \$2,019,776, or an average rate of \$83.03 for \$100. In less than a month after the passage of this act providing for the payment of the treasury notes outstanding, the act of March 2, 1861, was passed, which authorized a loan of ten millions at 6 per cent., redeemable upon three months' notice, after July 1, 1871, payable July 1, 1881, or, instead thereof, the issue of \$10,000,000 of new notes in denominations of not less than \$50, bearing interest at the rate of 6 per cent. per annum, payable semi-annually, receivable in payment of all debts due the United States, including customs duties, and redeemable at pleasure, within two years from the passage of the act. The same act largely increased the duties on imports, and authorized the substitution of treasury notes for the whole or a part of the loans previously authorized. Under this act, \$35,364,450 in all, of treasury notes, were issued, of which \$22,468,100 were redeemable in two years, and \$12,896,350 redeemable in sixty days after date; and a considerable portion of these notes were paid out to creditors. — General Dix was succeeded by Secretary Chase on March 7, 1861. The great increase of import duties, imposed by the act of March 2, had caused the bonds of the government to advance in the market, and it seemed to be a favorable time to offer the remainder of the bonds authorized by the act of Feb. 8, 1861. Bids for eight millions of the bonds were opened on April 2. Offers at from 94 to par were received for \$3,099,000, and 93½ for the remainder of the loans. All bids below 94 were rejected. In the midst of these negotiations it became known that arrangements were being made to send an additional force for the relief of Fort Sumter. No additional bonds were sold until May 31, when \$7,310,000 were sold at an average rate of \$85.34 for \$100. In place of bonds, five millions of treasury notes were offered, and the bids opened on April 11 amounted to only one million; but shortly thereafter the whole amount offered was taken. The United States 6 per cent. bonds were selling in the market at 83, and money at call was worth from 4 to 5 per cent.; but the treasury notes bearing 6 per cent. interest could be held and used or sold at a profit for the purpose of paying duties. Additional treasury notes of the same kind, as has been seen, were subsequently sold, amounting, in all, to more than thirty-five millions, at rates ranging from par to 1½ per cent. premium. On page 974 will be found the form of a \$50 note issued under the act of March 2, 1861. — Civil war was inaugurated by the attack on Fort Sumter on April 12. The fort surrendered on April 14, and on the following day President Lincoln issued a call for seventy-five thousand soldiers. The southern states were declared blockaded. Seven of these states had, by ordinances, publicly declared their secession from the Union, and their defiance of the national authority, and a convention at Montgomery, Alabama, had organized a new government, under

the name of "The Confederate States of America." Massachusetts soldiers, on their way to Washington, were attacked by a mob in Baltimore. In the month of May the confederate capital was removed to Richmond; North Carolina and Arkansas seceded, and the Union army crossed the Potomac into Virginia, and took possession of Alexandria and Arlington Heights. In June, Tennessee passed an ordinance of secession, and Gen. Butler was defeated at Big Bethel. The two-year treasury notes which had been recently issued at par, were at 2½ per cent. discount; and the government, instead of disposing of the notes, borrowed five millions at sixty days upon them as collateral security. During the following month the disastrous results of the first battle of Bull Run startled the entire country. The Union army, defeated, fell back upon Washington, and the capital of the country was believed to be in danger. Two days thereafter, President Lincoln called for five hundred thousand three-year volunteers. An extra session of congress had been

called for July 4, 1861, and on that day, amid events like these, Secretary Chase transmitted his first report to Congress, which recommended measures to provide the means for continuing a civil war which proved in magnitude to be unequalled in the history of nations. Specie payments were suspended on Dec. 28, 1861. The war was carried on chiefly by the use of treasury notes as a circulating medium. The purchasing power of these notes rapidly declined. Prices of all kinds advanced rapidly, and particularly the prices of articles most needed for the supply of the army. The expenditures of the government during the four years of the war were vastly increased beyond the amount which would have been necessary if the war could have been conducted upon the gold standard instead of upon the fluctuating standard of the legal tender paper dollar.—Never was a great national debt contracted so rapidly. In 1835, as has been seen, the country was entirely out of debt, and on Jan. 1, 1861, the whole debt of the Union amounted to but 166

millions. Gen. Lee surrendered at Appomattox, on April 9, 1865; which date was four years, lacking five days, after Fort Sumter had surrendered to the enemy. On the first day of July, 1861, the debt was 90 millions; at the close of that fiscal year it had reached 524 millions; at the end of the succeeding year, it was considerably more than twice that amount, being on July 1, 1863, \$1,119,772,138. During the following year it increased nearly 700 millions. For the next nine months, to the close of the war, it increased at the rate of about sixty millions a month. An immense amount of obligations against the government were presented, after the close of the war; and, for the five months thereafter, the ascertained debt increased at the rate of three millions a day. The cost of conducting the war, after it was once fully inaugurated, was scarcely at any time less than thirty millions a month. At many times it far exceeded that amount; sometimes it was not less than ninety millions a month, and the average expenses of the war, from the date of its inception to its conclusion, may be said to be not less than two millions each day. The public debt reached its maximum on Aug. 31, 1865, at which day it amounted to \$2,845,907,626.56. Of this amount, \$1,109,568,191 was in funded debt; \$1,503,020 was debt which had matured; and \$2,111,000 was in suspended requisitions. The remainder was as follows:

United States legal tender notes.....	\$ 433,160,569 00
Compound interest legal tender notes.....	217,024,160 00
Five per cent. legal tender notes.....	33,954,230 00
Seven-thirty notes.....	890,000,000 00
Fractional currency.....	26,244,742 51
Temporary loans.....	107,148,713.16
Certificates of indebtedness.....	65,093,000.00
Total.....	\$1,732,725,414.67

There were more than 684 millions of these obligations, which were a legal tender, of which 207 millions were bearing compound interest at the rate of 6 per cent. 830 millions were in treasury notes, bearing interest at the rate of $7\frac{3}{10}$ per cent. per annum. There were \$1,540,483,701 of treasury notes, either payable on demand or bearing interest. If the temporary loans, which were payable in thirty days from the time of deposit, after notice of ten days, and the certificates of indebtedness, which bore interest at 6 per cent., payable one year after date, or earlier, at the option of the government, are included with the treasury notes, the whole would amount to considerably more than three-fifths of the whole public debt of the country. — Secretary Chase, in his report, estimated the whole sum required for the fiscal year to be not less than 318 millions, of which 215 millions would be required for the war and naval service; more than twelve millions (\$12,639,861.64) to pay treasury notes due and to become due; and nine millions to pay interest upon the proposed new debt. He was of the opinion that not less than eighty millions should be provided by taxation, and 240 millions obtained by loans. The principal part of the revenue was to be obtained

from the tariff, the remainder by a system of direct taxation or internal duties. Six per cent. bonds, amounting to \$18,415,000, had already been sold, at from par to \$85.34 for \$100, and treasury notes bearing interest at 6 per cent. had been paid to creditors. He considered that "in a contest for national existence and the sovereignty of the people, it is eminently proper that the appeal for the means of prosecuting it with energy to a speedy and successful issue, should be made, in the first instance at least, to the people themselves." Among other recommendations, he proposed a loan of 100 millions, to be issued in the form of treasury notes, or exchequer bills, bearing interest at the rate of $7\frac{3}{10}$ per cent., to be paid semi-annually, and redeemable at pleasure, after three years from date. The interest at this rate was suggested, because it was liberal to the subscribers, convenient for calculation, and, under existing circumstances, a fair rate for the government. The rate would be convenient for calculation; for, the interest being equal to one cent a day on \$50, two cents a day on \$100, ten cents on \$500, twenty cents on \$1,000, and one dollar on \$5,000, it would be only necessary to consider the number of days since the date of the note, to determine, at the close, the amount due on it. It was proposed to issue these notes in sums of fifty, one hundred, five hundred, one thousand, and five thousand dollars, with the amount of interest for specified periods engraved on the back of each note, and the facility thus secured to the holder of determining the exact amount of interest, it was thought, would enhance its value. "While the rate proposed is thus liberal and convenient, the secretary regards it also as, under existing circumstances, fair and equitable to the government. The bonds of the United States, bearing an interest of 6 per cent., and redeemable twenty years after date, can not be disposed of at current market rates, so that the interest on the amount realized will not exceed $7\frac{3}{10}$ per cent.; nor is there any reason to believe that treasury notes, bearing an interest of 6 per cent., receivable for public dues and convertible into twenty years' 6 per cent. bonds, can be disposed of in any large amounts, so that the interest on the sum realized will fall much, if at all, short of the rate proposed. For the difference of interest, if any, between such notes and those of the proposed national loan, the secretary thinks that the absence of the feature of receivability for public dues in the latter is a sufficient compensation." He also proposed notes of small denominations, ten, twenty and twenty-five dollars, payable one year from date, to an amount not exceeding fifty millions, bearing interest at the rate of $3\frac{3}{10}$ per cent., to be exchanged for the other form of treasury notes, bearing interest at $7\frac{3}{10}$, or, if more convenient, made redeemable in coin, on demand, without interest. "The greatest care," he said, "will, however, be requisite to prevent the degradation of such issues into an irredeemable paper currency, than which no more certainly fatal expedient for impoverishing the masses, and dis-

crediting the government of any country can well be devised."—Treasury notes authorized by the acts of June 30, 1812, Feb. 24, 1815, and three intervening acts, bore interest, as recommended by Secretary Gallatin, as has been seen, at the rate of 5½ per cent. a year, and were receivable in payment of all duties and taxes laid by the authority of the United States, and for all public lands sold by said authority; and when so received, interest was to be computed at the rate of "one cent and one-half a cent per day" on every one hundred dollars of principal, each month being reckoned as thirty days. It is probable, that the proposition for the issue of the seven-thirty notes was obtained from this act, for a substitute was proposed for the legal tender act, which passed the house of representatives Feb. 6, 1862, which contained a section providing for the issue of transferable certificates bearing interest at the rate of 5½ per cent. per annum. These recommendations of the secretary were embodied in the acts of July 17 and Aug. 5, 1861. The first was passed by nearly the unanimous vote of the house, only five votes (one from Kentucky, two from Missouri, one from Ohio, and one from New York) having been against it. It authorized the secretary to borrow 250 millions, either in twenty-year treasury notes, with interest not exceeding 7 per cent., or in seven-thirty three-year treasury notes, and to issue demand notes, bearing no interest, and receivable for public dues. These latter notes were limited to fifty millions, and to denominations of not less than ten dollars. But the act of August 5 authorized the issue of five dollar notes; also twenty-year 6 per cent. bonds for the amount of the seven-thirty notes issued, which bonds were to be used only in exchange, or for the purpose of funding such notes. Under these acts, nearly 140 millions of seven-thirty notes were issued, and sixty millions of demand notes, without interest; ten millions of these notes having been authorized by the act of Feb. 12, 1862.—The first demand notes were issued in August, and paid for salaries at Washington. They were received with reluctance, and the merchants and shop-keepers endeavored to discredit them. Railroad corporations refused them in payment of fares and freight; and leading banks in the city of New York refused to receive them except on special deposits. The secretary and other officers of the treasury signed a paper agreeing to accept them in payment of salaries. A circular was issued to the various assistant treasurers, stating that treasury notes of the denominations of five, ten and twenty dollars had been, and will continue to be issued, redeemable in coin on demand in Boston, New York, Philadelphia, St. Louis and Cincinnati. Gen. Scott also issued a circular on Sept. 3, 1861, announcing to the army, "that the treasury department, to meet future payments to the troops, is about to supply, besides coin, treasury notes in five, ten and twenty dollars, as good as gold in all banks and government offices throughout the United States, and most convenient for

transmission by mail from the officers and men to their families at home.' Of these notes \$24,550,325 were issued before the 1st of December, and \$33,460,000 were in circulation at the time of the suspension of specie payment on Dec. 28. The whole amount authorized was issued prior to April 1, 1862. Notwithstanding the circular of the secretary, it became necessary to use the available coin in payment of the interest upon the public debt, and there was at times some difficulty in redeeming the notes promptly in gold. At a meeting of the associated banks in the city of New York, in January, 1862, it was resolved, "That before we receive such notes, we must require that such legal provision be made by congress as shall insure their speedy redemption, and that a committee of the association be appointed to consider the subject and report on it at an adjourned meeting." The notes were receivable for duties, and soon obtained good credit. After the suspension of specie payment, efforts were made to retire them as rapidly as possible, for as they were receivable for duties, they embarrassed the government in providing for the gold interest upon the public debt.—On July 1, 1863, more than fifty six millions had been retired, and a much larger amount of legal-tender notes had been placed in circulation. The demand notes were not, by the terms of the law, made payable in gold, but as they were authorized prior to the suspension of specie payment, and proclaimed as payable in coin by the circular of the secretary, they were considered so payable, and, after the suspension of specie payment, were quoted at times at about the same premium for legal-tender notes as gold. Interest upon the first issue of the seven-thirty notes was also paid in gold. These notes were fundable into twenty-year 6 per cent. bonds of 1881, and but few were presented for payment. The amount redeemed in money to Nov. 1, 1864, was only \$63,500, while the whole amount converted into bonds to that date was \$125,864,900.*—The seven-thirty loan was successfully negotiated through the associated banks of New York, who, jointly with the banks of Boston and Philadelphia, made a contract with the secretary on Aug. 15, 1861, for the purchase of government securities to the amount of 150 millions, in three different installments. The total amount taken by the New York banks, was 105 millions. Whenever subscriptions were made, 10 per cent. was paid to the assistant treasurers in New York, Boston and Philadelphia, and the remainder was placed to the credit of the United States on the books of the banks subscribing. The arrangement of the associated banks among themselves was to issue certificates to each subscriber, stating the amount so subscribed, and placed to the credit of the government; and, as such deposits were withdrawn, or paid into the treasury, seven-thirty notes were issued for the same amount to the subscribers respectively. An immediate issue was to be made of seven-thirty treasury notes, dated Aug. 15, 1861, to the extent

* Finance Report, 1864, p. 10.

of fifty millions, bearing interest from that date. The associated banks were to take jointly this amount at par, with the privilege of fifty millions on Oct. 15, and fifty millions on Dec. 15; the banks giving their decision on the first days of these months. It was understood, that, if the whole amount should be taken, no other government stock or treasury notes, except demand notes, should be negotiated or paid out by the treasury until Feb. 1, 1862. The details of this negotiation, which was perhaps the most important one during the war, are given in the Bankers' Magazine for September, 1861, and August, 1862. — The report of June 12, 1862, of the loan committee of the associated banks of New York, states, that, at the time the negotiation was made, "the credit of the government had become impaired to such a degree that a large loan could not be obtained in any ordinary way, nor even a small temporary loan, except for a very short period at a high rate of interest. Men's hearts failed them: the rebellion was on so large a scale, and had so unexpectedly broken out and raged with such fury, that to subdue it seemed to most persons to be impossible. Then it was, after careful deliberation and consultation with the secretary, that the banks decided it to be wise for them to depart from their usual legitimate business, and sustain the government credit, and stand or fall with it. This act restored the public confidence, and was the highest indorsement of the public credit that could then have been given. * * When the banks agreed to advance this large amount to the government, they did so without hope or expectation of profit from it, and they earnestly sought to obtain from the government the assurance that they should be indemnified from loss. It was not until five months after taking the first loan, and two months after taking the third, in the month of January last, that there was any reason to expect the securities to command in the market a price higher than that at which they had been taken. * * Much doubt was expressed, even by our most experienced bankers and financiers, when the contract was entered into, of the ability of the banks to fulfill it. It has been fulfilled by them to the letter, and has proven of more value to the country than can be estimated. As fortunately as unexpectedly, it has resulted profitably for the associates, and has probably enabled them to employ their means to nearly as much advantage as would have been done but for the political disturbances of the country."—Secretary Chase, in his report for Dec. 9, 1861, thus refers to this negotiation: "Representatives from the banking institutions of the three cities, responding to his invitation, met him for consultation in New York, and after full conference, agreed to unite as associates in moneyed support to the government, and to subscribe at once a loan of fifty millions of dollars, of which five millions were to be paid immediately to the assistant treasurers, in coin, and the residue, also in coin, as needed for disbursement. The secretary, on his part, agreed to issue

three year seven-thirty bonds, or treasury notes, bearing even date with the subscription, and of equal amount; to cause books of subscription to the national loan to be immediately opened; to reimburse the advances of the banks, as far as practicable, from this national subscription; and to deliver to them seven-thirty bonds, or treasury notes, for the amount not thus reimbursed. It was further understood, that the secretary of the treasury should issue a limited amount of United States notes, payable on demand, in aid of the operations of the treasury, and that the associated institutions, when the first advance of fifty millions should be expended, would, if practicable, make another, and, when that should be exhausted, still another advance to the government of the same amount, and on similar terms. * * All these objects were happily accomplished. Fifty millions of dollars were immediately advanced by the banks. The secretary caused books of subscription to be opened throughout the country, and the people subscribed freely to the loan. The amounts thus subscribed were reimbursed to the banks, and the sum reimbursed, though then covering but little more than half the amount, enabled those institutions, when a second loan was required, to make a second advance of \$50,000,000. Thus, two loans, of \$50,000,000 each, have been negotiated for three-year seven-thirty bonds, at par. The first of these loans was negotiated, and the first issue of bonds bears date, Aug. 19, the second Oct. 1, 1861."—On Nov. 16, a third loan was negotiated with the associated institutions under the seventh section of the act of Aug. 5, 1861, by agreeing to issue to them fifty millions of dollars in 6 per cent. bonds, at a rate equivalent to par, for the bonds bearing 7 per cent. interest, authorized by the act of July 17, 1861.—The table on page 978 gives quotations of United States 5 and 6 per cent. bonds, of treasury notes and of gold, at the dates stated, compiled from tables in Hunt's Merchants' Magazine for 1862-3-4.—About three years after the passage of the act authorizing the first issue of seven-thirty notes, another act was passed, on June 30, 1864, authorizing 200 millions of similar notes, and a subsequent act of March 3, 1865, authorized 600 millions in addition, and under this act the whole amount (including \$29,992,500 of reissues) was issued. Of this amount forty-four millions were in denominations of fifty dollars; 137 millions, in one hundreds; 228 millions, in five hundreds; 370 millions, in one thousands; and about fifty millions, in five thousands. They were issued in three series, dated Aug. 15, 1864, June 15, 1865, and July 15, 1865. These notes, like those that preceded them, were fundable into 6 per cent. bonds—the former into eighty-ones, and the latter into five-twenties—and this fact was printed upon the reverse of each note. The 800 millions last issued were payable, principal and interest, in lawful money. More than twenty millions, which were authorized by the act of June 20, 1864, were paid to the soldiers direct. Of the 600 millions, authorized by the act

of March 3, 1865, seventy millions were issued during that month, and the whole remainder was taken during the following four months. Secretary McCulloch, in his report for Dec. 4, 1865, thus refers to the negotiations and issue of the remaining 530 millions of these notes: "Upon the capture of Richmond, and the surrender of the confederate armies, it became apparent that there would be an early disbanding of the forces of the United States, and consequently heavy requisitions from the war department for transportation and payment of the army, including bounties. As it was important that these requisitions should be promptly met, and especially important that not a soldier should remain in the service a single day for want of means to pay him, the secretary perceived the necessity of realizing as speedily as possible the amount—\$530,000,000—still authorized to be borrowed under this act. The seven and three-tenths notes had proved to be a popular loan, and although a security on longer time and lower interest would have been more advantageous to the government, the secretary considered it advisable, under the circumstances, to continue to offer these notes to the public, and to avail himself, as his immediate predecessors had done, of the services of Jay Cooke, Esq., in the sale of them. The result was in the highest degree satisfactory. By the admirable skill and energy of the agent, and the hearty co-operation of the national banks, these notes were distributed in every part of the northern and some parts of the southern

states, and placed within the reach of every person desiring to invest in them. No loan ever offered in the United States, notwithstanding the large amount of government securities previously taken by the people, was so promptly subscribed for as this. Before the first of August the entire amount of \$530,000,000 had been taken, and the secretary had the unexpected satisfaction of being able, with the receipts from customs and internal revenue and a small increase of the temporary loan, to meet all the requisitions upon the treasury."— On the opposite page is the form of the seven-thirty note issued under the act of March 3, 1865, with one coupon attached. The whole half year's interest was payable with the note, and there were five coupons upon the right end of the note. On the reverse were printed these words: "Pay to bearer. At maturity convertible at the option of the holder into bonds redeemable at the pleasure of the government, at any time after five years, and payable twenty years from July 15, 1868, with interest at 6 per cent. per annum, payable semi-annually in coin."— During the month of July, 1862, gold was at a premium for legal tender notes of from 10 to 15 per cent., and demand notes, which were receivable for customs at a premium of about 8 per cent. The subsidiary silver coinage authorized by the act of Feb. 21, 1852, was about 7 per cent. less in intrinsic value than the silver dollar, and this difference in weight was authorized, so that it might be retained in the country for purposes of change. This silver

15, 1876; and an act was passed on April 17, of the same year, directing the secretary to replace this circulation by the issue of subsidiary silver coin. The fractional paper currency was issued in five different series. The highest amount outstanding at any one time was less than fifty millions. The amount outstanding on February 1, 1884, was \$15,363,184. A considerable amount is still held by banks and bankers, which is grudgingly paid out to those customers who desire it for purposes of remittance by letter. The principal portion of the amount outstanding will probably never be presented for redemption. The proportion of loss to the people from this fractional currency is vastly greater than that of any other kind of circulation ever issued in this country, and this loss, in a large measure, must be attributed to the small value of the notes and the many casualties of the war. The proportion of legal-tender notes and national bank notes of the highest amount outstanding at any one time, not presented for redemption in the course of twenty years, is estimated at about $1\frac{1}{4}$ per cent. — Authority was given by the second section of the act of March 3, 1863, to issue 400 millions of treasury notes; bearing interest at a rate not exceeding 6 per cent. in lawful money for a term not exceeding three years, payable at periods expressed on their face, and in denominations of not less than ten dollars. These notes were exchangeable, together with the accumulated interest for treasury notes not bearing interest. They were made legal tender for their face value, excluding interest. Power was also given to the secretary to issue 150 millions of additional greenbacks, which were to be issued only in exchange for these interest-bearing notes. Under this act, \$44,520,000 notes were issued, redeemable one year from date, and \$166,480,000 two years from date, bearing interest at 5 per cent. per annum, which were known as "one and two year notes of 1863." — Authority was given by the act of June 30, 1864, for the issue of 200 millions of treasury notes in denominations of not less than ten dollars, not exceeding three years, and bearing interest not exceeding 7.30 per cent. per annum, interest payable semi-annually, principal and interest to be paid in lawful money. The notes were to be a legal tender for their face value. No seven-thirty notes were issued under this act, but, in lieu thereof, \$266,595,440 of compound interest notes were issued. The act did not authorize in terms the issue of compound interest notes, but as the interest at 6 per cent. compounded, would be considerably less than at 7.30 per cent. simple interest, their issue was not in conflict with the terms of the act. The notes were in the form shown on the opposite page. Of these notes, \$177,045,770 were issued in redemption of the one and two year 5 per cent. notes, and it is not probable that more than 200 millions of these notes were outstanding at any one time. Secretary Fessenden, in his report for Dec. 6, 1864, thus refers to the issue of these notes: "The whole amount of national circula-

tion, not bearing interest, exclusive of fractional currency, and of notes issued by national banks, is limited to four hundred millions of dollars, subject to slight occasional increase from the fifty millions held in reserve for the payment of temporary deposits. Of 5 per cent. interest-bearing notes there were outstanding, on the first of November last, \$120,519,110. To a considerable extent these notes have been, and will continue to be, used as currency. Those with coupons have been found particularly objectionable, as, though withdrawn to a certain extent while the interest is maturing, they are liable to be periodically rushed upon the market. In consideration of this feature, a large amount, viz., about ninety millions of the original issue of one hundred and fifty millions of these coupon notes, have been withdrawn and destroyed, and their place occupied by notes payable in three years, bearing interest at 6 per centum, compounded semi-annually. This is believed to be the best form of interest-bearing legal-tender notes, as being more likely to be withdrawn and held until maturity, as an investment. Of these, fifteen millions in amount were issued under the act of March 3, 1863, and about ninety millions under the act of June 30, 1864. The total amount of interest-bearing notes outstanding on the 22d of November last, was \$210,222,870. What proportion of these may be considered as an addition to the circulation I am unable to determine. To that extent, whatever it may be, they contribute to the amount of the currency, and thus in some degree occasion and in still greater degree sustain, an increase of prices, and depress values." — About two years and eight months after the passage of the last act, authority was given for the issue of temporary loan 3 per cent. certificates, for the purpose of retiring the compound interest notes. When these notes were issued, it was expected that they would, as the interest accumulated, soon pass out of circulation into the hands of bankers and capitalists. These expectations were realized, for the interest was only payable at maturity three years from date. Such notes, with accrued interest, would not be paid out by the holders except in cases of absolute necessity. In order to insure the retirement of these notes, "An act to provide ways and means for the payment of compound interest notes," was passed on March 2, 1867. — This act authorized the issue of 3 per cent. certificates in denominations of not less than \$100, payable on demand. The national banks were authorized to hold these certificates as a part of their reserve, provided that not less than two-fifths of the entire reserve should consist of lawful money of the United States. This privilege did not largely diminish the amount of gold coin and greenbacks which the banks were required continually to keep on hand, as most of the banks held a large amount of cash reserve, in addition to the amount required by law. This excess could with great profit be invested in the new certificates, and they could be used to advantage for clearing-house purposes, and the banks at once availed

be retained in the treasury for the payment of the same on demand. Certificates representing coin in the treasury were authorized to be issued in payment of interest on the public debt, but it was provided that the amount of certificates issued should not, at any one time, exceed 20 per centum beyond the amount of coin and bullion in the treasury. These certificates were authorized to be received at par in payment of duties. The first issue was made on Nov. 13, 1865. On June 30, 1875, there were outstanding \$21,796,300, of which the national banks in New York city held \$12,642,180. Their issue was discontinued on Dec. 1, 1878, just previous to the resumption of specie payment, and the amount outstanding had decreased on June 30, 1879, to \$15,413,700. The amount outstanding on Oct. 3, 1883, was \$4,907,440, of which the national banks held \$4,594,300. On Jan. 1, 1883, the amount outstanding was \$3,568,840. Most of these certificates were issued for clearing-house purposes, in denominations of \$1,000, \$5,000 and \$10,000. — On June 8, 1872, an act was passed authorizing the secretary of the treasury to receive United States notes on deposit without interest from national bank associations, in sums not less than \$10,000, and issue certificates therefor, of denominations not less than \$5,000. These certificates were similar to the 3 per cent. certificates just referred to, except that they bore no interest, and were largely used in place thereof for clearing-house purposes. The certificates were payable on demand in United States notes at the place of issue, and they were authorized to be held and counted

by national banks as part of their legal reserve, and to be used in settlement of clearing-house balances. These certificates were not properly treasury notes, and the highest amount issued was \$64,780,000, on Aug. 3, 1875, which amount was rapidly reduced after the resumption of specie payments. On June 30, 1875, there were outstanding \$59,045,000, of which the national banks held \$47,310,000. On June 30, 1876, the amount outstanding was \$33,140,000, of which the banks held \$27,955. The amount outstanding on June 1, 1883, was \$11,805,000, of which the banks held, on May 1, \$8,420,000. — The act of Feb. 26, 1879, authorized the issue of 4 per cent. certificates, of the denomination of \$10, which were convertible at any time, with accrued interest, into the 4 per cent. bonds authorized to be issued July 14, 1870. This act was passed for the purpose of facilitating the refunding of 5 and 6 per cent. bonds then falling due into 4 per cents, but the act was really unnecessary, for about the time the certificates began to be issued, the 4 per cent. bonds were above par in the market. Long lines of people gathered at the different government depositories where the certificates were offered, and the amount was taken as fast as they could be furnished. \$40,012,750 were disposed of at par, of which \$39,398,110 were issued during the fourth quarter of the fiscal year 1879, and the amount outstanding on June 1, 1883, was \$358,000. — The following table exhibits the amount of treasury notes of the different forms issued during the late civil war, outstanding on June 1, 1883, interest upon all of which has long since ceased :

NOTES.	Act.	Rate of Interest.	Interest Ceased.	Principal	Interest.
Treasury notes of 1861.....	Mar. 2, 1861	6 per cent.	March 3, 1863.	\$ 3,000	\$ 361 50

Gold certificates.....	Mar. 2, 1867.	3 per cent.	Feb. 28, 1873.	5,000	394 31
	July 25, 1868.	No interest.	11,805,000
	June 8, 1872.	No interest.	3,568,840
	Mar. 3, 1863.	No interest.

—“An act to authorize the issue of United States notes, and for the redemption or funding thereof, and for refunding the floating debt of the United States,” which was signed by President Lincoln on Feb. 25, 1862, is the first law ever placed upon the statute books making treasury notes, or anything but gold and silver coin, a tender in payment of debts. Indeed, it may be said that neither the congress of the United States nor the continental congress, which preceded it, issued any form of legal tender treasury notes. The continental congress had no power to enact such a law. It did, however, pass a resolution, on Jan. 4, 1777,

recommending to the legislatures of the different states to pass laws making the bills of credit issued by congress a lawful tender in payment of public and private debts, and a refusal thereof an extinguishment of such debts; that debts payable in sterling money be discharged in continental dollars at the rate of 48.6 sterling per dollar; and that in the discharge of all other debts and contracts, continental dollars shall pass at the rate fixed by the respective states for the value of Spanish milled dollars. In accordance with the recommendation contained in these resolutions, continental money was made a legal tender in Connecticut, Massachusetts,

Rhode Island and New Jersey in 1776, and in Pennsylvania, Delaware, Maryland and Virginia in 1777. — The legal-tender act was passed during the second session of the 32d congress, which met Dec. 2, 1861. The report of the secretary of the treasury bears date Dec. 9. The third installment of fifty millions, of the loan of 150 millions already referred to, had been negotiated on the 16th of November previous, with the associated banks. The secretary was hopeful that the war would be brought to an auspicious termination before mid-summer, but at the same time submitted estimates based upon its continuance. In this event, it was estimated that the public debt, which, on July 1, 1861, was \$90,867,828, would be, on July 1, 1862, 517 millions, and on July 1 of the following year, 897 millions. He recommended the issue of circulating notes in place of the existing bank note circulation, which depended "on the laws of thirty-four states, and the character of some sixteen hundred private corporations." Two plans for effecting this object were suggested: the first was the withdrawal of the bank circulation, and the issue of United States notes instead thereof, payable in coin on demand; the second contemplated the delivery to banks of notes prepared for circulation under national direction, and to secure prompt convertibility into coin by the pledge of United States bonds, and other needful regulations. Both of these plans were discussed at considerable length in the report, the preference of the secretary being decidedly in favor of the issue of bank notes. The avails of the large loans made from the banks were not allowed to remain on deposit, to be drawn by checks as the necessities of the government should require, but were, from time to time, paid into the treasury, so that it was quite difficult for some of the banks to meet the last installment. The banks were in danger of suspending specie payment at the time of the meeting of congress. Suspension finally took place on Dec. 28, 1861, and two days later, on the 30th, Mr. Spaulding, of the subcommittee of the committee of ways and means, introduced the legal-tender bill. — A national bank bill had been prepared previously, and when nearly completed, Mr. Hooper, of Massachusetts, also of the subcommittee, incorporated in it several provisions contained in a recent free banking bill, which had passed the legislature of his own state. Two hundred copies of this bill, which was hastily prepared late in the month of December, were printed for the use of the committee of ways and means, and a copy of this bill, which was the basis of the national bank act which became a law about a year afterward, is in the possession of the writer of this article. It being evident that the bank bill would encounter considerable opposition from the friends of banks organized under state laws, and that great delay would necessarily occur from the consideration of an elaborate bank bill of sixty or more sections, arranged for the organization of banks in the different states of the Union, the bill was laid aside, and the bill authorizing the issue of

legal-tender notes was considered. An informal letter was read to the committee from Attorney General Bates, in which he gave it as his opinion that congress had not only the right to issue such bills of credit, but also to make them a legal tender. Discussion of the bill continued for several days, and, upon a vote being taken, it was found that the committee was equally divided, but by the change of a vote it was finally reported to the house on July 7, 1862, and published in the leading New York newspapers, only two of which were favorable to the measure. Delegates from ten of the principal banks in the three leading cities appeared in Washington and opposed the bill. The bill was afterward submitted to the secretary of the Treasury by the committee, and, upon its return with his suggestions, was reported to the house on Jan. 22, 1862, with the title above given, as a substitute for the previous bill. The bill passed the house on Feb. 6, 1862, by a vote of 93 to 59. The vote to strike out the legal-tender clause was lost in the senate by 17 yeas to 22 nays, and the bill passed by a vote of 30 to 7. The chief amendments in the senate were: requiring payment of interest semi-annually in coin on bonds and seventy-three notes; conferring on the secretary power to sell 6 per cent. bonds at the market value thereof for coin; making the bonds redeemable in five years and payable in twenty years from date at the option of the government, and authorizing temporary deposits in the treasury at 6 per cent. — There was considerable debate in both houses upon the question of the right of the government to issue demand notes, and the arguments were not unlike those which have already been given in previous debates in congress. The principal discussion was, however, upon the constitutional right of congress to issue legal-tender notes. On the 20th the amendments were returned to the senate with the concurrence of the house in part of them, and non-concurrence in others, and with some amendments to the senate amendments, after which a conference committee was appointed in the house and senate, which committee had a long consultation extending through two or three days. The report of the conference committee was agreed to on the 24th in the house by yeas 97, nays 22, and in the senate on the 25th without a division, and on the same day the bill was approved by the president. It authorized the issue of 150 millions of United States notes, not bearing interest, payable to bearer at the treasury of the United States, and of denominations of not less than \$5, fifty millions of which were to be in lieu of the demand treasury notes which had been previously issued; they were similar in form to those notes, but they were not receivable in payment of duties on imports, and were not payable by the government for interest upon its obligations, which were payable in coin: they were to be a legal tender in payment of all other debts, public and private, within the United States. They differed from the first notes issued also, and in this respect, that all holders of legal-tender

notes were authorized to deposit any sum not less than \$50, or any multiple of \$50, with the treasurer, or either of the assistant treasurers, and receive duplicate certificates, upon which were to be issued to the holder an equal amount of bonds of the United States bearing interest at the rate of 6 per centum per annum, payable semi-annually, and redeemable at the pleasure of the United States after five years, and payable twenty years from the date thereof. The second section of the same act authorizes the issue of 500 millions of five-twenty bonds into which the treasury notes were to be funded, in accordance with the previous section and as stated in the title of the bill. The first notes issued were of the date of March 10, 1862, and there was printed upon the back the following words: "This note is a legal tender for all debts, public and private, except duties on imports and interest on the public debt, and is exchangeable for United States 6 per cent. bonds redeemable at the pleasure of the United States after five years."—On June 7, 1862, the secretary addressed letters to the chairman of the committee of ways and means of the house and the finance committee of the senate, recommending a further issue of 150 millions of dollars of legal-tender notes. He said that nearly the whole issue of sixty millions in demand notes was held by bankers and by capitalists, and was at a premium of $\frac{1}{4}$ to $1\frac{1}{4}$ per cent. on account of its availability for the payment of duties; so that there was really only about ninety millions of United States notes in circulation. He said that the United States notes are maintained at near par in gold by the provision for their conversion into bonds bearing 6 per cent. interest payable in coin, and that resumption would be more easily effected "if the currency—small as well as large—were of United States notes, than if the channels of circulation be left to be filled up by the emissions of non-specie paying corporations, solvent and insolvent." With these letters he transmitted bills for the consideration of these committees. The immediate necessities of the government admitted of but little delay, and the bill, substantially as recommended by the secretary, passed both houses, and was signed by the president on June 11, 1862. The bill authorized the issue of 150 millions of legal-tender notes, thirty-five millions of which were to be in denominations less than \$5. The subsequent act of March 3, 1863, authorized the issue of an additional 150 millions, making the aggregate authorized issue of legal-tender notes 450 millions of dollars. This act was similar to the previous legal-tender acts, so far as the issue of treasury notes was concerned, except that it provided "that the holders of United States notes issued under former acts shall present the same for the purpose of exchanging them for bonds as therein provided on or before July 1, 1863, and thereupon the right to exchange the same shall cease and determine."—After the passage of the act of March 3, 1863, the secretary decided to commence the negotiation of 5 per cent. ten-forty bonds, and gave notice

that he should decline to allow the holders of legal tenders to fund such notes in bonds bearing a greater rate of interest than 5 per cent. after July 1, 1863. The negotiation of the 5 per cent. was not successful at that time, and that portion of the act of March 3 which repealed the right to fund legal tenders into five-twenties, as printed upon the back of the notes, was not only a violation of the contract with the holder, but also a serious financial mistake. It had the effect to materially reduce the value of the treasury notes in the market, prevented for a time the further funding of treasury notes after July 1, and undoubtedly postponed for many months the date for the resumption of specie payment.—The highest amount of legal-tender notes outstanding at any time was on Jan. 3, 1864, when the amount reached \$449,338,902. The second section of the act of June 30, 1864, provided that "the total amount of United States notes issued or to be issued shall not exceed 400 millions, and such additional sum, not exceeding fifty millions, as may be temporarily required for the redemption of temporary loans." The following table shows by denominations the amount of legal-tender notes outstanding on June 1, 1883:

Ones	\$27,565,568 80
Twos	25,808,502 20
Fives	71,677,845 00
Tens	73,465,906 00
Twenties	63,266,909 00
Fifties	23,708,325 00
One hundreds	34,348,090 00
Five hundreds	14,562,500 00
One thousands	12,457,500 00
Five thousands	330,000 00
Ten thousands	170,000 00
Destroyed in the Chicago fire	—1,000,000 00
Total	\$346,681,016 00

—Secretary McCulloch, in his report for 1865, expressed the opinion, that the legal-tender acts were war measures, and ought not to remain in force one day longer than should be necessary to enable the people to prepare for a return to the gold standard. The house of representatives during the same month passed a resolution, by a vote of 144 yeas to 6 nays, "cordially concurring in the views of the secretary of the treasury in relation to the necessity of the contraction of the currency with a view to as early a resumption of specie payment as the business interests of the country will permit." In order to carry into effect this resolution, congress, by an act approved March 12, 1866, authorized the retiring and cancellation of not more than ten millions of legal-tender notes within six months from the passage of the act, and thereafter not more than four millions in any one month. Under this act, the amount outstanding was so far reduced, that on Dec. 31, 1867, the amount was 356 millions. On Feb. 4, 1868, the further reduction of the volume of such notes was prohibited, leaving the last-named amount outstanding until Oct. 1, 1872. Between that date and Jan. 15, 1874, under Secretaries Boutwell and Richardson, the amount was increased to

\$382,979,815, and on June 20, 1874, the maximum amount was fixed at \$382,000,000; section six of the act of that date providing that "the amount of United States notes outstanding and to be used as a part of the circulating medium shall not exceed the sum of 382 millions, which said sum shall appear in each monthly statement of the public debt, and no part thereof shall be held or used as a reserve."—Section three of the act of Jan. 14, 1875, authorized an increase of the circulation of national banks in accordance with existing law, without respect to the limit previously existing, but required the secretary of the treasury to retire legal-tender notes to an amount

equal to 80 per cent. of the national bank notes thereafter issued, until the amount of such legal-tender notes outstanding should be 300 millions, and no more. Under the operation of this act \$35,818,984 of legal-tender notes were retired, leaving the amount in circulation on May 31, 1878, the date of the repeal of the act, \$346,681,016, which is the amount now outstanding.—The following table exhibits the amount of the various issues of treasury notes outstanding on July 1 of each year from 1862 to 1883; together with the amount of national bank notes and the value of the legal-tender treasury note as compared with coin for the same dates :

YEAR ENDING JULY 1.	Demand Notes.	Legal Tender Notes.	7-30 Notes.	Fractional Currency.	One and Two Year Notes of 1863.	National Bank Notes.	Value of Paper Dollar as compared with Coin.
1862.....	\$53,040,000	\$ 96,620,000	\$122,582,485				\$0 86.6
1863.....	3,351,019	297,767,114	139,974,435	\$20,192,456	\$ 89,879,475	\$ 31,235,270	.76 6

—The act of Jan. 14, 1875, required the secretary of the treasury, on and after Jan. 1, 1879, to redeem in coin the legal-tender notes on their presentation at the office of the assistant treasurer in the city of New York, in sums of not less than \$50. In order that he might always be prepared to do this, he was authorized "to use any surplus revenue from time to time in the treasury not otherwise appropriated, and to issue, sell and dispose of at not less than par in coin any of the 5, 4½ and 4 per cent. bonds authorized by the act of July 14, 1870. Under this act Secretary Sherman, in 1877, sold at par in coin fifteen millions of 4½ per cents, and twenty-five millions of 4's; and in April, 1878, he sold fifty millions of 4½ per cents at a premium of 1½ per cent. This coin was placed in the treasury for purposes of resumption, and on Jan. 1, 1879, the secretary held 135 millions of gold coin and bullion, and, in addition, over thirty-two millions in silver coin and bullion; the gold coin alone being nearly equal to 40 per cent. of the United States notes then outstanding.—The assistant treasurer of the United States, at New York, became a member of the clearing house, thus facilitating the business of the banks with the government. The banks in New York strengthened the hands of the government by agreeing to receive United States notes,

not only for their ordinary balances, but in payment of the interest upon the public debt, and of other coin obligations of the government. The banks of the country, at the date of resumption, held more than one-third of the outstanding treasury notes, but they had so much confidence in the ability of the secretary to maintain resumption that none were presented by them for redemption. The people preferred the issues of national banks and of the government to coin itself. There was, therefore, no demand for payment of the notes of the government, and the gold coin in the treasury, which amounted to 135 millions on the day of resumption, increased more than thirty-six millions in the next ten months. The amount held on Nov. 1, 1879, exceeded 171 millions, and on Nov. 1, 1883, 209 millions. The resumption act is still in force, and gives the secretary unlimited power, with which to provide for the redemption in coin of the legal-tender notes. He is thus enabled, so long as the credit of the government continues good, to check, by the sale of United States bonds, any exportation of coin which might endanger the redemption of United States legal-tender notes.—From the date of the passage of the act of April 12, 1866, which authorized a reduction of the amount of legal-tender notes, to the passage of the act of July 12, 1882, enabling national banking

associations to extend their corporate existence, a period of more than sixteen years, hundreds of bills of almost every conceivable form to regulate the currency were introduced in congress. Throughout the country the subject was continually discussed, not only during political campaigns and at public conventions, but in the smaller gatherings of the school district and the meetings of individuals by the way side. Speeches and political pamphlets by the thousand, essays, campaign papers innumerable, and caricatures of almost every kind and description, upon the subject of the expansion and contraction of the currency, and its effect upon business, were distributed broadcast in all directions. Perhaps the most plausible argument which was presented over and over again in every portion of the country during these continued discussions, was in reference to the retirement of the national bank notes, and the substitution thereof of treasury notes, in order, as was claimed, to save to the government the interest upon the bonds held by the national banks, as security for their circulating notes. Discussions of this subject in its various forms, and statements of the profits of the circulation of the national banks at different dates, may be found in the reports of the comptroller of the currency during the last nine years. — The act of Feb. 28, 1878, authorized any holder of silver dollars of the weight of 412½ grains troy of standard silver, to deposit the same with the treasurer, or any assistant treasurer, of the United States, in sums not less than ten dollars, and receive therefor certificates of not less than ten dollars, each corresponding with the denominations of the United States notes. It required that the coin deposited or representing the certificates should be retained in the treasury for the payment of the same on demand, and that said certificates should be receivable for customs, taxes and all public dues, and also authorized their reissue. This act did not authorize their use as clearing house certificates, nor make them available as reserve for the national banks. — The act of July 12, 1882, authorized and directed the secretary of the treasury to receive deposits of gold coin in denominations of not less than \$20 each, corresponding with the denominations of United States notes. The coin deposited for the certificates is required to be retained for the payment of the same on demand, and these certificates, and also silver certificates, are authorized to be counted as part of the lawful reserve of the national banks. The act also provides that no national banking association shall be a member of any clearing house in which such certificates shall not be receivable in the settlement of clearing house balances.

YEARS.	Coinage.	Amount in Treasury.	Silver Certificates Outstanding
1878	\$ 8,573,500	\$ 7,718,357	\$ 1,850,410
1879	35,801,000	28,358,569	2,589,950
1880	63,734,750	45,108,286	12,374,270
1881	91,372,705	68,249,900	51,166,530
1882	119,144,780	87,524,182	66,096,710
1883	147,255,989	111,914,019	88,616,881

— The preceding table shows the amount of standard silver dollars coined under the act of Feb. 28, 1878, which authorized the same, the amount in the treasury and the amount of silver certificates issued on July 1, from 1878 to 1883 inclusive.

— The amount of gold certificates which had been issued under the act of July 12, 1882, was, on Nov 1, \$21,790,000, and on Jan. 1, 1884, \$87,874,500 —

JOHN JAY KNOX.

UNITED STATES NOTES. Legal-Tender Cases—Decisions of the Supreme Court of the United States.

On April 30, 1866, the legislature of New York provided by law for refunding to the banks and other corporations in like condition, the taxes of 1863 and 1864 collected upon that part of their capital invested in securities of the United States exempt by law from taxation. The board of supervisors of the county of New York was charged with the duty of auditing and allowing, with the approval of the mayor of the city and the corporation counsel, the amount collected from each corporation for taxes on the exempt portion of its capital, together with costs, damages and interest. This act was passed in conformity with the decision of the United States supreme court in the Bank Tax Case (reported in 2d Wallace, 200), which decided that a tax on the obligations of the United States by state authority was void. The bank of New York presented a claim to the said board of supervisors for the refunding of those taxes which the bank had paid on the United States notes, commonly called "greenbacks," during the years aforesaid. The board refused the application on the ground that "greenbacks" were not "securities" of the United States government, but were practically and in effect "money," taxable as cash. The court of appeals of the state of New York sustained the action of the board, but on appeal to the United States supreme court (Bank vs. The Supervisors, 7 Wallace, 26), that court, at its December term, 1868, reversed the opinion of the state court. The court said: "The act of February, 1862, declares that 'All United States bonds and other securities of the United States held by individuals, associations or corporations within the United States, shall be exempt from taxation by or under state authority.' We have already said that these notes are obligations. They bind the national faith. They are, therefore, strictly securities. They secure the payment stipulated to the holders by the pledge of the national faith, the only ultimate security of all national obligations, whatever form they may assume." — On June 20, 1860, a certain Mrs. Hepburn made a promissory

note. by which she promised to pay to Henry Griswold on Feb. 20, 1862, eleven thousand two hundred and fifty "dollars." At the time when the note was made, and also at the time when it fell due, there was, confessedly, no lawful money of the United States, or money which could be lawfully tendered in payment of private debts, but gold and silver coin. Five days after the day when the note by its terms fell due, that is to say, on Feb. 25, 1862, congress passed the first legal tender act, commonly so called, by which the United States notes issued thereunder were made a legal tender for "all debts, public and private, within the United States," except certain public debts. In March, 1864, Mrs. Hepburn tendered payment of the debt, principal and interest, in the United States notes issued under this act. The amount tendered, \$11,250 in legal-tender notes, at that time was worth only about \$7,000 in coin. The tender was refused. She was sued in the Louisville chancery court in the state of Kentucky. She tendered and paid the same money into court. It was declared by the chancellor to be a satisfaction of the debt. The case was appealed to the court of errors of Kentucky. That court reversed the chancellor's decision, and ordered a contrary judgment to be entered. Whereupon Mrs. Hepburn took the case to the United States supreme court, where it was argued by very numerous and able counsel at the December term, 1868, but not decided until the December term, 1869. (*Hepburn vs. Griswold*, 8 Wallace, 603.) The court was comprised of Mr. Chief Justice Chase, and Associate Justices Nelson, Clifford, Field, Grier, Davis, Miller and Swayne. Mr. Justice Grier resigned before the opinion of the court was announced, but agreed with the majority in the consultation room, as was announced by the chief justice. The chief justice delivered the opinion of the court. In this opinion Justices Nelson, Clifford and Field concurred. The court held that the language of the act of Feb. 25, 1862, making the United States notes issued thereunder "a legal tender in payment of all debts, public and private, within the United States," included pre-existing debts as well as debts which should be incurred after the passage of the act, and while it might be an exercise of rightful power in congress under those powers granted it by the constitution to declare war, suppress insurrection, raise and support armies and navies, borrow money on the credit of the United States to pay the debts of the Union, and to provide for the common defense and general welfare, to emit bills of credit or United States notes intended to circulate as money, and make the same legal tender for debts to be incurred after the passage of the act, yet inasmuch, as the act by construction declared these notes to be legal tender in payment of pre-existing debts, that the act was inconsistent with the spirit of the constitution, and was not a law "necessary and proper" for carrying into execution the powers vested by the constitution in congress or in the government of the United States. The constitution reads that

congress shall have, besides certain powers granted in express terms, "power to make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this constitution in the government of the United States or in any department or offices thereof." The court held that the legal-tender clause was unnecessary and improper. That the notes would have maintained themselves equally well without it. The chief justice quoted the fact that the three hundred million of dollars in notes issued by the national banking associations under the act of February, 1863, and the fifty millions of fractional currency issued under the act of March, 1863, were not made a legal tender, and argued that it was the quality of receivability for public dues, and not the quality of legal tender, which made these United States notes circulate as freely as they did. The chief justice declared that the act was obnoxious to those clauses of the constitution, also, which forbade the impairment of the obligations of contracts, the taking of private property for public use without compensation, and the deprivation of any person of his property without due process of law. And that the constitution was ordained to "establish justice," which this act did not do, so far as regards pre-existing debts. For all of which reasons elaborately stated, the court held the act unconstitutional and therefore void. Mr. Justice Miller, with whom concurred Justices Davis and Swayne, delivered a dissenting opinion. He held that what was "necessary and proper" to carry into execution the powers vested by the constitution in the government of the United States, can not rightfully be construed to mean only such legislation as is indispensably necessary, but that congress has the choice of means, and is empowered to use any means, which are, in fact, conducive to the exercise of the power granted or calculated to produce the end desired. He fortified this position by the clear, strong decisions of the court delivered by Chief Justice Marshall, who announced this exposition of the constitution in *United States vs. Fisher*, 2 Cranch, 358, and in *McCulloch vs. The State of Maryland*, 4 Wheaton, 316. He further said, that, while the constitution forbade any state from impairing the obligation of a contract, it said nothing about the power of congress in the premises. And that the provision that private property should not be taken for public use without due compensation, nor any person be deprived of his property without due course of law, had no application to the indirect effect of great public measures whereby lands, stocks, contracts etc., might depreciate in value, because, for instance, such an effect would doubtless succeed an immediate abolition of the tariff on iron by depreciating the value of furnaces and the capital employed in its manufacture, and yet no one would claim that such a repeal was therefore unconstitutional and void. That the whole argument of the injustice of the law and of its being opposed to the spirit of the constitution, was too

abstract and intangible for application to courts of justice. That the act was passed to save the life of the government, to pay its soldiers and sailors and other public debts. That the legal-tender clause was considered "necessary and proper" by congress, and that the courts had no right to interfere with that discretion. "It would authorize this court to enforce theoretical views of the genius of the government, or vague notions of the spirit of the constitution and of abstract justice, by declaring void laws which did not square with those views. It substitutes our ideas of policy for judicial construction, an undefined code of ethics for the constitution, and a court of justice for the national legislature."—One Parker (Legal Tender Cases, 12 Wallace, 457) was under contract to convey a lot of land to one Davis, upon payment of a certain sum of money. The contract antedated, and suit was brought on the same before, the passage of any of the legal-tender acts. After the passage, to wit, in February, 1867, the supreme court of Massachusetts decreed that Davis should pay into court a certain sum of money, and that Parker should thereupon execute a deed to him for the land in question. Davis accordingly paid into court the given sum in United States notes. Parker refused to execute the deed on the ground that he was entitled to coin; whereupon the court changed the decree, and ordered that Parker should execute the deed upon payment by Davis into court of the specific sum in United States notes. From that decree the case was appealed to the United States supreme court. The case was argued at its December term, 1870, and on Jan. 15, 1872, the opinion of the court was delivered by Justice Strong, who, with Justice Bradley, had been added to the court in 1870 by President Grant, making a full bench of nine. The other justices were the same that sat in the case of *Hepburn vs. Griswold*. The court overruled the latter case and held the legal-tender acts to be constitutional as respects contracts made before their enactment as well as after. The court said, in reference to the case of *Hepburn vs. Griswold*: "That case was decided by a divided court and by a court having a less number of judges than the law then in existence provided this court shall have. These cases have been heard before a full court, and they have received our most careful consideration." And Mr. Justice Bradley, in his separate concurring opinion said: "And in this case, with all deference and respect for the former judgment of the court, I am so fully convinced that it was erroneous and prejudicial to the rights, interest and safety of the general government, that I, for one, have no hesitation in reviewing and overruling it. It should be remembered that this court, at the very term in which, and within a few weeks after, the decision in *Hepburn vs. Griswold* was delivered, when the vacancies on the bench were filled, determined to hear the question reargued. This fact must necessarily have had the effect of apprising the country that the decision was not

fully acquiesced in, and of obviating any injurious consequences to the business of the country by its reversal." Justice Strong, in delivering the opinion of the court, reiterated and enforced the arguments made by the minority in *Hepburn vs. Griswold*. He held that the distinction made by the chief justice in regard to the constitutional validity of the act as to debts contracted after its passage and debts contracted before, was not well founded, and that the fundamental question was, Can congress constitutionally give to United States notes the character and quality of money? If they can, then such notes can be made legally available to fulfill all contracts solvable in money, without reference to the time when such contracts were made, unless expressly otherwise provided. "What we do assert is, that congress has power to enact that the government's promises to pay money shall be, for the time being, equivalent in value to the representative of value determined by the coinage acts, or to multiples thereof." And that, therefore, all contracts calling for "dollars" simply can be legally fulfilled by a tender of the government's promises to pay dollars, by force of the legal-tender acts, without regard to date. And on this point Mr. Justice Bradley, in his concurring opinion, says: "So with the power of the government to borrow money, a power to be exercised by the consent of the lender, if possible, but to be exercised without his consent if necessary. And when exercised in the form of legal tender notes or bills of credit, it may operate for the time being to compel the creditor to receive the *credit of the government* in place of the gold which he expected to receive from his debtor. All these are fundamental political conditions on which life, property and money are respectively held and enjoyed under our system of government, nay, under any system of government. There are times when the exigencies of the state rightly absorb all subordinate considerations of private interest, convenience or feeling; and at such times the temporary, though compulsory, acceptance by a private creditor, of the government credit, in lieu of his debtor's obligation to pay, is one of the slightest forms in which the necessary burdens of society can be sustained. Instead of being a violation of such obligation, it merely subjects it to one of those conditions under which it is held and enjoyed." The chief justice, with whom concurred Justices Nelson, Field and Clifford, delivered a dissenting opinion. He strenuously maintained his former views, as did also Justices Field and Clifford, in separate opinions. The burden of their argument was, that the constitution forbade any state to make anything but gold and silver a legal tender, and granted to the government only the right to coin this gold and silver, and regulate the value thereof and of foreign coin. And while the power to emit treasury notes was conceded as one means of borrowing money, yet that congress had no right to make such notes money, or legal tender as money. Mr. Justice Clifford showed that the

words "and emit bills on the credit of the United States" were originally reported in article seven, in the draft of the constitution as submitted to the convention. Mr. Morris moved to strike the clause out on the ground that it was unnecessary, and a vicious suggestion of a power which would be unquestionably used anyhow without it. Mr. Madison thought it would be sufficient to let the clause remain, as it did not contain the hurtful power to make such bills legal tender, but finally voted in favor of striking out the clause entirely, as was done, as eliminating even a "*pretext for a paper currency, and particularly for making the bills a tender either for public or private debts,*" without disabling the government from the use of treasury notes.

JOHN JAY KNOX.

UNITED STATES OF AMERICA, The.—

I. COLONIAL HISTORY. 1. *Discovery.* It is unnecessary to consider here the controversy in regard to the discoveries of the Northmen, for the existence of the United States is due, in the first place, to the discovery of the new world by Columbus (see AMERICA), and, in the second place, and yet much more directly, to the discoveries of John and Sebastian Cabot in 1497 and 1498. There are but scanty records of their voyages; but it is quite certain that Sebastian sailed along the coast of what is now the United States from parallel 38° (Virginia) to its northern limit. As both were in the service of the English king, and Sebastian was probably born in Bristol, England, their discoveries were the foundation of the English claims in North America. — The discovery of the coast further south was mainly due to voyages from the Spanish West Indies. Ponce de Leon discovered Florida, on the eastern side, in 1512; and in 1528 Narvaez secured a temporary foothold on its northwest coast. In 1520 Ayllon discovered the coast of what is now South Carolina; and in 1524 Verrazzani, an independent voyager in the service of France, filled up most of the gaps by exploring the coast from the southern border of North Carolina to Nova Scotia. It is thus quite certain that the coast of the Atlantic and gulf of Mexico was fairly well known in 1524. There has always been a strong suspicion, however, that the Atlantic coast was just as well known years before 1524, by the voyages of Cortereal in 1500, and of other forgotten sailors before and after him. It is asserted, for example, that a planisphere, dating from 1502, has been discovered (1883) at Modena, in the archives of the Este family, and that it gives the outline of the whole Atlantic coast of the United States, including Florida. There has even been a disposition, in some quarters, to deny the claims of Columbus as a discoverer, and to make him also a mere reproducer of the work of unknown predecessors. However this may be, the political history of the United States can not look back further than Columbus' discovery for the causes of the country's existence. The discovery of the Pacific coast is elsewhere treated. (See NORTHWEST BOUNDARY.)—

All this work was confined to the seacoast, and no attempt was made upon the interior for nearly a century, with a single remarkable exception, the most extraordinary episode in this part of the history of the United States. In 1539 Ferdinand de Soto, with a Spanish force, landed at Tampa bay, marched north into what is now northern Georgia, thence back to Mobile, and thence northwest into Arkansas, discovering and crossing the Mississippi, in April, 1541, near the present southerly boundary of Tennessee. After nearly crossing Arkansas, he moved down the Washita river to the Mississippi. Here he died, in May, 1542, and the remnants of his force built boats, in which they reached Mexico. With the exception of this quixotic affair, and a few expeditions sent northward by the Spanish governors of Mexico into what is now New Mexico and California, the interior of North America was for a long time untouched: the ocean was the base of operations for all the early discoverers. — 2. *Colonization.* The colonization of the central belt of North America, now covered by the United States, was essayed at different times by five nations of Europe, England, France, Spain, Holland and Sweden. The details of these attempts will be found under the names of the various colonies referred to below. It is intended here only to show the manner in which Great Britain gradually ousted the other sovereignties from this particular territory, and formed here a chain of thirteen homogeneous colonies of her own, fitted for subsequent coalescence into a nation. — The claim of Spain to the whole of the two Americas, confirmed by a papal bull in 1493, was respected by other nations, until they were touched by the influences of the reformation. In 1562 an unsuccessful colony of French Huguenots was planted at Port Royal, and this part of the continent was named Carolina, in honor of Charles IX. of France. In 1564 a more successful colony was planted on the St. John's river, in northern Florida; but this was extirpated by the Spaniards under circumstances of great atrocity. There were no further attempts at colonization by French Protestants; and the energies of Spain were bent toward the richer regions of Mexico and South America; so that central North America remained uncolonized. — England was now controlled by the reformation; a new era of mental and physical activity was opening; and her policy was taking a line of pronounced opposition to Spain. Her connection with the new world had been kept up by a vigorous prosecution of the Newfoundland fisheries; and in 1578 her preliminary failures in the process of colonization were begun. In that year, and in 1583, two unsuccessful voyages were made to North America by Sir Humphrey Gilbert, Sir Walter Raleigh's half-brother, under patent from Queen Elizabeth. In 1584, under a new patent, Raleigh sent out two small vessels under Amidas and Barlow. They explored the coast of North Carolina, and reported so favorably that Queen Elizabeth named the country Virginia, as a token of the favor of the

virgin queen. In 1585 Raleigh fixed the first English colony in America on Roanoke island, in North Carolina: it was starved out in a year. In 1587 he established another at the same place: it had disappeared, when it was searched for three years afterward, and has never since been heard of. Raleigh's ill success discouraged him and others, and there were no further individual efforts at English colonization. English voyagers still skirted the coast and trafficked with the Indians, but at the beginning of the seventeenth century there was not an English colonist in North America. — English colonization was forced by the general poverty and discontent of the English lower classes; but English statesmen wisely intrusted the execution of the work to joint-stock companies. Two companies were formed, and were chartered by one patent of James I., dated April 10, 1606. To the London company, composed of merchants and gentlemen in and near London, was granted the Atlantic coast between north latitude 34° and 41°, that is, from about Cape Fear to Long Island. To the Plymouth company, whose members lived in the west of England, was granted the coast between north latitude 38° and 45°, that is, from the mouth of the Potomac to the eastern boundary of Maine. From the Potomac to Long Island, where the two grants conflicted, neither company was to plant a settlement within 100 miles of a settlement previously planted by the other. The western extent of both grants was indefinite. — The patent practically reserved to the crown all powers of legislation, and gave the nominal ruling bodies, the councils, little or no power. But it contained the following important clause, which was always rated as more significant by the colonists than by the crown: "And we do, for us, our heirs and successors, declare by these presents that all and every the persons, being our subjects, which shall dwell and inhabit within every or any of the said several colonies and plantations, and every of their children, which shall happen to be born within any of the limits and precincts of the said several colonies and plantations, shall have and enjoy all liberties, franchises and immunities, within any of our other dominions, to all intents and purposes as if they had been abiding and born within this our realm of England, or any other of our said dominions." The intention of this royal advertisement and contract for the encouragement of emigration always seemed to the colonists too plain for argument. The ingenuity of crown lawyers was easily able to convince the crown, in after years, that there were many "liberties, franchises and immunities," extorted from the crown by English subjects, which did not extend to the colonists. But the colonists were never convinced, and it is difficult to see any reason why they should have been convinced. — The patent also contained a provision, that, if any resident of the colonies should trade with foreign countries, without first obtaining a license from the crown, his ship and "all his goods and chat-

tels" should be forfeited to the crown. It was evident from this that the British government had no higher conception of colonization than the other governments of the time, and that its purpose was "to monopolize the consumption of the colonies, and the carriage of their produce." (This branch of the subject is fully treated under NAVIGATION LAWS.) — The Plymouth company, after an unsuccessful attempt to fix a colony at the mouth of the Kennebec river in 1607, did no colonizing for itself, and in 1620 received a new charter, covering the territory between north latitude 40° and 48°, that is, from about Philadelphia to Cape Breton island. This charter was also surrendered to the crown in 1633; but, before the surrender, the company had made the grants which resulted in the formation of the several colonies of New Hampshire, Massachusetts and Connecticut (see their names), and the unauthorized settlement had been begun, which became the colony of Rhode Island. (See its name.) Massachusetts was at first two colonies, Plymouth and Massachusetts Bay; and Connecticut, in like manner, was dual, Connecticut and New Haven. It is notable that only two of these six colonies, New Hampshire and Massachusetts Bay, were founded under the auspices of the company. The first settlement in the company's territory, at Plymouth, Dec. 21, 1620, was made without the company's permission or knowledge, and the two Connecticut colonies and Rhode Island were equally unauthorized. After the dissolution of the company, the crown reduced the number of colonies to four, by consolidation, and chartered these at various times. — The London company was more active and successful. Its first expedition fixed the first permanent English colony in North America at Jamestown, in the present state of Virginia, May 13, 1607. In 1609 it received a new charter, limiting its territory to the present states of Virginia, Maryland and North Carolina. By the subsequent creation of the colonies of Maryland and Carolina the jurisdiction of Virginia was reduced to the area which it covered as a state. (See VIRGINIA TERRITORIES.) In 1624 the London company was deprived of its charter, and Virginia became a royal province; but the inhabitants were not deprived of the privileges which the company had granted them. — The grant of land for the new colony of Maryland in 1632 was carved out of the Virginia jurisdiction, and so was the northern half of the grant of Carolina in 1663. (See NORTH CAROLINA.) But, in the latter case, the grant extended far to the south of the original grant to the London company, covering the old French claims to "Carolina." The Spaniards felt no more amicably toward the new than toward the old intruders, but were unable to get rid of them in the same summary fashion, and submitted to the intrusion. In 1732 the last of the original thirteen colonies, Georgia, was carved out of South Carolina as a barrier against the Spaniards in Florida; and at the peace of 1763 it was extended a little further south, to its present southern boundary. — Holland and

Sweden were the only powers which disputed the territory of the inchoate nation with England, and their attempts were confined to the region of three degrees between the specific grants to the two English companies, from about Philadelphia to Long Island. The attempt of the Swedes may be briefly dismissed: it was never supported earnestly by the mother country, and fell like an unsupported forlorn hope after the first assault. It was located in the present state of Delaware, but with efficient support from home would have grounded a fair claim to the whole of the present state of Pennsylvania. Unsupported, it was unable to resist the Dutch to the north, who conquered and annexed it in 1655. All the present middle states thus became Dutch. — Holland claimed the coast line explored in 1609 by Henry Hudson, an Englishman in the service of the Dutch East India company. It extended from Chesapeake bay to the Hudson river, and up that river to where Albany now stands. To this they added claims, by exploration or conquest from the Indians or Swedes, to Long Island, the territory west and northwest of the coast line, and the territory between the Hudson and the Connecticut rivers. In 1621 all this territory, under the name of New Netherlands, was granted by Holland to the Dutch West India company, which colonized and governed it for forty years. In 1664, Charles II. granted the territory comprised in New Netherlands to his brother, duke of York, who took possession at once by force. New York and New Jersey were made separate colonies. (See their names.) In 1681 Pennsylvania was made a separate colony, and Delaware remained united with it, by very loose ties, until the revolution. (See their names.) — The central zone of North America seems made for a great nation, and the English people had thus seized the whole of its vantage ground, the Atlantic coast. At first the seizure was made almost at one blow and without opposition, so far as regarded the northern and southern portions of the coast; and the natural pressure of these upon the centre had begun the last stage of the work, when it was hastened by force in 1664. The last rival then disappeared from the coast, and the whole gateway to an imperial domain was in English hands. — 3. *Colonial Development.* The disturbed state of England during the forty years following the landing of the settlers at Plymouth, undoubtedly contributed very essentially to the growth of the colonies. At first, while the high church party controlled the administration of affairs in England, dissenters of every grade of intensity, from the low church puritan to the independent, found safe refuge in New England, and increased the population of this section. In this manner about 20,000 persons emigrated in the eleven years, 1630–41. When the high church party went down, and when the Presbyterians suffered a like misfortune, their adherents found refuge in the colonies to the southward. In either case the emigration was itself a protest against the existing order of things in England, which came

little short of rebellion: it was the only substitute for force. — It is certain, however, that the wonderful increase in the population of the colonies was due to the natural *vis generandi* of the race, set loose in a boundless and fertile territory, rather than to persecution and immigration. As soon as statistics began to make any approach to accuracy, it became evident that the population of the colonies was doubling steadily once in twenty-five years. And yet Franklin, a man of cautious estimate, could write as follows, in 1751: "There are supposed to be now upward of one million English souls in North America, though it is thought scarce eighty thousand have been brought over sea." Whether this estimate be well or ill founded, it shows the belief at the time that the old English people had not been transferred to America, but that a new English people had grown up there from a small seed. — But, in spite of the comparative smallness of the seed, its peculiar character, and the reasons for its transfer, were of enormous weight in the history of the United States, and have colored all the subsequent order of events. The original settlers were to frame the institutions of the new nation, to cast the mould in which their descendants were to be developed. In doing the work, they were controlled by the lurking and generally unconscious feeling of incipient rebellion under which they had emigrated. Their minds naturally reverted to the traditions of their race; they rejected most of the forms of class supremacy which they had found so troublesome at home; and in each of the thirteen colonies they established as near an approach to democracy as circumstances would allow. It is a mistake to suppose that the privileges of the people were secure only under the charter governments of New England. In what might be called the palatine governments, Pennsylvania, Delaware, Maryland, and (at first) New Jersey and North and South Carolina, in which the crown resigned the dominion of the colony to a palatine, or proprietor, the patents were very full and liberal in enumerating the privileges of the people, and the people were always more ready to assert them against a proprietor than against the king. In the Carolinas (see NORTH CAROLINA) the proprietors attempted to establish a privileged aristocracy, but were defeated by popular opposition. In the royal colonies, New Hampshire, New York, New Jersey, Virginia, the Carolinas, and Georgia, in which any struggle had to be leveled at the king's vicegerent, the tender plant of popular privilege was effectually shielded by the distance of the colonies from the mother country, and by the uniform contempt of the mother country for the colonies. The former furnished special safeguards, but the latter was a general safeguard. A timely creation of a number of American peerages, with grants of land, and with hereditary privileges, even if only in the royal colonies, would have vitally altered the conditions of the new country, and would have immensely increased the difficulties of the final revolution. It must be evident that this

was the only policy which could have prevented or checked the establishment of democracy in America, but it had an implacable opponent in the prejudices of the ruling class in England. Thus, from various influences the thirteen commonwealths which grew up on the Atlantic coast of North America were of a generally democratic character. They varied only in degree, from the highly democratic charter commonwealths, through the scarcely less democratic palatine commonwealths, to the royal commonwealths, in which democracy maintained itself successfully against the feeble opposition of a distant king. There were some limitations on the elective franchise; there were, in most of the colonies, attempts to establish an ecclesiastical order; but hereditary privilege, with all its powerful influences on politics, was a complete blank in the colonies. The unwisdom of the English ruling class, its disdainful refusal to recognize any equal class in the new country, had resulted in the spread of democracy over all America — During the first period of their development, the colonies had little or no political connection with one another, but were loosely united by a common allegiance to the crown. Each colony lived its own life, uncontrolled by any or by all of the other colonies. These are the circumstances on which has been built the theory of "state sovereignty." (See that title.) They are admitted, but not the consequences which are sought to be drawn from them. On the contrary, it must be evident that all the materials for a new nation were here present in chaos, waiting for the blow which should crystallize them into permanent form. (See NATION.) So long as there were no controlling common interests, the repelling force between individual colonies showed itself rather in inaction than in action, rather by a negation of union than by positive and individual commonwealth assertion. Just as rapidly as the importance of public action increased, just so surely did the signs of union multiply. They were naturally confined at first to the homogeneous New England colonies, which united for a time in 1643. (See NEW ENGLAND UNION.) When the French wars fairly opened, after 1689, the middle colonies began to take part with the New England colonies in their expeditions against the Canadian strongholds. Finally, when the great French and Indian war broke out, common interests brought all the colonies into something like common action. (See WARS, I.) South Carolina troops were with Washington at Fort Mifflin; and wherever troops from different colonies came together, as they frequently did thereafter, they learned to use the common name "provincials" to distinguish themselves from the British troops. There was even a promising but unsuccessful attempt at a formal union of the colonies in 1754. (See ALBANY PLAN OF UNION.) — A more successful attempt to unite the colonies was made in 1765. (See STAMP ACT CONGRESS.) It was due to the first attempt of the home government to impose internal taxes on the colonies

by acts of parliament. Against this attempt there was one general plea, the original promise of the crown to all emigrants to America, that they should "enjoy all liberties, franchises and immunities," "to all intents and purposes as if they had been abiding and born within this our realm of England." Certainly the people of England had secured, as at least one of their "liberties, franchises and immunities," the right to be taxed by their own parliaments, not by a foreign parliament or by the crown. The colonies accordingly claimed the same for themselves; none of them was able to maintain it individually; and they drifted together in common action. — The action of the congress of 1765 was altogether advisory and deliberative, not legislative, and had only the effect of accustoming the colonists to the idea of union. The case was much the same with the first continental congress of 1774. But events were moving rapidly. It has been stated that the rights of the colonists were not guaranteed at all in the royal colonies, except by the original promise of the crown; that they were considerably better secured in the palatine, or proprietary, colonies; and that they were best secured in the charter colonies of New England. When, therefore, the crown and parliament chose, or were forced, to attack the rights of Massachusetts, one of the charter colonies, the attack was felt by all, and all united to resist it. When the second continental congress met, in 1775, the struggle had taken the shape of force, and the congress was compelled to resort to action, not to deliberation. (See CONGRESS, CONTINENTAL; REVOLUTION; FLAG.) — In theory, the second congress was exactly like the first, a meeting of committees from thirteen independent commonwealths, without any authority to act except what was formally given to each delegation by its own commonwealth. But in practice the case was radically different. The congress became a revolutionary national assembly, and seized all the powers of national government; and the authority for the seizure was not in any grant of power by the states, but in the acquiescence and support of the people at large. It is true that the people universally desired the retention of state lines in the organization of the new nation; but the retention was due to the will of the mass of the people, not to the will of any or all of the states. If the mass of the people had desired it, congress would have blotted out or ignored state lines, as it did in the case of Vermont, and any individual state would have been as powerless against congress as against the crown. The states, then, owe their existence as states, originally and continuously, to the will of a people practically unanimous on that subject. It is very true that this national people can express its will only with the very greatest difficulty, and then mainly by acquiescence or resistance; but it is equally true, that, when it has been necessary, as in 1775 and 1787-9, when the usual machinery of state government has failed, the national people

has found a way to express its will, and its will has been obeyed. The statement of conflicting views in regard to the ultimate "sovereignty" of the United States is necessarily reserved to a subsequent section of this article: but the reasons above assigned will explain why this series of articles holds that the ultimate sovereignty of the United States is in the mass of the people; and that state and national governments and constitutions owe their existence to the will of the ultimate sovereignty, and hold from it. This has seemed to the writer the only theory which can account in an orderly manner for the successive changes of national government: it makes the continental congress a legal, even if revolutionary, exponent of the general popular will; the articles of confederation a valid system for its time, even if unnecessarily ratified by the state legislatures; and the convention of 1787 a legitimate exponent of the general popular will to have a change of government, in spite of the state legislatures, but without sacrificing the states. Any other theory makes the continental congress a clique of daring usurpers, seizing national power in defiance of the *de jure* sovereignties, the states; the articles of confederation a similar successful usurpation by the state legislatures, to which their commonwealths had granted no powers to make any such league; and the constitution itself a *contra* usurpation by an illegal convention, condoned by the tardy ratifications of state conventions. (See CONGRESS, CONTINENTAL; CONFEDERATION, ARTICLES OF; CONVENTION OF 1787.) Either the sovereignty of the United States is in the mass of the people, divided into states by its own will; or the political history of the United States must be abandoned as only a labyrinth without a clue.

— II. NATIONAL HISTORY. 1. 1775–89. If we take the first instance of the use of force in the struggle between the colonies and the mother country, the fight at Lexington, April 19, 1775, as the signal for the transformation of congress into a revolutionary national assembly, the people of the "United Colonies" were still nominally under the rule of George III. for more than a year thereafter. Congress still addressed them and spoke of them as "his majesty's most faithful subjects in these colonies," even while it was exhorting them to kill the soldiers sent to America by his majesty. When the royal proclamation of Aug. 23, 1775, charged them with "forgetting the allegiance which they owed to the power that had protected and sustained them," the congress, in its answer of the following Dec. 6, defined its position thus skillfully: "What allegiance is it that we forget? Allegiance to parliament? We never owed—we never owned it. Allegiance to our king? Our words have ever avowed it, our conduct has ever been consistent with it." When, however, it was found that the king was irrevocably committed to the enemies of the United Colonies, the congress, July 4, 1776, abolished the royal authority forever. (See DECLARATION OF INDEPENDENCE, ALLEGIANCE.) In 1778 the new nation was recog-

nized by France, and in 1788, by the definitive treaty of peace which closed the struggle, it was recognized by the king of Great Britain. (See REVOLUTION, AMERICAN, and, for the terms of the recognition, STATE SOVEREIGNTY.)—The congress retained its position as a revolutionary government for six years, 1775–81, though its power was constantly decreasing during the last half of the period. In 1781 it passed, without a jar, into the new government under the articles of confederation. This purported to be a pure federation, a league of sovereign states, and it was soon found to be useless and dangerous. In 1787 a federal convention was extorted from the state legislatures and congress by a general concurrence of the popular will. It framed the constitution, which was ratified by state conventions and became the basis of a new national government. (See CONGRESS, CONTINENTAL; CONFEDERATION, ARTICLES OF, and TERRITORIES for the delay in ratifying them; CONVENTION OF 1787; CONSTITUTION.)— 2. *The Federalists*, 1789–1801. At the time of the organization of the new government, parties had already been developed, though the line of division was not permanently preserved. All who had supported the new constitution took the name of federalists, as those who opposed it took the name of anti-federalists. The anti-federalists, as a distinct party, disappeared as soon as the new government was fairly organized, and the federalists were left in undisputed control of national affairs. But the latter party contained many members, particularly in Virginia, who were opposed to the growth of national power at the expense of state power, and to strong government or class government at the expense of the individual. These coalesced into a new party of constitutional opposition, the democratic-republican party, which grew stronger all through this period, until, in 1801, it finally overthrew the federal party. (See ANTI-FEDERAL PARTY; FEDERAL PARTY, I.; DEMOCRATIC-REPUBLICAN PARTY, I., II.; CONSTRUCTION; HAMILTON; JEFFERSON.)—In July, 1788, when the ninth state had ratified the constitution, the congress of the confederation had named New York city as the place, and March 4, 1789, as the time, for the organization of the new government. Difficulty of travel, and the slovenly habits learned under the confederacy, delayed the organization until April 6, when a quorum of both houses was obtained to count the electoral votes. Until 1804 the electors simply voted for two persons, without specifying the vote for president and vice-president. (See ELECTORS.) In this case, Washington was found to have a unanimous vote, and became president, and John Adams, having the next largest vote, became vice-president. (In all cases under this article, for electoral votes see the article ELECTORAL VOTES; for cabinets, see ADMINISTRATIONS; for brief biographies, see the names of the persons mentioned.)—The federalists, with very little opposition, proceeded to organize the new government by acts defining the powers of the various departments,

and organizing inferior courts and territories. Their work was so well done that it still forms the skeleton of the government of the United States. Two other measures, involving the first broad construction of the powers of congress, provoked a warmer opposition. The organization of a national bank (see BANK CONTROVERSIES, II.), and the assumption of state debts (see FINANCE; CAPITAL, NATIONAL), resulted in the rise of the republican party, under Jefferson. Nevertheless, the result of the presidential election of 1792 was the same as that of 1789. — Foreign affairs now began to control American politics, for the French revolution had begun its destructive course, and the republicans, and still more the democrats, were in pronounced sympathy with it. (See GENET, CITIZEN; DEMOCRATIC CLUBS.) England had begun a systematic effort to drive American commerce into her own harbors, and the republicans were anxious to begin a war of commercial restrictions against her (see EMBARGO, I.); but this question was put to rest for ten years by a treaty concluded in 1794-5. (See JAY'S TREATY.) French agents, however, continued to interfere in American politics, and diplomatic difficulties with France continued through the following term. — Vermont was admitted as a state in 1791, Kentucky in 1792, and Tennessee in 1796. (See their names.) The rest of the western border was the occasion of more difficulty. Travel was exceedingly difficult, for the roads were so bad as to be almost worse than no roads; internal migration was slow; the Indian title to lands west of Pennsylvania was not extinguished; and border lawlessness was as ready to oppose national laws as to attack the Indians. In 1794 it became necessary to march a militia force into western Pennsylvania to suppress disorders. (See WHISKY INSURRECTION.) A war with the Miamis resulted in their defeat and their cession of nearly the whole of Ohio in 1795; and in the same year, by Jay's treaty, the British gave up the forts in the northwest territory, which they had held for twelve years in violation of the treaty of 1783. Emigration to Ohio increased at once, and the movement of American population was turned finally toward the northwest territory. — During Washington's second term, party division advanced so far that the republican members of the cabinet successively retired, and the administration became altogether federalist. In 1796 Washington refused to be a candidate for a third term (see FAREWELL ADDRESSES), and John Adams was elected president. Jefferson, however, ran ahead of the other federalists, and became vice-president. Adams' single term was one of great difficulty at home and abroad. The United States came to the verge of war with France (see X Y Z MISSION), and the federal majority in congress seized the opportunity to enact dangerous laws for their own partisan advantage. (See ALIEN AND SEDITION LAWS.) Opposition in congress was so evidently hopeless that the republican leaders at first attempted to use the state legislatures

as instruments of resistance. (See KENTUCKY AND VIRGINIA RESOLUTIONS, NULLIFICATION.) But the presidential election of 1800 proved to be a surer instrument: the federal party was defeated, and fell, never to rise again. There were some points which were settled with great difficulty (see DISPUTED ELECTIONS, I.; ELECTORS, VI), but the main question had been settled for the time: the people, as yet, preferred that power should not be granted to the federal government at the expense of the states. (In general, see FEDERAL PARTY, I., DEMOCRATIC-REPUBLICAN PARTY, I., II.). — 3. *The Republicans*, 1801-29. The methods of the government of the United States were altogether the same after 1801 as before: the constructive skill of the federalists had planned them so wisely that it would have been worse than folly to drop them. But its spirit had changed, and the change was quickly reflected by the states. Democracy had got the bit in its teeth; the hand of the federalists had not been heavy enough to control it. In every state outside of New England, all restrictions upon the right of white males over the age of twenty-one to vote were gradually swept away, with the exception of residence qualifications; and all connection between state and church was severed. It became the fashion to think, talk and act more freely, and with less subservience to the prejudices of the individual's class or creed. In this sense the "revolution of 1800" has never gone backward. every party, court, church and person in the United States feels the influence of the force which was then loosed. — In foreign affairs, Jefferson's administrations were marked by a war with Tripoli (see ALGERINE WAR), and a revival of the commercial difficulties with Great Britain. (See EMBARGO.) These latter continued through Jefferson's administrations, and into those of his successor, and culminated in the war of 1812. (See WARS, IV.; CONVENTION, HARTFORD.) No part of the political history of the United States is so weak as this period, for the negation of national sovereignty in internal affairs carried with it impotence in foreign intercourse. (See NATION.) In 1807 the British frigate "Leopard" stopped and searched the United States frigate "Chesapeake," and took from her four seamen, claimed to be deserters; and the only retaliation was a proclamation ordering British armed vessels to quit the waters of the United States. — In domestic affairs, Jefferson's first administration was marked by the annexation of Louisiana, in 1803 (see ANNEXATIONS, I.), which more than doubled the territory of the United States. Four years afterward, in 1807, Fulton produced a usable steamboat, and within four years the building of steamboats on western waters had begun. Fulton's invention carried emigration far more rapidly into the northwest territory, and through it to Louisiana. But Jefferson's second term, said John Randolph, was like the lean kine, and ate up the fatness of the first. It was disturbed, to a dangerous extent, by the distress and discontent

produced in New England by the restrictive system. (See **EMBARGO, II.**; **SECESSION, I.**; **HENRY DOCUMENTS.**) The newly acquired Mississippi river became the route of a mysterious expedition, under the late vice-president, Burr, which excited general fears for the safety of Louisiana. (See **BURR.**) Jefferson's second term ended unhappily, with a general suspension of commerce, discontent, distrust and uncertainty, and he was succeeded by Madison. — During Madison's first term the embargo system passed by successive stages into open war against Great Britain. (See **EMBARGO, III.-V.**; **WARS, IV.**) The war achieved none of the objects for which it was begun, but it served a greater purpose by hardening the gristle of the young nation into something like bone. No test could be so severe, for a nation which still considered itself a "voluntary confederation," as a war to which one of its most influential sections was conscientiously and angrily opposed; but the test was endured successfully. (See **CONVENTION, HARTFORD**; **DRAFTS, I.**; **NATION, III.**) With the close of the war a new era began, which only waited for the introduction of the railroad in 1830 to develop into the full life of the United States. Commerce revived. Manufactures, fostered by the restrictive system and the war, demanded and received protection; and in the process they destroyed the remnants of the federal party. (See **TARIFF**; **FEDERAL PARTY, II.**) The war, especially on the northern and southwestern frontier, had forced upon the attention of the people the danger of their shocking lack of good roads, and there was a general movement toward an improvement in some shape. The energies of the national government were at first turned to the construction of roads. (See **CUMBERLAND ROAD.**) But the state of New York had the enterprise to open a new vein by the construction of the Erie canal, and this turned other states and the national government to a general system of public improvements. (See **NEW YORK, INTERNAL IMPROVEMENTS.**) A new national bank was created. (See **BANK CONTROVERSIES, IV.**) All these measures were opposed to that strict construction of the constitution, and that complete supremacy of state life and action, which were the formal basis of the dominant party; but the drift of the party to their support could not be checked. It was aided by the supreme court, whose influence as a nationalizing factor now first became apparent. (See **JUDICIARY, II.**) The whole change reconciled the federalists to their absorption into the republican party. Indeed, they claimed, with considerable show of justice, that the absorption was in the other direction; that the republicans had recanted; and that the "Washington-Monroe policy," as they termed it after 1820, was all that federalists had ever desired. — This was an era of state making. Louisiana was admitted in 1812, Indiana in 1816, Mississippi in 1817, Illinois in 1818, Alabama in 1819, Maine in 1820, and Missouri in 1821. (See their names.) In the admission of Missouri there was a series of difficulties

which showed that the two sections, the north and the south, were drifting dangerously far apart on the subject of slavery; but these difficulties were settled in a manner sufficiently satisfactory to both sections to quiet the question for nearly thirty years. (See **COMPROMISES, IV.**; **SLAVERY, V.**) State admissions ceased for fifteen years after the admission of Missouri; but the organization of territories, and the continued movement of population to the west, were guarantees that state formation had not ceased altogether. — At the end of Madison's second term, in 1817, Monroe became president with hardly any opposition, except in the matter of his nomination. In 1821 he was re-elected without opposition. The federal party had disappeared in national politics, and, during the next three years, it disappeared in state politics also. (See **ERA OF GOOD FEELING.**) In the all-absorbing republican party, four distinct geographical sections had been developed: the northern, headed by John Quincy Adams, wished for protection to manufactures; the northwestern, headed by Clay, wished for internal improvements; the southwestern, headed by Jackson, without defined economic principles, had a general fondness for democracy; and the southern, headed by Crawford, wished for none of these things, but cared only for state independence. In the presidential election of 1824, all these four leaders were candidates, and the result was that Adams was elected by the house of representatives. (See **DISPUTED ELECTIONS, II.**) During his single term the Clay and Adams factions united in a common policy as to a protective tariff and internal improvements. (See **TARIFF, INTERNAL IMPROVEMENTS.**) On the other hand, the Jackson and Crawford factions also drew nearer together; Crawford's severe illness made Jackson the recognized leader of a united opposition; and in 1828 he was elected president over Adams. — From the close of the war until the end of this period, democracy was assailing the original spirit of the federal government at every vulnerable point. The old federalist system of leaving nominations to conferences and correspondence of leaders had long been abandoned in favor of caucuses of congressmen, as more directly representing the people. Now, this was not democratic enough, and the people began to take the matter of nominations into their own hands. (See **CAUCUS SYSTEM**; **CAUCUS, CONGRESSIONAL**; **NOMINATING CONVENTIONS.**) The electors had long ceased to be anything more than automata; but now congress began to assert a revisory power over their action, which has proved more dangerous as it has grown more complete. (See **ELECTORS.**) Jackson's election in 1828 was generally demanded as a rebuke to the house of representatives, which had disregarded the wish of a plurality of the people, while it followed the forms and spirit of the constitution, in electing Adams in 1824. About the same time began the long list of attempts, as yet unsuccessful, to make the electoral system still more democratic, or to do away with it altogether.

(See ELECTORS, VI.) In one point the movement was more successful: in all the states, excepting South Carolina, the choice of electors was abandoned by the state legislatures, and given to the people. — In foreign affairs, the most noteworthy event was the formulation of the "Monroe doctrine." This is fully treated elsewhere. (See MONROE DOCTRINE.) — (In general, see FEDERAL PARTY, II.; DEMOCRATIC PARTY, III.; WHIG PARTY, I.) — 4. *The Democrats, 1829-49.* Since the beginning of Jackson's first term democracy has held social and political control of the United States. It showed itself first in a blind and unhesitating support of Jackson, as the exponent of democracy. To his opponents this seemed like the establishment of a popular tyranny, a Cæsarism. They, therefore, took the party name of whigs, as the opponents of a would-be king, and were joined, after the failure of nullification, by most of the extreme state rights republicans of the south. (See WHIG PARTY, II.) Jackson's supporters very naturally took the name of democrats, though they still asserted a sole right to the name of republicans, when they chose to use it. (See DEMOCRATIC PARTY, IV.) Under the lead of Jackson and the new school of politicians which surrounded him, the democrats attacked the national bank, drove it into politics, and, after a struggle of about five years, destroyed it. (See BANK CONTROVERSIES, III.; DEPOSITS, REMOVAL OF.) They broke up, not without much rebellion in their own ranks, the Adams system of internal improvements. (See that title.) They obtained a gradual reduction of the protective tariff (see TARIFF), while they suppressed the attempt of the South Carolina nullificationists to abolish it suddenly and by revolutionary means. (See NULLIFICATION.) They gave the people a nominal control over the appointing power by introducing the practice of "rotation in office"; its real effects are fully treated in a distinct series of articles. (See SPOILS SYSTEM, REMOVALS.) At the same time they gave the people, or rather the politicians who represented the people, full control over nominations by the creation of the modern machinery of a national party. (See NOMINATING CONVENTIONS.) Finally, under Van Buren, Jackson's successor, they completed the "divorce of bank and state," by introducing the sub-treasury system. (See INDEPENDENT TREASURY.) — All these changes are credited to the democratic party: in reality, most of them were due to Jackson, who toned up and re-enforced any wavering energy in his party by an abundant use of his veto power. (See VETO.) By whatever means accomplished, they still further changed toward democracy the feelings of the people; and the introduction of the railroad in 1830, and the telegraph in 1844, into the vast territory of the United States, fixed the character of its political and social life, particularly in the north and west. The south did not feel the change so much (see SLAVERY, IV.); and from this time the drift of the two great sections apart became more rapid. (See NATION, III.) — In foreign

affairs, the policy of the new leaders was as vigorous as in domestic affairs. Claims for depredations on American commerce during the Napoleonic wars had long been urged against France, Spain, Naples, Portugal and Denmark. Jackson collected them. (See EXECUTIVE, III.) There was much popular sympathy with the Canadian revolt of 1837, but the government suppressed any active interference with its course. (See MCLEOD CASE) — This whole period, 1829-49, has been assigned to the democrats, in spite of the whig success in the presidential election of 1840. Harrison, the whig president, died after serving but one month, and the new president, Tyler, was a natural democrat. His use of the veto power neutralized the whig majority in congress during the first half of his term; and during the second half he was supported by a democratic majority in the house. In 1844 the democrats returned to the full enjoyment of their temporarily suspended power, by the election of Polk and a democratic congress. As a consequence of the election, Texas was annexed (see ANNEXATIONS, III.); the war with Mexico followed (see WARS, V.); and this was followed by a still larger acquisition of territory. (See ANNEXATIONS, IV., V.) While this was going on, the territory of Oregon was secured by treaty with the only other claimant, Great Britain. (See NORTHWEST BOUNDARY.) By all these changes, the area of the United States took on the rounded and complete form which has not since been altered, except by the later acquisition of Alaska. Six new states were admitted: Arkansas in 1836, Michigan in 1837, Florida and Texas in 1845, Iowa in 1846, and Wisconsin in 1848. (See their names.) The agency of the railroad in hastening the westward movement of population had now become more evident, and several other incipient states were developing. Foreign immigration had not yet swelled to the enormous proportions which it was soon to take; but the population had grown about 600 per cent. larger in sixty years, from 3,900,000 in 1790 to 23,000,000 in 1850. A little people had become a great people. (See, in general, DEMOCRATIC PARTY, IV.; WHIG PARTY, II.) — 5. *Sectional Conflict, 1849-61.* Southern leaders always blamed the growing spirit of democracy in the north and west for the anti-slavery agitation which began about 1830. (See ABOLITION, II.; PETITION.) There was, no doubt, very much truth in the assertion: Garrison, Wendell Phillips and other abolitionists were the product of the modern democratic spirit, not of the temper of colonial or earlier constitutional times. The spirit which moved them was one which cared more for the equal rights of all mankind than for political theories, nationality, state rights or constitutions; and they became the Ishmaelites of politics. They have claimed and received a large share of the credit for the final overthrow of slavery; and yet it is very difficult to locate the reasons for their claim, unless he who provokes a wild beast to such frenzy that his neighbors have to kill it may justly claim the credit for its death. Most

of them were absolute impracticables, unable to suggest a policy or a remedy for slavery, except, possibly, the forcible expulsion of slave-holding states from the Union. The liberty party of 1840 and 1844 had neither growth nor effects; and the free-soil party (see its name) of 1848 and 1852 was hardly an improvement on the liberty party, if we leave out its mere political allies. From 1830 until 1848 it can hardly be said that the real abolitionist feeling or influence increased even in proportion to the growth of population. The only real result of the twenty-years anti-slavery agitation was to exasperate the slaveholders, to convince them that the north was against slavery, instead of against slavery extension, and thus to embitter the conflict of the sections over the territory wrested from Mexico. Anti-slavery agitation never had the faintest prospect of success by its own exertions: its first chance of life came from the Mexican annexations, its first prospect of success from the Kansas-Nebraska bill, and its final victory from the civil war; and each of these events took place against the will of the abolitionists. Slavery was destroyed by no human skill or foresight.—In 1846, when the first indication appeared of a purpose to acquire territory from Mexico, outside of Texas, as “indemnity for the past, and security for the future,” it was proposed to add a proviso forbidding slavery in any such acquisition. (See WILMOT PROVISIO.) For four years this was the controlling question of national politics. At first the proviso did not seem to be very objectionable to the south or to the dominant party: its proposer was a democrat, and it was favored by the Polk administration. As the discussion went on, the south came to consider the proposal as an attack upon slavery; and when the proviso failed in 1850 several southern states had on record declarations of their intention to secede if it was adopted. The governing purpose of the democratic party was to preserve its national organization intact. It succeeded in so doing by evolving the idea that the question was to be settled, for each territory, by its own people (see POPULAR SOVEREIGNTY): this was acceptable to the northern wing, and was not as yet repudiated by the southern wing. Nevertheless, its inevitable result was to make the former somewhat smaller than the latter, and thus to begin to unbalance the party. The whigs proposed no solution of the great question, and thus their two wings, while maintaining their relative strength, were steadily drifting away from one another. In 1848 they succeeded in electing Taylor president and Fillmore vice-president, by means of nominating a popular and successful general, without a platform; but the success was deceptive. All through the administration of Taylor and Fillmore the two great parties were shifting their material. In the south, pro-slavery whigs went into the democratic party; in the north, anti-slavery democrats went into the free-soil party. Thus the democratic party, while remaining national, was becoming unbalanced, and stronger in the south than in the north. The

northern whigs, abandoned by all the factions, were the only stationary feature in the political kaleidoscope; and in the presidential election of 1852 they were left completely in the lurch by their former southern associates.—The Taylor administration proposed, as a solution of the territorial question, the immediate erection of the territories into states, with full power to govern their own affairs. This was followed out in the case of California, because of the discovery of gold in it and the consequent increase of population. In the other territories, Utah and New Mexico, both sections were content, in 1850, to ignore the Wilmot proviso and leave the question untouched. (See COMPROMISES, V.) The whole difficulty was thus covered out of sight for a time. But there was an uneasy feeling that further difficulties were not far off, and that the country was in worse shape to meet them, not only from the shifting of parties, but from the changes of leaders. In the four years before 1853, Clay, Webster, Calhoun, Polk and Taylor had died; and the new men who took their places can hardly be ranked as first-class men. Most of them had laid the foundations of their political characters in the belief that the great business of politics was to evade and ignore slavery. The abler men were those who had an active programme to offer, the radicals of both sections; Jefferson Davis in the south, and Seward, Sumner and Chase in the north. Thus all the ability in politics was a sign of disunion. The same tendency was shown in every direction. Calhoun's speech of March 4, 1850, is a clear statement of the manner in which the political, ecclesiastical and social cords that held the Union together were being snapped in every direction. Even the churches obeyed the general impulse, and divided into churches “north” and “south”: only the Roman Catholic and Episcopal organizations, of those which had a national extent, were able to resist it. When the whig party succumbed to it, after the presidential election of 1852, there was no great tie left, except the national organization of the democratic party, and that had lost much of its spirit. It is a remarkable evidence of the innate strength of the American Union that the two fragments of the planet, thus rent asunder by slavery before 1852, should for nine years longer have gone in close and parallel courses, held by such weak ties, before the force of repulsion finally mastered them.—In spite of the general uneasiness in respect to the future, the first four years after the compromise of 1850 passed quietly, except for the excitement attending the execution of the new fugitive slave law, and the opening movements of the attempts to obtain new slave territory by “filibustering.” (See FUGITIVE SLAVE LAW, FILIBUSTERS, OSTEND MANIFESTO.) In 1854 the slavery question was again brought on the political field in larger proportions than ever by the passage of the Kansas-Nebraska bill, which virtually repealed the Missouri compromise. (See KANSAS-NEBRASKA BILL.) The passage of the law not only provoked

but compelled a struggle between the sections, for it threw between them the territory of Kansas, as a prize for the more active. Slave state immigrants and free state immigrants were at once arrayed against one another; and the struggle continued for more than four years, marked by all sorts of fraud and violence, and most of the characteristics of civil war. (See KANSAS.) The struggle, at any rate, cut away the dead material from politics. It put an end to the whig party. Many of its members endeavored to galvanize its corpse, and reunite its southern and northern portions, by introducing opposition to foreigners as an issue paramount to slavery; but the attempt was a failure. (See AMERICAN PARTY.) In 1856 the American party nominated presidential candidates, Fillmore and Donelson; and their defeat put an end to their party. When the boards were cleared, it was found that there were but two rivals in politics: the democratic party, having a national organization, strong in the south, and weaker in the north; and the republican party, sectional of necessity, and confined to the north. (See DEMOCRATIC PARTY, V.; REPUBLICAN PARTY, I.) This division made the election of 1856 almost entirely sectional, Fremont, the republican candidate, carrying most of the northern states, and Buchanan, the democratic candidate, carrying the southern states, with enough northern states to elect him. (See ELECTORAL VOTES, XVIII.) But Fremont's defeat was a Pyrrhic victory for slavery. For the first time in our history an electoral vote had been cast for a candidate pledged against the extension of slavery; and his party had so nearly united the free states that he was defeated only by the failure of Pennsylvania and Illinois to vote for him. Both these states were evidently drifting straight to the republican party, and it was not difficult to forecast the result of the next election, unless some great change of policy took place in one section or the other. — No such change took place: on the contrary, both sections became more aggressive. The administration, since 1852, had steadily sustained the southern view, that the constitution protected property, recognized slaves as property, and therefore protected slavery in the territories, while they were territories. In 1857 the supreme court also sustained the southern view. (See DRED SCOTT CASE.) This was the last re-enforcement which the south could hope for, and it was a failure. The dominant party of the north received it with more wrath than respect, and answered it with an increase of state laws to nullify or modify the fugitive slave law. (See PERSONAL LIBERTY LAWS.) A few of the bolder advanced the skirmish line of the war which was to follow, and attempted a fugitive slave migration on a grand scale. (See BROWN, JOHN.) Kansas had achieved her destiny, and had really become a free state; there was little on the surface to fight about; and yet the wider divergence of the sections was yearly becoming more apparent. — During Buchanan's administration the first conflict took place with

the Mormons in Utah, and they made a nominal submission. (See MORMONS.) The admission of California in 1850, Minnesota in 1858, and Oregon in 1859, increased the number of states to 33; but the increase was a new danger to slavery. The south had always abandoned the control of the house of representatives to the superior numbers of the north, while the admission of states had been calculated as carefully as possible to secure to the south an equal share in the senate, without whose assent no law could be passed. For the first sixty years after 1789, each new free state was balanced by a new slave state; but this process had now ceased to be possible. Texas was the last slave state that ever was admitted; and since its admission five new free states had come in, Kansas was in readiness, and the germs of others had appeared. If this majority of free states was to continue the previous drift to the republican party, that party would soon control both houses of congress, elect the president, and pass such laws as it pleased. Nor was the supreme court safe from it: if the natural change in its *personnel* by death and appointments to fill vacancies should prove too slow a process, a law to increase the number of justices would quicken it and put the Dred Scott decision at the mercy of a republican majority. This was the underlying danger, seldom referred to but often thought of, which compelled slavery to strike for its life while it yet had time. — In 1860 the last of the old natural cords which held the Union together was snapped by the disruption of the democratic party. (See DEMOCRATIC PARTY, V.) There were now four parties in the political field, a northern democratic party, a southern democratic party, a republican party, and a "constitutional union" party. (See the names of the two latter.) In the election the free states at last became practically unanimous, and Abraham Lincoln was elected president by the republicans. It should be noted, however, that in the congress which was to make the laws during the first half of his administration, the republicans were in a decided minority. Nevertheless, his election by a union of the free states against the slave states offered a *casus belli* which southern leaders were not disposed to neglect. Secession was begun by South Carolina; the six other gulf states followed at once; and in February, 1861, the seceding states formed a new government under the name of the "Confederate States of America." The forts, custom houses, mints, navy yards, and public buildings of the United States within the seceding states were seized, and the few regular soldiers were compelled to surrender, except at the forts near Key West, Fort Pickens, at Pensacola, and Fort Sumter, in Charleston harbor; and the two latter were closely invested. Buchanan was successful in keeping the peace until the end of his term; but, when Lincoln was inaugurated, the authority of the United States was suspended in the gulf states; from South Carolina to Texas. (See, in general, SECESSION; CONFERENCE, PEACE; CONFEDERATE STATES; BUCHANAN.) — 6. *The Re-*

bellion, 1861-5. Early in April, President Lincoln decided to put an end to the almost successful process of starving out Fort Sumter, and sent a provision fleet to supply it. The batteries around it at once opened fire on the fort, and it surrendered April 14. Then followed a call for troops to suppress the rebellion, and a declaration of war by the confederate states, early in May, against the United States. The first attempt at "coercing" the seceding states was followed by the secession of the southern tier of border states, North Carolina, Tennessee and Arkansas, and of Virginia in the northern tier. Delaware, Maryland, Kentucky and Missouri refused to secede. (See BORDER STATES, and the names of the states.) These secessions brought the area of the confederacy to its maximum. — The financial history of the war is fully given elsewhere. (See FINANCE, BANKING IN THE UNITED STATES, INTERNAL REVENUE, DISTILLED SPIRITS, INCOME TAX, TARIFF.) An outline of its military and naval history is elsewhere given. (See REBELLION, ALABAMA CLAIMS, GENEVA AWARD.) Its political history is also given elsewhere. (See ABOLITION, III, EMANCIPATION PROCLAMATION; HABEAS CORPUS; REPUBLICAN PARTY, II; DEMOCRATIC PARTY, VI.; DRAFTS; RECONSTRUCTION, I.) At the close of the rebellion no one was criminally punished for participation in it. (See TREASON, AMNESTY.) Almost the only civil victim was President Lincoln, who was assassinated just after the fall of Richmond. (See his name). — Three states were admitted during this period: Kansas in 1861, West Virginia in 1863, and Nevada in 1864. — 7. *Reconstruction*, 1865-70. The war of the rebellion and its result are usually regarded as the decisive proofs of the stability of the American form of government. And yet the five years following were, for it, a still more crucial test. The formation of the confederacy made the theatre of war *pseudo* foreign soil during the rebellion; and the territory remaining under the direct control of the United States government was spared many of those effects of war which are most evil to a republic. And those evils which were felt were met with the reserve power arising from years of peaceful constitutional discussion and long settled habits of political thinking. The difficulties of reconstructing the Union were to be met without any such reserve power, and even with the counteracting influences of the passion of war and victory. That the reconstruction should have been accomplished under such difficulties, and yet with so little alteration of the spirit of the system, is the most decisive proof that the American system is impregnably fixed in the affections of the people. It is easy to find blunders and contradictions in the process: it is far harder to find any difference in the status of New York and Mississippi, now that the smoke has cleared away. — When the war began, there was a general idea that any seceding state might again secure its former privileges in the Union on the simple conditions of ceasing hostilities and organizing a loyal state government. Under this theory the so-called "Pierpont" government of Virginia was recognized as the government of the state; its consent to the organization of the new state of West Virginia was accepted as valid; and its senators and representatives were admitted to congress. As the war grew warmer, and slavery was attacked, the original simple plan of reconstruction was necessarily modified. The executive, President Lincoln, first, and afterward President Johnson, only modified it so far as to require an assent to the abolition of slavery as an additional requisite: the repudiation of the ordinances of secession and of the state war debts seems to have been required only as an evidence of loyalty and good faith. In congress there was a growing belief, after 1862, that the national government, by legislation and its execution, should supervise the process of reconstruction, fix the qualifications of voters, and decide on its satisfactory completion. As this belief grew stronger, the southern members admitted under the influence of the original theory were excluded from congress; the reconstructed governments of Virginia, Arkansas and Louisiana were carefully ignored; and, as far as possible, all evidences of the original theory were wiped out. President Johnson still held fast to it, and in 1865 the remaining states of the defunct confederacy were reconstructed under his leadership. This reconstruction was still ignored by congress, which proposed, officially and unofficially, terms of its own. These became harder as the resistance of the southern people, backed by President Johnson and the democratic party of the north, was overcome, until in 1867 negro suffrage and the disfranchisement of leading confederates became a part of the terms. Reconstruction was then carried out under military supervision; most of the seceding states were readmitted in 1868; and in February, 1871, all the states were represented in congress, for the first time since December, 1860. (See, in general, RECONSTRUCTION.) During this period three amendments to the constitution were ratified (see CONSTITUTION, III.); Nebraska was admitted as a state; and Alaska was purchased. (See ANNEXATIONS, VI.) — During the struggle between congress and the president over reconstruction, other acts were passed over his veto (see FREEDMEN'S BUREAU, CIVIL RIGHTS BILL, TENURE OF OFFICE, VETO, JOHNSON); and the struggle ended in an unsuccessful impeachment of the president in 1868. See IMPEACHMENTS, VI.) In the presidential election of 1868 the republicans were successful in electing Gen. Grant. — 8. *The Republicans*, 1870-84. The congressional plan of reconstruction had undoubtedly had a view to the party advantage which would come from a unanimous negro vote for the republican party in the south. But, during Grant's two terms of office, this advantage almost entirely disappeared. One after another, the reconstructed governments of the south passed under the control of the white voters, until the last of them, South Carolina and Louisiana, followed the others

in the opening months of the Hayes administration, in 1877, and the so-called "solid south" was formed. (See, in general, **KU-KLUX KLAN; INSURRECTION, II; RECONSTRUCTION, III.**) As one result of the struggle to maintain the reconstructed governments, there was a secession from the republican party in 1872, under the name of "liberal republicans"; but its only immediate result was the re-election of Grant, and the defeat of the democrats and liberals. An indirect result was the reinstatement of the democrats as a national party, by their abandonment of their opposition to the consequences of the war. (See **LIBERAL REPUBLICAN PARTY; DEMOCRATIC PARTY, VI.**)—The loose methods of dealing with large amounts, which had grown up during the war, became more noticeable as the expenses of the government decreased, and the inevitable result, during Grant's two terms, was a great crop of public scandals. (See **CRÉDIT MOBILIER; WHISKY RING; IMPEACHMENTS, VII.; SALARY GRAB.**) An effort was made to reform the civil service, but it was a failure for the time. (See **CIVIL SERVICE REFORM.**) In 1873 a period of financial depression set in; it continued for several years, and had considerable influence on politics. It helped to give the democrats a majority in the house of representatives which met in 1875, and it brought to the surface of politics a struggle between "hard money" and "soft money," between a resumption of specie payments and a continuance of paper emissions. The republican party was first brought under control, and, before it lost the house of representatives in 1875, it had passed an act to resume specie payments Jan. 1, 1879. The democrats opposed the act, and, in their national platform of 1876, demanded its repeal on the ground that it was premature and an impediment to resumption. A third party grew up rapidly, which opposed resumption altogether. (See **GREENBACK PARTY.**) In spite of the opposition, the republican support of the act was successful, and resumption took place on the date assigned.—In foreign affairs, the great interest of Grant's two terms was in the treaty of Washington of 1871. It submitted to arbitration the various unsettled questions pending between the United States and Great Britain. (See **ALABAMA CLAIMS; GENEVA ARBITRATION; TREATIES, FISHERY; NORTHWEST BOUNDARY.**) There was an unsuccessful attempt to annex San Domingo. (See **SAN DOMINGO.**) In October, 1873, a Spanish vessel captured the "Virginus," which was carrying recruits and supplies to the insurgents in Cuba, and a number of those on board were shot. For a time there was a probability of war, for the "Virginus" was sailing under the United States flag; but it was shown clearly that she had forfeited her right to carry it.—Indian affairs were much disturbed. An attempt in 1873 to remove the little tribe of Modocs from southern Oregon to a reservation was only successful after a war which was made difficult by the character of the country, a region of extinct volcanoes, abounding in hiding places. In

1876 the Sioux Indians in Montana left their agencies: Gen. Custer attacked the whole tribe with but five companies, and was killed with his whole party. The Sioux were then driven into British America.—The presidential election of 1876 fell into complete confusion, but ended in the success of the republicans, and the inauguration of President Hayes. (See **DISPUTED ELECTIONS, IV.; RETURNING BOARDS; ELECTORAL COMMISSION; ELECTORS.**) He withdrew the troops which had been supporting the reconstructed governments of Louisiana and South Carolina, and these also passed under the control of the white voters. The whole administration was a welcome period of unwonted calm in politics. Its only serious breaks were the attempts of the democratic majority in the house to repeal some of the war legislation (see **RIDERS, VETO**), and the transfer of public interest to silver. An act of 1870 had made the bonds of the United States payable in "coin"; and, as silver was falling in price, the act of Feb. 12, 1873, dropped the silver dollar from the list of United States coins. In 1878 a general vote of both parties passed the "Bland silver bill" over the veto. It made the silver dollar a legal tender for public and private debts, and directed its re-coinage at the rate of not less than \$2,000,000 a month. (See **COINAGE, PARIS MONETARY CONFERENCE.**) In the close of this and the beginning of the following terms the national debt was refunded, its term lengthened, and its interest charges largely decreased. (See **FINANCE.**)—In the presidential election of 1880 the republicans were successful, and Garfield was elected president. His death, in September, 1881, left his office to President Arthur. (See both names, and **EXECUTIVE, IV.**) In the domestic politics of the country the controlling interest of his term has centred upon the tariff. (See that article.) There have also been efforts in various southern states to form third parties, under various names, in which both whites and blacks could join, in order to break up the "color line" in politics. These have been supported by the administration, but have not been successful, except in Virginia, and, in part, in Tennessee. (See those states.) In the inevitable reform of the civil service a great step in advance has been taken, and for the first time the public sentiment of the country has supported it strongly. (See **SPOILS SYSTEM, REMOVALS.**)—In foreign affairs, Chinese immigration has been restricted in accordance with the terms of a treaty negotiated under the preceding administration. (See **CHINESE IMMIGRATION.**) The proposed cutting of a canal through the isthmus of Panama, under French control, brought up the idea that the Monroe doctrine (see that article) required the control of the canal to be in the United States. The Garfield administration began a diplomatic correspondence to that end with Great Britain, which was dropped by its successor. Peru had begun a war against Chili, and had been completely conquered; and the United States interfered to prevent the extreme spoliation of the conquered

nation. But, as Chili refused to yield to moral force, and the United States was not disposed to use physical force, the interference came to nothing. There was some fear of difficulty with Great Britain on the question of extradition, which had long been troublesome. (See EXTRADITION.) There had been for years an enormous immigration from Ireland to the United States. (See EMIGRATION.) A very large part of it was the real or imagined result of former English misgovernment in Ireland. As might have been expected,

this class of immigrants gave a warm support to revolutionary movements in Ireland, but there was no remedy for it, since their support did not pass beyond legitimate bounds. The further question whether refugees charged with violence are subject to extradition, or are insured against it by the political purpose and character of their acts, has not yet been formally and officially raised (1884). — (See, in general, the names of the various persons and political parties mentioned; ADMINISTRATIONS, for the presidents, vice-presidents and

† Returning Board count. (See Returning Boards.)

cabinet officers; CONGRESS, SESSIONS OF, for the duration of congresses, the speakers of the house, and their parties; JUDICIARY, II., for justices of the supreme courts; the names of the various states for their political leaders; ELECTORAL VOTES.)—Presidential electors are chosen in such manner as the legislature of each state shall direct. Until about 1824 the general rule was that electors were chosen directly by the state legislatures, and choice by popular vote was exceptional. Since 1824 choice by popular vote has been the rule, except in South Carolina until 1868. (See ELECTORS.) The electoral votes for all the elections are elsewhere given. (See ELECTORAL VOTES.) The popular votes at the elections since 1824 are given in the tables shown on pages 1001, 1002. In each election the name of the successful candidate for president is placed first. (For full names, and names of candidates for vice-president, see the names of the parties under the year.)

—III. THE CONSTITUTION OF THE UNITED STATES. — 1. *General Character of the Union.* The Union is an anomaly in at least one respect: it is the only great nation in which the location of sovereign power is, and has always been, a fairly disputed point. No one has any doubt as to the location of sovereign power in Russia, France or Great Britain; but in regard to the United States there are almost as many opinions as there are commentators. There is a general agreement that sovereign power is in "the people of the United States," by whose will the constitution, which governs the government, was established; but this only pushes back the difficulty one step further to an equally general disagreement about this "people of the United States." In this general disagreement there are three great divisions of opinion, as follows: 1st. The people of the United States is the people of the *several* states, each having sovereign control over its own life and action, its entrance to the Union, its continuance therein, and its departure therefrom. (See STATE SOVEREIGNTY, and the authorities under it.) This would make the Union continuously voluntary on the part of each state, and would make each state the sovereign and protector not only of its own life, but of the life of the Union within its borders. It is contradicted by the facts of our history, and fell at the first attempt to enforce it in practice. (See SECESSION.) 2d. The people of the United States is the people of the several states, holding sovereignty only as a unit, the people of those states which voluntarily remain united (including the doctrine of possible state-lapse); and the possession of sovereignty by the people as a mass is nothing but an hypothesis, and has no political consequences whatever, except as some person or persons may succeed in using sovereign power in the name of such people. This has been best elaborated by J. C. Hurd, as cited below. It is objectionable because, as Mr. Hurd not only acknowledges, but maintains, it makes the national government really sovereign. "Sovereign governments" are the very things to escape which the

American people was organized; and if it should ever unwittingly become subject to one, it would very soon provide a new means of escape. 3d. The people of the United States is the national people, organized by its own general will into a nation, and divided by its own general will into states. The existence of nation and states alike is bottomed on the same foundation, the ultimate sovereignty of the whole people, which has as yet shown itself only in this attitude of protection. In other respects it rules only through its ministers, the state and national governments, and no crisis has yet proved too great to be met through one or other of these agencies. This view has been best elaborated by Jameson, as cited below. The objection to it is that the national people has never yet acted politically as a unit, but always under the state formation. Nevertheless, it has been adopted in this series of articles as apparently the least objectionable of all. If it is correct, the sovereign power of the United States depends for its strength upon its unanimity, and is least palpable when it is most nearly unanimous, and, consequently, strongest. As it is now practically unanimous on the questions of state and national existence, it is wholly impalpable, and agencies or ministers only are visible. Of course, so distant a sovereignty will appear to many to be worse than no sovereignty at all; but it seems to the writer that its distance is just the reason that the American people has always been satisfied with it, and that there is as yet no symptom of a desire to replace king Log by king Stork. At any rate, enough has been said to call attention to one of the most curious features of the American Union. (See STATE SOVEREIGNTY, NATION.) — In its first form the government of the United Colonies, or United States, was revolutionary, depending for its powers solely on the general obedience of the national people. It received no powers from state governments or state peoples, and asked for none; on the contrary, the states were at first consciously and confessedly dependent on it even for their existence and defense. As the danger from the enemy became less urgent, the authority of the revolutionary government waned, and that of the state legislatures increased, until they assumed the ungranted power to frame a national government by the articles of confederation. As no such power had been granted to them by their state peoples, it also could have been valid only by the general acquiescence of the national people in the surrender of power by their revolutionary government. The same objection holds good to the convention of 1787, as bottomed on the sovereign power of the states, either separately or collectively: there was no warrant in any state constitution or in the articles of confederation for the selection of delegates by the state legislatures, or for the action of congress in standing sponsor to the convention. It seems to have represented only the universal, and, consequently, sovereign, will of the people of the whole country, that the form of government should be changed, but that the change should

impair state rights as little as possible. Even in the ratifications, the same quiet pressure of the national will was the controlling factor. Without it, if the consideration and decision of each state had really been entirely autonomous, as it purported to be, the present constitution would never have gone into effect, for it would have been rejected by at least six states, Rhode Island, North Carolina, Massachusetts, New Hampshire, New York and Virginia. All these states ratified only in deference to the general will, as represented by heavy minorities in their own states and heavy majorities in the others. In this case, as in all others, the sovereign power avoided the use, or suggestion, of force, and only materialized itself so far as was absolutely necessary. If the constitution had been rejected, the sovereign power would have materialized itself further; very few men at the time doubted that, or wished to make the step necessary. That the states yielded to this sovereign power without the employment of force is no impeachment of the power of the sovereign. If that were so, every peaceful presidential election would make the sovereign power more doubtful. (See CONGRESS, CONTINENTAL; CONFEDERATION, ARTICLES OF; CONVENTION OF 1787; CONSTITUTION; STATE SOVEREIGNTY.)— Under this third form of government, the constitution of the United States, the country still continues. It restricts the power of the states in many points, and it grants many powers to the national government; and by one of the amendments, but still more by the whole spirit of the instrument, it maintains the states in all powers not forbidden, and forbids to the national government the exercise of all powers not granted by it. (See CONSTRUCTION.) The operation of its provision for admitting new states, with the successive acquisitions of new territory, has given the country for which the constitution was made its present shape. There are now (1883) thirty-eight states, eight organized territories, two unorganized territories, and a federal district. The states are self-governing commonwealths in all points reserved to them by the federal constitution, and their state governments take cognizance of everything not forbidden to them by the federal constitution or by their state constitutions. The territories are theoretically in absolute subjection to the federal government; but the consistent policy of the federal government has always been to grant self-government to them as rapidly as possible, in order to encourage their conversion into states. (See TERRITORIES; ANNEXATIONS; and the names and admissions of the states under CONSTITUTION, I.)— All through the state and territorial organizations runs the national organization, acting on individuals, however, not on states, with the exception of the judicial veto referred to hereafter. It is limited by the oath of its members to respect and obey the federal constitution, by the power of the judiciary to nullify or veto those of its acts which are unwarranted by the constitution, and by the general disposition of the people to punish by the

ballot any unwarranted assumption of power. The last is incomparably the most important safeguard, without which the others would be worthless; and it is the only form in which the ultimate sovereignty of the United States exhibits itself. Attempts have been made to substitute for it the will of an individual state, but they have been failures (see NULLIFICATION); and it is now settled that the individual owes his privileges as a state citizen to the will of the whole people, not to that of his state. If the federal government assumes ungranted powers, its acts are void. The final decision upon their validity is entrusted to the supreme court in matters on which a case can be made up; in other matters, the decision is left to the voters in the presidential and congressional elections. It is, therefore, but partly true, that the supreme court is the arbiter of disputed constitutional questions. If a state government assumes ungranted powers, or if a state people in forming a state constitution, insert a provision in conflict with the federal constitution, these acts are also void; but in these cases the supreme court is the sole final arbiter. (See JUDICIARY.)— As a general rule, then, it must be admitted that the state must yield, in a conflict with the federal government, when the federal judiciary has finally pronounced against her, and that the state is subordinate, though not subject. But every unprejudiced observer must admit, that, in any such conflict, the state has a greater prospect of success than the federal government, even in the federal supreme court. (See *State Rights*, under STATE SOVEREIGNTY.) Even in the matter of the last two amendments to the federal constitution, carefully drawn for the express purpose of curbing state action, the federal judiciary in 1883 is interpreting them far more favorably to the states than any state court would have done in 1873. If the state should choose to carry the conflict further, into forcible resistance, her citizens are bound to take sides against her, and with the more direct representative of the general will. (See TREASON, ALLEGIANCE.)— *Division of Powers.* The federal government has been proved by experience to be an exceedingly simple and effective piece of machinery. It has served as a model for the constitutions of new states, and the constitutions of the original states have been so changed as to follow it. Its leading characteristic is its careful division of the powers of government into three departments. The power of legislation is given to two houses, co-ordinate in rank and power, but with different constituencies. The executive power is given to a single person, with a limited veto on the legislative: he is responsible to the legislative department by impeachment, but is not elected by it. The power to interpret the laws, and to veto such as are in conflict with the will of the people, as expressed in the constitution, is given to an organized judiciary. Most of the state constitutions follow this division of powers exactly, except for their restrictions on the powers of the legislative. (See RIDERS.) Where they differ

from it, it is mainly on three points: the election of the executive by the legislative, in default of a choice by popular vote; the greater or less limitation of the executive veto power (see VETO); or the election of judges by popular vote or by the legislative, and for a term of years, while the federal judges hold by appointment of the executive, and during good behavior. (See JUDICIARY, ELECTIVE; STATE CONSTITUTIONS.)—*Amendments.* Amendments are made in the same manner as the original constitution, by convention and ratification (see this subject fully treated under CONVENTION, CONSTITUTIONAL): or by proposition of congress and ratification by three-fourths of the state legislatures. In the states the same is true, except that the proposition is by the legislature or convention, and the ratification is by popular vote. There is no point in the state constitutions in which amendment is forbidden, and but one (Art. V.) in the federal constitution: "no state, without its consent, shall be deprived of its equal suffrage in the senate." (See also COMPROMISES, III., VI.) Its terms forbid the passage of any amendment to strike out this prohibition. It must be confessed that the terms of the articles of confederation, forbidding any amendment not ratified by all the state legislatures, were still more sweeping, and yet that a way was found to override their letter and spirit by the adoption of the constitution. But the single prohibition of the constitution has a far stronger safeguard in the universal will that it shall be maintained. (See, for amendments ratified and for amendments proposed, CONSTITUTION, III.)—*Citizenship.* From the beginning the constitution took citizens as it found them, made so by state laws, and only interfered to secure to the citizens of each state the privileges and immunities of citizens in the other states. It was and is possible, for example, for a person who has only declared his intention to become naturalized, to be a state citizen by state laws, and thus to vote at congressional and presidential elections. When the abolition of slavery had been accomplished, the fourteenth and fifteenth amendments were made parts of the constitution. There was at first a strong disposition to take them as having transferred from the states to the federal government the whole control of citizenship and suffrage. But the authoritative interpretation of them by the supreme court has since shown that they are exactly in the line of the original interference of the constitution; that they are restrictive, not constructive; and that they are to prevent unjust discrimination by the state, not to assume the state's former functions. (For a full discussion of this subject, see NATIONALITY, LAW OF; SUFFRAGE.)—2. *The Federal Legislative; the Congress.* Congress, or "the congress," as it is properly called, is made up of two houses, the house of representatives and the senate. The house of representatives has (1883-5) 325 members, elected by the states in proportion to population. (See APPORTIONMENT.) The senate has 76 members, two

from each state. Laws must be passed by a majority vote of both houses, and approved by the president, though the disapproval of the latter may be overridden by a two-thirds vote of both houses. (See VETO.) The legislative powers of congress are considered elsewhere. (See CONGRESS, POWERS OF.) The house has the sole power to prefer, and the senate to try, impeachments. (See IMPEACHMENTS.) The senate is an executive council in the matters of treaties and appointments. (See TREATIES, JAY'S TREATY, CONFIRMATION BY THE SENATE.) Each house has its own officers and rules, and its own distinctive features. (See, in general, CONGRESS; SENATE; HOUSE OF REPRESENTATIVES; CONGRESS, SESSIONS OF; PARLIAMENTARY LAW.)—3. *The Federal Executive; the President.* The executive power is given to a president, elected by electors for a term of four years. (See ELECTORS AND ELECTORAL SYSTEM.) He is commander-in-chief of the army and navy; he has power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment; he makes appointments, and concludes treaties, with the concurrence of the senate; he takes care that the laws are faithfully executed, and is responsible to congress by impeachment. (See EXECUTIVE, MESSAGE, IMPEACHMENT, CONFIRMATION BY THE SENATE, TREATIES, JAY'S TREATY, TENURE OF OFFICE.) With him is elected a vice-president, who presides over the senate, and succeeds to the presidency in case of the death, resignation, removal or inability of the president. (See EXECUTIVE, V.) The list of presidents and vice-presidents is given elsewhere. (See ADMINISTRATIONS.)—*Departments.* The subordinates of the executive are divided into seven departments—the departments of state, the treasury, war, the navy, the interior, justice, and the postoffice. The heads of these departments form what is called the cabinet, though that title is wholly extra-constitutional. The cabinet functions of the heads of departments depend entirely on the right given to the president by the constitution to "require the opinion in writing of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices"; and "cabinet meetings," in the form which they have taken, depend on the president's will. The functions of the various departments and their heads are strictly defined by law (see ADMINISTRATIONS, and the articles on the various departments.) One department, that of agriculture, has been so constituted by law, while its head is not recognized as a cabinet officer. Each department has its own building at the national capital, the city of Washington, where its business is transacted and its records are kept. (See CAPITAL, NATIONAL.) Each department has its subdivisions, called bureaus. The most numerous are those of the department of the interior, as follows: Indian affairs, pensions, patents, public lands, census and education. In like manner customs, internal revenue, the currency, the coast survey, the lighthouses, and sta-

tistics, are under control of the treasury department. — The appointment and removal of the subordinate officials of the departments is, in general, the province of the president. (See **TENURE OF OFFICE, CONFIRMATION BY THE SENATE.**) In the practical execution of his powers, the president has come to rely upon the advice of heads of departments, members of congress, and leading politicians of his own party in the various states. The public service has thus come to be the cement for party organizations (see **NOMINATING CONVENTIONS**); and its efficiency has been seriously injured. (See **SPOILS SYSTEM, PATRONAGE.**) In 1883 the passage of the so-called Pendleton bill made a serious inroad into the system which had controlled appointments and removals for the preceding half century. It authorized the application, after July 16, 1883, of the system of appointments and promotions by examination to public offices in which there are fifty or more employes. (See **CIVIL SERVICE REFORM.**) — 4. *The Federal Judiciary.* The organization and powers of the supreme court, the circuit courts, the district courts and the territorial courts of the United States are given elsewhere. (See **JUDICIARY.**) The judges hold office during good behavior, and are responsible only through the long and doubtful process of impeachment. There is also a court of claims, which deals with claims against the United States; with an appeal to the supreme court. — 5. *The State Legislatures.* The organization of these bodies is given elsewhere. (See **ASSEMBLY.**) Their powers of legislation cover the whole field of subjects not prohibited to them by the federal constitution or their several state constitutions, so that, in general terms, they control all matters pertaining peculiarly and exclusively to their several states. They regulate the right of suffrage within their states, under certain limitations. (See **SUFFRAGE.**) They elect United States senators, and prescribe the manner of the election of presidential electors, and, in default of action by congress, of representatives also. (See **ELECTORS, APPORTIONMENT, GERRYMANDER, HOUSE OF REPRESENTATIVES.**) It is, therefore, not an uncommon event for the elections in a few doubtful legislative districts to rise to a national importance, since their result may decide the political complexion of a legislature which is to choose a United States senator, and his election may decide the political complexion of the United States senate and the general character of United States laws. A minor local election may thus be of the very greatest moment to the country at large. In matters which are peculiarly of state interest, the tendency is to limit both the duration and the powers of the legislature: the former by making sessions biennial; the latter by requiring general, instead of special, legislation. (See **RIDERS**; and, in general, see **CAUCUS SYSTEM, PRIMARY ELECTIONS.**) — 6. *The State Executive; the Governor.* When the colonies were transformed into states, at the beginning of the revolution, their executive was regularly styled president. The appropriation

of this title to the national executive by the constitution led to the universal adoption of the title of governor for the state executives. At present all the state constitutions provide that "the executive power of the state shall be vested in a governor": some of them vary it by calling it the "supreme" or "chief" executive power; and two, Massachusetts and New Hampshire, give the governor the title of "his excellency." Massachusetts, New Hampshire and Rhode Island elect the governor for one year; New Jersey and Pennsylvania, for three years; and the other states, for either two or four years. (See the names of the several states and **STATE CONSTITUTIONS.**) The only qualifications are those of age (usually thirty years), residence and citizenship. The chief executive officers, under the governor, are the lieutenant governor, secretary of state, auditor or comptroller, treasurer and attorney general, regularly chosen by election, though some of them are appointed in some of the states. To these offices are frequently added others, such as superintendent of public instruction or public works, inspector of prisons, etc. In Florida and North Carolina these subordinate officers are the governor's cabinet, or council of state; in Maine, Massachusetts and New Hampshire, an advisory body, called a council, is elected by the people; in the other states there is no council, but in most of them the governor may call for his subordinates' opinions or advice in writing. A vacancy in the governor's office is generally filled by the lieutenant governor, president of the senate, and speaker of the house, in the order named. — The governor, as the representative of the state's physical force, has power to execute the laws, preserve the peace, suppress insurrection, and repel invasion. In this capacity he is given various titles, from the simple title of "commander-in-chief" to the higher distinction (in Rhode Island) of "captain-general and commander-in-chief of the military and naval forces of the state." He has the power of pardon or reprieve, though in many of the states the council, or a special board of pardons, shares the power with him. In most of the states he has a more or less limited veto power. (See **VETO.**) — 7. *The State Judiciaries.* The state constitutions agree in giving judicial powers to justices of the peace, to a supreme (or superior) court, and to such inferior courts as may be established by the constitution in some states, or by law in others. The inferior courts are usually circuit or district courts, county or parish courts under various names, probate, orphans', surrogate's or prerogative courts, and a great variety of minor criminal and city courts. A few states retain the court of chancery, together with a court of errors and appeals from both common law and equity courts; but in most of the states the supreme court has also equity jurisdiction. In Maine, Massachusetts, New Hampshire and Rhode Island, the supreme court is to give its opinion on constitutional questions whenever requested to do so by the executive or legislative. — The most marked tendencies in the his-

torical development of the state judiciaries have been toward a codification of the statutes, and an elective judiciary. (See JUDICIARY, ELECTIVE.) The former tendency has been formally resisted by a few states, but even in these it has had great influence upon the practice in the courts; while, in those states which have fully yielded to it, it has radically altered the practice. The latter tendency, to an elective judiciary, seems to be in some manner akin to the former, for the states which have resisted or succumbed to the one have generally done the same with the other. Both innovations are due to the advancing spirit of democracy, and it therefore seems probable that all the states will finally yield to both, though at different times and in different degrees. Codification has been adopted in part by congress for the federal judiciary, but the constitution has as yet proved an insuperable barrier to an elective federal judiciary. (See JUDICIARY, VII.)—The reader's attention has been directed, in another article (see *State Rights*, under STATE SOVEREIGNTY), to the vigorous individuality of life which characterizes the states, and which does not need the stimulant of a delusive "sovereignty." The American federal system has certainly proved a very powerful check to the tendency of a democracy to reduce all men to uniformity as well as political equality; and it can hardly be said that any part of the federal system has contributed more largely to state individuality than the state judiciaries. State constitutions have come to look somewhat as if they were cast in one mould, and state laws as if they were made after one pattern; but the state judiciary, which finally and authoritatively interprets both, retains and gives full force in the interpretation to every tradition, prejudice and peculiarity of the state life. State legislatures are naturally very prone to enact innovations only on the strength of their success in other states, and, perhaps, under very dissimilar circumstances; but that must be a very reasonable innovation indeed which can pass unscathed the gauntlet of the state courts, and make for itself a permanent place in its new location. The divergences of form are no less marked than the divergences in spirit. However similar the forms of the states may be in other respects, their courts exhibit the most bewildering diversity of form, name and jurisdiction. Lawyers are apt to complain of such a diversity, and to wish that courts and practice were uniform throughout the states. It is to be feared that the wish, if it were granted, would bring far more serious and pregnant evils in its train than those of the present diversity.—IV. STATISTICS. 1. *Area and Population.* Exclusive of Alaska, the land area of the United States is 2,970,000 square miles, and the water area 55,600 square miles; total, 3,025,600 square miles. Until 1880 the census made the total area 3,026,494 square miles; but careful remeasurements have altered the recorded areas of all the states and territories, and fixed the total as above. The most striking result of the remeasurement is the reduction of the area

of California from 188,981 to 158,360 square miles. The area of Alaska can not be considered as even approximately ascertained. It has always been placed at 577,390 square miles, and is so given elsewhere (see ANNEXATIONS); but the areas of its six subdivisions, as estimated by the special agent for the census of 1880, make a total of but 531,409 square miles. The total area of the United States, on the first estimate of Alaska, is 3,602,990 square miles; on the second estimate of Alaska, 3,557,009 square miles.—The population in 1880 was 50,155,783, excluding Alaska, and was divided as follows: male, 25,518,820; female, 24,636,963—native, 43,475,840; foreign, 6,679,943—white, 43,402,970; colored, 6,580,793; Chinese, 105,465; Japanese, 148; Indians, 66,407. The population of Alaska is given by the special agent as 33,426: 430 white, 1,756 creole, and the rest Innuut and kindred tribes. The ratio of population to square miles of area was 17.29 in 1880; 13.3 in 1870; 10.84 in 1860; and 7.93 in 1850. The number of families in 1880 was 9,945,916, a ratio of 5.04 persons to a family. In 1870 the ratio was 5.09; in 1860 it was 5.28; in 1850 it was 5.56. The territories and Pacific states (except Oregon) have an excess of single men, and low family ratio. In the more eastern states, the lowest ratios of persons to a family are: New Hampshire, 4.32; Connecticut, 4.55; Vermont, 4.55; Maine, 4.58; Rhode Island, 4.59; Massachusetts, 4.70; and New York, 4.71; and the highest, West Virginia, 5.54; Minnesota, 5.45; Kentucky, 5.45; Tennessee, 5.38; Missouri, 5.38; Virginia, 5.36; and Texas, 5.35. There were 8,955,812 dwellings in 1880, or 5.6 persons to a dwelling. The densest urban population was in New York city, where there were 16.37 persons to a dwelling. The five cities which led in population were: New York city (1,206,299), Philadelphia (847,170), Brooklyn, N. Y. (566,663); Chicago, Ill. (503,185), Boston, Mass. (362,839). The one hundredth in rank was Springfield, Ill. (19,743).—The following table gives the land areas in square miles, the population, the ratio of population to square miles of land area, and the gross land and water areas, in the several states and territories in 1880 (territories in italics). The unorganized Alaska and Indian territories are not included in the ratio, and Alaska is not included in the areas.

STATES AND TERRITORIES	Land Area	Population	Ratio.	Gross Area.
Alabama	51,540	1,282,505	24.50	52,250
Arizona	112,920	40,440	0.36	113,020
Arkansas	53,045	802,525	15.13	53,850
California	155,981	864,694	5.54	158,360

— *Increase of Population.* The decennial census has been a feature of the United States government since the establishment of the constitution. (See CENSUS, APPORTIONMENT.) Mr. Bancroft, taking the ground that the ratio of increase was about as constant before the year 1790 as after it, estimates the population of the colonies in the years 1750–90, as follows: 1780, 2,945,000; 1770, 2,312,000; 1760, 2,195,000; 1750, 1,260,000. The census records give the population, at inter-

vals of ten years, and the increase per cent., as follows:

YEARS.	Population.	Increase per cent.
1890.....	50,155,783	30 0
1870.....	36,566,371	22 6
1860.....	31,443,821	35 6
1850.....	23,191,876	35 8
1840.....	17,069,453	32 6
1830.....	12,866,020	33 5
1820.....	9,683,822	33 1
1810.....	7,239,891	36 3
1800.....	5,308,463	35 1
1790.....	3,929,214

— *Immigration.* No authentic record of immigration is available before 1819. Contemporary writers estimate immigration at 4,000 per annum up to 1794; and Dr. Adam Seybert, in 1818, considered 6,000 per annum, or 180,000 for the whole period 1788–1818, a liberal estimate. The act of March 2, 1819, required quarterly reports of immigrants by collectors of customs, and these have been brought together in the annual reports of the secretaries of state. (See EMIGRATION.) — *Centre of Population.* This is defined, in Walker's "Statistical Atlas," (1874), as "the point at which equilibrium would be reached were the country taken as a plane surface, itself without weight, but capable of sustaining weight, and loaded with its inhabitants, in number and position as they are found at the period under consideration, each individual being assumed to be of the same gravity as every other, and consequently to exert pressure on the pivotal point directly proportioned to his distance therefrom." On this basis the census bureau has calculated the position of the centre of population, at intervals of ten years, as follows. Its approximate location by important towns, and its westward movement during the preceding ten years, are also given.

YEARS.	N. Latitude.		W. Longitude.		Approximate Location.	Westward Movement
	Deg.	Min.	Deg.	Min.		
1790.....	39	16 5	78	11 2	23 m. E. Baltimore.
1800.....	39	16 1	76	56 5	18 m. W. Baltimore.	41
1810.....	39	11 5	77	37 2	40 m. W. by N. W. Washington.	36
1820.....	39	05 7	78	33 0	16 m. N. Woodstock.	50
1830.....	38	57 9	79	16 9	19 m. W. S. W. Moorefield.	39
1840.....	39	02 0	80	18 0	16 m. S. Clarkeburg.	55
1850.....	38	59 0	81	19 0	23 m. S. E. Parkersburg.	55
1860.....	39	00 4	82	48 8	20 m. S. Chillicothe.	81
1870.....	39	12 0	83	35 7	48 m. E. by N. Cincinnati.	42
1880.....	39	04 1	84	39.66	8 m. W. by S. Cincinnati.	56

It was, in 1880, in Kentucky, one mile from the Ohio, and one and a half miles southeast of the village of Taylorsville. — *Urban Population.* The following table shows the growth of the urban

population of the United States: it gives, at intervals of ten years, the number of cities of 8,000 or more inhabitants, total population, and its percentage of the total population of the country:

YEARS.	No. of Cities.	Population.	Per ct.	YEARS.	No. of Cities.	Population.	Per ct.
1800.....	6	210,873	3 9	1850.....	85	2,897,586	12 5
1810.....	11	356,920	4 9	1860.....	141	5,072,256	16 1
1820.....	13	475,135	4 9	1870.....	226	8,071,875	20 9
1830.....	26	964,509	6 7	1880.....	266	11,318,547	22 5

— *School, Military and Voting Population.* The following table gives the population of school age

(male and female, 5 to 17), military age (male, 18 to 44), and voting age (male, 21 and over), in the

several states and territories. (Territories are given in italics.)

STATES AND TERRITORIES.	5 to 17, both inclusive.		18 to 44, both inclusive	21 and over.

Total.....	7,605,126	7,458,641	10,231,239	12,830,349

— *Education and Illiteracy.* The census of 1880 reports 225,880 public schools in the United States, including 16,800 separate schools for colored children, and 5,430 high schools or high school departments. Pennsylvania stands first with 18,616 schools, New York second with 18,615, Ohio third with 16,473, and Wyoming lowest with 55. The school buildings number 164,832. Pennsylvania stands first in this respect with 12,857 buildings, Ohio second with 12,224, New York third with 11,927, and Wyoming lowest with 29. The total number of teachers is 236,019; white male 96,099, white female 124,086, colored male 10,520, colored female 5,314. The aggregate of months of teachers' service was 1,539,303, at an average monthly salary of \$36.21. The monthly average is highest in California (\$76.54), and lowest in North Carolina (\$21.27). The total number of pupils is 9,090,248; white male 4,687,530, white female 4,402,718, colored male 433,329, colored female 422,583; and the average daily attendance is 6,276,398, 5,715,914 white, and 560,484 colored. The receipts of the public schools, mainly derived from

taxation, were \$96,857,534; and the value of their school property was \$211,411,540. (See, in general, EDUCATION AND THE STATE; EDUCATION, BUREAU OF.)— The following abstracts are from the report of the commissioner of education for 1880:

CLASSES.	No.	Instructors.	Students.
Colleges and universities.....	864	4,160	59,594
Scientific schools.....	83	953	11,584
Theological schools.....	142	633	5,242
Law schools.....	48	229	3,134
Medical schools.....	90	1,384	11,929
Dental schools.....	16	219	730
Schools of pharmacy.....	14	57	1,347

— The newspapers and periodicals number 11,314, of which 971 are issued daily, 8,633 weekly, and 1,167 monthly. The aggregate circulation per issue is 3,566,395 for the dailies, and 28,213,291 for the others. English is the language of 10,515 of them, and the others range from 641 in German to three in Indian, two each in Chinese, Polish, and Portuguese, and one each in Catalan and Irish. — Out of a total population of 36,761,607, of ten years old and upward, 4,923,451, or 13.4 per cent., are returned as unable to read, and 6,239,958, or 17 per cent., as unable to write. It must be confessed that these are uncomfortable figures for a republic based on manhood suffrage, but it must be taken into account that they are abnormally increased by the still prevailing illiteracy of the colored race. Of the 32,160,400 white persons of ten years old and upward, the number unable to write is 3,019,080, or 9.4 per cent.; while the corresponding figures for the colored race are a total of 4,601,207, of whom 3,220,878, or 70 per cent., are unable to write. There are 11,343,005 white males of twenty-one years old and upward (voters), and 886,659, or 7.8 per cent., of these are unable to write. There are 1,487,344 colored voters, and 1,022,151, or 68.7 per cent., of these are unable to write. These terrible percentages of colored illiteracy can only be regarded as survivals of antebellum conditions, and private benevolence is supplementing public energy in the effort to reduce them. The Peabody fund distributed \$1,191,700 among the southern states for educational purposes during the years 1868–80, and the various missionary associations probably increased the amount to about \$10,000,000. The following is a summary of the higher educational institutions in the southern states for the colored race.

CLASSES	No.	Instructors.	Students.
Colleges and universities.....	15	119	1,717
Preparatory schools.....	36	120	5,237
Normal schools.....	44	227	7,408
Theological schools.....	22	65	800
Law schools.....	3	10	33
Medical schools.....	2	17	87
Schools for deaf, dumb and blind.....	2	18	122

— 2. ECONOMICS.— *Agriculture.* The total number of farms was 4,008,907 in 1880, against 2,659,985

in 1870, an increase of 50 per cent. The increase was altogether in farms of fifty acres and over; farms of less than fifty acres show a decrease, as follows:

CLASSES.	1880.	1870.	1860.
Under 3 acres.....	4,852	6,875
3 to 10 acres.....	134,889	172,021	54,676
10 to 20 acres.....	254,749	294,007	162,178
20 to 50 acres.....	781,474	847,614	616,558
50 to 100 acres.....	1,032,910	754,221	606,878
100 to 500 acres.....	1,095,983	565,054	487,041
500 to 1,000 acres.....	75,972	15,873	20,319
Over 1,000 acres.....	28,578	3,720	5,864

It will be noticed that the changes for 1870-80 are in exactly the opposite direction to those of 1860-70. The average size of farms was 134 acres in 1880, against 153 acres in 1870, and 199 acres in 1860. The total number of acres in farms was 536,081,835 in 1880 (284,771,042 acres improved), against 407,735,041 in 1870 (188,921,099 improved), and 407,212,538 in 1860 (163,110,720 improved). The value of farms is put at \$10,197,096,776 in 1880, \$9,262,803,861 in 1870, and \$6,645,045,007 in 1860. The value of farming implements and machinery is put at \$406,520,055 in 1880, \$336,878,429 in 1870, and \$246,118,141 in 1860. Production of leading crops was as follows:

	1880.	1870.	1860.
Barley, bush.....	43,997,495	29,761,305	15,825,896
Buckwheat, bush.....	11,817,327	9,821,721	17,571,818
Indian corn, bush.....	1,754,591,676	700,944,549	898,792,742
Oats, bush.....	407,868,999	282,107,157	172,643,185
Rye, bush.....	19,881,595	16,918,795	21,101,380
Wheat, bush.....	459,488,137	287,745,626	173,104,924
Cotton, bales.....	5,755,359	3,011,996	5,387,052

(CONTINUED.)

Cheese, lbs.....	27,272,489	53,492,153	103,662,927

There should be added to the wool production in 1880 about 85,000,000 pounds for the wool of "ranch" and slaughtered sheep, as estimated after special investigation. The value of live stock in 1880 was \$1,500,464,609, against \$1,525,276,457 in 1870 (the average value of the paper dollar in 1869-70 being 81 cents in gold), and \$1,089,329,915 in 1860. The total number of animals was as follows:

	1880.	1870.	1860.
Horses.....	10,357,488	7,145,370	6,249,174

Swine.....	47,681,700	25,134,569	33,512,867

There should be added to the number of sheep in 1880 about 7,000,000 on ranches and public lands, as estimated after special investigation. — *Manufactures*. The general results of the census in 1880, 1870, and 1860, are as follows:

	1880.	1870.	1860.
Establishments.....	253,652	252,148	140,433
Hands employed:			
Males over 16.....	2,025,335	1,615,598	1,040,349
Females over 15.....	431,639	323,770	270,897
Children.....	181,921	114,628
Capital.....	\$2,790,272,606	\$2,118,208,789	\$1,009,855,715
Wages for the year.....	947,953,795	775,584,843	878,878,966
Value of materials.....	3,396,823,549	2,468,427,242	1,031,605,062
Value of products.....	5,869,579,191	4,222,825,442	1,885,961,676

Out of the 332 manufacturing and mechanical industries specified in the census report of 1880, the following are selected:

INDUSTRIES.	Establishm'ts.	Capital.	Hands.	Product.
Clothing, men's.....	6,166	\$ 79,861,696	160,813	\$209,548,460
Clothing, women's.....	562	8,207,273	25,192	32,004,794
Cotton goods.....	1,005	219,504,794	185,472	210,950,383
Mixed textiles.....	470	37,996,057	43,373	66,221,703
Silks.....	382	19,125,300	31,337	41,033,045
Hosiery and knit goods.....	859	15,579,591	25,865	29,167,227
Worsted goods.....	76	20,374,043	18,303	33,549,942
Woolen goods.....	1,990	96,095,564	88,504	160,806,721
Carpets.....	195	21,468,587	20,371	31,732,802
Dyeing textiles.....	191	26,222,961	16,696	32,297,420
Drugs and chemicals.....	592	28,596,458	9,545	38,173,658
Tanned leather.....	3,105	50,222,054	23,812	113,948,696
Iron and steel.....	1,005	280,971,884	140,978	296,557,685
Iron pipe.....	35	6,129,565	5,110	18,202,162
Agricultural implements.....	1,943	62,109,668	39,580	68,640,466
Fertilizers.....	364	17,912,680	14,366	23,660,795

(CONTINUED.)

INDUSTRIES.	Establishm'ts.	Capital.	Hands.	Product.
Foundry and machine shop.....	4,958	\$154,519,484	145,351	\$214,378,468
Flouring and grist mill.....	24,338	177,361,878	58,507	505,185,712
Furniture.....	4,849	38,669,764	48,729	68,037,902
Hardware.....	402	15,363,551	16,801	22,653,693
Glass.....	211	19,844,699	24,177	21,154,571
Planned lumber.....	1,208	17,612,923	15,289	36,803,856
Sawed lumber.....	25,708	181,186,122	147,956	233,268,729
Printing and publishing.....	3,467	62,983,704	58,478	60,789,341
Carpentering.....	9,184	19,541,358	54,138	94,152,139
Blacksmithing.....	28,101	19,618,852	34,520	43,774,271
Carriage and wagon.....	8,841	37,973,493	45,394	64,951,617
Wheelwrighting.....	10,701	10,641,080	16,108	18,892,858
Boots and shoes.....	17,972	54,358,501	133,819	186,920,481
Brick and tile.....	5,831	27,073,616	69,355	32,833,587
Shipbuilding.....	2,188	20,979,874	21,345	36,800,327
Slaughtering.....	872	49,419,213	27,297	303,562,413
Sugar and molasses.....	49	27,432,500	5,857	155,484,915
Tobacco (total).....	7,674	39,905,292	67,587	118,670,166
Liquors (total).....	3,152	118,037,729	33,689	144,291,241

The seven leading states are as follows, arranged according to capital:

STATES.	Establishm'ts	Capital.	Hands.	Product
New York.....	42,739	\$514,246,575	531,533	\$1,080,696,596
Pennsylvania.....	31,232	474,510,993	387,072	744,818,445
Massachusetts.....	14,352	303,806,185	352,255	631,135,264
Ohio.....	20,699	188,939,614	183,600	348,298,390
Illinois.....	11,549	140,652,066	144,727	414,864,673
Connecticut.....	4,488	120,480,275	112,915	185,697,211
New Jersey.....	7,128	106,226,598	126,038	254,380,236

These seven states lead in product also. For other aspects of this branch of the subject see CUSTOMS DUTIES, TARIFF, DISTILLED SPIRITS, EXCISE LAW, INTERNAL REVENUE. — *Mining, Fisheries, State Debts, Finance, Banking.* For these subjects see MINES; FISHERIES; DEBTS, NATION-

AL, STATE AND LOCAL; FINANCE; COINAGE; BANKING IN THE UNITED STATES; CLEARING HOUSE. — *Commerce.* The following table gives the specie value of imports and exports of merchandise, 1861-83, each year ending June 30, and the excess of imports or exports:

YEARS.	Exports.	Imports.	Excess
1861.....	\$219,553,838	\$289,310,542	\$69,756,709 Import.
1862.....	190,670,501	189,356,677	1,313,824 Export.
1863.....	203,964,447	243,335,815	39,371,368 Import.
1864.....	158,837,988	316,447,283	157,609,295 Import.
1865.....	166,029,303	238,745,580	72,716,277 Import.
Total five years.....	939,056,072	1,277,195,897	338,139,825 Import.
Average.....	187,811,214	255,439,179	67,627,965 Import.
1866.....	348,859,522	434,812,066	85,952,544 Import.
1867.....	294,506,141	395,761,096	101,254,955 Import.
1868.....	281,952,899	357,486,440	75,483,541 Import.
1869.....	286,117,697	417,506,379	131,388,682 Import.
1870.....	392,771,768	435,958,408	43,186,640 Import.
Total five years.....	1,604,208,027	2,041,474,389	437,266,362 Import.
Average.....	320,841,605	408,294,877	87,453,272 Import.
1871.....	442,820,178	520,223,684	77,403,506 Import.
1872.....	444,177,586	626,595,077	182,417,491 Import.
1873.....	522,479,922	642,136,210	119,656,288 Import.
1874.....	586,283,040	567,406,342	18,876,698 Export.
1875.....	513,442,711	533,005,436	19,562,725 Import.
Total five years.....	2,509,203,437	2,889,366,749	380,163,312 Import.
Average.....	501,840,687	577,873,349	76,032,662 Import.
1876.....	540,384,671	460,741,190	79,643,481 Export.
1877.....	602,475,220	451,323,126	151,152,094 Export.
1878.....	694,985,766	437,051,532	257,934,234 Export.
1879.....	710,439,441	445,777,775	264,661,666 Export.
1880.....	835,638,658	667,954,746	167,683,912 Export.
Total five years.....	3,383,803,756	2,462,848,369	920,955,387 Export.
Average.....	676,760,751	492,569,674	184,191,077 Export.
1881.....	902,367,346	642,664,628	259,702,718 Export.
1882.....	750,542,257	724,639,574	25,902,683 Export.
1883.....	823,839,402	723,180,914	100,658,488 Export.

The percentage of the total exports and imports of all kinds carried by American vessels (see AMERICAN MERCHANT MARINE) was as follows: 1861, 65.2 per cent.; 1862, 50 per cent.; 1863, 41.4 per cent.; 1864, 27.5 per cent.; 1865, 27.7 per cent.; 1866, 32.2 per cent.; 1867, 33.9 per cent.; 1868, 35.1 per cent.; 1869, 33.1 per cent.; 1870, 35.6 per cent.; 1871, 31.8 per cent.; 1872, 29.1 per cent.;

1873, 26.4 per cent.; 1874, 27.2 per cent.; 1875, 26.2 per cent.; 1876, 27.7 per cent.; 1877, 26.9 per cent.; 1878, 26.3 per cent.; 1879, 22.9 per cent.; 1880, 17.6 per cent.; 1881, 16.2 per cent.; 1882, 15.5 per cent.; 1883, 16.3 per cent. — The following are the exports and imports of merchandise to and from the various countries of the world, for the year ending June 30, 1883:

Order.	COUNTRIES.	Exports.			Imports.	Total foreign commerce.	Per ct. of total.
		Domestic	Foreign.	Total.			
		Dollars.	Dollars.	Dollars.			
1	United Kingdom (England, Scotland, Ireland) . . .	420,433,473	4,990,701	425,424,174	183,682,619	614,046,793	39.69
2	France	55,065,191	2,717,082	58,682,223	97,980,164	156,671,387	10.13

— Mr. Mulhall estimates the earnings or income of the world and leading nations for 1880 as follows, in millions of pounds sterling: World, 6,773; United States, 1,406; Great Britain, 1,156; France, 927; Germany, 851; Russia, 632; Austria, 460; Italy, 252; Spain, 186; Holland, 104. In his "Balance Sheet of the World for 1870-80," he gives the

following estimates of the capital or wealth of the nations named, and the increase for ten years. The figures are millions of pounds sterling :

NATIONS.	Capital, Million £.	Increase, Million £.
Great Britain.....	8,960	650
United States.....	7,880	1,560
France.....	7,417	295
Germany.....	6,075	725
Russia.....	3,540	250
Austria.....	3,050	220
Italy.....	1,960	110
Spain.....	1,373	183
Holland.....	1,130	50

— *Railroads.* Following tables are from census report of 1880. The respective groups are composed of the following states and territories: (group I.) Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut; (group II.) New York, Pennsylvania, Ohio, Michigan, Indiana, Maryland, Delaware, New Jersey and District of Columbia; (group III.) Virginia, West Virginia, Kentucky, Tennessee, Mississippi, Alabama, Georgia, Florida, North Carolina and South Carolina; (group IV.) Illinois, Iowa, Wisconsin, Missouri and Minnesota; (group V.) Louisiana, Arkansas and Indian Territory; (group VI.) Dakota, Nebraska, Kansas, Texas, New Mexico, Colorado, Wyoming, Montana, Idaho, Utah, Arizona, California, Nevada, Oregon and Washington. Miles under construction are included in miles projected.

The total amount of permanent investments above is made up as follows: construction of roads, \$4,112,367,176; equipment, \$418,045,458; lands, \$103,319,845; stock of other companies, \$184,866,527; bonds of other companies, \$158,933,605; telegraph lines and miscellaneous, \$204,913,196; total, \$5,182,445,807. The average per cent. profit upon the capital stock was as follows: Group I., 6.16; Group II., 6.92; Group III., 4.84; Group IV., 7.02; Group V., 5.91; Group VI., 4.86; general average for the United States, 6.32. — The summary of accidents includes 364 killed and 1,438 injured through causes beyond their own control, and 2,174 killed and 4,174 injured through their own carelessness (For a fuller treatment of the whole subject, see RAILROADS.) — *Canals.* The canals of the United States in operation in 1880 had a length of 2,515.04 miles, with 411.14 miles of slack water. Their cost of construction was \$170,028,636; their gross income was \$4,538,620; their total of expenses was \$2,954,156; and their freight traffic amounted to 21,044,292 tons. The abandoned canals made up a total length of 1,933.56 miles, constructed at a cost of \$44,013,166. — *Telegraphs and Telephones.* There were, in 1880, 110,726.65 miles of telegraph lines, 291,212.9 miles of wire, and 12,510 stations, employing 14,928 persons in all, 9,661 of whom were operators. The messages sent numbered 31,703,181, of which 3,154,398 were for the press, and 28,548,783 were for the public. Their gross receipts were \$16,696,623.38, of which \$13,512,116.17 came from messages; and the expenses were \$10,218,281, leaving net receipts of \$6,573,843.04, including deficits of some companies. Deducting charges of \$604,341.27, there was a net income of \$5,969,501.77, of which \$4,136,749.75 went to dividends. The stock issued for cash was reported at \$66,529,200. The total length of telegraph lines in 1883 is probably over 144,000 miles, not including private, railway, government, and other lines, as to which statistics are not obtainable. The telephone statistics were not complete in 1880: they aggregated 148 companies and private concerns, with 34,305 miles of wire, 54,319

receiving telephones, 48,414 subscribers' stations, and 3,338 employes. The total capital stock issued was reported at \$13,358,720; debt, \$1,247,067; receipts, \$3,098,081; expenses, \$2,373,703; net income, \$770,516; and dividends, \$302,730. The length of telephone wires in 1883 is estimated at about 100,000 miles. One company, the American Bell company, with a capital stock of \$5,950,000, had in use by license, Jan. 1, 1883, 245,000 telephones, with 69,000 miles of wire. — *Tonnage.* Full statistics of the merchant service are given elsewhere. (See AMERICAN MERCHANT MARINE.) It seems proper to add here the figures for the three years following the close of that article, as follows:

YEARS.	Sail Tonnage.	Steam Tonnage	Total.
1881.....	2,792,736	1,264,998	4,057,734
1882.....	2,810,107	1,353,826	4,163,933
1883.....	2,822,293	1,413,194	4,235,487

This was distributed as follows:

YEARS.	Foreign Trade.	Coastwise Trade.	Whale Fisheries.	Cod and Mackerel Fisheries.
1881.....	1,297,035	2,646,011	38,551	76,137
1882.....	1,259,492	2,795,776	32,862	77,983
1883.....	1,269,681	2,838,354	32,414	95,038

The new vessels built in 1882 and 1883 were as follows:

CLASSES.	1882.		1883	
	Vessels.	Tons.	Vessels.	Tons.
Steam vessels.....	502	121,843	439	107,230

Canal boats.....	68	7,892	42	4,711
Barges.....	135	33,747	66	16,443
Total.....	1,371	292,270	1,268	265,430

— *Occupations.* The following table is from the census report of 1880:

	Persons.	Age and Sex.							
		All Ages		10-15.		16-59		60 and over.	
		Male.	Female.	Male	Female	Male	Female	Male.	Female
Agriculture.....	7,670,493	7,073,983	594,510	584,867	135,862	5,888,133	485,920	602,983	22,728
Professional and personal services.....	4,074,238	2,712,943	1,361,295	127,565	107,830	2,446,962	1,215,189	138,416	38,276
Trade and transportation.....	1,810,256	1,750,892	59,364	26,078	2,547	1,672,171	54,849	52,643	1,068
Manufacturing, mechanical and mining.....	3,837,112	3,205,124	631,988	86,677	46,930	2,978,845	577,157	139,602	7,901
Total.....	17,392,099	14,744,942	2,647,157	825,187	293,169	12,966,111	2,283,115	933,644	70,873

The census report concludes that the figures for the first two classes are to some extent confused by reporting as "laborers" persons who should have been reported as "agricultural laborers." It has thus resulted that the second class shows much the greatest increase of the four classes since 1870. The number of farmers and planters is reported as 4,225,945; of "agricultural laborers," 3,323,876; of "laborers," 1,859,223. The particulars of some of the occupations under the various classes are as follows: clergymen, 64,698; domestic servants, 1,075,655; hotel and restaurant

keepers and employes, 133,856; lawyers, 64,137; army and navy, 26,761; civil service, 115,531; physicians and surgeons, 85,671; teachers, 227,710; saloon keepers and bartenders, 68,461; bakers, 41,309; blacksmiths, 172,726; shoemakers, 194,079; butchers, 76,241; cabinet makers, 61,097; carpenters, 373,143; fishermen, 41,352; lumbermen, 43,882; printers, 72,726; tailors and milliners, 419,157; tobacco workers, 77,045. — *Valuation and Taxation.* The following table presents a summary of the census report on these subjects for 1880 :

ASSESSED VALUATION.

DIVISIONS.	Real Estate	Personal Property.	Total.
New England states.....	\$1,896,201,787	\$ 755,809,745	\$2,652,011,532
Middle states.....	4,818,648,962	745,929,526	5,564,578,488
Southern states.....	1,677,847,248	693,076,021	2,370,923,269
Western states.....	4,584,048,039	1,603,218,586	6,187,266,625
Territories.....	60,020,889	68,192,740	128,213,629
Total.....	\$13,036,766,925	\$3,866,226,618	\$16,902,993,543

Maryland and the District of Columbia are placed in the middle states, and Missouri and the Pacific states in the western states.

TAXATION.

DIVISIONS.	State.	County.	Minor Civil Divisions.	Total.
New England states.....	\$ 4,246,713	\$ 2,095,331	\$35,668,173	\$ 42,010,217
Middle states.....	11,980,323	14,851,961	74,634,063	101,466,347
Southern states.....	13,732,068	13,344,391	10,430,958	37,507,417
Western states.....	21,440,939	87,585,725	59,541,288	118,567,952
Territories.....	619,912	1,729,163	290,686	2,648,761
Total.....	\$52,019,955	\$69,606,571	\$180,574,168	\$302,200,694

There should be added to the taxation of minor civil divisions of the western states \$10,457,783, the estimated amount of taxation so indefinitely reported as to be useless. The total taxation for the western states would then be \$129,117,979, and for the United States \$312,750,721. — *Debt.* This subject is fully discussed elsewhere. (See DEBTS, NATIONAL, STATE AND LOCAL.) — 3. GOVERNMENTAL. — *Army.* In November, 1882, the army of the United States numbered 25,186, as follows :

	Enlisted	
	Officers.	Men.
Cavalry (ten regiments).....	431	6,368
Artillery (five regiments).....	280	2,493
Infantry (twenty five regiments).....	877	10,767
Miscellaneous.....	574	3,381
Total.....	2,162	23,024

The last class included the engineer battalion, recruiting parties, ordnance department, hospital service, Indian scouts, West Point signal detachment, and general service. The force was commanded by one general, William T. Sherman, one lieutenant general, Philip H. Sheridan, three major generals, Winfield S. Hancock, John M. Schofield and John Pope, and six brigadier generals, O. O. Howard, Alfred H. Terry, C. C. Augur, George Crooke, Nelson A. Miles and Ranald S. Mackenzie. Gen. Sherman retired in November, 1883, and was succeeded by Gen. Sheridan. There

were 66 colonels, 85 lieutenant colonels, 242 majors, 607 captains, 570 first lieutenants and 448 second lieutenants. The country is divided into three military divisions, each of which is divided into departments. The military division of the Missouri (Sheridan commanding) included the departments of the Missouri (Pope), Texas (Augur), Dakota (Terry), and the Platte (Howard). Its headquarters were at Chicago; its force was eight regiments of cavalry and twenty of infantry. The division of the Atlantic (Hancock) included the departments of the east (Hancock) and of the south (Col. H. J. Hunt). Its headquarters were at New York; its force was four regiments of artillery and two of infantry. The division of the Pacific (Schofield), included the departments of California (Schofield), the Columbia (Miles), and Arizona (Crooke). Its headquarters were at San Francisco; its force was one regiment of artillery, three of cavalry, and four of infantry. The assignments vary from time to time, and are only given in order to show the organization of the army. The pay of officers and men is increased according to their years of active service. The men receive from \$13 a month and rations (first two years) to \$21 a month and rations (after twenty years' service). The maximum pay of the principal classes of officers is as follows: general, \$18,900; lieutenant general, \$15,400; major general \$10,500; brigadier general, \$7,700;

colonel, \$4,500; lieutenant colonel, \$4,000; major, \$3,500; captain \$2,800; first lieutenant, \$2,240; second lieutenant, \$2,100. A deduction of two-sevenths will regularly give the pay for the first five years of service. The expenditures for the army, 1860-83, have been as follows :

1860.....	\$ 16,472,202.73	1872.....	\$ 35,372,157.20
1861.....	23,001,530.67	1873.....	46,323,138.31
1862.....	389,173,562.20	1874.....	42,313,927.22
1863.....	608,814,411.82	1875.....	41,120,645.98
1864.....	1,690,391,048.66	1876.....	38,070,888.64
1865.....	1,080,690,400.06	1877.....	37,082,735.90
1866.....	283,154,676.06	1878.....	32,154,147.85
1867.....	95,224,415.63	1879.....	40,425,660.73
1868.....	123,246,648.62	1880.....	38,116,916.22
1869.....	78,501,990.61	1881.....	40,466,460.55
1870.....	57,655,675.40	1882.....	43,570,494.19
1871.....	85,799,991.82	1883.....	48,911,382.93

— West Point, where the United States military academy is located, was a department of the division of the Atlantic until Sept. 1, 1882. The military academy was founded by act of March 16, 1802, and various subsequent acts have established professorships, and made the academy subject to the articles of war. In 1843 the present system of appointment was begun: it assigns one cadetship to each congressional district and territory, with ten appointments by the president. The number of cadets is limited to 312. There were, in 1882, seven professors, 145 cadets, and 204 enlisted men at West Point. — *Navy*. The navy of the United States is the subject of a separate article, in which the reader will find full statistics. (See NAVY.) — *Pensions*. Payments on this account were never large until the war of the rebellion. They never rose to more than \$1,000,000 per annum until 1819, and from that time until 1865 they remained below \$5,000,000 per annum. Since that time they have increased, particularly since the passage of the act of Jan. 25, 1879, for paying arrears of pensions to persons whose claims were barred by failure to apply within five years. The following are the payments for pensions, 1865-83 :

1865.....	\$16,347,621.34	1875.....	\$29,456,216.22
1866.....	15,605,549.88	1876.....	25,257,395.69
1867.....	20,936,551.71	1877.....	27,963,752.27
1868.....	23,782,386.75	1878.....	27,137,019.08
1869.....	28,476,621.76	1879.....	35,121,482.39
1870.....	28,340,202.17	1880.....	56,777,174.44
1871.....	34,443,894.88	1881.....	50,059,279.62
1872.....	28,533,402.76	1882.....	61,945,193.95
1873.....	29,359,426.86	1883.....	66,012,573.64
1874.....	29,038,414.66		

The number of pensioners on the rolls, June 30, 1883, (increase for year, 17,961), is shown in the table at the top of the opposite column :

	Survivors.	Widows, etc.	Total.
Army.....	198,643	74,373	273,016
Navy.....	2,468	1,907	4,375
War of 1812.....	4,931	21,386	26,317
Total.....	206,042	97,616	303,658

— *Patents*. The number of patents issued has steadily increased since 1837. The most prolific year was 1876, when there were 21,425 applications, 2,697 caveats and 17,026 patents issued. The following table gives the applications, caveats and issues since 1840, at intervals of ten years :

YEARS.	Applications.	Caveats.	Issues.
1840.....	735	228	473
1850.....	2,193	602	995
1860.....	7,653	1,084	4,819
1870.....	19,171	3,273	13,321
1880.....	23,012	2,490	13,947

— *Postoffice*. In June, 1883, out of the whole length of 353,166 miles of postoffice routes in operation, 110,208 miles were by railroad, 16,093 by steamboat, and 226,865 by other conveyances. The whole number of domestic letters mailed during the year 1882 was estimated at 1,046,107,348; the whole number of foreign letters, 43,632,547. The dead letters and parcels numbered 4,440,822. The domestic money orders numbered 8,807,556, for \$117,329,406; and the foreign money orders 466,326, for \$7,717,832. The business of the postoffice department since 1790, at intervals of ten years, has been as follows :

YEARS.	No. Post offices.	Miles of Route.	Revenue.	Expenditure
1790.....	75	1,875	\$ 37,935	\$ 32,140
1800.....	908	20,817	280,804	213,994
1810.....	2,300	36,406	551,684	495,969
1820.....	4,500	72,492	1,111,927	1,160,926
1830.....	8,430	115,176	1,850,583	1,932,708
1840.....	13,460	155,739	4,543,522	4,718,236
1850.....	18,417	178,672	5,552,971	5,312,953
1860.....	28,498	240,594	8,518,067	19,170,610
1870.....	28,492	231,232	19,772,221	23,998,837
1880.....	42,969	343,888	33,315,479	36,542,804
1881.....	44,512	344,006	30,785,308	39,251,736
1882.....	46,231	343,618	41,876,410	40,039,685
1883.....	47,863	353,166	45,503,692	43,282,944

— *Debt*. The history, growth and decrease of the national debt, are elsewhere considered. (See DEBTS, FINANCE.) The following is a somewhat detailed statement of the public debt, as given by the treasury department, Dec. 1, 1883 :

TITLES.	Rate.	Redeemable.	Outstanding.	Interest Due and Unpaid.	Interest Accrued.
Loan of July 12, 1882.....	.03	Option, U. S.	\$ 290,093,250.00	\$ 92,358.58	\$ 747,733.12
Funded loan of 1891.....	.04½	Sept. 1, 1891.	250,000,000.00	254,810.31	2,812,500.00
Funded loan of 1907.....	.04	July 1, 1907.	737,629,100.00	1,149,169.83	4,917,527.33
Refunding certificates.....	.04		318,450.00	57,321.00	2,123.00
Navy pension fund.....	.03		14,000,000.00	420,000.00	175,000.00
Debt on which interest has ceased.....			6,645,335.20	321,615.99	
Debt bearing no interest.....			555,910,850.31		
Unclaimed Pacific R. R. interest.....				4,220.86	
Total.....			\$1,803,596,985.57	\$2,299,705.67	\$8,654,883.45

Total principal and interest.....	\$1,874,551,574 69
Less cash in treasury.....	364,766,513.84
Debt, Dec. 1, 1883.....	\$1,509,785,060.85

The non-interest bearing debt was as follows :

Old demand notes: acts of 1861 and 1862...\$	58,800.00
Legal tender notes: acts of 1862 and 1863...	346,681,016.00
Certificates of deposit: act of 1872.....	14,465,000.00
Gold certificates: acts of 1863 and 1882.....	85,932,920.00
Silver certificates: act of 1878.....	101,782,811.00
Fractional currency.....	6,990,303.31
Total.....	\$ 555,910,850.31

This statement of net debt shows a reduction of \$41,306,146.63 since June 30, 1883, and of \$179,129,399.87 since June 30, 1882. The highest point touched by the debt was on August 31, 1865, when the interest-bearing debt was \$2,381,530,294, with annual interest of \$150,977,697 (\$4.29 per capita); and the debt, less cash in the treasury, was \$2,756,431,571 (\$78.25 per capita). The table at the top of the opposite column gives the net debt for preceding years since 1860, the debt per capita, the annual interest, and interest per capita. (Under the article DEBTS

will be found the gross debt for corresponding years.)

YEARS.	Debt, less Cash.	Debt per Capita.	Annual Interest.	Interest per Capita.
1860.....	\$ 59,964,402	\$ 1 91	\$ 3 443,687	\$ 0 11
1861.....	87,718,660	2.74	5,092,530	0 16

1882.....	67,219,751	43,570,494	15,082,046	9,796,747	61,845,194	186,905,233
1883.....	68,678,020	46,911,382	15,283,437	7,362,580	66,012,573	206,248,006

To these items of ordinary expenditure is to be added the interest on the public debt, which was \$59,160,131 for 1883, making a total expenditure of \$265,408,137. This, with \$1,299,312 from the treasury accounts of 1882, left a surplus revenue of \$134,178,756, which was applied to the redemption of the public debt. — The principal officers of the United States government were as follows, July 1, 1883: President, Chester A. Arthur, of New York; president of the senate, and acting vice-president, George F. Edmunds, of Vermont; secretary of state, F. T. Frelinghuysen, of New Jersey; secretary of the treasury, Charles J. Folger, of New York; secretary of the interior, Henry M. Teller, of Colorado; secretary of war, Robert T. Lincoln, of Illinois; secretary of the navy, William E. Chandler, of New Hampshire; postmaster general, Walter Q. Gresham, of Indiana;

attorney general, Benjamin H. Brewster, of Pennsylvania; commissioner of agriculture, George B. Loring, of Massachusetts. All these belong to the republican party. In the congress of 1883-5 the relative strength of political parties is as follows: In the senate there are thirty-eight republicans, thirty-six democrats, and two "readjusters" (from Virginia), who will regularly act with the republicans. In the house of representatives there are 194 democrats and one independent democrat, 120 republicans and two independent republicans, six readjusters, one greenbacker, and one vacancy (July 1, 1883). If a vote for president should devolve on the house of representatives, voting by states, in 1885, there would be twenty-two democratic states, fourteen republican states, one (Virginia) readjuster, and one (Florida) divided. — It is hoped that the bibliographies under the

articles referred to above will be sufficient to give the reader a guide to both sides of political questions, and that these articles, with the subsidiary articles referred to under them, will cover the field of American political history. Reference is particularly suggested to the following articles: ANTI-FEDERAL PARTY, DEMOCRATIC-REPUBLICAN PARTY, FEDERAL PARTY, WHIG PARTY, REPUBLICAN PARTY, ANTI-MASONRY, AMERICAN PARTY, LIBERAL REPUBLICAN PARTY, GREENBACK PARTY, the names of the presidents, and the names of the states. In the following list it is only intended to give the general authorities, and the special authorities for the last section of the article. The latter, government publications, are obtainable on application to the proper officer at Washington. (I.) 1-6 Bancroft's *History of the United States*; 1, 2 Hildreth's *History of the United States*; 1, 2 Bryant and Gay's *History of the United States*; Force's *Tracts relating to the Colonies*, and *American Archives*; Hazard's *Historical Collections*; Anderson's *Discovery by the Norsemen*; Kohl's *Discovery of America*; Da Costa's *Northmen in Maine*; Hakhey's *Divers Voyages touching the Discovery of America*; Helps' *Spanish Conquest of America*; Robertson's *History of America*; Parkman's *France and England in America*; Neill's *English Colonization in America*; Burke's *European Settlements in America*; Nicholls' *Life of Cabot*; Edwards' *Life of Raleigh*; Lodge's *English Colonies in America*; Doyle's *English Colonies in America*; Holmes' *Annals of America*; Grahame's *History of the United States (to 1783)*; Palfrey's *History of New England*; Marshall's *History of the Colonies*; Chalmers' *Annals of the Colonies, and Revolt of the Colonies*; Walsh's *Appeal from the Judgments of Great Britain*; Gordon's *History of the Independence of the United States*; 1 Pitkin's *History of the United States*; Frothingham's *Rise of the Republic*; Scott's *Constitutional Liberty in the Colonies*; Pownall's *Administration of the Colonies*; 1 Story's *Commentaries*; H. UNITED STATES OF COLOMBIA. (See **NEW GRENADA.**)

UNITED STATES PENSION LAWS AND THE PENSION LAWS OF OTHER COUNTRIES.

A pension is defined by Webster to be an annual allowance of a sum of money to a person by the government in consideration of past services. In theory at least a pension is an arbitrary payment of money by the money-giving power in a country—in this country, congress; in another, the crown or parliament—for what it considers services. A secondary definition, historically the primary one, in Webster, shows us the aspect in which a pension used to be regarded: "An allowance or annual payment considered in the light of a bribe." The more modern idea is to consider it in the light of a payment on an insurance policy. We will briefly consider how these different ideas about a thing called by the same name arose. — After a man or set of men have done any signal service to their country, it has in every country and in every age been thought only right and just that the popular appreciation and thanks should be expressed in something more than words. And consequently, after such services have been rendered, whether in peace or war, it seems perfectly proper for the country, by its representatives, to vote a pension or any other reward that may seem fit, whether it is to a class of men, an army or an individual. For instance, in this country, pensions in general have, at least until quite recently, been looked upon as un-American and unrighteous. But after every war of any consequence statutory provision has been made for the payment of pensions and bounties to those who have been wounded in it, or to the families of those who have died in it, and this without objection. Special acts of congress also have at every period of our history been passed, giving pensions where needed and deserved. — Such pensions as these have been, as we have said, at all times natural and proper. It can be easily understood, that in the old days of monarchical independence and independent bounty, the step from this class of pensions to gifts for what the crown called services—that is, personal service or complaisance rendered or to be rendered—was a very short and easy one. And so a door was opened for a vast amount of corruption and bribery. Salaries had to be paid to those who took up the profession of courtiers, just as to any officers of government. The king was the state, and his personal servants were civil servants, and were to be provided for for life as such. When Neckar assumed the administration of the French finances, the public pension list of France amounted to twenty-seven million livres; the private one had to be kept a secret. Every one knows what a shameful use was made of this privilege in England in the times of Charles II., and how from that time for a long period of history the free use of pensions was the only method by which cabinets and governments in that country could hold their own;

members of parliament became civil servants too, and had to have their salaries and provisions for life. Finally, the abuses became so great as to force a reform, and an act was passed forbidding any pensioner or placeman to occupy a seat in parliament. Even now, cabinet officers and holders of offices of emolument under the government, when they accept the position, have to resign their seat in parliament. Finally, the subordinate clerks of government began to claim such provision, and while by a gradual process these arbitrary powers were curtailed in nearly all European countries, the principle of pension giving was enlarged, and subjected to statutory provisions. More and more officers of government and classes of officers were embraced in pension-giving systems. — Mr. Dorman B. Eaton, in his book on the "English Civil Service," sketches the rise of the system in England, and we may take his remarks to illustrate the growth of such a system, and his reasoning as to the difference among different kinds of pensions, as an example of the arguments by which the growth has always been aided. — In 1809 an English statute provided for superannuation allowances to persons in the excise service, reciting, "Whereas no provision is made by law for persons employed in the revenue of excise, to the great discouragement of such officers and other persons, and to the manifest injury of the revenue." In 1810 a law proves a fact already suggested, that the voluntary contributions of those in certain branches of the service had provided a sort of retiring allowance by creating a fund in the nature of an insurance fund. This act is known as 50 Geo. III., ch. 117. The same law also provides for annual statements of persons in the public service, and of their salaries, pensions and allowances. It also establishes a system of superannuation allowances. Other laws from time to time were passed on the subject. In 1859 they were finally revised by 22 Vict., ch. 26, "An act to amend the laws concerning superannuation, and other allowances to persons having held civil offices in the public service." The allowance is given "to all persons who have served in an established capacity in the permanent civil service of the state, whether their remuneration be computed by day pay, weekly wages or annual salary." There is to be granted "to any person who shall have served ten years and upward, and under eleven years, an annual allowance of ten-sixtieths of the annual salary and emoluments of his office; for eleven years, and under twelve years, an annual allowance of eleven-sixtieths of such salary and emoluments; and in like manner a further addition to the annual allowance of one-sixtieth in respect of each additional year of such service, until the completion of a period of service of forty years, when the annual allowance of forty-sixtieths may be granted; and no addition shall be made in respect of any service beyond forty years." There is then a provision for computing the amount of superannuation to persons holding professional and other special offices not

embraced by the foregoing provisions. There are also provisions for granting allowances at discretion up to a fixed limit in cases of exceptional merit, severe bodily injury, disability in the service, abolition of offices, etc. Where the pensioner is under sixty, evidence of infirmity incapacitating him from discharging his duties, and of the probable permanence of such infirmity, must be given; and, even when these facts are established, he is liable to be required to serve again at any time before the age chosen as a limit. But persons (§ 12) retain the right to superannuation on transfer to other employment under the crown. All allowances are to be paid free of taxes. The system is made in principle analogous to pensions in military life. On the other hand, a deduction may be made from such allowances against any person when "his defaults or demerits in relation to the public service appear to justify such diminution. The act further provides, that no person (save a few especially excepted) shall be deemed to be in the civil service in such a sense as to entitle him to any superannuation or retiring allowance, unless he has been admitted to the civil service with a certificate from the civil service commissioners. This being the act under which pensions are now given in England, it has been rather more fully recited than in Mr. Eaton's book. Mr. Eaton further distinguishes between these superannuation allowances and pensions granted by crowns or administrations. Those allowances are really a part of the compensation of the office, of the conditions on which he entered public service, and are not, therefore, given on any theory of a gratuity or of favor. Looked at from the side of the government, they are regarded as presenting an ingenious and just method of receiving a good quality of service at the most reasonable rates; and from the side of the officer, as an inducement to greater economy, at the opening of official life, in order to secure, by reason of what he then forbears to receive, a certain provision for his declining years. The pension proper (in civil life) is a different matter altogether; being the bribe of the crown or administration for political effect, or its favor bestowed upon some person deemed fit for its charity or deserving of its honor, and often irrespective of such person being or having been in the public service. There was an available pension fund apparently in the discretion of the crown for political purposes until 1830, in spite of various statutes. In that year all the pension lists were consolidated. In 1837 Queen Victoria ascended the throne; and, by an act passed in her first parliament, the right of the crown to grant pensions was limited to about six thousand dollars a year (in addition to the previous list), and they can only be granted in that amount "to such persons as have just claims on the royal beneficence, or who by their personal services to the crown, by their performance of duties to the public, or by their useful discoveries in science and attainments in literature and the arts, have merited the gracious consideration of their sovereign and the gratitude

of their country." (1 Vict., ch. 11.) — There are nine classes of civil pensions in England: 1, annuities; 2, compensation allowance; 3, compassionate allowance; 4, hereditary pensions; 5, political pensions; 6, pensions; 7, retiring allowances; 8, special pensions; 9, superannuation allowances; and the amount thus spent was in 1881 over twenty millions. The oldest pension is to the heirs of Sir Thomas Clarges. The date is put at 1673. Nearly a million dollars have been paid to him and his heirs, and over three and a half millions to the duke of Marlborough and his heirs. — In France, pensions are awarded to civil, military and naval officers, to ecclesiastics, and to those distinguished in literature, science and the arts; also to the widows and children of high officials. In 1874 thirty-six thousand francs were awarded to aged and infirm ecclesiastics. Pensions for long services are given to non-commissioned officers and privates in the army who have served twenty-one years in the infantry, or twenty-four years in the cavalry, or sooner in case of disability from wounds, loss of health, etc. — In Germany the military pension list was, in 1874, 37,996,878 marks. — We will now briefly consider the advantages and disadvantages of a pension system, with especial reference to the United States, and then go somewhat into detail concerning the pension laws and system now existing here. — In our consideration of the general theory of pensions, we may withdraw one class from discussion. That is the first class we have spoken of: those which, combined with the wish of men to live without working, originated all the other kinds; what are called in France national recompenses, granted by legislative or kingly acts for distinguished services. As we have already said, these have always been granted, whether to armies or individuals, and so long as such are carefully scrutinized, and the merits for which they are given are first weighed in the balance and found worthy, no objection can be raised. They should be given, too, if the primary object should die, only to his dependent relatives, and not to his children after they attain a self-supporting age. It follows from this, that military pensions should be granted after any especial service or war, and with immediate reference thereto. And besides these, if any one enters the government service where there is a pension in existence already, he has a right to demand the pension. That does not affect the question whether such system should be abolished for the future, or the question whether any should ever be introduced. — Leaving these matters, therefore, out of the question, what we are to discuss is the advisability, or otherwise, of a pension system as a part of the method by which a government agrees to pay its servants, civil or military, for services not yet rendered. — 1. There is an objection in theory to a government's either creating an insurance fund for the benefit of, or promising to confer a gift on, its agents, civil or military, for future services, by any statutory provision. It is not within the province of government, as that province has been

limited and defined by history and by writers on the subject. A government's business is to protect its citizens' rights and to transact the clerical business of the state as a whole. There may be many things the government does now which do not come within this rule; but because it is difficult or not advisable to remove those already there, is no reason why, if the theory be true, still more exceptions should be added to the list. But, it is said, the government may hire a clerk or a soldier at so much a year to do certain duties. Has it not a right to choose its own manner of paying? may it not each year subtract so much from the salary, telling its servant, "If you work for me for a certain number of years without conducting yourself so badly as to get turned out, you shall get the proceeds of this investment that is made for you; and if you do get turned out, it will go to others who serve out their time"? Or, looking at it in another light, may it not, when the clerk or soldier enters its employ, say, "If you work for me for so many years, and I don't meantime dismiss you, I will at the end give you so much in every future year, and you need do no more work for it"? — It will readily be seen, that here, in a very finely drawn line, comes up the old question as to the powers of a government. Shall a government be "strong" or "weak"; paternal and grandmotherly, or not? shall it build and run railroads and telegraph lines, subsidize and regulate industries and arts and society, and institute social reforms? or shall it let all these things arrange themselves, so far as the rights of its citizens remain unimpaired, and confine itself closely to the business as we have defined it? The moment discretion is given a legislature or other governing body, to create and distribute funds for servants who may become invalid; or to confer in the future benefits on other servants if they perform good service; or to make any arrangement other than one of a strictly business nature, whether it be to establish an insurance fund or otherwise; that moment it takes to itself new powers, and these seem to us to be dangerous in their tendency, as liable to abuse. Their utility in fact we will deal with next. There are a great many arguments on both sides of the theory of the government question, and this is not the place to examine them. (See **GOVERNMENT INTERVENTION**, and other articles.) Each individual looks at it from his own standpoint. Here the writer can only express his personal opinion, that for a government to do anything more than pay its servants so much for so much work on an ordinary business or cash basis, is wrong in theory and outside its proper powers. — 2. *Utility.* It is admitted, that if it can be proved that any great advantage would accrue to the state by the introduction of such a system, that would in some degree atone for its wrongfulness in theory; but it is submitted that that fact can not be proven, and the balance of evidence tends to prove the reverse. — To put the question broadly, do public servants perform better work for the public if they have a pension in prospect? They ought not to;

if a man undertakes to do work for so much, he should do his work honestly and completely, no doubt. It is therefore not the duty of government to try and get them to work harder by promise of a higher, even if it be a deferred, reward. But, as Gen. Washington said to a committee of Congress, Jan. 29, 1778, in urging the adoption of a half-pay system for the army, "A small knowledge of human nature will convince us that with far the greater part of mankind interest is the governing principle, and that almost every man is more or less under its influence. * * Few men are capable of making a continual sacrifice of all views of private interest or advantage to the common good. It is in vain to exclaim against the depravity of human nature on this account: the fact is so; the experience of every age and nation has proved it; and we must, in a great measure, change the constitution of man before we can make it otherwise. No institution not built on the presumptive truth of these maxims can succeed." Mr. Eaton has taken, as the motto for his book on civil service, already quoted from, a saying of John Locke's: "I think every one, according to the way Providence has placed him in, is bound to labor for the public good so far as he is able." We may notice the different ways of looking at a thing which a practical and a theoretical statesman have, and pass on to the point we wish to make, which is rather, can the public get better servants by giving so much an annual salary and a pension at the end of a certain period, or by giving a higher annual salary and no pension? For no pension fund can be instituted on sound principles if the salaries are to be as high as if there were no pensions. In France, a few years since, the amount derived from the pension fund was only one-third of the amount of pensions to be paid, proving the existence of a vicious system. — The advantages of the system are very well put by Mr. Worthington C. Ford: "In the administration of government, there is employed a large number of public servants, servants of many grades, who give their time and energies to the performance of their duties. As a rule, and the exceptions are to be found only in the higher positions, the salary these servants receive is their only resource. Let the government be overthrown, or let the offices be abolished, and these men are thrown upon the world to obtain their living in other occupations through whatever capacity they have developed in the public employ. Nor are these the only chances of hardship that they must fear. Sickness and infirmity may come upon them and render them incapable of performing any task whatever. They have the alternative then of becoming a burden on their relations or a charge upon the state or locality in which they reside. In order to prevent this, and in consideration of long and faithful service, most governments have instituted a system of pensions. This is all the more necessary where the salary of public employes is somewhat lower than those that can be obtained in other walks of life. It

might be added that this is rarely the case, and it is certainly not so in the United States, where, through a variety of causes, many of which were intended to have but a temporary effect, the salaries of public servants are very much higher than those obtained for the same kind of labor in trade and industry." "In theory nothing could be more just than such a system. As the right to a pension is generally guarded by some restrictions, such as age, time of service, position in the civil service, special disability, etc., it is practically a premium offered to such as will perform the necessary conditions, and so insures a better class of public officers. It encourages a strict performance of duty on the part of the employe, and inspires him to discharge the functions of his office to the best of his ability in order that he may in the end secure this reward. It holds out to him the promise of a competence in his old age or in the event of any infirmity that might make him unfit for labor, and gives him the encouragement that after his death his family will not be left wholly in want. He more cheerfully gives the best of his years to toil and fatigue when conscious that the benefits derived from his labor will not end with his death or incapacity. A pension is not, in such cases, a charitable donation, nor a gift bestowed without any return. It is, as I have said, rather an insurance fund; a gift, if you please, but one that is earned by honest toil and by a devotion to the employer's interest." But Mr. Ford adds: "The expediency or necessity of civil pensions has never been recognized in this country. The pay is good, and there is always an abundance of applications for positions. The introduction of civil service rules has made the occupants of positions more certain of retaining them during good behavior, and has thus given a reason even for reducing salaries. * * Whenever a special case of hardship occurs in the civil service it is usually treated by a special enactment of congress."* The three general objects which, we

* In justice to Mr. Ford it should be added, that he draws a distinction between pensions granted to civil servants of the government and those granted to military and naval servants, and this distinction is manifestly a just one to make. While the dangers of corruption attending the liberal use of civil pensions are many, and in fact might be said to be inseparable from the system, there exist strong reasons for granting allowances for military and naval service when there exist also the proper safeguards against abuse. If there be any principle recognized and established in this country it is that pensions must be confined to those who were separated by the nature of their service from the great mass of the community, and who devoted themselves exclusively to military duties; who laid aside the character of a citizen, and became a soldier; who, in abandoning the pursuits, distinguished also the habits, of private life. But, in bestowing military pensions, it should be recognized that provision should be made only for those who, being unable to support themselves, are necessarily thrown upon public or private charity. "It would not, I think," wrote Attorney General Rush in 1815, "be going too far to say that in every case where an officer or private loses his health while in service, to such a degree as to be disabled from performing his duty any more, he is contemplated, *prima facie*, as an object of this charitable relief from the legislature." And more recently the expediency of military and naval pensions was defended in congress as follows: "The service which the soldier renders may be voluntary, but

are told, are gained by a pension fund, are, therefore: 1, increased happiness on both sides; 2, economy—smaller wages are given, and the balance accumulated, but it is not every one who comes to get his pension, and therefore by the pensions of so many is the government a gainer; 3,

it is not a service which he may give or withhold at pleasure, but one which, if not offered, may be compelled by the strong arm of the government. The recognition by the state of the distinguished military services of its citizens in its support and defense in the form of a pension, though sometimes granted as a charity, or as an act of grace, is generally given in fulfillment of some promise made by the government, or inducement held out to the soldier either at the time or after his enlistment. It is not given to every man who performs military service, however distinguished and meritorious that service may be, but to those only who receive wounds or contract disease while in the line of duty. The purpose and design of the government is to make the soldier good, as far as money can do it, for the injuries he received, or in other words, to make up to him as much as he could have earned at his trade or vocation if he had not been wounded or had not contracted the disease. Under this rule—and in my judgment it is both just and magnanimous—no man is entitled to a pension for military service except those who have received disabling wounds or injuries during the war, and the widows, minor children and dependent relatives of those who were killed or who have since died from the effects of such service. This is the humane policy recognized and acted upon by every civilized country on the globe. It has been truly said that every pensioner is, in one sense, a burden upon his fellow-citizens, either directly or indirectly; and no reason can exist for imposing such a burden on behalf of men who did only their plain, simple duty as citizens, and received no material injury in its performance. A disabled soldier is not a pauper for taking a pension. A well man would be nothing else if he were to accept one. For this reason I do not deem it right or expedient to select out any particular class of soldiers, or men who rendered any particular service, or suffered any peculiar hardships and privations, and pension them, regardless of whether they can show any pensionable disability or not. Under the lenient rules adopted by the present commissioner of pensions, every soldier who was wounded or contracted disease while on active duty in the field, or during confinement in rebel prisons, can, if not already pensioned, apply for and receive one now under the general law. It is impossible for congress to grade and adjust pensions to the different degrees of suffering and hardship endured in the service. All that we can do is to grant them in cases where the evidence shows there is a pensionable disability; but if we should go beyond this rule we should be simply pensioning a large number of men, who, while they endured great suffering and privations, received no material injury, and are now able to earn their living. In this connection I desire also to say that I would not create a civil pension list by granting pensions to men who are injured in the civil service of the government. They go into that service voluntarily, and can not be compelled to enter it against their will, and can leave when they please. When they assume the duties they take all the risks, and are paid for doing so. I believe pensions should only be granted to men who have been injured in the military or naval service of the country; and, without stopping here to elaborate the point, I will simply say that in my judgment we are not called upon in granting pensions to break down the barriers set up by our fathers between the military and civil service, and launch out into a sea which I fear would prove shoreless and bottomless." Nor is it any condemnation of such pensions to point out the great frauds that have arisen under various systems. That is the fault of the laws. "The state has in time of war a fundamental right to the money, the services, and, if need be, the life of every citizen, without other compensation than the security and protection it affords him at all times. The pension laws are not passed to secure to the maimed survivor of the war, or to the helpless dependents on those who lost their lives in the struggle, a right existent independently and in the nature of things, but as a voluntary and fitting assumption of care over those who, in the service of the nation, have lost the ability to care for themselves. It is doubly

permanency in office, by increasing the value of the salary and office as time goes on. All of these points are involved in the general question of utility. — In reply to this argument let us quote Mr. Bentham, when discussing his proposition, that such pensions are needless, and therefore given in waste. In his "Constitutional Code," under the head Finance, he says: "Labor applied directly to a man's own use, or indirectly in exchange for an equivalent given by an individual in return for it, is one source of subsistence: labor employed for an equivalent in the service of government, that is, of the public at large, is another source. In the first case, generally speaking, no such allowance of reward, after service has ceased, has place. In the case of him whose subsistence is derived from dealings with the public at large, as in the case of a wholesale or a retail trader, a master manufacturer, an artisan, or a manufacturer, it is impossible. In the case of habitual service rendered by contract to an individual there is no custom for it. The case of incapacity produced by age or disease is a case equally open to expectancy in both instances. From the time of his embarking in his profit-seeking occupation a man makes for all such contingencies such provision as his means enable him, and his prudence disposes him, to make. For the securing to individuals any such extraordinary supply at the expense of the public there is, if there be any difference, less demand in the case of an occupation pursued by the rendering of service to the public for hire, than in the case of him whose subsistence as above is derived from commercial dealings with individuals. In the case of a public functionary a man's income is completely certain; certain as to its existence, certain as to its quantity. In the other case it is altogether uncertain in both respects." — Another objection is, that there is a tendency, under a promise of pensions and rewards, in government servants to endeavor to secure the approbation of their immediate superiors in ways outside the duties of their office for a long enough time or in a sufficiently intense degree for them to obtain the reward. And *vice versa* in the case of the superiors toward their inferiors and superiors both. It is to their interest to remain together for the given time, and as long as they approve of each other reciprocally they are certain of their pension. This gives rise to a class and privileged feeling among the employés, which in turn causes an inattention to and carelessness of the interests of private individuals, more noticeable, and perhaps largely on this account, in the public offices in Great Britain than here, where the government servants have been, if anything, too independent of their official superiors and too dependent on extra-official protection. Mr. Eaton urges, as a reason in its favor in his book, that "the provision it makes for old age and misfor-

demoralizing and doubly shameful that beneficent laws like these should be made the cover of fraud and robbery—it not only despoils the public treasury and unjustly burdens the shoulders of the tax-paying masses, but it delays and often fatally prejudices the cause of really deserving applicants."

tunes, besides promoting a better feeling in the service toward the state, and making effective discipline easier, actually enables the state to purchase the services of its officers at a less cost to the public treasury. The allowances for special merit and the deductions for bad conduct are based on records kept in the departments, and they are considered to have a salutary influence (analogous to promotions, prize money and brevet rank in the naval and military service) in stimulating honorable exertions in the public interest." This is our objection put in another way. It creates an *esprit du corps* among the young people in a circumlocution office like that in an army. The longer the clerks are there the more they become, superiors and inferiors, knit together in interests as against the outside world. An official class, or even aristocracy, is created. — If a pension is to be obtained at the end of a term of years, the nearer that end comes the harder and more ungrateful it becomes for a superior to dismiss an inferior, often in disregard of the wishes of his own superiors, especially in countries where a free press and a popular assembly give the inferior opportunity for revenge and retaliation. In other words, it may tend to permanence in office, but the permanence is not of a healthy kind, and is not so dependent merely on good work as it would otherwise be. — Again, it is to be remembered that the people filling the positions go into them at their own request and wish, and they give so much work for so much money. When they first enter, if they find themselves underpaid they may resign, and go into another business. In every country there are more applicants for government positions than there are positions for them to occupy. It is not necessary, therefore, that any more favorable pay should be given to such employés than to those in another occupation. Nor is there any reason on account of the nature of the work. And in this country, at any rate, the clerks in the public offices would strongly object to any pension fund being instituted if their salary should be lowered in consequence. Most American clerks are quite capable of investing their surplus income themselves, and they would say that they did not need to have the government, and the government had no right to, do it for them. — Again, it causes poor work in a great many cases. Many men will cling on after their time for usefulness is entirely over, merely to get their pension, or a larger one than they would get if they were to then retire. This often happens in England, although the commissioners do their best to prevent it. We have in this country recently had an example in a very high place, where a justice of the United States supreme court, long past any ability to do any work, insisted on keeping his place until his pension should accrue, and so doing a great injury to the business interests of the country. — In this country it is very doubtful whether any salaries could be lowered for such a purpose, and so there would be very little economy. The salaries of the United States judges were not lowered when pen-

sions were extended to them. Besides, if our other suggestions are true, if the service became less effective on account of such a system, it would be poor economy to introduce it just to gain a few lapsed pensions. The making money out of its employé's in such a way by the government in this country would only create disgust and disaffection on the part of the employé's; and, through them, of the public. — Again, there are computed to be over one hundred thousand civil servants in the employ of the national government in this country, besides the ordinary employé's, messengers and lower servants employed about a government office and building, numbering perhaps as many more. This fact alone ought to be enough to deter any one from making any attempt to introduce such a system here. — The principle suggested by its advocates is to institute a pension fund, like any insurance fund. "The average life of the persons who are to share in the benefits of the fund should be accurately determined, in order to learn how large a proportion of the total number will be able to perform all the requirements, and be able in the end to obtain their portion. This involves a determination of the death rate, the probability of life. From these data may be found the actual sum that must be set aside each year in order that the pensions falling due may be met. If, to take a simple example, it is found that the average number of persons entitled to a pension of say \$500 each year is three, at least \$1,500 must annually be obtained from the pension fund. If such a system were instituted here it would probably be carried on much as the naval pension fund is. The secretary of the navy, as trustee, invests so much of the fund then in the United States treasury as may not be required for the payment of the naval pensions for the then current fiscal year, together with the interest of the preceding year, and he gets 3 per cent. on it. Under section 4759 the privateersman fund is maintained. Two per cent. on the net amount after deducting all charges and expenditures of the prize money arising from captured vessels and cargoes, and on the net amount of the salvage of vessels and cargoes recaptured by the private armed vessels of the United States, shall be secured and paid to the collector or chief officer of the customs at the port where such vessel comes, or with the United States consul or agent, if out of the United States. And the moneys arising thereupon are pledged by the government of the United States as a fund for the support and maintenance of the widows and orphans of such persons as may be slain or wounded, etc., on board of the private armed vessels of the United States, in any engagement with the enemy. The secretary of the navy is trustee to assign and distribute this fund according to law. (Rev. Stat., secs. 4753, 4754.)—The history of pension legislation in the United States forms a most interesting and curious chapter, and in no other nation has the principle of rewarding military and naval service been carried to such a limit as by congress. Early in the revolution it was seen

that the discipline of the troops depended much upon the characters of the officers placed over them; so congress recommended to the several states that they should use their utmost endeavors to appoint in the service men of honor and of known abilities. On Oct. 7, 1776, as an encouragement for men of that class to enlist as commissioned officers, their monthly pay was increased, and somewhat later it was resolved that those who should continue in the service till the end of the war should receive half pay for seven years from the establishment of peace. This applied only to military service, and was more in the nature of a bounty than a pension, still it contained the germs of a pension system. Meantime, however, owing to the difficulties which arose from the inability of congress to fulfill its obligations save in a greatly depreciated paper currency, it became evident that few officers could remain, even if willing, in active service till the end of the war, without making great personal sacrifices. And, although Washington prepared a scheme of half pay and pensionary establishments, and strongly urged upon congress the necessity of making some provisions, the matter dragged, opposed by some as tending to create a standing army, and by others, because they thought the states should be first consulted. The result was a compromise measure. All military officers, commissioned by congress, who should continue in the service during the war, and not holding any office of profit in the states, should be entitled to receive half pay for seven years after the war, provided that this gratuity should extend to no officer who should not take an oath of allegiance to the United States, and actually reside within the same. The provisions of this act were in 1780 made to apply to the widows and orphans of such officers as had died in service. Non-commissioned officers were to receive a specific reward of \$80 at the end of the war. This measure, however, did not allay the discontent of the officers, and in 1780 an act was passed granting half pay for life to officers who served till the close of the war. It is curious to find a law passed three years later commuting this half pay for life into full pay for five years, and reciting, that "as the officers of the several lines under the immediate command of his excellency General Washington, did, by their late memorial, transmitted by their committee, represent to congress, that the half pay granted by sundry resolutions, was regarded in an unfavorable light by the citizens of some of these states," etc. In 1780 some of the states had already made provisions for their officers. For example, Pennsylvania granted half pay for life, and the result was that the troops from this state were in excellent condition, few resignations being made, while in the quotas of other states resignations were frequent. — But it would be a mistake to imagine that the results of these laws were at all in proportion to the promises they contain. When in 1783 half pay for life was commuted into full pay for five years, certificates bearing 6 per

cent. annual interest were issued, and because of the refusal of the states to fulfill the requisitions of congress, the value of these certificates became greatly depreciated, falling until they could command but one-eighth of their nominal value. The army was disbanded, and the officers were compelled by their necessities to part with their certificates for whatever they could obtain. At the end of eight years the principal and interest were funded at 3 per cent., but the paper was now chiefly in the hands of speculators, and it was not until nearly forty years had elapsed that congress undertook to do justice to the revolutionary officers. When the matter came up for settlement in 1826, out of 2,480 commissioned officers (exclusive of foreigners) who came out of the war, only 230 were alive. In all that time there existed a deeply rooted opposition to pensions, as a system of favoritism by which those in power made provision, at the public expense, for their friends and followers. — Up to this point, however, we have been concerned only with the officers of the army. In 1785 congress recommended to the states the propriety of making adequate provision for invalids. In 1788 it was further resolved that "each state shall have credit in its general account with the United States, for such sums as may become due to invalids." Subsequent laws, both of a public and a private character, were passed applying to invalids, and in the organization of the army a like provision was incorporated. By 1806 a general system of pensions had been framed, and in 1808 the United States assumed the state pension obligations. From that time until 1818 the principle was settled that all persons disabled in the course of military or naval service should be provided for at the public expense, whether they had served in the land or sea service of the forces of the United States, or any particular state in the regular corps, or the militia, or as volunteers. The law, however, was surrounded by many safeguards against fraud, and a pension was to be allowed only for disabilities incurred in the service. So limited and confined was it that the abuse arising under it was comparatively unimportant. Abuse, however, there was, and in 1804 it called out the saying that "the revolutionary claimant never dies; he is immortal." — In 1818 the first departure from this conservative policy was made, and was followed by others in 1820 and 1823. On March 18, 1818, an act was passed granting pensions to all who had served in the army of the revolution "for a period of nine months or longer at any period of the war"; and "who, by reason of reduced circumstances, shall stand in need of assistance from their country for support." Here the principle which limited the granting of pensions to such as were disabled in actual service was abandoned, and the length of service and the poverty of the pensioner are made the conditions on which pensions were hereafter to depend. It was doubtless the intention of the framers of the bill to have its provisions apply only to those who had during the revolution given

up their private pursuits and devoted themselves exclusively to military service, and not to men who had rendered casual service; and in support of this view it may be said, that, as originally introduced, the bill would cover the demands of those who had served for three years, and who stood in need of assistance from the government for their support. During the passage of the bill the three years' requirement was displaced by one of nine months, and in that form the measure became a law. It was estimated that the annual charge upon the treasury would amount to about \$160,000, but the results proved that this estimate was far from correct, and that the door had been opened to frauds so extensive that they became unimportant only in the light of subsequent pension legislation. 27,948 persons applied for the benefit of the act of 1818—a number greater than that of Washington's army at any period of the war, and exceeding the whole number of soldiers that could by the established rate of mortality be supposed to be alive in 1818. The claims of upward of 18,000 were admitted, and it was afterward discovered that fully one-third of this number had no legal claim to government bounty. The money required to pay these claims was between two and three millions annually; the appropriations for this branch of expenditure being in the first year under the act, \$1,847,900, and in the next, \$2,766,440. Then congress interfered, as the country was becoming alarmed. Men who had never served at all, or for very short periods, men who had given away their property to their children, or conveyed it in trust for their benefit; in short, every one who was old enough to have served in the revolution found little difficulty in getting himself placed on the pensions list. To correct this open scandal a law was passed May 1, 1820, which retained the "nine months" and "indigent circumstances" requirements, but provided greater safeguards against fraud by requiring every applicant to submit a schedule of his property and to take the necessary oaths. This caused 6,000 names to be stricken from the list. In 1829 an attempt to pass what was known as the "mammoth pension bill" called out a vigorous protest from Mr. Hayne. Its effects, he said, would be to open the door of the treasury to "mere sunshine and holiday soldiers, the hangers-on of the camp, men of straw, substitutes who never enlisted until after the preliminaries of peace were signed." — An act of June 7, 1832, was followed by more extensive frauds, and this was adverted to in the president's message for 1834. The provisions of the pension laws had by this time been extended so as to apply to wars other than the revolution, and in subsequent years they were made to include all military service wherever rendered. A list of the wars will be found at the end of this article. The results of legislation are shown in the following brief statement contained in a report to congress made in 1834: "There are supposed to be now living about 42,600 persons who receive pensions or gratuities

from the government under different laws. Of these about 3,900 are invalid pensions, 10,500 come under the act of 1818, 700 under that of 1828, and 27,500 under the law of June 7, 1832. The amount expended in the previous year reached three millions of dollars." — It would be unprofitable even to attempt to trace minutely the effects of the many laws relating to pensions passed between 1832 and 1860. Enough has been said to show that the tendency of such legislation was to pass from a strictly defined and on the whole well-guarded system, to one which allowed extensive frauds, and in reality gave the government's bounty to the undeserving. As the laws were more generally applied, and included a greater and greater number of subjects, the opportunity for fraud was ever present, and was not allowed to pass unnoticed. — The rebellion, however, gave rise to some pension legislation which deserves more than a cursory notice, because it gives ample proof of the tendency of such laws to run into wasteful expenditure, and also to become a political engine, a device for gaining the votes of the "soldier" population. It may be premised that pensions were offered early in the war to secure volunteers; and further, as every such volunteer was subjected to a medical examination, and was—at least theoretically—allowed to serve only when sound in body, it followed, that, if he were not sound at the end of the war, he must have been disabled or become diseased while in service. This fact becomes important in the light of legislation after the close of the war. — Since the rebellion the following are the more important laws relating to the granting of pensions to soldiers and their families: July 14, 1862; July 4, 1864; March 3, 1865; June 6, 1866; July 25, 1866; July 27, 1866; July 7, 1870; July 8, 1870; June 6, 1874; June 18, 1874; June 20, 1874; June 22, 1874 (consolidation act); Aug. 15, 1876; Feb. 27, 1877; Feb. 28, 1877; March 3, 1877; March 8, 1878; March 9, 1878; June 17, 1878; June 18, 1878; June 20, 1878; Jan. 25, 1879 (arrears of pensions act); March 1, 1879; June 9, 1880; June 16, 1880; Feb. 26, 1881; Aug. 7, 1882; and in addition to these, countless bills of a public or private nature became laws or were rejected. Under these laws the most liberal provisions were made for those who had suffered, directly or indirectly, while in the army during the rebellion. It is doubtful whether any other nation has provided so liberally for its disabled soldiers and seamen, or for the dependent relatives of the fallen. "If any person, whether officer or soldier, belonging to the militia of any state, and called out into the service of the United States, be wounded or disabled while in actual service, he shall be taken care of and provided for at the public expense." (Revised Statutes, § 1639.) This principle has governed the pension legislation of the country almost from the beginning (1792). The government undertook to make good, as far as possible, the loss of health or members, when such loss was incurred strictly in its military or naval service, and to furnish regular pecuniary aid to

the families of those whose lives or health were thus sacrificed. From a very simple impulse of justice has sprung an entire system of rewards, or rather of recompense, which has grown to proportions little anticipated by those who framed the first laws. In place of laws for particular emergencies, cautiously limited to retrospective action, we now have statutes which regard on an equal plane all branches of the service, regulars, volunteers and militia, and further providing for the future as well as for the past. The few simple and efficacious safeguards which were imposed upon the earlier laws have been abolished, or so modified as to be, to all intents and purposes, null and void, and step by step, as the system was expanded, its benefits have largely fallen to the undeserving, to professional schemers for public plunder. And of this the arrears of pensions act is a notorious example, the history of which throws a strong light upon the methods of shrewd lobbyists who thrive upon the necessities of others. Briefly stated, that history is as follows: The laws then in force, it was claimed, were faulty, and it was expedient to abolish certain inequalities which the pension system was believed to contain. Under the existing acts certain restrictions or limitations were imposed upon the time within which application for a pension should be made. If a man was unable to secure the necessary papers and proofs required by the practice of the bureau within the appointed time, his pension could not be granted until the defects were remedied and the proper documents filed in the department. It thus happened, that, while many obtained pensions beginning from the date of discharge or disability, a large number of others, who were equally deserving, had their claims for many years delayed, and when allowed drew their bounty from the date of the issue of the proper documents, and not from the date of discharge or disability. The law prevented any dating back, and it was claimed that as a simple act of justice this defect should be remedied and the operation of the system made more equal. "By the act of July 14, 1862, the first on the subject of pensions growing out of the war of the rebellion, it was provided that if the soldier made application within one year after his discharge, his pension should commence with the date of such discharge, but if he failed to make his application until after the expiration of the year, then his pension, when granted, should commence with the date of such application. This was a statute of limitations of one year, and deprived the crippled soldier of one year's pension money or more, if, for any reason, he was not prompt in presenting his claim within the time prescribed. It was a vicious principle with which to begin our pension system. No government can afford to higgler with its preservers over the price of their blood, nor is it a becoming thing to thrust a contemptible statute of limitations, the last resort of a dishonest debtor, into the faces of the maimed who are living, or of the widows and orphans of the dead, in full payment of the most

sacred obligations ever incurred by a nation in the history of the world. By subsequent acts amendatory of the act of 1862, the statute of limitation, or the time within which to file an application so as to carry a pension from the date of discharge or death, was extended first to three and then to five years, and it stood at this latter period in January, 1879. The arrears act was designed to eliminate from the then existing law that meanest form of defense to a debt ever interposed by an individual or a government, the defense of the statute of limitations. It destroyed the detestable argument so often heard, that the lapse of time can pay an honest debt; that if you can successfully evade the payment of a claim for a certain number of years, either through your own ingenuity or the ignorance and helplessness of your impoverished creditor, the claim becomes an old claim; then, in the pompous and stupid parlance of the day, a stale claim, and that at this point it is to be considered paid and wiped out." — It would, however, be a mistake to suppose that the law arose from such philanthropic motives as the sentences just quoted from a speech in defense of it would indicate. In fact, it was nothing more than a piece of selfish and interested legislation, originated by a ring of pension claim agents who made a living by trading upon the necessities of deserving pensioners, and it was by their efforts more than by any other influence, that the arrears act was hurried through congress. In 1871 the total number of applications filed was 43,969; in 1872, 26,396; in 1873, 18,303; in 1874, 16,734; and in 1875, 18,704. The claim agents saw that their business was falling off, and took measures for increasing it. In 1875 and 1876 they had begun their peculiar methods, and were flooding the country with blank petitions. The commissioner of pensions said, in his report for 1878: "A comparatively small number of professional claim agents and claim firms at Washington and some other points of the country, through the intervention of sub-agents, and by extensive advertising, employing for that purpose in some instances sheets issued in the form of periodical newspapers purporting to be published in the interest of the soldiers, the columns of which contained matter in which apparent anxiety for the soldiers' welfare and appeals to their love of gain were cunningly intermingled, always representing the advertisers as in the enjoyment of special and peculiar facilities for the successful prosecution of claims, and usually adding the suggestion that no charge would be made unless a pension should be obtained." The result of this activity was to bring before congress a host of petitions praying for further legislation. Already a measure providing for arrears of pensions had been introduced into the 44th congress, but it was killed in committee, and in the next congress a like measure promised to experience the same fate, when it was unexpectedly taken up and passed under a suspension of the rules without debate, and apparently without having been considered by the

proper committee. The bill was rushed through the senate in the same unceremonious manner, and in the short debate there is an absence of any effort to discover what would be the effects of the bill should it become a law. Making an estimate based upon a communication from the commissioner of pensions prepared three years previously, it was stated that the arrears might amount to nineteen or twenty millions annually. The secretary of the interior thought that \$41,000,000 would be all that was needed to meet the provisions of the new law, and accepting this estimate, the secretary of the treasury asked for authority to issue bonds to that amount. This estimate was prepared, however, after the measure was passed and had received the signature of the president. The pension bureau never made an estimate of the cost of the arrears bill until after it had become a law. Such was the loose manner of framing and discussing an important law. — The truth, however, was soon seen. The practical operation of the law was to offer a bonus of \$1,000 down, in addition to subsequent periodical payments, to all persons who might thereafter file and prosecute to a successful issue, pension claims against the government. Even while the bill was in the hands of the president, its real results were beginning to be foreshadowed. Secretary Sherman told his associates in the cabinet that it would require an expenditure of \$150,000,000. On Jan. 25, Secretary Schurz read in a cabinet meeting a letter from the commissioner of pensions, saying that the bill would require an immediate expenditure of \$36,000,000, and largely increased annual requisitions. In spite of these damaging statements the president, Mr. Hayes, signed the bill. In February, 1879, Secretary Schurz addressed a letter to congress calling attention to the vast sum probably involved by the arrears act, and urging upon that body, in the most emphatic terms, the necessity of adopting legislation to protect the government against the frauds which the new measure would be sure to encourage. At once the flood gates were opened. In his report for the year ending June 30, 1879, a date less than six months after the passage of the act, the commissioner said that the new claims of invalids, widows, minor children and dependent relatives, had come in at "an unprecedented rate." The claims of invalids, he said, were more than double in number those of any previous year, except 1868 (just at the close of the war), and nearly double that year, while other claims were large in an almost equal proportion. Furthermore, at the time the arrears act was passed there were about 100,000 unsettled claims which were regarded as alive and pending; besides these, there were not less than 80,000 on the files which had been rejected for one reason or another. Among these claims, which were on the files and had not been admitted, were about 45,000 which were counted as dead claims, the claimants having abandoned their prosecution, or died leaving them unsettled. The arrears act not only brought in new original claims at the rate of 10,290 per

month for the whole period of seventeen months from February, 1879, to June 30, 1880—while the average from July 1, 1878, to Feb. 1, 1879, was only 1,597 per month—but it revived from thirty thousand to forty thousand old cases which were on the rejected files. The drain on the treasury was greatly increased. The largest annual disbursement previous to the passage of this act was in 1871, and amounted to about thirty-three millions. In 1878 it was \$26,844,415; in 1879, \$33,780,526, in 1880, \$57,240,540; and in 1881, \$50,620,538. In this last year the commissioner estimated that the act would consume, sooner or later, more than \$510,000,000. This piece of legislation, which is little else than a gigantic swindle, has remained unchanged in spite of efforts to overturn it. It was conceived for private advantage, and carried through without consideration or debate, and by means of political pressure. It is the old story of the prætorian guards repeated; the soldiers' votes formed the main object to be secured by its passage. — One more point deserves attention, as showing the great stimulus exerted by pension legislation. When the bill granting pensions to all the survivors of the war of 1812, and to the soldiers' widows, was before congress, it was generally asserted and believed that the number of persons entitled to such pensions, about seventy years after the war, must necessarily be small. The armies of the United States in 1812-14 had not been large, and the number of people who attain the age of eighty or ninety years can never be very large. Yet in the table we give, we find more than 7,000 survivors and more than 24,000 widows drawing pensions! "Either the war of 1812 must have had a mysteriously vitalizing effect upon those in any way engaged in it, or the passage of the pension bill must have resuscitated a large number of those who, in the ordinary course of nature, had died years ago." And in his report for 1882 the commissioner of pensions makes some interesting speculations regarding the pension population of the country. "The proposition is as follows: How many persons are there now living who served in the army during the late rebellion, or who bore a pensionable relation to those who served, who have not yet applied for a pension? The adjutant general of the United States reports the following aggregate of enlistment for the different periods of service:

60 days	2,045	9 months	89,899
3 months	108,416	1 year	393,706
100 days	85,807	2 years	44,400
4 months	42	3 years	2,028,630
6 months	26,118	4 years	1,042
8 months	373	Aggregate	2,780,178

Taking this as a basis of my calculation, I have endeavored to ascertain the number of individual enlistments; that is, excluding second, third, fourth, and subsequent enlistments of the same person. The result of my investigation and estimate upon this point shows an aggregate of 2,049,969 different individuals who enlisted for greater or less periods during the war. To this number should be added the number of persons

serving in the regular army and navy at the commencement of the war, viz., 16,422. So that the grand total of individual persons who entered the service during the war may be approximately stated to be 2,063,391. Up to July 1, 1882, there have been filed by army invalids, 450,890 applications for pensions. Up to the same date there have been filed 294,277 applications on behalf of the service of deceased soldiers. There have been filed by navy invalids 7,633, and by those representing deceased sailors, 3,294. This makes an aggregate of those who have applied for pension of 756,119 out of the whole number who enlisted, as before stated. As near as I can ascertain, there are about 86,800 representatives of deceased soldiers who have not yet applied for pension, and 1,000,469 survivors of the war who have not yet applied for pension, and 220,000 who died during and since the war, who left no pensionable relatives surviving them. * * The general proposition, however, is presented with the best available information at hand, that there is a surviving soldier population of a little over ten hundred thousand, out of which claims for pension in the future may be made by those who incurred pensionable disabilities."—In the United States special acts have, as we have said, with great frequency been passed for pensioning any person not falling within the provisions of the law in force at any given time. For instance, cap. 43, approved June 17, 1844: "Be it enacted, etc., that the secretary of war be and he is hereby authorized and directed to pay to Milly, an Indian woman of the Creek nation, and a daughter of the prophet Francis, a pension at the rate of \$96 per annum, payable semi-annually, during her natural life, as a testimonial of the gratitude and bounty of the United States, for the humanity displayed by her in the war of 1817 and 1818 in saving the life of an American citizen who was a prisoner in the hands of her people, and about to be put to death by them," etc. In another case Baron de Steuben was granted a pension of \$2,500 a year during life, "which said annuity shall be considered in full discharge of all claims and demands whatever of the said Frederick William de Steuben against the United States." Many of these private acts granted pensions to private individuals who had, like Milly, the Creek woman, performed some act of heroism. They did not fall within the provisions of the pension laws, and form the first exceptions to the rule that in the United States there are no civil pensions. Up to 1869, so far as the writer is aware, such form the only exception. In that year (Statutes at Large, vol. xvi., p. 45), a bill was passed to increase the United States judges, and it provided, among other things, that "any judge of the United States, who, having held his commission as such at least ten years, shall, after having attained the age of seventy years, resign his office, shall thereafter, during the residue of his natural life, receive the same salary which was by law payable to him at the time of his resignation." — Since then, a new precedent has been

created as to ex-presidents' widows. First, Mrs. Lincoln was given one, then Mrs. Garfield, then Mrs. Polk and Mrs. Tyler. The life-saving department has had a pension arrangement made by law for a certain definite period. The internal revenue servants and the railway mail servants also have had endeavors for a pension system made in congress in their behalf. Employés in the quartermaster's and paymaster's departments have received them. Also nurses, and in one case the widow of a professor in the naval academy. The New York municipal police have also had a pension system introduced for their benefit, recently. Many bills have been introduced for such purposes, the most sweeping being Senator Edmunds', in the 47th congress. Its object was to allow all officers who may retire or be retired, one year's pay; after fifteen years of service, two years' full pay; after twenty years, a pension of half pay; after twenty-five years, two-thirds pay; after thirty years, three-fourths pay; after thirty-five years, four-fifths pay; and after forty years, full pay.—The subject of civil pensions has already been discussed. It is not contended that so far any but very excusable departures from the rules thus far in force in this country have been made, but every new departure from the same should very closely examined and criticised as long as the rule remains in force. If, after a full discussion, it shall be decided to put in force a system of civil pensioning, it will be an interesting, but at the same time a dangerous, experiment.—The existing provisions of the pension laws are too numerous to be given in this article, and the reader must be referred to the manuals prepared under the authority of the bureau. A word, however, as to the practice of the department. The applicant for a pension first sends a declaration, of which he can get a blank form from the office, giving the necessary dates and figures and circumstances, in detail. His identity must be shown by the testimony of two credible witnesses, who must appear before the officer. Then, on receiving this, the interior department makes application to the adjutant general and surgeon general or to the navy department, as the case may be, for the applicant's record and evidence as to the disability. If there be none, the applicant must obtain the affidavit of a commissioned officer who had personal knowledge of the facts. If there is no record even that there was a disability, the applicant must obtain the evidence of the surgeon by whom he was treated, and must prove that his own habits had no agency in the production of such disability. If the disability arises from disease, he must, in addition, get evidence from his physician setting forth the history of his disease and disability since its first appearance. The administrator or executor of a soldier is not entitled to arrears if the deceased had filed no application. If claimant died pending application, the pension, when granted, does not belong to the estate, but to the widow or children. If there are none, then the pension lapses, except

that the expenses of the claimant's last sickness may be paid. Death is to be presumed in cases where more than two years elapse since the date of the soldier's supposed death in action. No pension in hand or to come, or in whosever hands it is, is liable to attachment, levy or seizure by or under any legal or equitable process whatever. No pensioner may have more than one pension at a time. Helplessness means (act of 1876) dependence on another, and also inability to gain a subsistence by one's own exertions. The abandonment of her minor child by the widow forfeits her title to a pension. Any pledge, mortgage, sale, assignment or transfer of any right, claim or interest in any pension, which has been or may hereafter be granted, shall be void and of no effect. No pension money will be paid to any agent or attorney of the pensioner, and no agent is to recognize any warrant or power of attorney, except in the case of insane or Indian pensioners or those under disabilities. (Act of Aug. 7, 1882.) All pensioners must have been loyal during the war of the rebellion. At the outbreak all the pensioned in other wars who were in the insurgent states were cut off, and also those in the northern states known to be disloyal. In 1867, widows who could prove their loyalty during the war were restored. A pardon by the president does not restore the right to the former or any pension. As to what constitutes disloyalty, it has been held that compulsory service with the rebels does not. Making clothes and tents for them, does. Applying to the confederate congress for a federal pension does not.—On the next page we give a table of the pension claims filed and allowed since 1861.—There are fifty-eight agencies in the United States. Payments are made quarterly, and there is a biennial examination of the pensioners. New York contains the most pensioners, then Pennsylvania, then Ohio; the commissioners have said that there is not a single county or parish in the United States without its pensioner. The average age of our soldiers in 1863 was only twenty-six, and so this state of affairs is likely to continue for some time. Formerly the Washington office kept an alphabetical list of the rejected and admitted pensioners and of the claims filed, but this was found very cumbersome, and now all names are indexed according to their companies and military organizations. In the course of making the change (November, 1880) more than 3,000 duplicate claims for pensions were found, and fifty-three cases in which two pensions had been granted the same person. These new records consist of 176 volumes, of 250 pages each, and have claims for pensions on account of service in 2,268 regiments, 194 battalions, 706 independent companies, 208 batteries, and 46 staff corps. Besides this, the old three-fold invalid, widows and bounty lands divisions were abolished, and everything was arranged by states. The commissioners have therefore evolved a method by which the government may be better protected from fraud, and this they submit every year to

NUMBER OF PENSION CLAIMS FILED AND ALLOWED EACH YEAR SINCE JULY, 1861, AND THE NUMBER OF PENSIONERS AT THE CLOSE OF EACH YEAR SINCE JULY 1, 1860.

Note. — In the "Total number of pensioners on the roll" the survivors are included under the head of "Invalids."

congress, which, with equal regularity, pigeon-holes it. This is to have a number of pension commissions all over the country, consisting each of one surgeon and one pension clerk, appointed from Washington, whose duty it shall be in each case to go to any place in their district from which a claim has been forwarded, and there to summon the claimant and his witnesses, and such other witnesses as they themselves may wish or as may volunteer their testimony, and to examine such evidence thus furnished, and report thereon to Washington. The advantages of this system are, that: 1. "The testimony and proceedings will be public and reliable, facilitating prompt and liberal decisions, and the treasury will be protected from fraud." The claimants' expenses will be rather diminished. 2. "The medical examination will be made by an unprejudiced government surgeon. No one will be made a victim of the ignorance, prejudice or carelessness of a neighborhood surgeon." 3. There need be no more special agents' investigations. "The publicity of the proceedings will operate to restrain fraudulent claims, and give the government a guarantee against their success." The neighbors of any claimant are likely to come forward to expose any fraud in such a matter. Now, the honest claimants who are not able to fill a want in their evidence get injured, while the dishonest ones who fill such a gap by fraud succeed. There will therefore be less perjury, forgery and false personation under such a scheme. The old, and present, scheme "provides for the settlement of claims on *ex parte* testimony exclusively, given by witnesses who are entirely unknown to the office, and whose affidavits are almost universally prepared by claim

agents, who can receive no compensation for their services unless the claim is allowed." The examining surgeon is usually the neighborhood practitioner, whose professional interest it is to please the claimant at the expense of the government. (Commissioner's Report, 1877.) — The following table shows the annual expenditure of the government of the United States on account of pensions, from March 4, 1789, to June 30, 1883 (by calendar years to 1843, and by fiscal years, ended June 30, from that time):

DAVID A. WELLS, and
EUSTACE CONWAY.

UNITED STATES SURPLUS MONEY, Distribution of, among the States. The secretary of the treasury (Ingham), in his report to congress, in December, 1829, estimated that the revenues of the government for that year would amount, including the balance on hand on Jan. 1, to \$30,574,666; and the expenditures to \$26,164,595, of which \$9,841,011 was on account of principal and \$2,563,994 on account of interest of the public debt. He also estimated that the public revenue for the next five years would be such as to leave free for application to the payment of the public debt about twelve millions yearly. The amount of debt becoming due or payable during the next five years was \$48,522,869. The surplus, after paying this indebtedness, would be twelve millions. The secretary did not favor a sudden change in the tariff, but recommended such gradual changes as would reduce the revenues to cor-

respond with the existing expenditure. President Jackson, in his message to congress in 1829, said: "After the extinction of the public debt, it is not probable that any adjustment of the tariff, upon principles satisfactory to the people of the Union, will, until a remote period, if ever, leave the government without a considerable surplus in the treasury beyond what may be required for its current service. As, then, the period approaches when the application of the revenue to the payment of debt will cease, the disposition of the surplus will present a subject for the serious deliberation of congress, and it may be fortunate for the country that it is yet to be decided. Considered in connection with the difficulties which have heretofore attended appropriations for purposes of internal improvement, and with those which this experience tells us will certainly arise whenever power over such subjects may be exercised by the general government, it is hoped that it may lead to the adoption of some plan which will reconcile the diversified interests of the states, and strengthen the bonds which unite them. Every member of the Union, in peace and in war, will be benefited by the improvement of inland navigation and the construction of highways in the several states. Let us, then, endeavor to attain this benefit in a mode which will be satisfactory to all. That hitherto adopted has, by many of our fellow-citizens, been deprecated as an infraction of the constitution, while by others it has been viewed as inexpedient. All feel that it has been employed at the expense of harmony in the legislative councils. To avoid these evils, it appears to me that the most safe, just and federal disposition which could be made of the surplus revenue, would be its apportionment among the several states according to their ratio of representation: and should this measure not be found warranted by the constitution, that it would be expedient to propose to the states an amendment authorizing it. I regard an

appeal to the source of power, in cases of real doubt, and where its exercise is deemed indispensable to the general welfare, as among the most sacred of all our obligations." It thus appears that President Jackson regarded as unconstitutional the appropriation of money for internal improvements by congress, and, in view of the anticipated surplus, suggested that its distribution among the states would enable them to make such improvements, without the assistance of congress. He intimated that such a distribution would be constitutional, but if there was any doubt on this point, an amendment would remove the difficulty. — During the session of congress of 1829-30, the duties on tea, coffee, cocoa, salt, and also on tonnage, were reduced, but the reductions were not sufficient to exhaust the surplus after the debt then maturing should be paid. In his message for December, 1830, President Jackson referred to this subject as follows: "In my first message I stated it to be my opinion that it is not probable that any adjustment of the tariff, upon principles satisfactory to the people of the Union, will, until a remote period, if ever, leave the government without a considerable surplus in the treasury beyond what may be required for its current services. I have had no cause to change this opinion, but much to confirm it." — The secretary of the treasury, in his report for 1832, says: "After Jan. 1, 1833, no part of the public debt, except the remaining fragments of the unfunded debt, of which only small portions are occasionally presented, will be redeemable before the following year; and, though there will be in the treasury during the year ample means to discharge the whole debt, they can be applied only to the purchase of stock at the market prices." The whole public debt was virtually extinguished by Jan. 1, 1835, on which date the balance of available funds in the treasury was \$5,586,232. It was estimated that for the year 1835 the receipts from all sources would be twenty millions: but the actual receipts were \$35,430,087, receipts from the sale of the public lands during that year having greatly increased. In 1834 these receipts were only \$4,837,600, but in 1835 they were \$14,757,600. The receipts from the sales of public lands in 1834-5-6 were \$44,492,381, and the total receipts from this source, from 1796 to 1834, had been but \$44,595,000. The balance left in the treasury at the beginning of the year 1833, was \$2,011,777; in 1834, \$11,702,905, in 1835, \$8,892,858, and on Jan. 1, 1836, \$26,749,803. — In view of this large balance, and its probable large increase by Jan. 1, 1837, the act of June 23, 1836, was passed, authorizing the distribution of the surplus among the states. As has been seen, this method of disposing of the surplus was favorably suggested by President Jackson in his message for 1829, and again indorsed by him in his message for 1830. In 1836, however, the views of the president appear to have changed. Secretary Woodbury, in his report for 1835, disapproved of the distribution of the surplus among the states, intimating that it was unconstitutional. He said:

"The people themselves, it is believed, can best manage all their own money, which they and their representatives think may not be wanted for public purposes; and it would seem to be far preferable to leave it originally in their possession, than to withdraw it for the expensive operation of returning it substantially to the place whence it came, and that probably in a manner not conformable to the constitution, till after the delay of procuring an amendment to it; and even then not expedient, because calculated injudiciously to strengthen the general government, and to render the states more dependent on a great central power for yearly and important resources. Indeed, a reduction in the price of public lands, whose unusually large sales the past year are the source of most of the present surplus, would, if their sales should not thereby be much increased, seem another mode far more natural to obviate the present difficulty. But, before adopting it, this and various other considerations must be weighed, and it must be fully considered whether all the revenue anticipated from them at their present prices would not be necessary, after the great reductions in the tariff in 1842, and whether a resort to a higher tariff would not then become indispensable, if the average receipts from lands or customs should, from any new legislation, become then much diminished below the estimates which have been submitted on the present occasion." This change in the opinion of the administration from 1829 to 1836 was probably owing to the hostility of the president to the bank of the United States, resulting in the veto of the bill for renewal of its charter on July 10, 1832, and the removal of the United States deposits from the bank by order of the secretary of the treasury of Sept. 26, 1833. (See BANKING IN THE UNITED STATES.) — In 1835 and 1836 the revenues of the government were deposited with the state banks, the favorites of the administration, and the distribution of the surplus at this time among the states would have deprived these banks of the deposits. In his message to congress of 1836, after the passage of the act of June of that year, regulating the public deposits, and providing at the same time for the distribution of the surplus in the treasury on Jan. 1, 1837, President Jackson said: "Without desiring to conceal that the experience and observation of the last two years have operated a partial change in my views upon this interesting subject, it is nevertheless regretted that the suggestions made by me in my annual message of 1829 and 1830 have been greatly misunderstood. At that time the great struggle was begun against that latitudinarian construction of the constitution which authorizes the unlimited appropriation of the revenues of the Union to internal improvements within the states, tending to invest in the hands, and place under the control, of the general government, all the principal roads and canals of the country, in violation of state rights, and in derogation of state authority. At the same time the condition of the manufacturing interest was such as to create an apprehension that

the duties on imports could not, without extensive mischief, be reduced in season to prevent the accumulation of a considerable surplus after the payment of the national debt. In view of the dangers of such a surplus, and in preference to its application to internal improvements, in derogation of the rights and powers of the states, the suggestion of an amendment of the constitution to authorize its distribution was made. It was an alternative for what were deemed greater evils—a temporary resort to relieve an overburdened treasury, until the government could, without a sudden and destructive revulsion in the business of the country, gradually return to the just principle of raising no more revenue from the people, in taxes, than is necessary for its economical support. Even that alternative was not spoken of but in connection with an amendment of the constitution."—In the meantime Jackson, in his attack on the bank of the United States, had been bitterly opposed by Clay, Calhoun, Webster, and a majority of both houses of congress, by whom many of his acts were regarded as an exercise of arbitrary power. In his first message in 1829 he recommended that the bank of the United States should not be rechartered. In January, 1832, the bank's memorial for recharter was presented both in the house and senate, and, after some debate, the bill for the recharter passed both houses. This bill was vetoed, on July 10, by the president, and the recharter of the bank was made one of the issues of the campaign of 1832. Henry Clay was defeated, and Jackson re-elected, and the latter claimed that the result was an indorsement of his policy against the bank.—During the summer of 1832, Jackson, as a measure of hostility against the bank, conceived the project of the removal of the United States deposits. Benton, in his "Thirty Years' View," (vol. i., p. 377), says: "General Jackson was not the man to tolerate these illegalities, corruptions and indignities. He therefore determined on ceasing to use the institution any longer as a place of deposit for the public moneys; and accordingly communicated his intention to the cabinet, all of whom had been requested to assist him in his deliberations on the subject. The major part of them dissented from his design; whereupon he assembled them on the 22d of September, and read to them a paper containing his views on this subject. This paper concludes as follows: 'Under these convictions he feels that a measure so important to the American people can not be commenced too soon; and he therefore names the first day of October next as a period proper for the change of the deposits, or sooner, provided the necessary arrangements with the state banks can be made.'"—Secretary Duane refused to carry out the wishes of the president without a previous reference to congress. Roger B. Taney, then attorney general, was made secretary of the treasury, and issued the order for removal of the deposits on Sept. 26, 1833. The opponents of the administration, looking at the surplus revenue, regarded the proposi-

tions made for distribution of the surplus among the states favorably, as tending to deprive the president of a portion of an immense patronage.—The deposit of the public money in the pet banks had been followed by great financial distress, continuing during the year 1834; and previous to and during that year propositions were frequently made in the public press for distribution of the surplus revenue among the states as a measure of relief. These propositions were first in the form of a distribution of the revenue from public land, then a distribution of the public lands themselves, and finally the distribution of both land and customs revenues.—During the session of 1835, on motion of Mr. Calhoun, a select committee, consisting of Calhoun, Webster, Benton, Bibb, Southard and King, were appointed to inquire into the extent of executive patronage, the increase of public expenditures, and the number of persons employed or fed by the executive government. The committee assumed that there would be an annual surplus of nine millions for the next eight years. It regarded the disposal of this surplus as a problem to be solved with great difficulty, but one which was important to determine, lest the executive should greatly increase his power by depositing the public funds with the favorite banks. The committee accordingly "reported a resolution so to amend the constitution that the money remaining in the treasury at the end of each year till Jan. 1, 1843, deducting therefrom the sum of \$2,000,000 to meet current and contingent expenses, shall annually be distributed among the states and territories, including the District of Columbia; and, for that purpose, the sum to be distributed to be divided into as many shares as there are senators and representatives in Congress, adding two for each territory and two for the District of Columbia; and that there shall be allotted to each state a number of shares equal to its representation in both houses, and to the territories, including the District of Columbia, two shares each. Supposing the surplus to be distributed should average \$9,000,000 annually, as estimated, it would give to each share \$30,405, which, multiplied by the number of senators and representatives from a state, will show the amount to which any state will be entitled." This resolution was opposed by Benton, who represented the administration in the senate. He argued that the customs revenues could be largely reduced by changes in their methods of collection; that the revenues from the sale of land could be made to disappear by selling these lands at nominal prices to the people. If, after this, there should still be a surplus, he advocated its use in the construction of fortifications to protect the coasts and frontiers of the country. The proposition of the committee to amend the constitution to authorize the distribution was never brought to a vote. In the spring of 1836, the following paragraph appeared in the "Philadelphia National Gazette": "The great loss of the bank has been in the depreciation of the securities, and the only way to

regain capital is to restore their value. A large portion of them consists of state stocks, which are so far below their intrinsic worth that the present prices could not have been anticipated by any reasonable man. No doubt can be entertained of their ultimate payment. The states themselves, unaided, can satisfy every claim against them; they will do it speedily, if congress adopt the measures contemplated for their relief. A division of the public lands among the states, which would enable them all to pay their debts, or a pledge of the proceeds of sales for that purpose, would be abundant security. Either of these acts would inspire confidence, and enhance the value of all kinds of property."—A bill for the distribution of the revenues was introduced in the senate, and supported both by Mr. Clay and Mr. Webster. It was opposed by Mr. Benton, who introduced an antagonistic bill devoting the surplus revenues to public defenses. The bill passed the senate by a vote of 25 to 20. Being sent to the house for concurrence, it became evident that it could not pass that body, as a majority of its members regarded the project in its form of a distribution as unconstitutional. The friends of the measure in the senate determined to change its form so as to remove the difficulty. Instead of a distribution it was to be a deposit, and the faith of the states was to be pledged to the return of the money. — There was another bill in the senate for regulating the deposit of public moneys with the state banks, and the proposition in the form of a deposit with the states became sections thirteen and fourteen of this bill, which passed with only six dissenting votes. It passed the house by a large majority, 155 to 38. In the form of distribution it had no chance of passing the house. "It was approved by the president," Benton says, "but with a repugnance of feeling and a recoil of judgment which it required great effort of friends to overcome." Probably, if he had returned it with his veto, it would have had two-thirds of each house in its favor. — The following is a copy of the 13th and 14th sections of the act of June 23, 1836: "An act to regulate the deposits of the public money. Section 13. That the money which shall be in the treasury of the United States, on the first day of January, eighteen hundred and thirty-seven, reserving the sum of five millions of dollars, shall be deposited with such of the several states, in proportion to their respective representation in the senate and house of representatives of the United States, as shall, by law, authorize their treasurers, or other competent authorities, to receive the same on the terms hereinafter specified; and the secretary of the treasury shall deliver the same to such treasurers, or other competent authorities, on receiving certificates of deposit therefor, signed by such competent authorities, in such form as may be prescribed by the secretary aforesaid; which certificates shall express the usual and legal obligations, and pledge the faith of the state for the safe keeping and repayment thereof, and shall

pledge the faith of the states receiving the same, to pay the said moneys, and every part thereof, from time to time, whenever the same shall be required by the secretary of the treasury, for the purpose of defraying any wants of the public treasury, beyond the amount of the five millions aforesaid: *Provided*, that if any state declines to receive its proportion of the surplus aforesaid, on the terms before named, the same shall be deposited with the other states, agreeing to accept the same on deposit in the proportion aforesaid: *And provided, further*, that when said money, or any part thereof, shall be wanted by the said secretary, to meet appropriations by law, the same shall be called for, in ratable proportions, within one year, as nearly as conveniently may be, from the different states with which the same is deposited, and shall not be called for, in sums exceeding ten thousand dollars, from any one state, in any one month, without previous notice of thirty days for every additional sum of twenty thousand dollars which may at any time be required. Section 14. *And be it further enacted*, That the said deposits shall be made with the said states in the following proportions and at the following times, to wit: one-quarter part on the first day of January, eighteen hundred and thirty-seven, or as soon thereafter as may be; one-quarter part on the first day of April, one quarter part on the first day of July, and one quarter part on the first day of October, all in the same year." — In his message for December, 1836, President Jackson objected to the method of distribution provided in the law, viz., according to representation, and advocated a method founded on the population of each state. — On Jan. 1, 1837, the surplus in the treasury, after reserving the five millions required by law, was \$37,468,859.97, and the apportionment among the several states is shown by the following table:

STATES.	No. of elec- tional votes.	Amount to be deposited dur- ing the year 1837.	Amount of each Installment.
Maine.....	10	\$1,274,451 02	\$318,612 75
New Hampshire.....	7	892,115 71	223,028 93
Massachusetts.....	14	1,784,231 43	446,057 86
Rhode Island.....	4	509,780 41	127,445 10
Vermont.....	7	892,115 71	223,028 93
Connecticut.....	8	1,019,560 81	254,890 20
New York.....	42	5,352,094 28	1,338,173 57
New Jersey.....	8	1,019,560 81	254,890 20
Pennsylvania.....	30	3,823,533 06	955,882 26
Delaware.....	3	382,335 31	95,583 83
Maryland.....	10	1,274,451 02	318,612 75
Virginia.....	23	2,931,237 31	732,809 03
North Carolina.....	15	1,911,676 53	477,919 13
South Carolina.....	11	1,401,896 12	350,474 03
Georgia.....	11	1,401,896 12	350,474 03

Ohio.....	21	2,676,347 44	669,086 78
Indiana.....	9	1,147,005 92	286,751 48
Illinois.....	5	637,225 51	159,306 38
Arkansas.....	3	382,335 31	95,583 83
Michigan.....	3	382,335 31	95,583 83
Total.....	\$37,468,859 97	\$9,367,214 98

The table on preceding page, with the exception of the last column, is copied from the report of Mr. Woodbury to congress, of January 3, 1837.

—It will be noticed, that, by the law authorizing the deposit of the surplus, each state was required to authorize its treasurer by law to receive the deposit and to give certificates of deposit therefor. The necessary forms for carrying out this plan were prepared by the secretary of the treasury, and may be found in Ex. Doc. and Reports of Committees, 1st Sess. 25th Congress, Doc. No. 30.

—All of the states named in the foregoing table of apportionment passed laws authorizing the receipt of the deposit, and some took the opportunity of instructing their representatives to protest against, or to endeavor to obtain changes in, some of the features of the law. The legislature of the state of New Hampshire, by resolution, declared that any distribution of surplus was unconstitutional. They instructed their delegates to vote for a reduction of revenue and against any measure for relinquishment, by the United States, of the sums on deposit with the states. The legislature of the state of Indiana requested its senators and representatives to use their exertions to procure the passage of an act of congress for the relinquishment on the part of the United States of all claims of surplus revenue deposits under act of June 23, 1836. These resolutions show conclusively that these states regarded the money received as a deposit to be likely to be recalled, and not as a gift. —The first three installments were paid to the states as nearly as possible on the following dates, viz.: one-fourth on Jan. 1, 1837, one-fourth on April 1, and one-fourth on July 1, following. The sums were paid by transfers from the deposit banks. On Nov. 1, 1836, the secretary of the treasury notified the banks of the requisition which would be made upon them to meet the installments due, on Jan. 1, to the several states. On Feb. 18, 1837, he gave similar notification in reference to the next three installments. Forms of the letters sent to each of the deposit banks are given, also, in Document 30, Sept. 26, 1837, before referred to. The installments payable on Jan. 1, April 1, and July 1, were transferred to the states on or near those dates. They amounted in all to \$28,101,645, and proportionate amounts were deposited with and receipted for by each state. —In May, 1837, the financial pressure became so great that the banks generally suspended specie payments. The fifth section of the act of June 23, 1836, for regulating deposits of public money, provided that no bank shall be selected or continued as a place of deposit of public money which shall not redeem its notes and bills on demand in specie. On May 1, 1837, the number of the deposit banks was 88, distributed by states as follows:

Maine.....	8	New Jersey.....	3
New Hampshire.....	4	Pennsylvania.....	3
Vermont.....	2	Delaware.....	2
Massachusetts.....	6	Maryland.....	1
Connecticut.....	3	District of Columbia.....	1
Rhode Island.....	2	Virginia.....	3
New York.....	16	North Carolina.....	1

South Carolina.....	2	Kentucky.....	7
Georgia.....	3	Ohio.....	9
Alabama.....	1	Indiana.....	1
Mississippi.....	2	Illinois.....	1
Louisiana.....	2	Michigan.....	2
Tennessee.....	2	Total.....	88

The number of deposit banks on Nov. 1, 1836, was 89. Their capital was \$77,576,449; United States deposits, \$49,377,986; other deposits, only \$26,573,479.* —The difficulties arising from the necessity of discontinuing as public depositories those banks which refused to pay specie, made it apparent that it would be very inconvenient, if not impossible, to transfer the fourth installment of the deposit with the states. Further legislation was deemed necessary in this emergency, and an extra session of Congress was called by President Van Buren. Congress met on Sept. 4. Among other reasons for the extra session, the president in his message mentioned, that "questions were also expected to arise in the recess in respect to the October installment of those deposits, requiring the interposition of congress."

—Secretary Woodbury, in a report made on the safe keeping of the public moneys, on Sept. 23, in answer to a resolution of the house of representatives, said: "This last mode [viz., deposit with selected state banks] ceased by operation of law during the last spring, except in relation to five or six deposit banks which have continued to redeem their notes in specie. The direct losses sustained under it appear to be large. But, in the end, they are not considered likely to amount to anything, though the disappointments, delays and injuries under it, must, it is manifest, in several cases be great. The indirect losses to the public creditors and contractors have been considerable, and are difficult to be computed." From this it will be seen that only six out of the eighty-eight banks designated as public depositories on May 1, could be used as such in September. —Benton says, in relation to these payments: "The deposit with the states had only reached its second installment when the deposit banks, unable to stand a continued quarterly strain of near ten millions to the quarter, gave up the effort, and closed their doors. The first installment had been delivered on Jan. 1, in specie or its equivalent; the second in April, also in valid money; the third one, demandable on July 1, was accepted by the states in depreciated paper; and they were very willing to receive the fourth installment in the same way."

—The secretary's report shows that there would be a deficiency in the revenues to meet expenditures of over ten millions of dollars, which would render it necessary either to recall some of the money deposited with the states, or to postpone the payment of the fourth installment due on Oct. 1. The secretary mentioned the inconvenience of paying the fourth installment, arising from the difficulty of transferring from the west and southwest, where the money received from sales of public lands had accumulated. The lack of revenue

* For statement of resources and liabilities of these banks see Report of Comptroller of the Currency, 1876, p. 43.

was his principal reason for urging the withholding or postponement of the fourth installment. Believing the money would be immediately necessary to the government, he thought it would be less inconvenient to withhold payment than to pay and immediately recall. — On Sept. 11, 1837, Mr. Silas Wright, from the senate committee on finance, reported a bill which provided "that the transfer of the fourth installment of deposits directed to be made with the states, under the thirteenth section of the act of June 23, 1836, be and the same is hereby postponed until further provision by law." The bill was brought up for consideration on the 14th, when he said, that, according to the report of the secretary of the treasury of the 28th ult., there was then in the treasury subject to draft, available and unavailable, but \$8,100,000. If the expenses of the month of September were deducted, which were estimated at two and a half millions, there would be in the treasury, subject to draft on Oct. 1, less than six millions without the transfer of a dollar to the states toward the October installment. If the October installment was to be transferred to the states, all the means in the treasury on the day when that installment was made transferable would not be equal to two-thirds of the amount, and money must be borrowed upon the credit of the United States to supply the deficiency. The largest portion of the funds in the treasury was wholly unavailable; they were in the western and southwestern banks, and experience had already shown, that the drafts of the treasurer upon these banks would not be received in payment by the public creditors, neither would the states, other than those in which the banks were located, take these drafts, and give their obligations for a repayment of the amount in money in pursuance of the provisions of the deposit law. The transfer to the states, therefore, could not be made, even to the amount of the funds in the treasury subject to draft, by reason of the character of the funds to be drawn upon. The whole means in the treasury on the first day of October next would be from three and a half to four millions less than the transfer required. If congress should insist upon this transfer, it must authorize a loan of money upon the public credit in order that that money when loaned, may be deposited with the states for safe keeping. Mr. Webster thought that it was a mere question of convenience, the distributed money would go to all the people, and any deficiency in the treasury must be supplied by all the people. He thought the most convenient way was to pay the installment, and provide for the necessities of the treasury by other means. Mr. Preston opposed the bill on the ground that many states had already appropriated the money, and had undertaken public works on the strength of it, etc. Mr. Crittenden, of Kentucky, opposed it on the same ground. By other senators the deposit act was treated as a contract which the United States was bound to carry out. Mr. Buchanan proposed an amendment, the effect of

which, it was urged, was to change the character of the deposit act and make it a distribution measure. By the act it was the duty of the secretary of the treasury to call for a return of the deposit when needed by the federal treasury. The amendment superseded this, and enacted that the deposits should remain until called for by congress. Mr. Niles pointed out the effect of this amendment. He said the majority of those who voted for the deposit act did so because it was a deposit and not a distribution, and merely withdrew the public moneys from the banks and deposited them with the states. The amendment would change the deposit to a loan, or, more properly, a grant, to the states. Mr. Buchanan's amendment, however, passed by a vote of 32 to 12, and thus the recall of the deposits already made was taken from the hands of the secretary and placed with congress. — In the house of representatives the disposition to regard the deposit act as a contract was even stronger than in the senate. Mr. Caleb Cushing argued that it had all the features of a contract, that it was a "contract of deposit." It was a contract in honor, and, as far as there could be a contract between the United States and the states, a contract in law. On the other hand, it was argued very forcibly that neither in honor nor in law was there any reason for paying the fourth installment when there was no surplus in the treasury. Mr. Halsey, on the same side, said, "In reference to the deposit act, if a contract, it was a contract based alone upon the distribution of an existing surplus, not wanted for the ordinary or extraordinary expenditures of the government. The structure was reared upon that rock, and was so understood at the time the statute was enacted. The money to be distributed was out of a surplus fund. Where was there a surplus fund? There was none." The opponents of the bill, apart from the argument of contract, mainly founded their arguments on the fact that the states had been induced to undertake public works and other engagements by the promise of the money, and the inconvenience to which they would be put by withholding the fourth installment. It was justly observed by their opponents, that the states should have regulated their action by the actual terms of the law of congress, to which they agreed when they accepted the deposits. The opposition to the bill was persistent, the debate was long, and many members were participants, among whom were Adams of Massachusetts, Fillmore and Sibley of New York, Bell of Tennessee, and Wise of Virginia. It finally passed the house by the close vote of 119 to 117. A motion to reconsider was made by Mr. Pickens, and carried. On reconsideration, Mr. Pickens moved to amend so that, instead of postponing the payment indefinitely until further action by congress, it be postponed to Jan. 1, 1839, a day certain. This amendment was agreed to and concurred in by the senate, and the bill finally passed in that form. — The effect of the postponement of the payment to a fixed day has been held by some to bind the United States

to such a payment; and the making the withdrawal of the first three installments received by the states dependent on an act of congress, has, by the same kind of construction, been regarded by some as altering what was originally a deposit to a gift. — As Jan. 1, 1839, approached, it became apparent that there would be no funds in the treasury available for the deposit of the postponed installment. The secretary of the treasury, in his report for December, 1838, stated that the available balance on Jan. 1, 1839, would be \$2,765,342 only, and at the date of the report the treasury notes outstanding amounted to over \$7,754,560. He said, "It will be perceived by these statements that no surplus balance will probably exist either on Jan. 1, 1839, or during that year, to be deposited with the several states for safe-keeping as a fourth installment under the deposit act of June 23, 1836." Since Jan. 1, 1839, there has never been a time when the United States had in its treasury a surplus over and above all its debts and estimated expenditures. The amount deposited in the first three installments with the states, has always been carried as funds of the treasury unavailable; and, under the terms of the acts relative to its deposit, it could now be recalled at any time by an act of congress. — General John A. Dix, secretary of the treasury, in a letter to the chairman of the committee on ways and means, of Jan. 18, 1861, called attention to the fact that "there are deposited with twenty-six of the states, for safe-keeping, over twenty-eight millions of dollars belonging to the United States, for the payment of which the promise of these states is pledged by written instruments on file in this department. The annual statement of receipts and expenditures for the year ending June 30, 1860, represents this amount as part of 'the balance in the treasury' on that day. * * I refer to this final resource as an available one, should the public exigencies demand it. It is not doubted that the greater portion of the amount so deposited would be promptly and cheerfully paid should an exigency arise involving the public honor or safety. If, instead of calling for these deposits, it should be deemed advisable to pledge them for the repayment of any money the government might find it necessary to borrow, loans contracted on such a basis of security, superadding to the plighted faith of the United States that of the individual states, could hardly fail to be acceptable to capitalists." (See UNITED STATES NOTES.) — It is easy to see that there can be no constitutional authority for the claim that this money, already in the possession of the states, irrevocably belongs to them, since, according to the constitution, it is still in the treasury of the United States. The only method of taking money out of the treasury is by an appropriation by congress, upon which the secretary of the treasury is authorized to issue his warrant, and no such method was ever adopted in relation to this money. The whole object and intention of the act was to deposit the surplus, not distribute it, as it has been seen that a distribution act was known at the time

to be unconstitutional. Upon the delivery of the money the treasurer of each state gave to the United States, not a receipt, but a *certificate of deposit*, subject to the future requisition of the government. The amount of the deposit has always been held among the "unavailable funds of the treasury," and is annually so reported among other like funds, as may be seen by reference to page 383, Finance Report, 1882, and previous reports. But whether a deposit or a distribution, no constitutional method has been taken to authorize the payment of the money out of the treasury. Moreover, it was a deposit of surplus and surplus only, and when the surplus did not exist was suspended by act of congress until a certain date; and, when at that date there was still no surplus, the deposit was again withheld by the executive, and, on the same principle, has been withheld ever since. Congress at any time can authorize the withdrawal of the whole amount from the states, and it doubtless could authorize the perpetual withholding of the fourth installment in view of the fact that at some time in the future, after the national debt is paid, there may be a surplus similar to that which existed Jan. 1, 1877. — Benton, in his *Thirty Years' View*, thus refers to the use made of the deposits by the different states: "All sorts of plans were proposed for the employment of the money; and combinations, more or less interested or designing, generally carried the point in the universal scramble. In some states a pro rata division of the money per capita was made; and the distributive share of each individual, being but a few shillings, was received with contempt by some, and rejected with scorn by others. In other states it was divided among the counties, and gave rise to disjointed undertakings of no general benefit. Others, again, were stimulated, by the unexpected acquisition of a large sum, to engage in large and premature works of internal improvement, embarrassing the state with debt, and commencing works which could not be finished" — A claim has been made within a few months (1884) upon the secretary of the treasury, under authority of an act passed by the legislature of the state of Virginia for the deposit of the amount of the fourth installment (\$732,809.33) under the act of June 23, 1836. A similar claim has also been made by the treasurer of the state of Arkansas, through Senator Garland of that state, to which the secretary replied, on Oct. 8, 1883: "I find that the tradition of this department for over a dozen years has been to consider that act as obsolete, or at least not imperatively effective during a season of large public federal indebtedness. I can for the present follow in the path of my predecessors in the office of the secretary of the treasury. It is not improbable that I may ask the attention of congress to the matter in the next annual report from this department." JOHN JAY KNOX.

UNIVERSAL SUFFRAGE. (See SUFFRAGE.)

UNIVERSITIES. *Purport of this Article.* In Europe the university has its definite character,

well understood by educated men, although it is not easy to define its functions within the limits of a single sentence. In the United States, on the contrary, the word is used carelessly, as if it were quite unimportant to remember its real significance. Sometimes it is applied to a strong institution which combines the four traditional faculties; and sometimes to schools of a very low grade, or to those which promote but a single department of knowledge. There are indications in many parts of this country that the true idea is hereafter to be more clearly recognized; generous gifts for such purposes have been made by states and individuals; and legislation has been sought in order that the university may hereafter be developed on a proper basis. In this epoch of munificent foundations, it is of the utmost importance that correct ideas should prevail among us; for, otherwise, the United States will remain behind the other countries of christendom in the highest department of education. — *Meaning of the Word.* Something may be gained by retrospect. The word university, which, in these days and in all the modern languages of Europe, has an educational meaning, was primarily a word of wider use. In its Latin origin it signified the entirety, the whole, the unit made up of individuals; thus *universitas incolarum oppidi* meant the community — *universitas canonicorum*, the company of canons. It was nearly equivalent to our word society or corporation. Gradually it was restricted to a society of teachers and scholars, and more especially a society in which several faculties were combined. Hence it came to signify an association in which all branches of knowledge were taught, especially the highest educational body in a city or country—the supreme “high school.” Sometimes *universitas* pointed to the governing authority of the corporation, while in contrast *studium generale* indicated its teaching function. *Societas magistrorum et discipulorum* was early employed as an almost synonymous phrase. In modern times the buildings, libraries, museums and other possessions of the corporation are often spoken of as the university. But in all legitimate uses of the word the idea has never been lost sight of, that the university is an organization for advanced instruction in the chief departments of knowledge; it is a high school in which the principal arts and sciences are taught. An essential element in its plan is comprehensiveness, or breadth; it is a unit made up of many constituents; a confederation under a sovereignty. — *To be distinguished from other Words.* Hence it is acknowledged by the best authorities, that a single faculty, whether of law, medicine, theology or philosophy, does not constitute a university. Such a faculty, however far its instructions may be carried, is too narrow to claim legitimately the title which belongs to a different and broader organization. Universities must also be distinguished from learned societies (like the Royal society, the French institute, the American academy, etc.), in which no instruction is offered; and they should

never be confounded, as they often are in this country, with colleges (corresponding to the German *gymnasia*, or the French *lycées*), in which youth are trained by well-known methods for the higher work of more advanced students. The university (like Oxford and Cambridge) may well include one or more colleges in its organization, as the greater includes the less, but the higher authority of the greater should always be recognized—as it is, for example, by such titles as these: Trinity college in the university of Dublin; the university of McGill college in Montreal; the college of agriculture in the university of California; and Adelbert college in the Western Reserve university at Cleveland. — In every true university, all departments of learning should find a congenial home as members of one family governed by one authority. Within their precincts, pupils trained for freedom by preparatory discipline should be encouraged to go forward in the pursuit of science, as deep as they will, as far as they can. The dangerous effects upon the mind of an individual, of his devotion to a single subject, will be counteracted by living among men who attach equal, if not superior, value to very different studies. With occasional exceptions, it may be stated, as a rule, that the self-taught man suffers from disadvantages which the society of other scholars tends to remove. Association in studies of a superior character, under some recognized combining and coordinating authority, is the most efficient method which is known for the development of talents, and also for the promotion of knowledge. Hence, under all phases of organization, the purpose of the university has remained the same; namely, to collect, weigh, perpetuate and disseminate systematic knowledge on important subjects, by the employment of eminent scholars in the instruction of properly qualified youth. — *Origin of Universities.* It is commonly said that universities had their origin in the thirteenth century, but this date can not be considered exact, nor can any one foundation claim unquestioned priority. The faculty of philosophy can be traced as far back as the sixth century when its courses included the *trivium* (grammar, logic, rhetoric), and the *quadrivium* (music, arithmetic, geometry, astronomy), the seven liberal arts, of which a liberally educated man should be the master (*artium magister*). A mnemonic hexameter* thus recalls the sequence:

GRAMM. loquitur; DIA vera docet; RHET. verba colorat;
MUS. cant; AR. numerat; GEO. ponderat; ASTR. colit astra.

In the eleventh and twelfth centuries, when the dawn of better things began to follow the mediæval darkness, schools of law grew up (as at Bologna), and of medicine (as at Salerno), and of theology in the monastic foundations. The first clear indications of the general study of philosophy are seen in Paris, where at length the four faculties began to co-operate in the government of students, and where, in 1209, the word university was employed in connection with the affair of

* Quoted by Hallam, Lit. Eur., i., 26.

Amaury de Chartres.* It is found in use, a few years later, at Oxford, where an aggregation of colleges had been growing up for many years, perhaps (though not certainly, nor even probably) since the days of King Alfred. The university of Paris early exerted an influence upon the organization of other high schools. Its methods, its regulations, its usages, were adopted in distant countries, and may now be traced in the history of English, Scotch, German and American foundations.—*Modern Notions of the University*. From this retrospect, let us turn to some of the modern statements of the proper scope of a university. Discussions on this subject have been rife in Germany, France and Italy, but for our purposes citations will only be drawn from British writers: for it is on the basis of English educational experience that American high schools have been organized.—In an article which was published in October, 1837, by Sir William Hamilton, the Scotch philosopher, the following remark is found: "We shall find no difficulty in proving that university, in its proper and original meaning, denotes simply *the whole members of a body* (generally incorporated) *of persons teaching and learning one or more departments of knowledge*;† and not an institution privileged to reach a determinative circle of sciences, and to grant certificates of proficiency (degrees) in any fixed and certain departments of that circle (faculties)."—In his efforts for the foundation of a Catholic university in Ireland, John Henry Newman, now cardinal, published, in 1852, a series of "Discourses on the Idea of a University," which begin with this sentence: "The view taken of a university in these discourses is the following: That it is a place of *teaching universal knowledge*. This implies that its object is, on the one hand, intellectual, not moral; and on the other, that it is the diffusion and extension of knowledge rather than the advancement. If its object were scientific and philosophical discovery, I do not see why a university should have students; if religious training, I do not see how it can be the seat of literature and science."—In 1868, during the discussions which related to the reorganization of Oxford, Goldwin Smith, then about to withdraw from his connection with that university, wrote as follows: "Experience seems to show that the best way in which the university can promote learning and advance science is by allowing its teachers, and especially the holders of its great professorial chairs, a liberal margin for private study; by this, by keeping its libraries and scientific apparatus in full efficiency and opening them as liberally as possible, by assisting, through its press, in the publication of learned works which an ordinary publisher would not undertake, and by making the best use of its power of conferring literary and scientific honors."—While the proposal was under consideration to

establish the Victoria university in Manchester (in 1862), Professor A. W. Ward brought forward some interesting evidence from the German renaissance, saying, among other things: "The renaissance age was in its way singularly alive to the uses of associated study; and if I may speak of different times, I may say in passing that there is no side of modern university life better worth not only preserving, but developing, than that of *combination in study*. Between teachers and learners, the laboratory and the seminary; among learners, their own associations connected with the studies of their academical life—are the real and necessary supplements of the lecture room." And again: "A well-organized system of university education should carefully lead from a common basis of sound general training to the several main branches of study, and in these again leave room for the closer pursuit of special lines of research."—In a consideration of the "Future of English Universities," Professor James Bryce (1883) urges that these foundations should aim to attract and educate the whole nation [meaning all classes of the nation]. Secondly, he argues that "it is their business to offer to all comers the best possible teaching on every subject—that is, to attract the most learned, skillful and energetic men, give them a platform to speak from, set them to teach, both by public oral instruction and by showing pupils how to study, and give them every motive of honor and interest for doing their best as teachers." Thirdly, he speaks of what can be done for the advancement of letters and sciences; and finally, he calls attention to the importance of "bearing a part in movements for improving the education and raising the culture of those who can not come to the university as students."—This modern conception of the university is most completely worked out in the German empire and in Austria, where, under the control of each state (Austria, Prussia, Baden, Saxony, etc.), the system of public instruction is crowned by one or more universities. Those Germans only can gain access to the lecture rooms who bring the certificates of thorough preparatory discipline, though foreigners are welcomed on terms less rigid. The ultimate authority is the government, which is bound to supply the requisite financial support, has the appointment of professors, and prescribes the general regulations. But within these limitations the professors are free to give such instruction and by such methods as they think wise, and their wishes are usually, if not always, considered by the sovereign authority in the state. In fact, the professorships make the university. As a rule, the universities have four faculties—philosophy, law, medicine and theology. Sometimes there are two divisions—Catholic and Protestant—in the faculty last named; and, in a very few instances, the faculty of philosophy has been subdivided, but the general sentiment at the present time is adverse to such sections.—The universities of Switzerland, Sweden, Norway, Holland, Russia, etc., are largely influ-

* The disciples of this philosopher were condemned for heresy by a council held in Paris in 1209.

† The fault of this definition is that it might include a kindergarten, or a school of Choctaw.

enced by the example of Germany and Austria. The development of universities in England has been quite different. Oxford and Cambridge have perpetuated the idea of collegiate discipline under university control; but, whatever may be the nominal rule, actually the colleges control the university. The Scotch universities have other peculiarities. Ireland has still a different system. France, again, has an organization of its own. Until 1875 (when a law was passed making university education free), there was but one university in France, and that had control, under the government of the state, of all the faculties. It has lost its exclusive powers, but is still an administrative, teaching and examining authority, with jurisdiction over the public foundations, not alone in Paris, but throughout the state. — *The Essentials of a University*. Gathering up the experience of the past, and comparing it with what is now in progress, it is safe to say that these are the essentials of a university which shall be worthy of its noble name. The first requisite is a superior staff of teachers—men gifted with unusual powers, proficient in particular departments of learning, trained to habits of exact inquiry, and skilled in the art of presenting what they know. It is the business of such men to inspire as well as to inform their pupils; to show the right method of study, as well as to bring forth ascertained results. This function is best exercised by meeting students face to face. A library can never take the place of an assembly of living teachers, though books are made efficient by the teacher's presence. Even in the advancement of knowledge, experience has shown that the most successful agents are superior teachers engaged in the tuition of superior scholars. The university must therefore, in the second place, bring together a company of pupils qualified to profit by the guidance of the professors. For both, in the third place, books, collections, instruments and buildings must be liberally provided. Fourthly, examinations must be held, in order to ascertain what progress has been made in study. The bestowal of academic degrees and prizes should be made to stimulate intellectual exertion, and to protect the public against pretentious ignorance. In the fifth place, universities may be called upon to pronounce opinions for the benefit of the public upon important matters in dispute. Sixthly, universities should promote the publication of learned treatises which would not otherwise see the light, either by the maintenance of a printing press, or by giving their corporate sanction to works of unusual importance. — *University Education in America*. The condition of university education in America can not be understood without reference to our history. The earliest settlers in New England and in Virginia brought with them the idea of a liberal education as it was provided at the beginning of the seventeenth century by the English universities. At least ninety university men had immigrated to New England prior to 1648, about three-fourths

of them being from Cambridge, and one-fourth from Oxford.* At that period in England college life completely overshadowed university life. Residence within academic walls, tutorial discipline, ecclesiastical obligations, were much more important elements in the system than the bringing together of eminent professors and requiring attendance upon their lectures. Harvard, Yale, and William and Mary, the three foundations of the seventeenth century, were colleges in the definite and restricted English sense, though they exercised the right to confer degrees, even in faculties where no instruction was provided. Their younger sisters, in New York, New Jersey, Pennsylvania, New Hampshire and other states, were planned upon the New England model. Down to the close of the revolutionary war the highest schools of the colonies were colleges, and nothing but colleges. The year of the peace, 1783, was marked by the foundation of a medical faculty in connection with Harvard college, but it was more than thirty years before the faculties of law and theology were added. In New Haven, also, the medical faculty was the first addition to the college faculty, in 1813, and several years later came the faculties of theology and law. Gradually the college faculties of Harvard and Yale have been greatly expanded, and now correspond closely with the German faculties of philosophy, although engaged in the instruction both of graduate and undergraduate students. It thus appears that the two foundations which have become at the present time the most completely organized universities in this country, include a group of faculties grafted upon a college stock. The same mode of development is in progress elsewhere, with more or less success. For want of a better name, this type may be called "the collegiate university." As the foundations were laid in the interests of the church, the term ecclesiastical university might be thought more appropriate. It is still the form of development preferred by many of those who have watched the steady and successful growth of the older institutions. — But it is not the only type. As early as 1812, the state of Maryland authorized the college of medicine (incorporated four years before) to annex to itself "the other three" colleges or faculties, viz., law, divinity, and arts and sciences. Of these faculties two have continued until now. Upon a similar plan, in 1826, the university of Virginia was organized by Thomas Jefferson, who disregarded the historic foundation of William and Mary for an institution of much broader scope. He brought out the continental notion of a university as quite distinct from the college. He did not favor the ecclesiastical organization which prevailed in the original American establishments; but induced the state, as a purely civil government, to give name, funds and authority to the university of Virginia. The success of this institution had much influence, especially in the new states, where, however, the traditions of New England were still powerful. Thus

* So ascertained by Prof. F. B. Dexter.

the second type, "the state university," has been developed in Michigan, Wisconsin, California and many other parts of the Union. The bestowal of public lands for university education has greatly helped this class of institutions, but for a long time to come there is likely to be friendly rivalry between the advocates of colleges under ecclesiastical or denominational control and the friends of freer and more comprehensive universities under legislative control.—A third type of university organization is beginning to appear, quite distinct from the historic collegiate or the modern state universities. Individuals are giving large sums of money to endow universities, organized under special acts of incorporation more or less private in their character. The gift of Rich, in Boston; of Cornell, in Ithaca; of Packer, in Bethlehem; of Johns Hopkins, in Baltimore; and recently of Tulane, in New Orleans, are examples of this tendency. The large funds thus bestowed, at a period when the country is awakening to the need of university work as distinguished from collegiate, are very significant. This type may be called "the privately endowed."—Mention should also be made of a fourth form of university organization, of which the chief example is the university of the state of New York, wherein, with the authority of the state, a supervision is exercised, of a very gentle but definite nature, over the colleges and seminaries of the state. No instruction is given by this university, and the only degrees conferred are honorary. This is "the supervisory type."*—The embodiment of authority in a university is a problem of much difficulty in this country, where the decentralization of civil government is so complete. European precedents have but little value here. The governing bodies of Harvard and Yale are close corporations, having exclusive responsibility for their proceedings under their charters. For the state universities, trustees or regents are sometimes elected by popular vote, and are sometimes appointed by the governor or the legislature; they have even been considered civil officers (as in California), liable to be removed or superseded at the pleasure of the legislature. Gradually the usage is coming into vogue of allowing the graduates of an institution to have a voice in the election of the trustees. In some places the president is the head of the legal corporation, as well as of all the faculties. He is the lineal descendant of the ancient rector, or chancellor, and has corresponding powers. In other institutions he is a member of the corporation, but not its head. Elsewhere he has a seat among the trustees, but has no vote. In some places he is precluded from listening to their deliberations, and is only

* It is proper to add, that two or three instances of fraudulent universities have been detected and crushed. They were simply scandalous ventures of unscrupulous persons to entrap the unwary into purchasing diplomas—and would not here be mentioned were it not that foreigners have sometimes been misled by announcements which to every educated American are obvious frauds. These sporadic appearances are counterfeit, not entitled to any nomenclature.

an agent or executive officer. Consequently his functions vary, from those of a king in council to those of a servant in livery. Usually the professorial responsibility is limited to the instruction and government of the students, and does not extend to the selection of their colleagues, the management of funds, or the construction of buildings—functions retained by the trustees. In consequence of these uncertainties, the educational growth of new foundations has generally been less steady than it should be; a wavering policy has been followed. It has been found difficult to retain the services of good men, particularly in the executive or administrative office; and probably for a long while to come, with now and then an exception, our institutions, especially those of the second type—state universities—will suffer from this fact. Stability is of incalculable value in a seat of learning; instability will sooner or later result in the casting off or slipping away of valuable teachers. In the long run the success of universities will be promoted by entrusting the chief powers to the professoriate, with supervision and support from a body of educated trustees.—University degrees have varied very much in their significance and value. Originally, they were steps in the academic life. The bachelor had attained to one rank; the master or doctor, to a higher. The right to bear these titles was also the right to enjoy certain corresponding privileges; and it was carefully guarded by examinations, certificates and regulations, like other social positions. This dignity of academic titles has diminished in modern times, partly because they have been distributed almost haphazard, as bonbons are thrown to a carnival crowd; partly because they have been conferred by some universities in Germany *in absentia*, and for pecuniary returns; partly because of the extravagant distribution of honorary distinctions, especially in this country, where the height of absurdity has been reached; and partly because so many variations of the academic titles have also been introduced in this country, that their meaning is lost sight of. Fortunately, signs of reaction against these bad usages are visible, and possibly degrees may yet be restored to their former significance.—From this brief review, it is apparent that the American universities are likely to be the outgrowth of our own free institutions, ecclesiastical and civil, and of the outpouring of private generosity. They are not likely to be based upon English, German or French models, but are to be benefited by the experience of all existing foundations. They are to be truly American, in the sense of being adapted to our schools, our history, our laws, our ways, our land. It may be long before they equal in magnitude and renown the historic foundations of the old world; but if they succeed in enlisting and retaining illustrious and powerful teachers, their success will be assured.

D. C. GILMAN.

USURY. When every one produced nearly everything that he consumed, and commerce con-

sisted in almost accidental exchange, loaning was only a friendly service or charitable act. Morality or religion might then have justly branded the greedy man who made a vile use of the distress of his neighbor. But the relations of men to one another increased, and became complicated; in one way or another capital came into existence. Here, a conqueror took violent possession of lands, houses and animals; there, a pirate came to shore loaded with booty; elsewhere, wealth was accumulated by labor and saving. The surplus thus acquired (whether rightly or wrongly) was transformed into capital by the employment which was made of it. For, it is the use for which an object is intended which constitutes it capital. By the force of things the remunerated loan gradually lost part of the reprobation which attached to it, and interest was enabled to establish itself, but not without a struggle. Unfortunately, capital long remained a monopoly, and the loaning of it was necessarily dear, and all the dearer since loans were made in the beginning less by industry than by luxury and dissipation. The capitalist drew from his possessions all that he could; this he had a right to do, a right which, doubtless, he sometimes abused. Hence governments, having been long accustomed to look upon *subjects* as minors, believed themselves obliged to fix the rate of interest. Since then times have changed; labor has become more general; the sciences have pointed out the means of increasing its products by rendering it more efficient; wealth has accumulated in the hands of many; there is competition among lenders; and now luxury is scarcely ever, and industry almost always, the borrower: yet in certain countries prejudice has preserved a restrictive legislation. This is much to be regretted. The hiring of capital differs in nothing from that of any other object; and its price, too, depends on the action of demand and supply, as do the prices of all objects. In this world all abundant things are cheap, and all rare things dear. Human laws are powerless to modify this natural law, to which we may apply the words, *dura lex, sed lex*. — Restrictive laws on the subject of usury can only aggravate the evil which they propose to prevent. Interest is composed of at least two elements: 1, the remuneration of the service rendered by the loan (or, which is the same thing, the compensation which the lender imposes on himself); and 2, insurance against the risk of loss. Solvent and honest borrowers may, by a combination of unfavorable circumstances, find it impossible to return the principal. There are times in which these circumstances become frequent; and if the law prevents the capitalist from insuring himself against loss by his proportionately raising the rate of interest, one of two things will happen: either the capitalist will abstain from giving credit, or he will raise the rate of interest by the addition of a third element, insurance against the risk of punishment. — A pretense is made to justify the limitation of the rate of interest, by the obligation of protecting the needy person who borrows. Many

objections to this immediately present themselves to the mind. 1. If the borrower agrees to pay the price, the reason is, that the service rendered him does not seem to him too dear; a man may borrow at 20 or 30 per cent. if he foresees that he can gain 40 per cent. 2. Is the case that of a spendthrift? You can not prevent him from wasting his fortune; if he does not do it in one way, he will in another. 3. Why not put one's self at the lender's point of view also? If the return of the funds he loans seems to him more or less doubtful, why should he not have the right to cover his risk? 4. What difference is there between goods and money? and can not the former be sold legally at any price one wishes? 5. Lastly, admitting that some abuses are inevitable (and where is abuse wanting?), must we interfere with the use which is frequent, nay daily, to reach some abuses which are relatively rare? Are these abuses sufficient to warrant the putting of all those under the guardianship of the law, who for one reason or another desire to borrow? It is of general utility that trade in money should be as free as trade in merchandise; fraud alone should be punished. Moreover, to limit the rate of interest we should know what its *normal* rate is. But who can fix it? The legal rate is 5 per cent. in France, and 10 per cent. in Algeria. What is the legal rate in Turkey? What was the legal rate at Rome or during the middle ages? — The arguments we have just given have not escaped legislators, and in many countries the crime of usury has been blotted from the penal code, and gradually it will be blotted from the penal codes of all countries.* (Compare INTEREST.) MAURICE BLOCK.

UTAH, a territory of the United States. Its area was a part of the first Mexican cession (see ANNEXATIONS, IV.); and at the organization of

* Instead of the prohibition of interest which prevailed in mediæval times, most modern states have established fixed rates of interest, the exceeding or evasion of which, by contract or otherwise, is declared null and void, and is usually punishable as usury. If the fixing of the rate is intended to depress the rate of interest customary in the country, it uniformly fails of its object. If governmental control were great enough, vigilant and rigid enough, which is scarcely imaginable, to prevent all violations of the law, it is certain that less capital would be loaned than had been, for the reason that every owner of capital would be largely interested in employing his capital in production of his own. More capital, too, would go into foreign parts, and there would be less saved by those not engaged in any enterprise of their own. All this would happen to the undoubted prejudice of the nation's entire economy. — If, on the other hand, the control of the government be not great enough, the law would, in most cases, be evaded; especially as each party, creditor as well as debtor, would find it to his advantage to evade it. The latter, who otherwise would not be able to borrow at all, is, as a rule, more in need of obtaining the loan than the creditor is to invest his capital. How easily, therefore, might he be induced to bind himself by oath or by word of honor? He would, moreover, be compelled to pay the creditor not only the natural interest and the ordinary insurance premium against loss, but also for the special risk he runs when he violates the law threatening him with a severe penalty. Hence the last result of usury laws is either a material enhancement of the difficulty of obtaining loans, or an enhancement of the rate of interest. — WILLIAM ROSCHER.

the territory, by the act of Sept. 9, 1850 (see COMPROMISES, V.), it contained 220,196 square miles. Since its organization it has been largely reduced by portions which have been taken from it and added to Colorado, Nebraska, Nevada and Wyoming. It is now a compact, nearly square territory of 84,476 square miles. Its population, by the census of 1880, was 143,963, so that it is the most populous of the territories, if we except the District of Columbia. Its capital is Salt Lake City, and its governor (1880-84) is Eli H. Murray. — The American territorial system (see TERRITORIES) is essentially and altogether an adjunct to the federal system. A more complete antipode to the mercantile colonial system of a century ago could hardly be stated or imagined. The American territory is practically under the absolute control of congress; and yet it is never thought of except as on the way to self-governing statehood. It is useless, indeed, is worse than useless, unless it is considered as an inchoate state. And yet here is a territory, already containing the full voting power of a congressional district, whose possible statehood not only is unconsidered, but would be considered only as a worse peril to American institutions than its present absolute government. The territory of Utah is the anomaly of the American system; and the question of its proper treatment is one of the most serious and perplexing problems of American politics. It has two distinct aspects, that of Mormon polygamy, and that of the Mormon hierarchy. In considering them, two features of the American system must be constantly kept in view. 1. The subjects of marriage and divorce are exclusively state concerns. Congress may forbid polygamy in a territory, but, as soon as the territory becomes a state, its legislature acquires entire control of marriage within its jurisdiction. If any of the present state legislatures should abolish their penal laws against bigamy, and either expressly or tacitly permit plural marriages, there is no power outside of the voters of the state which could intervene. 2. Once a state, always a state. When a state once secures the power of self-government, whether by surprise, by secret purchase, or after deliberate consideration, no power can legally revise the action of congress in the admission: even congress is unable to reconsider its action, and the state is equally unable to forfeit its position, except by expressly abandoning its statehood and expressly demanding a return to a territorial condition. (See RECONSTRUCTION.) Mr. S. G. Fisher, as cited below, some twenty years since stated and advocated what he considered as the right of congress to expel a state, or the right of a state to secede with the express permission of the same congressional authority which admitted it: but this view has never been accepted. One of the fundamental provisions of the constitution is, that not even an amendment shall be passed to deprive any state, without its consent, of its equal suffrage in the senate. The population of a state may diminish to almost *nil*, or its moral conditions may be shock-

ing to the rest of the country, but its statehood must continue as long as it demands it. — *Mormon Polygamy.* The growth and conditions of this institution have been elsewhere stated. (See MORMONS.) The revised statutes of the United States prohibit polygamy in the territories, and jurisdiction of offenses against the prohibition is in the federal courts of the territories, with a power of writ of error, by act of June 23, 1874, from the United States supreme court to the supreme court of the territory. This was found ineffectual from the difficulty of obtaining evidence; and the stringent "Edmunds Act" was passed March 22, 1882. — The provisions of the Edmunds act are, in general, as follows: 1. The offense of bigamy (U. S. Rev. Stat., § 5352) is restated, and made punishable by fine and five years' imprisonment. 2. Cohabitation with more than one woman is made a misdemeanor, punishable by fine and six months' imprisonment. 3. Jurymen may be challenged for being guilty of bigamy or of unlawful cohabitation, or for believing it right to commit such offenses. 4. The president is authorized to grant amnesty for past offenses. 5. The issue of Mormon marriages up to Jan. 1, 1883, is legitimated. 6. Bigamy, polygamy and unlawful cohabitation are made bars to voting and to eligibility for election or appointment to any office under the territory or the United States. 7. All the registration and election offices of Utah are declared vacant. 8. Five commissioners are to be appointed by the president, with exclusive power to appoint subordinates for the purpose of registering voters, conducting elections, receiving or rejecting votes, canvassing and returning votes, and issuing certificates. 9. Mere *opinion* as to the right of bigamy or polygamy is not to be a bar to a seat in the legislature. — The first election held under the provisions of the Edmunds act resulted in an almost exclusively Mormon legislature, devoted to the maintenance of the corporate right of the church of latter-day saints to hold and enjoy its wealth. It is very evident, that, while polygamy is to be retained as a distinguishing mark for a peculiar people, it is to be practiced only by those who have an exclusively ecclesiastical ambition, and that the church will always take care to have monogamists ready to care for its political interests. No one can suggest any further step in the direction of the Edmunds act, except to make *opinion* a bar to a seat in the legislature. And that would mean the temporary abolition of legal government for Utah, and the relegation of government functions to the moral control of the church, through its unofficial courts of arbitration. — As a final remedy, it has been proposed to adopt an amendment to the constitution, prohibiting polygamy in the United States, and empowering congress to enforce the prohibition. An amendment to that effect was introduced at the opening of congress in December, 1883, but has not yet been acted upon. It may be that such an amendment, with appropriate legislation to back it, might solve the problem and make it safe to admit Utah as a state.

But considerable caution should be felt in coming to this conclusion after our experience with the fourteenth and fifteenth amendments. They were supposed, at the time of their passage, to be so carefully framed that they had transferred the protection of the civil rights of the enfranchised negro race to congress. But the supreme court has decided, in effect, that these civil rights were primarily under the protection of the states; that a diminution of the power of the states must be express to be valid; that these amendments gave to congress only a veto power over unconstitutional state legislation; and that individual offenses are still in the domain of the states. Why may not the proposed anti-polygamy amendment meet the same fate? Suppose that Utah is admitted after the amendment is passed; and that her legislature as carefully refrains from passing laws permissive of polygamy as from punishing polygamy by individuals. May we not then find that the sixteenth amendment is as much of a practical delusion as its two predecessors? And it will then be too late, it must be remembered, to return Utah to a territorial condition. Surely the hazard of such a chance is too great to be taken. — The only alternative seems to be to limit the sphere of the states by words that can not be mistaken or evaded, and to add to the powers of congress that of exclusive legislation, by general laws only, on the subjects of marriage and divorce within the United States. Utah might then be admitted with absolute safety, for no legal argument could emasculate such an amendment. Bigamy and polygamy would then be federal crimes; and no marriage would be valid, or its issue legitimate or capable of inheritance *ab intestato*, unless the marriage had been contracted according to the forms prescribed by a federal statute. Growth of population, wealth and culture in Utah would only increase the force of the influences, material and moral, which would aid the amendment to enforce itself. This remedy, succeeded by the immediate admission of Utah as a state, seems to the writer the only remedy for polygamy in the territories which holds out a fair promise of final and permanent success. It is open to the objection that a two-thirds majority in both houses of congress, or simple majorities backed by the president, might force free-love on the United States. But, if that time should ever come, all would be lost; and our posterity would be too busily engaged in guarding fundamental interests to have time to spare for Utah. The danger is on a par with that of the suspension of the privilege of the writ of *habeas corpus*; and is only one of a class of dangers which a democratic republic must meet and surmount or die. — *The Mormon Hierarchy*. Federal officials, who have honestly endeavored to execute federal laws in Utah, are almost unanimously of opinion that a greater danger than polygamy is in the Mormon hierarchy, supported by the immense resources of rigidly exacted tithes, bulwarked by the fanatical obedience of the people, and willing, if it could see its way

clear, to turn secret into open rebellion. Governor Murray, late in 1883, gave very forcible expression to this view in a newspaper interview, and urged strongly that the whole territory should be placed under an absolute military despotism until the hierarchy should be crushed out. One who has not been upon the spot must speak with diffidence upon such a subject. But, from all the information open to reach, it seems probable that this view is only the natural outcome of unsuccessful contest, and that the fate of the Mormon hierarchy is conditioned by that of Mormon polygamy in the following fashion — Polygamy seems to be primarily purposed to make the Mormons a "peculiar people," to give them a sense of homogeneity which the other elements of their "faith" will not supply, and thus to secure an obedience founded on faith rather than on force. Secondly, it has divided the Mormon leaders into polygamists, with church ambitions, and monogamists, with political ambitions. To the polygamists are given the present and future honors of the church, and the pleasure and profit of managing an enormous church revenue, without responsibility of accounting, except to the hierarchy. To the monogamists are assigned the present political honors of the territory, and the future political honors of the possible state. It is plain, from the results of the Edmunds act, that the monogamists, though at present of a humbler rank, are not only important, but absolutely essential, to the polygamists. Without the political auxiliaries, the hierarchy would be powerless; with them, it can endure patiently, labor, and wait with hope. To cut off the political auxiliaries would be to cut off hope. It seems to the writer, then, that the mistake has been in aiming all operations at the polygamists, while every blow fell harmless on the monogamous shield before them. The true policy would be to strike at the monogamists, to push them into a compulsory choice between their allies and their own hopes of political preferment. What blow would do so more effectually than the passage of the marriage and divorce amendment, followed by the admission of Utah as a state? If a record of conviction for bigamy, or for aiding a bigamous marriage, is to be a bar to office-holding, to citizenship, and even to voting, how long will political leaders, in the hot conflicts of real state politics, hold to an organization which can not even provide them with votes? Whichever side the church takes, it must bring votes in its hands. Mormonism is a democracy of revelation, in which a revelation is tested by its general acceptance. A new monogamous revelation would thus be the inevitable result of the gift of statehood, if we could give it safely; and such a revelation would only result in the disappearance of the Mormons as a "peculiar people," and the downfall of the hierarchy. Separate the political monogamists from the ecclesiastical polygamists by the marriage and divorce amendment; fling the apple of discord among them by granting statehood and introducing state politics;

and it seems evident that the problem of the hierarchy will be found to be only an outgrowth of the problem of polygamy, and that they stand or fall together. — It is not intended to make polygamists and ecclesiastical leaders exactly coincident classes. Some of the ecclesiastical leaders are certainly monogamists, but they are exceptions. — Authorities will be found under **MORMONS**. See *9 Stat. at Large*, 453 (act of Sept. 9, 1850); *Fisher's Trial of the Constitution*, 173.

ALEXANDER JOHNSTON.

UTILITY. This word has the same meaning in politico-economic language as in the usual vocabulary. What it designates, in things, persons or acts, is the power they have of rendering us some service, the service, for instance, of sparing us certain privations, inconveniences or suffering, or of procuring for us satisfactions and enjoyments. Economists, however, employ the word in the plural, when, instead of considering utility as an abstraction, made up of every distinct particularity, they look upon it as it exists in different objects with differences of nature and destination. — The first distinction to be made between utilities is, that there are natural and artificial utilities. Natural utilities are those which supply the necessities of our existence without our having to do anything to obtain them. Such are the utilities furnished us by the air which surrounds us, by the heat and light which the rays of the sun bring to us. These utilities are the work of nature entirely. Nature makes them a gratuity to us. Artificial utilities are those which we obtain only at the price of more or less painful efforts. It is for us to learn to produce them, and we never acquire their possession and use, except for some consideration or on the performance of certain services. — Political economy has scarcely anything to do with natural utilities. It may say that they are not all spread in the same measure over all parts of the globe; that there are no two regions in which heat, the force of the wind, water or arable land, is distributed in exactly like proportions, and that such a fact exercises a necessary influence on the modes of the activity, the facility of the development and the destiny of the populations of those regions; but here ends what political economy has to say about them. We are here in presence of a phenomenon whose essence it is not given to man to change, for it emanates from laws over which his will can not possibly have any efficient action. Everything, on the other hand, which relates to artificial utilities belongs to the domain of political economy, and challenges its investigation. — To produce utilities is all that it is in the power of men to do. When nature placed matter at their disposal, it did not wish that they might have the power to add one single particle to it. All they can do is to change the place of, to separate, to combine and to transform the elements of matter in such a way as to cause them to acquire properties which they do not possess in their raw state. The labor of

men consists only in giving the things on which it is brought to bear qualities and forms which adapt them to use; more than this, human labor can not do. Nature has reserved creative power to itself entirely; to men it has granted only the power to utilize its gifts. — It is easy to conceive that human labor can propose to itself no end but that of producing utilities. All labor involves pain and fatigue, and no one would surrender the sweets of rest if he had not in prospect the compensation which is the reward of labor. But there is no work which can reap reward unless it produces fruits endowed with some quality. Mistakes may, indeed, be made in this respect; it may be, that, from ill-advised endeavors, the results which the men who made them promised themselves may not come; but these are mere accidents. In the normal state of things, there is no labor which has not the production of pretty manifest utilities for its object, utilities sufficiently desired by others to make the advantage of disposing of them compensate for the sacrifices necessary to the obtainment of them. — In proportion as nations become enlightened and wealthy, they strive to produce utilities more diverse and in greater numbers. After those utilities which serve to satisfy the principal necessities of life, they create others which answer only factitious wants and tastes, which grow more and more elegant and refined. It is the eternal task of nations to seek for and endeavor to obtain all that can add to the well-being already acquired, to the satisfactions already enjoyed; and the better they accomplish this task, the higher is the degree of power and prosperity which they attain. — Artificial utilities, those which are the fruit of man's own labor, have given rise to distinctions. At first they were divided into material utilities and immaterial utilities. The former are those utilities which man communicates to matter, which he fixes and incorporates in matter either by changing its place or form; the latter are those which do not assume a form either tangible or ponderable. These latter again have been divided into two categories. To the first of these categories belong such utilities as are incorporated in persons, and fit them to render services to themselves or to others. Utilities attached to talent, to information or knowledge, are of this kind, as are also utilities whose use is beneficent and profitable. To the second category belong those utilities which emanate from services and acts that produce no change in the productive capacity of persons or in the condition of things. Of this latter kind are the utilities which result from the labor of judges, soldiers, public functionaries, physicians, lawyers, musicians and actors. These utilities may answer to very real social wants; but they have not, at least in appearance, directly reproductive effects; neither are they susceptible of accumulation or duration. — Utility is produced under forms so diverse that it would be easy to add to the number of these classifications and to establish new subdivisions among them. But it

is in view of the correlations and affinities which exist between utility and wealth that the classifications we have made have been admitted; and the ideas or notions to which they answer merit serious attention. The term utility is a generic one; and everything which, it matters not by what way or in what manner, has the power of satisfying our wants or relieving our sufferings, of contenting our desires, or contributing to our pleasure, possesses the quality characterized by the term utility. The meaning of the word wealth is a more restricted one. Although there can be no wealth whose basis is not utility, utility alone does not suffice to constitute wealth; it constitutes wealth only by allying itself in things to certain qualities of a particular order. Most assuredly natural utilities are indispensable to us; but as every one uses these utilities at pleasure, and gathers them without cost of any kind, and as they are not susceptible of private appropriation, it would be wrong to apply the term wealth to them. What constitutes wealth is *exchangeability*, it is the value things owe to the possibility of procuring us, by our delivering them to others, this quantity or that of other things. All economists, however, do not admit that exchangeable utility, or utility having a price, is sufficient to give things the name of wealth; they claim, that, in order that that name should properly belong to the things in which this utility is to be met with, these things should, besides, be susceptible of accumulation and duration; in other words, that they should exist under a material form. It is easy to see, that, according to the definition given to the word wealth, the number of utilities which is admitted to constitute a part of it, must increase or decrease, and that the classification adopted by some writers should not be adopted by others. Be this as it may, the question of immaterial products and unproductive labor is the one that suggests itself *à propos* of utilities. Of artificial utilities, there are some which are not converted into material wealth or into the means of producing material wealth; such utilities are considered by some writers as unproductive; and, in the eyes of these writers, the labor to which the utilities just referred to is due is in as much disfavor as sterile labor. Whatever the distinctions that may be established among the different kinds of utility, it is a mistake to suppose that there can be any utilities which do not contribute more or less actively to the production of all the others. All the utilities which man succeeds in realizing have the same destination, the improvement of his lot; they all assist one another, combine with one another, and mutually fecundate one another, in such a way that those least material are as much as the others essential to the formation and accumulation of wealth, and serve as much to produce it. — Take wealth in the form under which that name can be least denied it, the form of utilities fixed and incorporated in material objects: such wealth can be produced only with the aid and concurrence of immaterial utilities. It is intel-

lectual conceptions that the workman realizes in his action on matter; it is the knowledge he has acquired that decides the success of his work; and the more precise and extensive this knowledge is, the more fruitful are his efforts, and the more do these efforts increase the things they are intended to produce. But in what does knowledge consist if not in the acquisitions of the mind? And is it not certain that the nations which possess most knowledge are those which obtain material wealth in greatest abundance? Assuredly nothing is more indispensable to the production of material wealth than the formation and accumulation of the capital the employment of which that production necessitates. But it is to the action of utilities of the moral order that the creation of capital is due. It is love for one's family, temperance, economy, and care for the future, which determine or permit the making of savings. If these qualities were wanting, no one would lay by, in order to reap a remote advantage from them, resources whose consumption would increase the well-being of the present; and there can be no doubt that the countries in which these qualities are found are always those in which capital continually extends its conquests and increases wealth most rapidly. — Many economists admit rightly that the knowledge, skill and constancy of artisans and workmen are as much a part of the wealth of a country as the tools, machines and instruments which they use. Doubtless these kinds of utilities contribute powerfully to the formation and increase of wealth; from the point of view of the production of material wealth, there are, however, between them and the utilities which become incorporated in persons, differences only as to the modes in which their action respectively becomes manifest. And, in fact, that labor may produce wealth, it is not sufficient that it be enlightened, active and intelligent; it is further necessary that those who perform it be certain of reaping the fruits of their endeavors. But it is to insure this very certainty that the work of judges, magistrates, and even of armies, is intended; and such is the utility which results from the performance of such work. If the laborer, the manufacturer and the merchant display all the activity of which they are capable; if they make savings in order to extend the field of their operations; if they seek for and apply to production better and better processes, it is only because they have faith in the efficacy of the services of all those who are charged with guaranteeing the security of person and property. The utility produced by the prosecution, sentencing and punishment of crimes and misdemeanors, does not vanish, as is supposed, with the acts in which it is embodied; on the contrary, it continues to subsist in the minds of all, intimidating those who might be tempted to do wrong, and demonstrating to others that neither violence nor spoliation can attack them unpunished, and that they may devote themselves to their work in security. We have seen the services rendered by the agents of authority cease to keep their habitual course; and,

at that very instant, we witnessed, too, the production of wealth affected by languor and discouragement; so true is it that in the kind of utility which these services produce, is to be found the most indispensable stimulant to the success and energy of industrial labor. — We may boldly assert, that nothing which is useful, nothing which serves to enlighten minds, to quicken the moral sense, to propagate healthy habits, or to guarantee peace and security among a people, can be without effect on the success of the efforts employed in producing material wealth. Those immaterial utilities even which seem the least productive; those even the obtaining of which, according to eminent economists, instead of making nations richer in material products, impoverish them to the amount of the sum total of material products consumed by the men employed in the service of the public, contribute their share to the formation of wealth; so true is this, that the formation or production of wealth would become impossible if the immaterial utilities above referred to were either entirely wanting or not to be found in the proportion required by the wants which they serve to satisfy. — We have still to examine one other correlation of utility with wealth. It is certain that utility is a necessary condition to wealth. A product incapable of rendering any service whatever, unfit for any use, would find no one willing to give anything whatever for it; it would, consequently, be wanting in all exchangeable value, that is, in the quality, lacking which, it could not become wealth. This constant association of wealth and utility could not fail to attract attention; and, therefore, many writers supposed that there must exist between them relations such that the one might serve as a measure for the other. Although this error is refuted in the article VALUE, we can not pass it over in silence here. Although the utility inherent in things depends, so far as the estimate made of it is concerned, on circumstances momentarily variable, it is none the less certain, looked at from the general point of view, that it has its measure marked by the species of wants to which it relates. Thus, that utility exists in the highest degree in those things which supply the prime necessities of life, necessities which must be provided for under pain of inevitable death. It exists, in an inferior degree only, in the things which merely serve to defend us against privations and sufferings which do not jeopardize life, and in a degree still lower in those things whose use has no effect but to procure us pleasure or amusement. This gradation of utilities, based on the very nature of the evils or perils attached to the non-satisfaction of the wants which they enable us to satisfy, is simple and easy to understand. There is no one who does not recognize and assert that utility is much greater in the alimentary substances, without which we would have to suffer the deadly pangs of hunger, than in the products to which we owe enjoyments, the privation of which would be attended by neither pain nor harm. — But if utility finds its measure in

the greater or lesser absolute exigency of the wants of our nature, that measure is far from being found again in the value itself of the things we may use, and far from contributing, according to their degree of distinction, to make those things integral parts, more or less considerable, of public or private wealth. It is in vain that the bread which nourishes us and the woollens that cover us are of prime necessity to us: that does not prevent an object which, at best, is good only to relieve for a moment the ennui of the person who buys it, being paid for at a price infinitely higher. The reason of this is, that there are men rich enough to give full rein to tastes and desires which others are entirely ignorant of or can not satisfy. Those to whom it is easy to provide for the most essential wants of life, think of procuring all the enjoyments compatible with the size of their fortune. It is not enough for them to be well fed, comfortably lodged and warmly clothed; they offer incense to pleasure, and seek it in everything. They must have things which charm the eye, which afford them delicate impressions and sensations, whose possession flatters their vanity, which sometimes borrow all their attraction only from a fancy or from the caprice of a moment; and the value conferred on these objects by what those who desire them are willing to give in exchange for them, assures to them, among things considered wealth, a much greater place than they would occupy if nothing but the quantum of real utility they contain were taken into consideration. — It is only when the products indispensable to the satisfaction of the wants of existence are lacking that the utility which they contain makes its empire felt, and becomes the dominating principle of their value. When the things which can be dispensed with without peril or injury cease to be supplied in sufficient quantity, fewer of them are bought, and the rise in the price of them has its limit in the reduction of the number of those who ask to acquire them. The same is not the case with those whose use no one can give up without running the risk of death. In times of famine men dispute the means of subsistence with one another. The rich, to procure bread, sell everything which ministers only to their pleasure. The poor despoil themselves of their furniture, their clothing and their shoes. People must then perish or assuage their hunger: each sacrifices to the first of all wants, that of self-preservation, everything which is not of a nature to satisfy that want. Such cases present themselves in besieged cities when their stores are exhausted, and in deserts when, devoured by thirst, the merchants crossing them give for a few drops of water the treasures carried by their camels. But in the normal condition of things, when all kinds of utility are to be found in their customary proportion, their particular destination or quality has no influence on the value at which they figure in exchanges or at which they are estimated in the sum total of wealth. What operates, then, across the variations in price due to the fluctuations of supply and demand, is the

amount of the cost of production of each.—These considerations suffice to show in what the correlation which exists between utility and wealth consists. If value attaches to things only on condition that they be gifted with the utility which alone has the power to render them exchangeable, the value in attaching to them by no means takes for its measure the character of that utility. It is the quantity of other things which each of them permits us to obtain that determines its value; and a precious stone, a pearl or a jewel which serves only to adorn the lady who wears it, has, with like weight and quantity, a thousand of times the value of the wheat or fuel without which we should fall victims of hunger or cold, but which costs little to produce, abounds in the markets, and sometimes has to wait for purchasers.—To resume. Nature gratuitously gives up to men certain utilities which all enjoy equally; it imposes on them the necessity of creating the others. Their labor can produce only artificial utilities, and never has any end but to produce such utilities. The utilities which human labor obtains are of various kinds: some, becoming fixed and incorporated in matter, communicate to it the qualities which constitute wealth; the others are not realized under a material form; they attach to the persons of men, fitting them to render services to themselves or to others, or they attach to acts or services the performance of which has for effect to insure to the individuals or nations to whom they belong, satisfactions, advantages or guarantees, the absence of which would infallibly react in an injurious manner on their interests and on their well-being. It must be remarked, that, although immaterial, these utilities contribute actively to the formation as well as to the accumulation of the products which constitute material wealth; from which it follows, that, even considered solely in their relations to that wealth, the labor by means of which it is obtained has a character of productiveness not less real than the labor which acts more directly on matter itself.—Utility is one of the constituent conditions of wealth; it is inseparable from wealth, but can not furnish a measure of wealth. The utility inherent in things is greater in proportion as the wants to which they are fitted to give satisfaction are more urgent and intense; the wealth inherent in things, on the contrary, is greater in proportion as the cost of production of the latter is greater.

HIPPOLYTE PASSY.

UTOPIA (from the Greek, *οὐ τόπος*, that which exists in no place, nowhere). The word is the invention of Thomas More; the title given by him to one of his works which soon became celebrated; but the thing is much older than the name. By utopia is meant a certain organization of society and of the state, to which imagination and the spirit of system contributes not most but everything, without examining whether it is realizable in a given place or time, and without investigating whether or not it is compatible, even in a general

way, with the moral and physical conditions of human nature. It follows from this, that the utopia necessarily changes character according to the system which produces it. And, in fact, there are religious utopias and philosophical utopias; idealistic and sensualistic, sensual and even materialistic utopias. Lastly, there are utopias which have their origin in pantheism; and this is true of the greater number of utopias. The pretension of Gregory VII. to make christendom a republic entirely subject, in things temporal as well as spiritual, to the sovereign authority of the holy see; a pretension afterward developed in a systematic form by the great theologians of the thirteenth and fourteenth centuries, is a religious utopia. The republic of Plato is a philosophical, and, moreover, an idealistic utopia. On the other hand, we observe the inspiration of sensualism in the doctrine of Fourier, the inspiration of materialism in the "Leviathan" of Hobbes, and in the "Positivist Catechism" of Auguste Comte, and that of pantheism in the reveries of Campanella and Saint-Simon. The utopia is, therefore, different from the ideal, although the ideal may sometimes be found in the utopia. The ideal which applies to society, as well as to the individual, raises us above what we are, to show us what we should be, and, therefore, can be. The utopia deceives us in regard to both, by placing before our eyes a chimerical goal, which may at the same time be a type of debasement and servitude; for it is impossible to create a new form of society, without concerning ourselves with the government adapted to it, and the best suited to preserve it. We, therefore, can not admit the distinction made by some publicists between the social utopia and the political utopia. Every utopia is necessarily both political and social.—The age of utopias does not begin, as is generally supposed, with Plato; it is much more remote. It would not be difficult, for instance, to demonstrate that the republic of the Hebrews, such as we may represent it to ourselves in accordance with the institutions and the laws of the Pentateuch (see MOSAISM), was in great part a utopia which was never realized; that that sacerdotal race, a *people of priests*, who acknowledged no sovereign but God, never existed; that the periodical restoration of inheritances to their primitive boundaries and of slaves to liberty, any more than the perfect equality of fortunes, was never put in practice. But we are quite willing to accept as the extreme bound of antiquity the history of Greek philosophy. Even in that history Plato is not the first utopist. Aristotle ("Politics," book ii., ch. v., vi.) introduces us to two utopists, more ancient than Plato, one of whom, Phaleas of Chalcedon, gave social order, as its principle, the most perfect equality, and the other of whom, a celebrated architect called Hippodamus of Miletus, having introduced regularity and symmetry into the construction of cities, desired to impose these same qualities on the organization of the state. Thus he demanded that the citizens, to the number of ten thousand, should be invariably divided

into three classes: artisans, laborers and warriors; or, according to other testimony, into magistrates, warriors and workmen; and that a distinct portion of the territory of the republic should be allotted to each of these three classes. The two probably belonged to the Pythagorean school, which both commanded and practiced a community of goods. But no one before Plato knew, as well as he did, how to give a body to these imaginary conceptions, and to make the most of them by the graces of poetry and the power of dialectics. We know that he has connected his name with two entirely distinct utopias, one of which is developed in the "Republic," and the other in the dialogue on the "Laws." Both, according to his own avowal, belong solely to the world of ideas, but the second is nearer to reality than the first. The first has for its object perfect unity, the unity which consists in entirely melting the existence of the individual into that of society, and the real person of the individual into the ideal person of the state; the second, in default of unity, is satisfied with equality, which is also a means, but an inferior means, to hold together, under the empire of a common law, the different parts of the body social. All the elements of which the two Platonic constitutions are composed are explained, and, to a certain extent, excused, in these two primary ideas. Thus, the three classes of citizens, or rather the three *castes* of the "Republic," answer to the three faculties of the human soul, the magistrates to the intellect, the warriors to the will or the sentiments, and the laborers to the appetite. And because the appetite should be subordinate to the sentiments, and the sentiments to the intellect, the same hierarchy should exist in the classes which represent them. The most important of these classes is, beyond contradiction, the class of warriors; for the rôle of the lowest class is reduced to obedience; and the magistrate or philosopher, once he has performed his task, once he has founded the city on the supreme laws of the intellect, has nothing more to do. This explains why it is that the warriors should afford us the expression of the ideal unity of which we have just spoken. Hence the community of goods and women which Plato, by restricting it to them, considers a sacrifice, and not a privilege. — It is evident that in this organization the human person and individual liberty count for nothing. They are not quite so entirely annihilated, but they are still oppressed under the régime of equality presented to us in the "Laws." For instance, the division of the territory having to remain invariable, it is necessary that the number of citizens fixed by Plato at 5,040 should be invariable likewise. So much the worse for the children born in excess of that fatal figure. They will be forced to emigrate. Sterile families will be obliged to complete their number by adoption. The law will see to it that personal wealth shall not disturb the equilibrium of fortunes. It will trammel industry, commerce and the increase of capital in such a way that industry, commerce and

the increase of capital will become almost impossible. *A fortiori*, the burden of the law is felt in what concerns marriage, the education of children, and wills. It prescribes, as it did in Sparta, meals in common, prohibits travel, except in certain cases of necessity or of the public interest, subjects to the inspection of the authorities the most intimate relations of life, and lays down the most inflexible rules for all the occupations it is so good as to allow the citizens to engage in. — Pagan antiquity affords no other examples of the utopian spirit; for we can attach no value to a few lost fragments like those of Hecateus of Abdera, of Evemerus and Theopompus, which are evidently only reminiscences of the ideas of Plato; and, as to the "republic" of Cicero, it is less a work of the imagination and spirit of system than of patriotism and the political passion; it contains only a partial apology for the old institutions of the Roman republic. — The middle ages bring us to the religious utopias, of which the boldest and most brilliant is assuredly the utopia of Gregory VII. Universal theocracy never existed except in the ambition of that great pontiff. The condition of the world at the period in which it was produced, and the general state of society, have always made it an unrealizable dream. But after it had met with the resistance of facts, the idea of Gregory VII. entered the domain of speculation. It took possession of philosophy and theology through the works of Thomas Aquinas, of Giles of Rome, and notably through the *De regimine principum* and the treatise *De ecclesiastica potestate*. Another utopia, hatched at the same epoch, between the end of the twelfth and the beginning of the thirteenth century, but which savors perhaps as much of philosophy as of religion, is that which bears the name of the abbé Joachim, and which is described in the "Eternal Gospel" (*L'Évangil éternel*). Joining the pantheistic principles of Amaury de Bène and of David de Dinant to some misconstrued texts of the Gospels, the adherents of this doctrine expected the reign of the Holy Ghost or of love to succeed the Son, as the Son had succeeded the Father. During this last period of our history, for which the two preceding periods had only paved the way, all differences and inequalities were to disappear from the earth, even the difference between vice and virtue; for all the passions were to be sanctified; the flesh and the spirit reconciled with one another, or rather, confounded together, were to cease their struggle for pre-eminence; and the suppression of war and a community of goods and of women were to make all men one family. — With the renaissance the purely philosophical utopia reappeared; and it was the minister of a despot, the chancellor of Henry VIII., Thomas More, who, in calling it back to life, gave it its real name. Everything in Thomas More's book is not chimerical. It contains an extremely profound and sensible criticism of the politics, the political economy and legislation of his time. And even when he seems to abandon himself to the caprice

of his imagination, when with complaisance he gives us an exposition of the laws and institutions of the country of Utopia, there is a distinction to be made between its political conception and its social organization. The former is simply a representative government, with a leaning toward the republic, having a senate, an assembly of the people, a president appointed for life, and election to all the degrees of power, spiritual as well as temporal. The latter is summed up in communism, with some of the elements which subsequently served in the construction of the phalanstery system. This is sufficient to convince us that the communism of Thomas More does not flow from the same philosophical system as that of Plato. The latter remains as much an idealist, even in its most deplorable applications, as the former inclines to sensualism. It is no longer with a view to their moral perfection, but in the interest of their common happiness, that men, according to the English philosopher, should renounce property. It is sufficient that this end be proposed to them for labor, grown both more pleasant and more fruitful, to satisfy all the wants of society. The day in this system was to consist of only six hours: three hours before dinner and three hours before supper. Fatigue was to be avoided by diversity of occupation; every citizen, exercising several professions at the same time, might alternately pass from one to the other. He would, therefore, have leisure enough to give himself up to all the enjoyments of study and conversation, and to taste the pleasures procured by the fine arts.—Thomas More, however, does not carry the illusion so far as to believe that all trades, without distinction, could lend themselves to this combination. He recognizes that there are rude and repulsive trades, which are carried on only from necessity. But these trades are to fall to the lot of the public slaves, reduced to that condition in expiation of their crimes, or purchased by the state in foreign countries. Thus we see the utopian spirit resuscitating, in the bosom of Christianity, the institution of the helots. We must remark, however, that the citizens themselves are not treated much better. The law, like the discipline of a barracks, or the rule of a monastery, intervenes in all the details of life. It prescribes what their clothing, their food, their work and relaxation shall be, and leaves not the least place for freedom or intellect.—If Thomas More thinks little of liberty, he has at least some regard for morals. He respects marriage, and, to a certain extent, preserves the rights of conscience by basing the national religion on deism. No such consideration for them is to be found in the system of Campanella, which is easy to account for, since pantheism is its basis. Pantheism confounds man, nature and God; it does away with the individual, and recognizes only the collective existence of society. This is precisely what Campanella does in his famous "City of the Sun." All the actions, and even the sentiments and thoughts, of its imaginary subjects, are submitted to an absolute

authority. The chief of this solar people is something like the Supreme Father in the Saint-Simonian system, that is, he is both a monarch and an infallible pontiff, a man clothed with the attributes of God. Under him are three ministers in the departments of wisdom, of power, and of love; and under these three ministers are divers classes of magistrates set over all the virtues and all the faculties, who assign to each man his rank, his task, and, according to the manner in which he performs it, his share in the enjoyment of the common goods; the community is not here founded with equality. And so, although women are in common, they can be enjoyed only in accordance with the rules established by the minister of love affairs, and only on the days, at the hours and under the circumstances most favorable to the improvement of the human race. Despotism was always dear to Campanella. In his "Discourse on the Spanish Monarchy," written many years before the "City of the Sun," he reaches this conclusion: the only and the true monarch of the world will be the sovereign pontiff; all peoples will constitute only one flock under the staff of only one shepherd; the king of Spain will play the part of the dog charged to bring back to the fold the sheep which have strayed away, and to devour them if they resist!—At the same time that Campanella was taking up the ideas of Gregory VII, and paving the way for those of Saint-Simon, Bacon was writing his "New Atlantis"; but there is no reason why we should concern ourselves here with that work, since it relates more to the reformation and reorganization of learned societies than to the reorganization and reformation of the state. It offers, as it were, an anticipated plan of the institute of France. Hobbes and Harrington had another aim. It is laws and institutions which they pretended to make over from top to bottom, after a preconceived model which they present us with, Hobbes in the "Leviathan," and Harrington in the "Oceana." Although diametrically opposed to each other in their principles, since the former, in the name of materialism, invites us to servitude, whereas the latter, appealing to our moral dignity, urges us on to the conquest of liberty, these two writers have this in common, that their views do not extend beyond the domain of politics. Nevertheless, both are utopists; for the unity of power, as Hobbes conceives it, the absolute monarchy which disposes of men's bodies and souls, of conscience and interests, of religion and of the state alike, is not more easy to realize than the perfect equilibrium between power and property which Harrington seeks to effect, and which he bases on the agrarian law, as if the agrarian law was not itself a source and instrument of oppression.—The *Histoire des Sacerambes*, by Denis Vayrasse, containing only a mixture, without any consistency (being, so to speak, only a weakened echo of them), of the two systems of More and Campanella, it may be said that the history of utopias in the seventeenth century closes with the

two creations of Fenelon, the *Bétique* and the *République de Salente*. The first of these presents us not so much with a hope for the future as with a souvenir of the past. It is a classical reminiscence of the Arcadia of the poets. It transports us among a pastoral people like those who lived under the fabulous sceptre of Saturn. It introduces us to men who have none of the passions, and consequently none of the vices, of humanity; who have put everything in common, since they possess nothing, and have scarcely any wants; and to children, enjoying the peace and innocence of their tender years, while nature, like a kind mother, relieves them of all care and trouble. The *Republique de Salente* unveils to us much more clearly the real thought of the illustrious archbishop. It is the picture of a people, who, with no industry but agriculture, were able to attain the highest degree of perfection and happiness. Population is to that people the source of all wealth, and war the source of all misery. This is the very reverse of the maxims which guided the government of Louis XIV. But there is something more in Fenelon's republic. It is, despite the simplicity of its life and customs, an aristocratic state, the citizens of which, divided into seven classes, are distinguished from one another by their conditions, their occupations, their rights, their clothing even, and in which the first rank belongs to birth. It is the ideal republic of Plato modified by Christian morals and by the prejudices of race borrowed from feudalism. — The eighteenth century, independent and fruitful in every other matter, was only slightly inventive in social and even in political utopias. Rousseau and Mably confined themselves to reproducing, with some necessary development, the institutions of Lycurgus. Theirs was a retrospective utopia. Morelly, in his *Code de la Nature*, is only Rousseau's echo, while Babœuf proposed to become Rousseau's testamentary executor. All, while they never tired talking of liberty, succeeded only in imagining a system of slavery on the foundation of demagoguery and communism. — The first half of the present century it is that witnessed the birth of the boldest, the most radical and the most brilliant utopias: Saint-Simonism, Fourierism, positivist socialism and the atheistic theocracy of Auguste Comte. Even a summary exposition of these different doctrines would carry us beyond the limits allotted to us here. (See SOCIALISM.) But we must remark at least, that, while these doctrines are no less chimerical than the ideas of Plato, of Thomas More, Campanella, Hobbes and Rousseau, they are not, at bottom, more liberal. The tendency of Saint-Simonism is to re-establish, to the advantage of pantheism, the universal theocracy of Gregory VII. He hands over the destinies, not only of the state, but of human-

ity, to the discretion of one man, who is at once prince, pontiff and infallible arbiter of the works of human thought. There is no refuge from this universal despotism, since both property and the family have ceased to exist. Fourierism also destroys these two fundamental institutions: property and the family. The former it would replace by shares of stock delivered by the state to each in proportion to his labor, his talents and his capital. Of the latter, thanks to the consecration of *free love*, not a trace would be left. Nevertheless, it is not directly by the establishment of despotism, but indirectly by license in morals and the letting loose of all the passions, that Fourier annihilates liberty. To Fourier man is only a kind of machine, of which passion is the motive power, and which, putting itself in gear with an analogous machine, produces the effect desired without its knowledge. He reaches fatalism by the way of sensualism, and from sensualism he draws the most extravagant and unclean consequences that can present themselves to human thought. Lastly, in the materialistic Utopia of Auguste Comte, the priests of humanity, or rather of atheism, have a power no less exorbitant than the power of the Saint-Simonian Supreme Father. They have the right of life and death over all works of the mind, old and new, existing or to come into existence. They are the absolute masters of public education and of the state itself. They dispose, besides, of the honor of citizens, and regulate private life after their fancy, leaving to the lay power only the looking after of material interests. The proletariat Comte makes a public institution. *Majorats* and *substitutions* he re-establishes under another form, and extends them not only to landed but to commercial and industrial property. — The conclusions to be drawn from this succession of chimeras are these: that the progress and perfecting of social institutions are not sudden creations, issuing full-fledged from a human brain, and governed by one single idea, but the fruit of experience and time, of the thoughts and the efforts of a long series of generations; that no society is lasting or perfectible except the society which is founded on the liberty which respects the rights of the individual, and leaves him responsible for his acts and for the government and use of his faculties; that liberty is inseparable from property, and that it is impossible to preserve or suppress the one without preserving or suppressing the other; that liberty and property, in turn, suppose the moral dignity and the inviolability of the human person. Utopias have this advantage, that they bring these truths into greater relief, and compel the human mind never again to separate the progress of the social order from the conquests of civil and political liberty. ADOLPH FRANCK.

V

VALUE. The notion of value is one fundamental in political economy; but unfortunately there is no politico-economical idea which requires so much effort of the power of attention and so much patience to be thoroughly understood. The reason of this is, that the phenomenon to which it relates is purely relative, and consequently difficult to characterize. In order to acquire a just and precise idea of value, we must therefore enter into explanations of some length. — The things whose possession is necessary, useful or agreeable to us, are numerous and various; and we can obtain those which we ourselves need only by parting with others of which we have the disposal. Hence exchanges, which, by determining in what quantity one thing is accepted or delivered in return for another, have the effect of establishing a relation of value among all things. Can you, for example, get one hectolitre of wine for one hectolitre of wheat? If you can, the fact that you can, assigns to these two products their relative value. They figure in the exchange as equal quantities, and the one has the same value as the other. Suppose that from some cause, however, we have to give, not one hectolitre, but 120 litres of wheat for one hectolitre of wine; this establishes a new ratio between the quantities exchanged, and the values are no longer the same. The value which the wheat possessed relatively to the wine fell just in proportion to the increase in the number of litres to be delivered in exchange for one hectolitre of wine; the value of the wine, on the contrary, increased in proportion to the diminution in the quantity of it to be furnished in order to procure one hectolitre of wheat. What one of the products has lost in value the other has gained, and this in exactly the same proportion. What we have just said of wine and wheat, is true of all possible products. They all give rise to exchanges, and each of them obtains a value founded on the quantity either of another product, or, in general, of the other products for which it can at any given moment be exchanged. — The advance of civilization long since did away with barter. The more numerous and diverse products became, the more men realized the necessity of choosing one of them to serve as a medium of exchange; and coined money was chosen for this office, because it possesses certain qualities in a greater degree than any other. Money is one of those things which men desire because of the services which they render, and for which, when in need of them, they give a certain amount of other things. This fact, while it gives to money a certain value in each of the other products, gives also to each of these a value in money; determined by the amount which is required to procure them. Thus, the amount of money which all these products command, i. e., the price which is given for

them, constitutes a common denominator of the value which they have in commercial transactions, and it is only necessary to compare their prices to know their relative value. If a hat is worth three dollars, this price, compared with that of sugar, of cloth, of a plow, or of any object whatever, shows how much of these different products can be obtained for it, and consequently what value hats acquire from the quantity either of some particular product or of other products in general which their possession confers the power of acquiring. The existence of an intermediary which assures to the values attached to the various products a term of comparison equally applicable to them all, and which renders it easy to follow the fluctuations in their values, is an immense advantage. But it is important to bear in mind that prices and values are very distinct things. (See PRICES.) Prices express only the quantity of coined money which each product is worth, and this quantity is subject to changes which have their own special causes, but which, while they modify prices, have no influence on the relation of values that exists between the products themselves. Thus we see everything in value is relative. It is the relation existing between two things exchanged, a relation which depends upon the respective quantities which each must deliver to the other in order that the exchange may be made on equal conditions, a relation of which (from the very fact that these conditions must be equal) one of the terms (wherever there is a relation, there must be at least two terms) can not be affected in any sense whatever, without the other term being affected at the same moment in a contrary sense. It is essential that this purely relative character of value be clearly understood, if we would not fall into a multitude of economic errors, so great a part does value play in the speculative part of the science. Among the many consequences which flow from the idea of the relativeness of value, there are two which we will single out, if only to throw a little more light on a subject naturally intricate and abstract: one is, that there are only values, and there is no such thing as a collective value, formed by the union of particular values, susceptible of division, degree or measure; the other is, that there can be no such thing as a general rise or fall of values. And in fact, the values in things being only the expression of the quantity of other things which can be obtained in exchange for them, it is impossible that values should increase in the one case without diminishing in the other. The moment it becomes necessary to give more wheat in order to have a given quantity of wine, we give less wine to procure a given quantity of wheat. The fall in the value of wheat produces the rise in the value of wine, and it is thus in all exchanges. There is no rise of values which does not suppose a fall, and

in like manner no fall which does not suppose a rise. — It has taken much time and reflection to free the theory of value from the complications which rendered it uncertain and obscure. In vain did the first economists examine the question; they did not succeed in presenting its solution under forms sufficiently clear and precise. It would be wrong to blame them for this. To the difficulties met with in the analysis and definition of every relation (ratio), when neither of its terms has anything fixed in it, there were added others, in the case of these first economists, caused by the very imperfection of the language they were obliged to use. In common parlance, the word value had different significations. It was used indifferently to designate, at one time, the degree of utility inherent in the use of things; at another, the power of acquisition which these things possessed with regard to other things; at another still, their money price. Hence came, in the ideas suggested by the word value, associations which prevented people from noting differences and distinctions between these ideas, without the noting of which it was impossible to reduce them all to their essential meaning. — What economists first thought of was the necessity of attaching to the word value qualifying terms intended to characterize each of the meanings which it owed to usage. The French economists of the last century resolved to apply the term usual value (*valeur usuelle*) to that quality which gives things the capacity directly to satisfy the wants of those who possess them, and venal value (*valeur vénale*) to those qualities which give things that capacity only by means of exchange. This was the course taken by Adam Smith also. What the physiocrats called usual value, he designated as value in use, and value in exchange what they called, less correctly, venal value. The moment people introduced into science two distinct meanings for the word value, instead of reserving it, as the most eminent economists do now, to express only the ratio of quantity between things exchanged, it became necessary to make use of adjectives to determine which of the two significations they intended to give to the word, each time they used it. But even this care could not sufficiently obviate the grave inconvenience of using one and the same generic term to express qualities and circumstances which in themselves have nothing in common. Conceptions which involved the idea of value remained undecided; men's minds were confused by applying the idea of one kind of value to another, and the way was opened to confusions which seriously impaired the progress and authority of the science. — It will be necessary to call attention to several of these confusions by reason of the place which they occupy in the writings of the older economists, and which they have retained even in the works of some of their successors. Some observations upon the most serious of these confusions will serve, on the one hand, to guard us against certain errors into which it is easy to fall, and on the other, by showing what value is not, will make it easier to perceive

what it really is. — We will mention only those which it is important to call attention to. We may consider them as follows: the confusion of value with price; the confusion of value with certain circumstances by which it is influenced; the confusion of value with wealth; and, as a consequence of this last, confusion in the search for an undiscoverable measure of value. — It was easy, and even natural, to a certain extent, to confound values and prices, since, considering them from product to product, the ones serve to measure the others. In the ordinary course of facts we begin by exchanging the products which we have to dispose of, for their value in money, then we give the amount of money received for the other things which we wish to procure, and it is certain that the value in money of these things really corresponds to their relative value. An article that is worth two dollars in money is worth twice as much as that which is worth only one dollar, and if the exchange were made in kind, we would have to give double the quantity of one to obtain the other. But we must bear in mind that prices merely express the relation that exists between the quantities for which money, and other products, are reciprocally placed in the balance, and this relation remains subject to the empire of circumstances which may affect the disposable quantity of money. If money is abundant, it will be more freely offered for each of the products which it is used to purchase; then its value decreases, and prices rise. If money, on the contrary, becomes scarce, less of it will be given in exchange for other things in commercial transactions, its value will increase, and prices, on the contrary, will fall. Thus, unlike values, which can neither increase nor decrease simultaneously, prices, which are the simple results of the comparative value of money and all other products against which it is exchanged, undergo fluctuations peculiar to themselves, and they may all rise or fall at once. The confusion of prices and values has been the unfortunate cause of rendering nations which were not wanting in scientific worth, singularly obscure. It has led economists to conclude from prices to values, and from values to prices, to suppose them governed by the same laws, and subject to the same accidents, and to attribute to the amount of prices, an influence which it should not have. Hence proceeded errors which deservedly esteemed economists have not always avoided, and of which the works of Ricardo himself afford but too many examples. — One of the most frequent confusions, and one which, by its generality, has proved much more prejudicial to the science, is that which confounds value with some of the circumstances that concur in giving value to things. This is the immediate result of the many different acceptations given to the word value. Writers employed the expressions "value in use" and "value in exchange"; thenceforth it was natural that people should imagine that there must exist between the two kinds of value some secret affinity, some link or bond of union covered by some higher principle,

common to both, and they set to work to find that principle. Adam Smith believed he discovered it in materiality and duration; Ricardo, in labor; J. B. Say, in utility; others, in rarity, etc., etc. The inevitable consequence was, that they mistook the very nature of value, and forgot its origin and character; and nevertheless, among the masters of political economy, only a few of the more recent have succeeded in completely escaping from an illusion produced by the use of an inexact and vicious terminology.—The observations suggested by these errors are applicable to all such affinity except rarity. What is value? As we have already said, it is simply a ratio of quantity between products exchanged, and it is perfectly clear that it can not be found outside of this relation. Doubtless, when, in order to obtain a product, we consent to give others which belong to us in exchange for it, what determines us to do so is some quality in the product itself which pleases us, and which is not to be found, or which is found only in a smaller proportion, in those which we give in return for it. This is the reason for every exchange that is made: there would be no exchange if all things possessed the same qualities, and could procure for us the same enjoyments, and satisfy the same wants; and it is surprising that this simple remark did not suffice to prevent men from connecting with this or that particular quality of things the principle of their value.—There are things which, in order to answer to the wants in view of which we seek them, should possess materiality and duration; there are others which must have absorbed a great deal of labor in their making, and others again which must be susceptible of immediate consumption: we exchange them for one another because our wants and our tastes are different, and because, if to build a house, we must have materials whose duration will resist the ravages of time; we must have, in order to feed ourselves, bread and meat, which do not last, and for our recreation, theatrical representations, concerts and amusements, which produce but a passing emotion, and leave no trace except in our remembrance.—Utility is essential to the value of things, in this general sense, that we give nothing for any of them but upon condition of finding, in their possession or in the use which we make of them, some pleasure or enjoyment; it may be well to recall, however, that the nature of the wants which they are intended to satisfy has no influence on the more or the less of value which attaches to them. We must first provide for the most imperious necessities of life, and obtain the means of satisfying them; but, this once done, each one takes into consideration other consumers, and this consideration is ampler in proportion as he can accord them more. The wants of the intellect and of the heart, love of the arts, taste for luxury, the promptings of pride or vanity—all concur in determining the esteem in which things are held; and it is not uncommon for men to pay for a flower, or ribbon, or the pleasure of hearing a violinist, for instance, a price equivalent to a con-

siderable quantity of the products without which we would have to suffer the deadly attacks of cold or hunger.—What gives at times an immense value to products, whose deprivation causes neither inconvenience nor physical suffering, is the price that is put upon them by those who are able to obtain them, and the sacrifices men make in order to possess them. There are men rich enough to gratify their every fancy; and, no matter what the things which their fancy craves, these things from the moment they are sought after and there is a demand for them, acquire, equally with other objects, a real value, based upon the amount of other things which men give in order to obtain them. Although there is nothing that is indifferent in the feelings and tastes which dictate the employment of wealth, from the standpoint of morality, of the future and of social progress, nothing can prevent the objects which serve to gratify frivolous and even blamable desires from having the value of the objects for which they can be exchanged.—Among other consequences following the opinion that value should have a fundamental principle in one of the material qualities inherent in things, there is one consequence which has given rise to so many controversies, that we can not pass it over in silence here. It has been asked whether it were possible that immaterial things, acts, efforts, services, which are not realized under a tangible and durable form, could have a value; and a goodly number of writers have answered in the negative. The services of governments, of magistrates, of the clergy, of physicians, and of members of the bar; instruction given by masters, professors and artists—all these and many other similar things have been declared without real value; and this despite the fact that it was very evident that those who felt the want of these services did not hesitate to give, in order to obtain them, large quantities of things to which value was attributed because of their materiality. This erroneous opinion has now, however, but few adherents. It is recognized that nothing which men prize sufficiently to give a price for, can be devoid of value, and that those things which are called immaterial have, like all other things, a value proportioned to the quantity of each of the different things which they put those who dispose of such immaterial products in a way to procure for themselves. This error regarding immaterial services has not been confined to the question of value; we meet with it also in essays upon production, wealth and labor.—Rarity deserves special mention. It is not, like materiality, duration, labor, or utility, a quality substantially incorporated in things, it is merely the effect of a disproportion between the quantity in demand and the quantity obtainable, and it, therefore, exercises an effectual influence on the value of the things of which it is either the ordinary or the accidental lot. What causes rarity is the impossibility of increasing a thing at the pleasure of those who wish to obtain it; hence they vie for its possession, and give in exchange for it a much larger quantity of other

things than they would if it were more abundant. This it is that assures a very great value to certain products which are found in small number; this it is also which for a moment gives an extraordinary value to the most common products, such as wine, wheat, wool, cloth, or glass, when, by some accident, the want of them is felt. But rarity, besides being at all times an evil, is, like value itself, only the effect of a relation, and can exist only on condition that it (rarity) does not become general. When bread is more scarce than usual, it acquires an increase of value, but this increase it acquires only because the products given in exchange for it lose in relation to it some of their own proper value, and lose this only because they retain their accustomed abundance. If they became rare or scarce at the same time and in the same proportion as bread, the relation between the quantities exchanged would have suffered no alteration, and their respective values would have remained the same. Rarity acts only privately, only to the extent that it is confined to certain products in opposition to others; and to elevate rarity into the dignity of the general principle of value, is to make a strange mistake; for it is evident, that if rarity extended at the same time to everything offered in exchange, its effects would disappear immediately. — The confusions between value and wealth do not lead to consequences of so much importance. They spring from correlations which have a real existence, and it is easy to explain them. Private wealth is in proportion to the value of the things of which it is made up. Lands, houses, capital, merchandise, in a word, everything which belongs to individuals, is susceptible of exchange, and consequently possesses the value resulting from the amount of things of another kind which it can be used to obtain. In order to know, therefore, the amount of his wealth it will be sufficient for an individual to ascertain the value in money, the price, of each of the things which he possesses, and then to compare the sum of these prices with what it will enable him to procure in other things. But the correlation between private wealth and the value of the different elements of which it is made up, does not extend to real, positive and general wealth. This latter constitutes a whole, and for want of a term of comparison (because it is not exchangeable) it can not be estimated in any manner. If the things comprised in the sphere which general wealth embraces have all the value which is conferred on each one of them by its particular power of acquisition with regard to other things, the same can not be said of the mass; for this mass admits of no comparison which would permit us to assign it a value, and it would be vain to attempt to find, in the variable relations of exchange that exist between its constitutive parts, an expression which would cover them all. Hence we must have recourse to circumstances entirely foreign to the value which the elements of general wealth receive solely from the exchanges to which they give rise, if we wish to estimate the extent of the wealth of

nations in general, or of a nation considered separately. — However, it will not be without some utility to explain still more the differences which necessarily distinguish value from wealth. Wealth, taken in its aggregate, is the possession of those things by means of which men attain to the satisfaction of their wants, and the more abundant these things are, the greater wealth is. Therefore, it is by its ratio to the wants which it is destined to satisfy, that we must estimate wealth, and this ratio can not be affected by the ratios which exist between the things that constitute it. Not that wealth can increase without modifying the pre-existing ratios of value. Wealth increases only to the extent that the efforts of labor, becoming more ingenious and more fruitful, produce a greater amount of some one of those things whose use is either necessary, agreeable or useful to us; from which it follows that this thing offered and delivered in exchange for others in a greater quantity than before, loses something of its relative value, and causes these other things to gain in relative value. Thus every advance in wealth has the effect of reducing the value of the products which it increases, and of raising the value of the products on which it has no effect. This is an eminently beneficial change to the people among whom it takes place; but from the point of view of value the change has no effect, because the value of each thing depends on relations one of whose terms can not increase without the others decreasing. — It is so difficult for the mind to see in value only the effect of a ratio of exchange, that for a long time most of the economists were preoccupied with the idea of discovering some measure for it. This was a seeking for the impossible. It would have been necessary to find a value to measure value, and where could a value be found which was not itself the result of a ratio, and, because the result of a ratio, as changeable and variable as the other values to which it was sought to make it serve as a comparative measure or standard? But the search for this measure of value has been so common that we can not pass it over without remark. — Among the things which have attracted attention as specially fitted to serve as a measure of values, coined money, human labor and wheat have been accorded the preference. But it was not given to any one of the three to act as such measure better than the others. When money was taken as the measure of values, it was indeed possible to find what was the value in money of each product at a given moment, and thus to find a comparative term applicable to all products; but it was not possible to discover in money itself a fixed value protected from the variations which are the effects of causes operating on the quantities of the products which have just come into the market to be exchanged one against the other. It was plain that gold and silver, of which money is made, like all other products, varied in value, according to their greater or less abundance in the market, and that they had a very unequal power of acquisition at different

epochs, and were also subject to the empire of circumstances, which at one time rendered their extraction more costly, and at others made their consumption greater or more necessary. — And so of human labor, in which Smith had placed the origin of value, and which he had pointed out as the one thing which afforded its most exact measure. Human labor is unquestionably an element in all production of wealth; but it in no wise follows that its value is absolute, and, that in the relation which it holds to the things against which it is exchanged, it constitutes a term fixed and constant. On the contrary, labor is more or less in demand, and is better or worse compensated at different periods; this is clearly demonstrated by the frequent fluctuations of wages. — As to wheat, two reasons caused it to be considered that it might serve as a measure of value. One of them was the supposition that the same quantity of wheat must have served at all times to satisfy equal wants of nutrition per individual; the other was the supposition that alimentary products must have preserved, in exchanges, a fixed value, since such products have the power always to create for themselves the demand necessary to correspond to the extent of their supply. The first of these suppositions is erroneous; for wheat is far from having been at all times and in the same quantity an object of man's consumption; the second is true only within certain limits, and in what concerns not any special product, but the aggregate of all the products which minister to the wants of subsistence. Be this as it may, the value of wheat is, and always will be, a relative one, dependent upon the action of circumstances, among which we may reckon the extension and progress of agriculture, and the amount of manufactured products for which it can be exchanged, an amount which tends to increase in proportion as the labor required to produce them increases in power and skill. — The efforts made by economists to discover a measure of value, prove how difficult it is to disentangle the idea of value itself from the complications by which it is surrounded, and with which it presents itself to the mind. Many writers, even of our own day, have not succeeded in doing so, and it would be easy to cite comparatively recent works in which tendencies to suppose in things the existence of an absolute value still subsist. We must of course make due allowance for the lack of precision in the form under which every fact of relation manifests itself to the mind; but even more allowance must be made for the imperfection of the terminology in use. So long as the word value is used in different senses, we expose ourselves to a confusion of ideas, and the wisest plan would be to take a decided stand in this matter. John Stuart Mill proposes to use the word value to express only the effect of the relation in virtue of which products are bartered one for another, in proportion of such and such a quantity of the one against such and such a quantity of other things. There is nothing more necessary in the interest of science, nor

is there anything easier. We have the word *price* to designate the value of things in coined money; we have the terms *immediate* or *direct utility*, and other expressions to designate what is so improperly called value in use. It is easy to reserve for each thing an expression which maintains in language the distinction itself, the special sense which belongs to it. — Let it be distinctly understood, therefore, that through the rest of this article we shall use the word value only in its real sense. It shall be used to express only the quantity either of a thing or of the things in general which a thing serves to obtain; in other words, the power of acquisition which it exercises by means of exchange. — Upon what conditions may things be considered to possess value? On what foundations does the property which renders them exchangeable, rest? What are the circumstances which determine in what quantity one thing shall be given for another? The meaning of the word value once clearly determined, these questions become simple, and are easily solved. — First of all, it is plain that nothing is exchangeable except upon condition, first, of possessing qualities which render it desirable, and second, of being obtainable only at the cost of some effort and pains. No one gives any of those things which every one may have without labor, and value belongs only to those things whose possession costs labor and fatigue. The man who wishes to obtain a thing compares the satisfaction which it will afford him with the sacrifices he must make to obtain it, and decides to part with such or such a quantity of other things which belong to him, in order to procure it. It matters little what motives prompt him to acquire it, whether an imperative want, a frivolous taste, or a simple caprice, the thing has the value at the moment of what he consents to give for it. The diamond for which a value equal to a thousand hectolitres of grain is offered and accepted, has as much value as these thousand hectolitres. In like manner, a hundred kilogrammes of salt are worth no more than the lesson of a dancing master, or the service of a hair dresser, if the price paid for the lesson or the service is sufficient to enable us to buy the same quantity of salt. — The qualities which render things desirable, the impossibility of obtaining them without personal labor, or without giving in exchange for them other things which have cost personal labor: such are the conditions which confer value on things. The extent or the measure of the value of a thing depends upon the greater or less difficulty which those who covet or need it find in procuring it. It is this that makes the momentary value of a thing depend upon the relation existing between its supply and the demand for it. If a product is not to be found in sufficient quantity to supply all the demand for it, those who desire it enter into competition for its possession; they give in exchange for it more of other products, or of the money with which other products are bought, and, as a consequence, its value rises. If the contrary happens, that is, if a product

enters the market in a greater abundance than there is a demand for, its value falls. Those who possess it can not keep it forever; they are obliged to dispose of it, in order to procure other things which are necessary to them, and find themselves constrained, in parting with it, to be content with a smaller quantity of the products they receive in return. Thus it is the condition of supply and demand which assigns to each thing its power of acquisition over other things. All things increase in value when the demand for them is greater than the supply of them; all diminish in value when the supply of them is greater than the demand for them; hence the variations of price to which things are subject, variations which, by expressing the differences that arise in the sums of money against which those things which experience them are exchanged, express like differences in the quantities of other things which these sums enable one to obtain. — Besides, it must be remarked that the demand for a thing naturally extends or contracts in proportion to the modifications which its value undergoes. When there is a lack of a product it grows dearer; and as then there are many persons to be found whose desire to procure it is checked by the increase of the sacrifices which they must make to obtain it, the demand, checked by its increase in value, is restrained within the limits set by value itself. In like manner, when the price of a thing decreases, purchasers increase in number, and its value descends only to the point necessary that such a product may be found in the market in a quantity proportioned to the supply. Hence the fluctuations of value occasioned by the changes in the relation of supply and demand, have for effect the maintenance of an equality between the two terms of that relation; that is, an equilibrium between supply and demand. — We must not, however, infer from this fact that there exists any proportionality whatever between the movements of value and the differences in quantity of the things supplied. Everything depends, in the effect produced on the value of the goods, whether by the increase or the decrease of the supply, on the nature of these goods, and on the kind of wants they are intended to satisfy. All goods are not equally necessary to life; and if there are some the demand for which is greatly curtailed because their value has risen even ever so little, there are others, the demand for which people are not nearly so free to lessen. The value of wheat doubles the moment the quantity that can be delivered decreases one-fifth, and is trebled, when this quantity is reduced one-fourth. Wine does not increase in value in the same proportion when the quantity supplied diminishes, for the reason that its consumption is less indispensable; and the products which it is still easier to do without increase in value much less than wine when their supply diminishes. On the other hand, the qualities which render products more or less easy to keep in the state required for use, exert a sensible influence upon the decrease in their value. In case of an extraordinary or superabundant harvest,

there are crops which are abandoned to the first comer who wishes to take them, because the owner can not utilize them all himself, and because the price at which he is compelled to sell them will not pay the cost of transferring them to the nearest market. What we are warranted to assert is this, that value is fixed by the relation existing between supply and demand; that it usually increases or decreases in such a way as to equilibrate the two terms of that relation, but in no wise in proportions conformable to the differences expressed in the figure of the quantities supplied. — How decisive soever the influence exercised by the momentary state of supply and demand may be, the value of things has none the less its own *raison d'être*, and a measure which, in despite of the accidents which serve to expand or contract it, constantly tends to return to its normal dimensions. Vainly do the fluctuations of supply and demand succeed one another in contrary directions, these fluctuations necessarily end by compensating one for the other, and the point at which they meet marks the natural value of things. — What assigns a natural value to things is the fact that it costs something to produce them; that is, the onerosity which attaches to their production. This is true of all things, except of those the quantity of which can not be increased, or which can not be sufficiently increased to keep up with the demand for them. With this one exception, all things are exchanged against one another in accordance with the amount of cost necessary to fashion them for the use of, and to transport them to, the consumer. Those which cost most are exchanged in a lesser numeric quantity, against those which cost less, and thus the differences in their costs of production of various articles are balanced. (See COST OF PRODUCTION.) — Before attempting to show that this can not be otherwise, we must first recall what constitutes the cost of production. This cost is twofold: part of the cost of production is constant and unavoidable, and enters, though in unequal amounts, into all production; part is accidental, arising from artificial or special causes, and does not attach to all production. The first part of the cost of production here referred to consists in the expenses of labor and in the expenses attached to the employment of capital. There is nothing whose production does not require a certain amount of both these expenses. In the productions of the humblest artisan, days of labor and the consumption of capital under various forms, figure. Raw material has been purchased and transformed; tools and implements have been deteriorated; there have been risks and losses which must be covered; and, in addition to all this, there is the interest which must be paid on the capital employed: it is necessary that the thing produced should be exchanged on such conditions as shall restore to the producer the wages due to his own personal labor, as well as the wages due to the labor of his workmen, if he employs any, and the profit required to bring back to him the portion of

capital which he was obliged to sacrifice during the course of his labor. Suppose a product, which, in order to reach the consumer, costs six francs for workmen's wages, and four francs in profits for the preservation of, and interest on, the capital invested in it: the natural value of this product will be the sum of these two amounts; that is, ten francs. Thus the natural value of various products depends upon the proportion in which wages and profits enter into the sum total of their cost of production. All products tend to exchange one against another in proportion to this natural value; and this natural value is the value which continues to subsist for all products as their mean value, whatever departures from such mean value the momentary fluctuations caused by the variations of supply and demand may make in it. — The reason of this is plain. No industry could subsist if the commodities and goods which it furnishes the public were not taken at the price which the cost of production requires. An industry which could not recover in full the total of its outlay would soon fail. Hence from the moment that any product ceases to exchange against other products in a quantity sufficient to balance the expenses which must be borne by those who make it, we notice that its manufacture begins to be restricted; and the restriction does not stop until it reaches the point at which the reduction in the supply of the product causes it to regain the value in which it was lacking. On the contrary, if a product receives in other products more than the equivalent of its real cost, the profits assured to those who deal in it cause a speedy increase in its production, and the increase in the amount offered very soon deprives it of its value to the extent that such value is exaggerated. Thus it is that the value in things, whenever it departs from its natural point, is finally brought back to it. Competition diminishes in industries which are not sufficiently remunerative, and the supply diminishes with it; competition increases in those industries which are uncommonly remunerative; labor and capital abandon industries which are losing, to engage in those which are gaining; and, owing to this continual change, the value respectively of the products exchanged continues to be, or becomes again, in the case of all products, the value determined by the amount of the cost incurred in their production. — We do not mean to say that all products of the same kind, considered apart from all others, obtain in exchange merely the equivalent of their own cost in other products. Far from it; there are some which obtain much more, and for this reason: the quantity of each product which can and should be produced is determined by the demand for it, and its value always rises high enough to assure its supply in that quantity. But the conditions of labor are not in all respects equal or similar. They are less favorable in some places than in others, and when these places are called upon to furnish the market a contingent, without which the supply would be inadequate, it is the expenses which production

necessitates in those places that determine the general value of products. It follows that this value corresponds, not to an average cost, but to the cost of the part of the product which reaches the market after having required the greatest amount of the different costs. In the actual state of demand that portion has its outlet just as the others have, and among similar products it is the dearest which regulate the value of all, thus adding to those which are cheaper a value greater than their cost of production. This fact is deserving of all the more attention, because many modern writers have overlooked it when discussing the large profits reaped by certain producers, and still more frequently when discussing the subject of rent. — It is, for instance, a common opinion that the rent of land contributes to raise the price of the means of subsistence, and that it would be otherwise under combinations different from those which up to the present time have governed property. Nothing, however, could be more decidedly false. Like all other products, those of the soil owe their value to the demand for them. All lands are not equally fertile; they can not all produce on the same conditions, and whenever the wants of consumption are such that recourse must be had to lands of inferior quality, their products must necessarily be paid for at a price which will compensate for the cost attached to the cultivation of such lands. In a country like France, in which wheat has, on an average, a value of a little more than eighteen francs per hectolitre, there are lands on which its value is not twelve, and on these lands the excess of the value for which the wheat is exchanged over the costs at which it is harvested is a rent which accrues to the owners of these lands. But this rent has no influence upon the accrued value to cereals; it is simply the effect of that value. The population of France could not do without that part of the wheat crop which could not be produced at a cost less than eighteen francs per hectolitre, and it is this part which assigns to the other parts their natural value. If the demand for the means of subsistence should increase to such an extent as to require the cultivation of lands on which wheat could not be produced except at an average cost of twenty francs per hectolitre, its value would rise still higher, and with it the rent which the land paid to those who owned it. — The superaddition of value, which the wants of consumption confer, as compared with the products of their cost, or the products of the major part of the land, exists also in the case of a multitude of different industries. Thus it is the cost of extracting ore from those mines in which such cost is greatest, but whose product is necessary in order to meet the demand, which fixes the value of the ore. The same is true in manufacturing industries; the demand for the articles which they produce raises the value of these articles to a figure necessary to pay for the products of those manufacturing industries which are carried on, it matters not for what reason, at the greatest expense; and the higher net cost which is peculiar

to these latter, assures to the articles of all the other industries a value which exceeds the real amount of their cost of production. — But, if the value of the things which are susceptible of indefinite increase finds its rule and measure in the cost of the production of those of them which in order to reach the people who want them cost most, it is otherwise with the value of the things whose quantity it is impossible to increase at the desire or whim of the public. Their rarity exercises an influence on the value of the latter; and raises their value in a proportion which has no relation whatever with what they cost or did cost to produce. A work of art from the hands of one of the old masters, the autograph of an historic personage, or some object which he used during his lifetime, a jewel, a piece of armor, a bronze, a statue found under the lava of Pompeii or among the ruins of Athens or Rome, has an immense value; and there are persons who, to obtain one of these products, would part with a quantity of things in which had been invested a thousand times more wages and profit on capital than was invested originally in the product they purchase. In like manner precious stones, pearls of the first water, gold and silver and other precious metals, possess a value far in excess of what it cost to discover and extract them. Nature did not create them in sufficient quantity to satisfy the desires of all. So also, wines, fruits and tobaccos of certain choice brands, which possess special qualities that cause them to be eagerly sought after, possess in exchange a value far superior to that which their cost of production would give them. They can not be increased; their supply has forced limits; and the desire of obtaining them induces people to give much more for them than it costs to produce them. — Besides rarity, there are artificial circumstances which affect the value of things and help to increase it beyond what the cost of production would warrant. Such are taxes (except taxes on land, in so far as they affect only the rent), monopolies and restrictions on the freedom of trade. Every tax has the inevitable effect of increasing the price of the merchandise or product upon which it is imposed. The person who pays the tax must be reimbursed; he adds the amount of the tax to what the article costs him, and in exchange he receives back the amount which he paid the state in addition to the natural value of the thing. Such are the effects on the value of things of the taxes levied on them before they reach the consumer, no matter for what reason, at what moment or under what form such taxes are levied. The treasury of the state can levy nothing on them without increasing the cost of their production, and consequently without increasing in an equal measure the value for which they are sold. The effect of monopolies is equally pronounced, and more lamentable. Monopolies are of different kinds; some are established for the benefit of the state, and serve as a source of revenue for it. Of this kind is the monopoly on tobacco in France: the government alone purchases

the product in the crude state, manufactures it, and furnishes it for sale at a price which assures the state an annual revenue. Whatever superaddition of value such monopolies give to the products which they affect, is warranted if they serve to relieve a country of other taxes which would cause still greater inconveniences, and this must be borne in mind when considering these monopolies. Patents also constitute a monopoly in favor of the patentees; they may be a just remuneration for the labor and sacrifice to which an invention was due; but it is only by exaggerating the value of the patented article that they exercise any influence. Producers who are free from all competition are masters of the market, and it is an easy matter for them so to manage as to sell only at a large profit on the cost of production. The exclusion of foreign merchandise, through custom house duties intended to reserve the home market for home producers, has to a certain extent the same effect as patents. Consumers are forced to pay a higher price for the protected products than they can be bought for elsewhere, and are subjected to sacrifices which could and should be spared them. This alteration of the natural relations of value between exchangeable products is a real evil; nothing could be more prejudicial to the proper employment of productive forces, and thereby to the progress of social power and wealth. Such acts can be justified only by the necessity of defraying public expenses; but the products whose cost of production and value are to be artificially increased by the imposition of duties, should be carefully selected. The more these products are necessary for the satisfaction of wants common to all, the less those classes who consume scarcely any other products, and who have only the labor of their hands to give in exchange therefor, will have of them, and the more difficult it will be for them to reach that degree of well-being without which their condition can not be improved. — Value, relative in its very essence, and based for each thing solely upon the quantity of another thing, or of other things in general, which it enables one to obtain, can not be affected by any of the circumstances which act equally upon all things at once. Its elements are labor and capital. It is the very quantity of these two things which every product absorbs before becoming a fit object of consumption that fixes its relative value; and no matter what the rate of wages or profits in a country may be, as the relations of exchange between the products can not be changed by that rate, neither can values be changed thereby. This is not the case, however, when the rate of one of the elements of production only is modified, and this because all products do not contain it in a like proportion. When wages increase, the value of those things into whose cost of production it more largely enters, naturally rises, and the value of those which require less manual labor than capital is comparatively lessened. The contrary is true when the rate of profits increases. In this case, those things whose cost absorbs more capital than

labor increase in value, and obtain a greater quantity of other things in exchange. Such fluctuations in the respective value of things are of frequent occurrence, and when they happen it is easy to determine their cause. It will be noticed, however, that, in the ordinary course of facts, there are things whose value tends to fall gradually. These things are those whose manufacture requires more capital. The reason of this is, that, as civilization advances, capital accumulates in such a way that those who possess it are forced to content themselves with smaller profits. — Such are the laws which govern value, and preside over its distribution among things. Value is not a quality incorporated in things, but is for each product the effect of a relation of exchange, the effect of the quantity of other products it serves to obtain; and this relation is determined, at any given moment, by supply and demand. But, while supply and demand regulate the values of the moment, there is, none the less, for those things whose number may be increased indefinitely at man's pleasure, a natural value, which, despite all the fluctuations to which that value is subject, always prevails in the end. This natural value results from the cost of production, and is determined by the amount of labor and capital employed in the production. A clear understanding of these general principles suffices to enable us to solve all questions pertaining to value, no matter how complicated they may seem to be.

HIPPOLYTE PASSY.

VAN BUREN, Martin, vice-president of the United States 1833-7, and president 1837-41, was born at Kinderhook, N. Y., Dec. 5, 1782, and died there July 24, 1862. He was admitted to the bar in 1803, and served in the state senate 1813-20, in the United States senate 1821-8, as governor in 1829, as secretary of state 1829-31, and as minister to Great Britain 1831-2, this latter nomination being rejected by the senate. (See **ALBANY REGENCY, NEW YORK**) On his return he was successively elected vice-president and president, but was defeated in 1840. (See **BANK CONTROVERSIES, IV.**; **LOCO-FOCO**; **INDEPENDENT TREASURY.**) In 1844 his disapproval of the annexation of Texas cost him the democratic nomination; and his New York supporters were naturally in an attitude of armed neutrality toward the new administration. This state of things verged naturally toward open war; Van Buren was nominated for president in 1848; and his nomination was successful in defeating Cass, the regular democratic nominee. This result compelled a compromise between the two factions, but it left Van Buren definitively out of politics until his death. (See **BARNBURNERS**; **ANNEXATIONS, III.**; **FREE-SOIL PARTY**; **DEMOCRATIC PARTY, IV.**) — Van Buren is commonly known as a master of political intrigue, the democratic "little magician"; as the one who introduced into the national civil service the debauching influences which had for thirty years controlled the civil service of his own state; as the

forerunner of that class of mere politicians which has since 1829 generally supplanted the previous race of trained statesmen; as a smooth, easy and adroit manager of political machinery, without political principles, constitutional training, or scruples in party warfare, revering in politics only the Albany regency, and Martin Van Buren as its prophet. All this must be admitted, but only in part. That Van Buren had political principles and the courage to maintain them, even in opposition to his own party, is shown by his opposition, in the New York convention of 1821, to the popular idea of universal suffrage, to "cheapening the right of suffrage by conferring it with an indiscriminating hand upon every one, black or white, who would be kind enough to condescend to accept it"; by his opposition, in the same convention, to the equally popular proposal to exclude the blacks from the right of suffrage; by his refusal, during the panic of 1837, to violate his political creed by recommending interference by government with the course of business; and by his refusal in 1844 to compass his own nomination to the presidency by indorsing the annexation of Texas. On the whole, he may be set down midway between the earlier and the later schools of politicians, with defined principles derived from his education among the former, and yet with sufficient power of adaptation to make use of the vicious machinery of the latter. — See Holland's *Life of Van Buren*; Dawson's *Life of Van Buren*; W. A. Butler's *Martin Van Buren*; Emmons' *Life of Van Buren*; Abbott's *Lives of the Presidents*, 241; 3 Parton's *Life of Jackson*; 2 Hammond's *Political History of New York*; Jenkins' *Governors of New York*, 346; 4 Tucker's *United States*, 294; Bradford's *Federal Government*, 434; 2 von Holst's *United States*, 147; 2 *Statesman's Manual*, 1153 (for his messages). There is a pen portrait of Van Buren in 2 von Holst, 149. Mackenzie's *Life and Times of Van Buren* is a collection of stolen private letters of Van Buren and others, giving a painful interior view of "practical politics" in 1819-37.

ALEXANDER JOHNSTON.

VERMONT, a state of the American Union. — The boundary between Massachusetts and New Hampshire (see those states) was long disputed. It was settled in 1740; but, before that time, both colonies had made large grants of land to intending settlers in the disputed territory. After the settlement, a new question came up. New Hampshire, believing that her territory extended at least as far west as that of Massachusetts, claimed all the territory west of the Connecticut river, covered by the present state of Vermont, and, pursuing the usual policy in such cases, continued to make grants of land therein, in order to fill it with settlers devoted to her interests, and dependent on her supremacy for the title to their lands. In 1749 New York appeared as a claimant, though on what ground it is hard to see. She had acquiesced in the western boundary of Massachusetts

and Connecticut, as a compromise of their charter claim of the Pacific ocean, or at least the Mississippi, as a western boundary; but New Hampshire had no such charter claim. The fact seems to be that neither New York nor New Hampshire had any rightful claim, and that this territory had been overlooked, and was within the limits of no colony. In 1764 New York obtained an arbitrary decision of the king in her favor, and at once undertook to make the settlers on the "New Hampshire grants," as the territory now began to be called, pay for their land anew. All the judicial machinery of New York was brought into requisition to oust the settlers who refused to pay, and, although the king in 1769 ordered the issue of further New York grants to cease for the time, the New York courts did not cease to harass the settlers. The latter resisted the New York authorities boldly; organized militia forces; selected headquarters, marked by a liberty pole surmounted by a wild cat grinning defiance toward New York; and maintained their independence of both the claimants. Throughout the revolution they maintained a separate warfare against the British, and toward its close there were even some negotiations looking to a separate peace; but the final treaty of peace in establishing the northern boundary of the United States, recognized the "New Hampshire grants" as included in the new nation. — Jan. 17, 1777, a convention at Westminster declared the grants to be an independent state, by the name of "New Connecticut." A new convention at Windsor, July 2-8, 1777, gave the state the name of Vermont, and adopted the Pennsylvania constitution of 1776, with some few changes, prominent among which was a prohibition of slavery. (See ABOLITION, I.) The preamble contained a full statement of the grievances by reason of which Vermont had refused to submit to New York's jurisdiction. New Hampshire made little opposition to Vermont's proceedings, and Massachusetts recognized the new state in 1781; but New York's opposition was sufficient to prevent her admission to the Union. In 1781 Vermont proceeded to admit to her assembly delegates from the southwestern part of New Hampshire and the northeastern part of New York, east of the Hudson; but, though she disavowed these annexations in the following year, New York still prevented her admission. But New York was wearying of the struggle. Her assembly in 1786 voted final compensation to her worsted adherents, and in 1789 appointed commissioners to acknowledge the independence of Vermont. Jan. 6, 1791, a state convention decided to apply for admission, and the state was admitted by act of Feb. 18, to take effect March 4. — CONSTITUTIONS. The provision for a "council of censors," to meet once in seven years and revise the constitution, which was abandoned by Pennsylvania in 1790, was retained by Vermont until 1870. By their proposition of amendments, and their ratification by state conventions, the original constitution (see PENNSYLVANIA) has since been slightly modified.

In 1836 the original single house was divided into a senate and house of representatives, both elected annually, in the former by counties, and in the latter by towns. In 1870 the term of office of the legislature, governor and other state officers was extended to two years; the council of censors was abolished; and its powers to impeach state officers and to propose amendments were transferred to the legislature. In 1882 the manufacture or sale of intoxicating liquors was prohibited. — GOVERNORS. Moses Robinson, 1789-90; Thomas Chittenden, 1790-97; Isaac Tichenor, 1797-1807; Israel Smith, 1807-8; Isaac Tichenor, 1808-9; Jonas Galusha, 1809-13; Martin Chittenden, 1813-15; Jonas Galusha, 1815-20; Richard Skinner, 1820-23; Cornelius P. Van Ness, 1823-6; Ezra Butler, 1826-8; Samuel C. Crafts, 1828-31; William A. Palmer, 1831-35; Silas A. Jenison, 1835-41; Charles Paine, 1841-3; John Mattocks, 1843-4; Wm. Slade, 1844-6; Horace Eaton, 1846-9; Carlos Coolidge, 1849-50; Charles R. Williams, 1850-52; Erastus Fairbanks, 1852-3; John S. Robinson, 1853-4; Stephen Boyce, 1854-6; Ryland Fletcher, 1856-8; Hiland Hall, 1858-60; Erastus Fairbanks, 1860-61; Frederick Holbrook, 1861-3; John S. Smith, 1863-5; Paul Dillingham, 1865-7; John B. Page, 1867-9; Peter T. Washburn, 1869-70; John W. Stewart, 1870-2; Julius Converse, 1872-4; Asahel Peck, 1874-6; Horace Fairbanks, 1876-8; Redfield Proctor, 1878-80; Roswell Farnham, 1880-82; John L. Barstow, 1882-4. — POLITICAL HISTORY. A large part of the state's original population came from Connecticut, whence the proposed name of "New Connecticut"; and the subsequent drift of their descendants to the neighboring state of New York accounts for many Connecticut names, such as Seymour, Phelps and Chittenden, in both the other states. Most of this immigration was democratic, so that the state's politics inclined toward the democratic party; and this tendency, and the likelihood that Vermont would vote for New York city as the national capital, will help to account for New York's acquiescence in her admission. The administrations of Governors Tichenor and Martin Chittenden are the only distinctive federalist periods; and yet the federalists were strong enough to control the legislature, and thus obtain the state's electoral votes for Washington and Adams in 1792, and for Adams and Pinckney in 1796 and 1800. The political revolution of 1800 so far intensified political interest in the state that its majority took better care of the electoral votes, and they were thereafter cast for the democratic candidates until the downfall of the federal party. But the politics of the state had little of the bitterness which elsewhere characterized this period. Governor Chittenden's action in recalling, in 1813, a brigade of the state's militia from the service of the United States, was the only circumstance that ruffled the surface of events; and in the following year the state's participation in the Hartford convention was confined to one county and a single delegate. Immediately after the close of the war the federalist vote began

to decrease rapidly, so that in 1818 Gov. Galusha received 15,248 votes out of a total of 15,992, and thereafter the federal party in the state had practically no existence. Until 1815 it was about on an equality with its opponent in every county, and in a heavy majority in the southeastern part of the state. — As Vermont had been the first state to abolish slavery within its own limits, it was one of the first to declare war upon it without. In the United States senate, Dec. 9, 1820, resolutions of the Vermont legislature were presented, declaring that slavery was a moral and political evil, to be tolerated only of necessity, and that congress had the right to inhibit its extension by the admission of new slave states. (See COMPROMISES, IV.) These resolutions were the guide of the state's policy until the downfall of slavery. During and after the election of 1824 the Jackson candidates were always hopelessly beaten, and the "Adams republicans," even after 1827, regularly defeated both the Jackson and the anti-masonic candidates. About 1831 the national republicans and anti-masons practically united, and the state's electors in 1832 were chosen as anti-masons, with the understanding that they would vote for Clay if their votes could elect him. This contingency did not occur, and the state's vote was cast for Wirt. (See ANTI-MASONRY.) From this time the combination of national republican, anti-masonic and other elements, soon to be known as the whig party, controlled the state, and on the dissolution of the whig party the republican party at once succeeded to it. In effect, the state's last democratic electoral vote was cast in 1820. Since that year the democrats of the state have seldom polled more than 25 per cent. of the total vote in national elections; and, even in the great whig overthrow of 1852, the whig electors obtained a majority of the popular vote, Massachusetts, the only other northern whig state of that year, only giving a plurality. The state's political history is therefore invariably a part of that of the whig and republican parties. — In state elections the result has regularly been the same. The only elections that have ever been in the least degree doubtful were the triangular contests of 1843-52, between the whigs, the democrats and the abolitionists; but even in these the result was always a plurality for the whig candidates for state offices, and their final election by the whig legislature. The election of 1847 will fairly represent most of them: Eaton (Whig), 23,933; Dillingham (democrat), 18,059; Brainard (abolitionist), 7,163. But it must be remembered that Vermont whigs were usually quite as strongly anti-slavery as the abolitionists, differing from them only on the question of action. Thus, Gov. Wm. Slade was considered a whig in his own state, but a thorough abolitionist out of it. On the formation of the republican party all distinction disappeared, and the party vote rose again to about 75 per cent. of the total. In 1882 the legislature stands as follows: senate, thirty republicans, no democrats; house, 225 republicans, thirteen democrats. — As in several other states, the

heavy and certain majority for one party has hindered the national elevation of Vermont's leading men, among whom may be specified the following: Stephen Roe Bradley, democratic United States senator 1791-5 and 1801-13; Dudley Chase (uncle of Salmon P. Chase), democratic United States senator 1813-17 and 1825-31, and state chief justice 1817-21; Nathaniel Chipman, state chief justice 1789-91 and 1794-7, United States district judge 1791-4, and United States senator 1797-1803; Martin Chittenden, federalist congressman 1803-13, and governor 1813-15; Jacob Collamer, state judge 1833-42 and 1850-54, whig congressman 1843-9, postmaster general under Taylor 1849-50, and republican United States senator 1855-65; George F. Edmunds (republican), member of the state house of representatives 1854-9 and senate 1861-2, United States senator 1866-87, one of the most prominent members of that body, and one of the candidates for the republican presidential nomination in 1880; Horace Everett, whig congressman 1829-43; Solomon Foot, whig congressman 1843-7, and republican United States senator 1857-66; Hiland Hall, whig congressman 1831-43, and state judge 1846-50; Matthew Lyon, democratic congressman 1797-1801, afterward from Kentucky, 1803-11, most noted for his rough-and-tumble fight on the floor of the house in January, 1798, with Roger Griswold, a Connecticut federalist, and for his trial and imprisonment later in the year, under the sedition law; George P. Marsh, whig congressman 1843-9, and minister to Italy 1861-82; Justin S. Morrill, republican congressman 1855-67, and United States senator 1867-85; Samuel S. Phelps, state judge 1831-8, and whig United States senator 1839-51 and 1853-4; Luke P. Poland, state judge 1848-65, republican United States senator 1865-7, and congressman 1867-75; Samuel Prentiss, whig United States senator 1831-42, and federal district judge 1842-57; William Slade, whig congressman 1831-43, and governor 1844-6; and Isaac Tichenor one of the leaders of the original independent government, state judge 1791-6, federalist United States senator 1796-7 and 1815-21, and governor 1797-1807 and 1808-9. — The name Vermont, equivalent to Green Mountain, seems to have been suggested in 1777 by Dr. Thomas Young, of Philadelphia, to the leaders of the infant republic of "new Connecticut," and at once adopted. — See 2 Poore's *Federal and State Constitutions*; 2 Hough's *American Constitutions*; 4 *Documentary History of New York*, 329 (correspondence between New York and New Hampshire); Chipman's *Life of Seth Warner*; 1 Sparks' *American Biography* (life of Ethan Allen); Slade's *Vermont State Papers*; Chase's *Early History of Vermont*; Hiland Hall's *History of Vermont* (to 1791); Allen's *History of Vermont* (1798); B. ALEXANDER JOHNSTON.

VETO (IN U. S. HISTORY). I. BEFORE THE CONSTITUTION. The power in the executive to apply some check to the absolute power of the legislative, is an evident necessity in a national government. Franklin long ago noted that absolute power, if it must be granted at all, had better be granted to the executive than to the legislative. "A single man may be afraid or ashamed of doing injustice; a body is never either one or the other, if it is strong enough. It can not apprehend assassination, and by dividing the shame among them, it is so little apiece that no one minds it." The only question is whether the executive should possess a power of absolute, final prohibition of legislation, or a qualified and limited check. The *veto*, "I forbid," of the Roman tribunes, was absolute; the American veto is qualified. — By the theory of the British constitution the crown has an absolute veto on all legislation; no bill can become a law without the royal signature. Since 1692 the power has never been exercised, and its exercise now would probably provoke a revolution. Instead of it, an adverse vote of the house of lords has been used as a sort of veto upon the action of the house of commons; but its exercise, in matters on which the commons are obstinately bent, is now qualified by the tacit understanding, that "it is well enough once, by way of a joke, but it must not be repeated." Sometimes the way toward the final capitulation of the lords is smoothed by admitting unimportant amendments; sometimes a small majority is swamped by the creation of new peers. In 1871, when the lords obstinately resisted the bill for the abolition of the purchase of military commissions, the Gladstone ministry took the unusual step of putting the principle of the bill in force by royal warrant, as an act of prerogative. The lords, thus pressed, passed the bill with a spiteful vote of censure on the ministry. In any event, the veto of the lords is a very limited one. — But in the colonies, before the American revolution, the veto power of the crown was enforced with double rigor. In Connecticut and Rhode Island the governors were chosen by the colonies, and had no veto power. In other colonies the governor, whether appointed by proprietors or by the crown, had an absolute veto on the colonial legislature; and the crown had an absolute veto on the action of the governor and legislature. The veto was constantly used by governors to extort money or favors. In Pennsylvania, says Franklin, "it became at last the regular practice to have orders on the treasury in his favor presented along with the bills to be signed, so that he might actually receive the former before he should sign the latter." In many of the colonies, as in South Carolina, the persistent veto of the governor led to his expulsion before hostilities fairly broke out. In others, as in Virginia, the persistent veto of acts to check the slave trade formed one of the most prominent of revolutionary grievances. All of them agreed, in the declaration of independence, on the following, as the first of the reasons for a separation:

"He has refused his assent to laws the most wholesome and necessary for the public good; he has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained, and when so suspended he has utterly neglected to attend to them; he has refused to pass other laws for the accommodation of large districts of people, unless those people would relinquish the right of representation in the legislature, a right inestimable to them, and formidable to tyrants only; he has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures; he has dissolved representative houses repeatedly, for opposing, with manly firmness, his invasions on the rights of the people; he has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers." With such an experience of the veto power it is not strange that only one of the original state constitutions (Massachusetts, in 1780) gave its governor even a qualified veto power, and that in the articles of confederation there was no executive veto. Indeed, the articles went to the other extreme. By requiring the assent of nine states to important acts of legislation, they really gave an absolute veto to any minority of five states; and, by requiring the assent of every state to amendments, they gave a veto power to each state. In these respects they more resembled the constitution of the Polish diet, with its *liberum veto*, its power reserved to each member to veto absolutely any bill introduced into the house. Nullification (see that title) was a subsequent effort to revive and strengthen this state veto, in the interest of slavery and a section. — II. IN THE FEDERAL CONVENTION. The introduction of an executive power into the new scheme of government necessarily brought with it a veto power. Randolph's "Virginia plan" gave the veto power to the executive "and a convenient number of the national judiciary," to be final, unless overridden "by — of the members of each branch." Pinckney's plan contains a veto provision so like that which was finally adopted that it must have been altered after its first introduction. The "Jersey plan," as it had no executive, had no veto provision. June 4, Gerry proposed as a substitute for Randolph's veto provision, "that the national executive shall have a right to negative any legislative act which shall not afterward be passed by — parts of each branch of the national legislature." Hamilton moved to strike out the last fifteen words, so as to make the negative absolute; this was rejected unanimously. Butler moved that the executive have power to suspend any law for — days; and this was rejected unanimously. The blank in Gerry's motion was then filled by "two-thirds"; and the whole was adopted by a vote of eight states to two. In this form it was reported from the committee, June 19; was sent to the committee of revision July 26, and re-

ported by them almost in its final shape, except that the time for retaining bills was "seven days," instead of "ten days, Sundays excepted," and that it applied only to bills, and not to joint resolutions, orders and votes also, as the final revision made. Aug. 15, "two-thirds" was changed to "three-fourths," by a vote of six states to four, and one divided; but the change was reconsidered and reversed, Sept. 12, by an exactly similar vote. The whole was then made a part of article I., section 7. (See CONSTITUTION.)— But during these deliberations other questions had been under consideration. Randolph's plan of uniting the judiciary with the president, as a "council of revision," was again offered by Wilson, June 6 and July 21, and voted down. Aug. 15, Madison proposed to give the veto power to either the president or a majority of the supreme court judges, to be overridden by two-thirds of each house, if either the president or the court should veto a bill, or by three-fourths of each house, if both should veto it; but this was also rejected, and this plan was dropped. Another provision, that of a veto upon the state legislatures, was warmly urged from first to last. The sixth resolution of the "Virginia plan" gave Congress power "to negative all laws passed by the several states contravening, in the opinion of the national legislature, the articles of union, or any treaty subsisting under the authority of the Union, and to call forth the force of the Union against any member of the Union failing to fulfill its duty under the articles thereof"; but, by the eighth resolution, the council of revision was to have a veto on the congressional veto, unless the latter should be repeated by the requisite majority. May 31, the first part of the scheme was agreed to, "without debate or dissent." Madison, June 8, wished to extend the national veto to inadvisable as well as unconstitutional laws. He "could not but regard an *indefinite* power to negative legislative acts of the states as absolutely necessary to a perfect system. Experience had evinced a constant tendency in the states to encroach on the federal authority. A negative was the mildest expedient that could be devised for preventing these mischiefs. The existence of such a check would prevent attempts to commit them." This extension of the veto was voted down, three states to seven, and one divided. The original provision of the sixth resolution was retained in the report of the committee of the whole, June 13. July 17, the veto on state laws came up for consideration, and Madison again urged it strongly. Gouverneur Morris "was more and more opposed to it. It would disgust all the states, and a law that ought to be negatived will be set aside in the judiciary department." This excellent suggestion was at once heeded. The exceedingly dangerous veto power over state laws was dropped forever, and instead of it the "supreme law clause" of the constitution was adopted. Under this, the federal judiciary has exercised, with little notice or danger, a veto power over state laws which

congress could hardly have attempted without civil war. (See JUDICIARY.) Aug. 23, after the senate had been made a part of the constitution, Charles Pinckney moved that power be given to two-thirds of each house to negative state laws; but six states to five refused to send the proposition to the committee. In a single case, that of state impost laws, a power of "revision and control" was reserved to congress, Sept. 15. (See INTERNAL IMPROVEMENTS.)— Hamilton's plan, as read June 18, and still more as finally elaborated for preservation by Madison, would have made the executive veto power a tremendous instrument. It provided that "the governor or president of each state shall be appointed under the authority of the United States, and shall have a right to negative all laws about to be passed in the state of which he shall be governor or president, subject to such qualifications as the legislature of the United States shall prescribe"; and that "no bill, resolution or act of the [national] senate and assembly shall have the force of a law until it shall have received the assent of the president, or of the vice-president when exercising the powers of the president; and if such assent shall not have been given within ten days after such bill, resolution or other act shall have been presented to him for that purpose, the same shall not be a law; and no bill, resolution or other act, not assented to, shall be revived in the same session of the legislature." This proposition was never formally offered, and could never have been passed; but it is an instructive example of a "high-toned government," according to federalist ideas.— As finally adopted, the veto provision gives the president power to return, with his objections, to the house in which it originated, any bill or joint order, resolution or vote, of the two houses. If the vetoed bill is then passed again by two-thirds of each house, it becomes a law; if not, it is a nullity. If the president does not return the bill, with objections, within ten days (Sundays excepted), it becomes a law, unless congress adjourns within the ten days, in which case it shall not be a law. This last stipulation gives the president an absolute veto on all bills, etc., passed during the last ten days of a session of congress: he has only to retain them, as it were, in his pocket, and they are a nullity, even though nine-tenths of both houses should desire to pass them over the veto. This potent executive weapon, angrily called a "pocket veto" at the time, was first employed by Jackson at the close of the session of 1829-30. He had vetoed the Maysville road bill (see INTERNAL IMPROVEMENTS), but many of his supporters in congress were in favor of internal improvements, and he chose to employ the pocket veto on two similar bills passed afterward. When, in 1833, he disposed of Clay's distribution bill in the same manner, the whigs evolved the ingenious theory that the "adjournment" mentioned in the constitution, which made a pocket veto possible, meant only a voluntary adjournment by congress; that the close of a two-

years term of service was not an adjournment in this sense, since the constitution, not congress, prevented the return of bills; and that bills retained by the president at the end of a congress became law without his signature. This notion was never vigorously pressed, however. Evidently, it would put the president at the mercy of a mere majority in congress, which would only need to time the final passage of a bill so late on March 3 of their last year as to make it physically impossible for the president to use his veto power. — It has also been questioned whether the "two-thirds of each house," requisite to pass bills over the veto, is two-thirds of the number elected, or of the number present. The latter was undoubtedly the intention; for the constitution provides that a majority of each house shall be a quorum to do business, and refers repeatedly to this quorum as "a house." In but one case, the power of the senate to advise and consent to treaties, does it use expressly the words "two-thirds of the senators present"; but the treaty power is rather executive than legislative, and this provision can hardly have any bearing on the plain intent of the constitution in matters of simple legislation. — The American veto system seems to have struck the safest middle line, and attempts to modify it elsewhere have generally proved injurious. The French constitution of 1789 gave the king a veto power, with a provision that the passage of a law three years in succession should override the veto; but this was a failure, for the impatience of the people could not wait three years for a compliance with their will. The Mexican constitution of 1824, in addition to the presidential veto of the United States, gave each house a qualified veto on the other, as follows: if a bill, passed by one house and rejected by the other, should again be passed by the first house by a two-thirds vote, it could only be rejected by a two-thirds vote of the other house. But this had only its natural effect of hurrying on a revolution by a powerless majority. One modification, the power to veto single clauses, given by the confederate constitution of 1861, fairly deserves consideration. (See RIDERS, I.) — III. UNDER THE CONSTITUTION. The first exercise of the veto power was by Washington, April 5, 1792. (See APPORTIONMENT.) Until 1830 there were but nine vetoes, two by Washington, none by Adams or Jefferson, six by Madison, and one by Monroe. The most important of these were Madison's veto of the bill to establish a United States bank, Jan. 30, 1815 (see BANK CONTROVERSIES, III.), his veto of the internal improvement bill, March 3, 1817, and Monroe's Cumberland road veto, May 4, 1822. (See INTERNAL IMPROVEMENTS, II.) Jackson vetoed nine bills, including Clay's distribution bill, which he formally vetoed, Dec. 5, 1833, after giving it a pocket veto at the preceding session. Most of these vetoes were put on internal improvement bills; but one, July 10, 1832, was upon a new United States bank bill, and another, June 10, 1836, was upon a bill fixing a day for the meeting of congress. This fre-

quent use of the veto power by Jackson furnished the bond which united a great number of elements into the whig party, and gave it a name. (See WHIG PARTY, II.) The whig animosity to the veto power was revived by its exercise during Tyler's administration. He vetoed two United States bank bills, Aug. 16 and Sept. 9, 1841 (see BANK CONTROVERSIES, IV.); two tariff bills, June 29 and Aug. 9, 1842; a bill for harbor improvements in eastern states, June 11, 1844; and a bill for building two revenue cutters, Feb. 20, 1845, on account of ambiguity in the language. Polk vetoed two bills, a river and harbor bill, Aug. 3, 1846, and a bill for the settlement of French spoliation claims, Aug. 8, 1846; but an internal improvement bill, passed March 3, 1847, which had been disposed of by a pocket veto, was formally vetoed at the following session, Dec. 15, 1847. Pierce used the veto nine times, on a bill appropriating lands for insane poor, May 3, 1854; an internal improvement bill, Aug. 4, 1854; a French spoliation claims bill, Feb. 17, 1855; an appropriation for the Collins ocean mail steamers, March 3, 1855; two special internal improvement bills, May 19, 1856, another May 22, and two others, Aug. 11 and Aug. 14. Buchanan vetoed a homestead bill, June 22, 1860, in which the price of lands had been reduced by southern senators to so low a figure (25 cents an acre) as to provoke a veto. Lincoln regularly stated any minor objections which he held to any bill in the message approving it; and congress usually obviated the objections by supplementary legislation. June 23, 1862, he vetoed a bill to allow the circulation of bank notes of less than \$5 value in the District of Columbia. July 12, 1862, while approving a confiscation bill, he transmitted a veto message already prepared, the necessity for which had been removed by a subsequent explanatory resolution of congress. Up to this time the veto power on legislation had been final, since the two-thirds majority necessary to override it had not been obtained. — The accession of Andrew Johnson, a southern democrat, to the presidency, with a congress in which the republicans had a strong majority, but would not have a two-thirds majority if all the insurrectionary states should be allowed to send democrats to the senate and house of representatives, made a conflict inevitable. Congress was determined to secure, while it had the power to secure, the right of negroes to suffrage; and the president was as determined to obstruct reconstruction, unless the southern delegations were admitted at once, when the republican two-thirds majority would be at an end, the veto would be as potent as it had always been, and the president could control the course of reconstruction. From February, 1866, until March, 1869, there was an almost continuous storm of vetoes, most of them upon reconstruction bills, or bills extending the principles of negro suffrage in various directions. During 1866 there were the vetoes of the first freedman's bureau bill, Feb. 19; of the civil rights bill, March 27; of the Colorado bill, May 18; and of the sec-

ond freedmen's bureau bill, July 16; and, on the adoption of the 14th amendment, a message was sent to congress, June 22, suggesting that there were "grave doubts" as to the power of congress to frame an amendment while eleven states were refused representation. In 1867 there were the vetoes of the bill regulating suffrage in the District of Columbia, Jan. 5; of the second Colorado bill, Jan. 29; of the Nebraska bill, Jan. 30; of the tenure of office bill, March 2; of the reconstruction bill, March 2; and of the supplementary reconstruction bills of March 23 and July 19. In 1868 there were the vetoes of the bill regulating appeals on habeas corpus, March 25; of the bills for the readmission of Arkansas, June 20, and North Carolina, South Carolina, Florida, Georgia, Alabama and Louisiana, June 25; and of the joint resolution denying validity to the electoral votes of unreconstructed states. (See, for further particulars, RECONSTRUCTION, and titles of bills mentioned.) Many other bills, which the president neither wished to sign nor cared to veto, were left ten days, and became law without his signature. Congress left him little opportunity for "pocket vetoes," but on his retirement from office, March 3, 1869, he had such an opportunity, and used it, in the case of three bills, which were immediately afterward passed again, and signed by President Grant. — President Grant's two vetoes were those upon the bill to increase the amount of "greenbacks" to \$400,000,000, and to authorize the issue of \$46,000,000 in national bank notes, April 22, 1874, and the bill to repeal the increase of the president's salary to \$50,000, April 19, 1876. Various circumstances made President Hayes' term of office more prolific in vetoes. In addition to a distinct group of vetoes (see RIDERS, II.), were those upon the bill to authorize the coinage of silver dollars, February 28, 1878; the bill to restrict Chinese immigration, March 1, 1879; and the bill to fund \$700,000,000 of the national debt at 3 per cent., March 3, 1881. President Arthur vetoed a bill to restrict Chinese immigration, also a river and harbor bill of about \$20,000,000, in 1882.—IV. IN THE STATES. Four of the states, Delaware, North Carolina, Ohio and Rhode Island, have never given their governors the veto power. In eight others a very limited veto power has been given, which may be overridden by a majority of the whole number elected to each house. These are as follows, the year in which the veto was granted being added: Alabama, 1819; Arkansas, 1836; Connecticut, 1818; Indiana, 1816; Kentucky, 1799; New Jersey, 1844; Vermont, 1836; West Virginia, 1872. In twenty-four others, a two-thirds vote is required to override the veto: California, 1849; Colorado, 1876; Florida, 1865; Georgia, 1789; Illinois, 1870; Iowa, 1846; Kansas, 1859; Louisiana, 1812; Maine, 1820; Massachusetts, 1780; Michigan, 1835; Minnesota, 1857; Mississippi, 1817; Missouri, 1875; Nevada, 1864; New Hampshire, 1792; New York, 1821; Oregon, 1857; Pennsylvania, 1790; South Carolina, 1865; Ten-

nessee, 1870; Texas, 1836 (republic), 1845 (state); Virginia, 1870; Wisconsin, 1848. In Maryland (1867) and Nebraska (1875) a three-fifths vote is requisite. But one state, Kentucky, has changed from a two-thirds vote (1792) to a majority vote (1799). The following states, now requiring a two-thirds vote, as above, required only a majority vote at first: Florida, 1838; Illinois, 1848; Missouri, 1820. Connecticut, Maryland, South Carolina, Tennessee, Virginia and West Virginia were without the veto power until it was granted in the years mentioned above. In Nebraska a two-thirds vote only was needed from 1866 until 1875. In Illinois, 1818-48, the veto power was given to the governor and supreme court judges, to be reversed by a majority vote; and in New York, 1777-1821, to the governor, chancellor and supreme court judges, to be reversed by a two-thirds vote. In Vermont, 1786-1836, a suspensory power until the following session was given to the governor and council. In the states the tendency generally has been to increase the strength of the veto power by making the votes of two-thirds of all the members elected requisite to override it, and, further, by giving the power to veto single sections of appropriation bills. (See RIDERS, III.)—The veto messages until 1858 are in the *Statesman's Manual*; since that time they must be sought under their dates in the *Congressional Globe* and *Congressional Record*. See also 4 Franklin's *Works*, 283; 4 Elliot's *Debates*, 620; 5 *ib.*, 108, 130, 151, 190, 205, 385, 534, 560, 588-9; 2 Curtis' *History of the Constitution*, 57, 264; 4 *Whig Review*, 325; 9 *ib.*, 16; 10 *ib.*, 111; 14 Benton's *Debates of Congress*, 494; 3 Webster's *Works*, 416; 1 *ib.*, 267; 1 Colton's *Life and Times of Clay*, 496; 1 Kent's *Commentaries*, 226; *Federalist*, LI., LXXIII.; Story's *Commentaries*, § 878, and note to § 1566 (Madison's letter of June 25, 1831, on the veto); Poore's *Federal and State Constitutions*.

ALEXANDER JOHNSTON.

VICE-PRESIDENT. (See EXECUTIVE, V.; ELECTORS, SENATE; ADMINISTRATIONS.)

VIRGINIA, one of the thirteen original states of the American Union. Its area formed part of a general grant of James I., April 10, 1606, to two companies, controlled by a general council appointed by the king, the whole grant covering the Atlantic coast from north latitude 34° to north latitude 45°. The special grant to the "London company," with which we have to do, included the mainland and islands between latitude 34° and latitude 41°, or from about Cape Fear to Long Island sound; and the special grant to the "Plymouth company" extended from latitude 38° to latitude 45°, or from the mouth of the Potomac to the northern boundary of Vermont. Between latitude 38° and latitude 41°, where the grants conflicted, neither company was to plant a colony within 100 miles of a colony previously planted by the other. Under this grant settlement was begun at Jamestown, May 13, 1607.

May 23, 1609, a supplementary charter defined the limits of the colony, as stated below. March 12, 1611-12, a further charter gave power to convene a colonial assembly, or "great and general court," with power to legislate, provided the laws were not contrary to the laws and statutes of England; and under this charter the first legislative assembly in America met at Jamestown, June 30, 1619, being composed of a council named by the company, and a house of burgesses (see ASSEMBLY) elected by the towns. In 1624 the company was suppressed by a writ of *quo warranto*, its powers were assumed by the king, and Virginia remained a royal province until 1776. During the commonwealth period, it remained loyal to the crown, and for three years after the death of Charles I. his son was acknowledged as king of Virginia, so that at the restoration this colony claimed to be the new king's "Old Dominion." Its loyalty availed it little. A charter was refused it; the quit rents and the control of the church of England, its established church, were lavished upon court favorites; and in 1676 the tyranny of Gov. Berkeley drove the colonists into a rebellion, headed by Nathaniel Bacon, which was suppressed with vindictive punishment. "The old fool [Berkeley]," said Charles, "has taken away more lives in that naked country, than I for the murder of my father." With the exception of this episode, the colony grew quietly, but strongly, into a populous, rich, slaveholding, Episcopalian commonwealth, with a strong desire for self-government; and at the outbreak of the American revolution it was unquestionably the leading state. Its lower house was dissolved by Gov. Dunmore, May 25, 1775, while preparing a protest against the Boston port bill; but the members met the next day and inaugurated the revolution by proposing a congress. (See CONGRESS, CONTINENTAL.) In the following year, May 6, they again met as usual; but, as the governor had run away, and the regular government was suspended, they organized as a "provincial congress," and framed the first constitution of the state of Virginia. — BOUNDARIES. The charter of 1609 defined the colony's limits thus: from point Comfort, all along the seacoast to the northward 200 miles, and all along the seacoast to the southward 200 miles, "and all that space and circuit of land lying from the seacoast of the precinct aforesaid, up into the land throughout from sea to sea, west and northwest." The boundary lines were evidently not to be parallel lines: one was to be a westward line, and the other northwesterly. If the new colony was to have any limits whatever on the west it would seem most natural that the northerly boundary should be the westward line, and the southerly boundary the northwestward line, to intersect it. Virginia would thus have been a comparatively small colony, of a triangular shape. But the colony, resting on the words "from sea to sea," and interpreting them to mean "from the Atlantic to the Pacific," instead of from the Atlantic around the compound bound-

ary line to the Atlantic again, made the southern boundary the westward line, and the northern boundary the northwestward line, thus making her territory grow constantly wider as it went westward. She was compelled, indeed, to yield to the royal prerogative of taking back presents, and her 200-mile limits were interfered with on the south by the grant of Carolina (see NORTH CAROLINA), and on the north by the grant of Pennsylvania and Maryland. (See those states.) To these encroachments she submitted patiently, conscious that her charter, as she interpreted it, contained an abundant reward for her patience. A line drawn northwest from the western boundary of Maryland will show the extent of Virginia's claims to the western part of Pennsylvania, and to the whole territory northwest of the Ohio; indeed, her "northwest line" might have stretched on and included Alaska, but for the subsequent (1762) fixing of the Mississippi as the western boundary of the colonies. Her claims to the northwestern territory were finally abandoned. (See TERRITORIES.) Her Pennsylvania boundary was finally arranged by mutual consent in 1780, by continuing Mason and Dixon's line five degrees to the west, and thence due north, thus giving Virginia the "pan-handle" in the northwest. For her boundaries with North Carolina, Tennessee, Kentucky, West Virginia and Maryland, see those states. — CONSTITUTIONS. 1. The provincial congress, June 12, 1776, adopted a bill of rights, which has been retained in subsequent constitutions, but modified in 1867. Its most important sections were the third, which declared the right of the people to alter, reform or abolish their government at their own will; and the fourteenth, that no government separate from or independent of the government of Virginia should be erected or established within the limits thereof. The two were in effect a declaration of independence. (See STATE SOVEREIGNTY.) June 29, the first state constitution was adopted, without a reference to popular vote. It provided for a general assembly, consisting of a senate of twenty-four members, chosen by districts, to serve four years, and a house of delegates (see ASSEMBLY), chosen by counties and towns, to serve one year, for a governor and council of eight, chosen annually by joint ballot of the two houses; and for a judiciary, to be appointed by the legislature during good behavior. This constitution remained in force for half a century, until the growth of the western part of the state, and its unfairly small representation in the legislature, compelled a general revision. 2. A new constitution was framed by a convention at Richmond, Oct. 5, 1829-Jan. 15, 1830, and ratified by a popular vote of 26,055 to 15,563. It fixed the number of the house of delegates at 134, 31 to the twenty-six counties west of the Alleghanies, 25 to the fourteen counties between the Alleghanies and the Blue Ridge, 42 to the twenty-nine counties between the Blue Ridge and tide water, and 36 to the counties, cities, towns and boroughs on tide water; and the

number of the senate at 32, thirteen of the districts being west and nineteen east of the Blue Ridge. The proportional representation of the great divisions was not to be changed by the legislature. The governor was now to hold office for three years, and the judges were to be removable by a two-thirds vote of both houses. 3. A new constitution was framed by a convention at Richmond, Oct. 14, 1850 - Aug. 1, 1851, and ratified by a popular vote of 67,562 to 9,938. Its principal changes were, that the governor was to be elected by the people for four years; the judiciary was to be elected by popular vote for terms of twelve and eight years, and removable by a vote of a majority of the members elected to both houses; the number of the house of delegates was fixed at 152, chosen for two years, and apportioned among the counties, and the number of senators at 50, chosen by districts for four years; and, in default of the adoption of an equitable principle of apportionment by the legislature, a very complicated scheme was drawn up for reapportionment in 1865, which the course of events overruled. The principle of an obsolete statute of 1805 in regard to slavery was thus transferred to the new constitution: "Slaves hereafter emancipated shall forfeit their freedom by remaining in the commonwealth more than twelve months after they become actually free, and shall be reduced to slavery under such regulation as may be prescribed by law"; and "The general assembly may impose such restrictions and conditions as they shall deem proper on the power of slave owners to emancipate their slaves." 4. After the separation of West Virginia (see that title), the state government which had consented to it was transferred to Alexandria, where a convention from the counties within the federal lines, Feb. 13 - April 7, 1864, framed a new constitution, which was not submitted to popular vote. It abolished slavery, fixed the number of the house at not less than 80 nor more than 104, to serve two years, and the number of the senate at not less than one-fourth nor more than one-third the number of the house; and disfranchised those who had held office under the confederate government, or been members of the confederate congress or of rebellious legislatures. 5. The fifth constitution was framed by a convention at Richmond, Dec. 3, 1867 - April 17, 1868. It added four new clauses to the original bill of rights, providing that the state should ever remain a member of the United States of America; that the people thereof are part of the American nation; that their paramount allegiance is due to the constitution of the United States and laws of congress passed in pursuance thereof; that slavery shall never exist in the state; and that all its citizens have equal civil and political rights and public privileges. It gave the right of suffrage to "male citizens" over twenty-one on twelve months' residence in the state; made disfranchisement a penalty for dueling; gave the veto power to the governor, and the election of judges to the legislature; and regulated the government of cities. The con-

stitution was ratified by a popular vote of 210,585 to 9,136, July 6, 1869. At the same election the disfranchisement clauses, which had caused the long delay in ratification, and which were submitted to separate vote under an act of congress of April 10, 1869, were rejected. In 1876 an amendment was adopted requiring the payment of a capitation tax before voting, disfranchising for petit larceny, and empowering the legislature to remove dueling disabilities by a two-thirds vote. The capitation tax was subsequently abolished by another amendment.—GOVERNORS. Patrick Henry, 1776-9; Thos. Jefferson, 1779-81; Thos. Nelson, 1781; Benjamin Harrison, 1781-4; Patrick Henry, 1784-6; Edmund Randolph, 1786-8; Beverley Randolph, 1788-91; Henry Lee, 1791-4; Robert Brooke, 1794-6; James Wood, 1796-9; James Monroe, 1799-1802; John Page, 1802-5; Wm. H. Cabell, 1805-8; John Tyler, 1808-11; James Monroe, 1811; George W. Smith, 1811-12; James Barbour, 1812-14; Wilson C. Nicholas, 1814-16; James P. Preston, 1816-19; Thos. Mann Randolph, 1819-22; James Pleasant, 1822-5; John Tyler, 1825-7; William B. Giles, 1827-30; John Floyd, 1830-34; Littleton W. Tazewell, 1834-6; Windham Robertson, 1836-7; David Campbell, 1837-40; Thos. W. Gilmer, 1840-41; John Rutherford, 1841-2; John M. Gregory, 1842-3; James McDowell, 1843-6; Wm. Smith, 1846-9; John B. Floyd, 1849-52; Joseph Johnson, 1852-6; Henry A. Wise, 1856-60; John Letcher, 1860-64; William Smith, 1864-5; Francis H. Pierpont, 1865-8; Henry H. Wills, 1868-70; Gilbert C. Walker, 1870-74; James L. Kemper, 1874-8; F. W. M. Holladay, 1878-82; Wm. E. Cameron, 1882-6.—POLITICAL HISTORY. For the century succeeding the opening of the conflict with the mother country, 1760-1860, the whole policy of Virginia is expressed in the declaration of her bill of rights, "that no government separate from or independent of the government of Virginia should be erected or established within the limits thereof." Under the colonial system the resistance to encroachment was directed against the king's governors, and under the constitution against the federal government; and the only period during which the Virginia policy ever had full and free play was that of the confederation and the few years of loose alliance that preceded it, 1775-89. Size, population, wealth and concurrence of sentiment among leading men made Virginia the great exponent of "state sovereignty." (See that title.) For such a rôle her colonial history went far to prepare her. The character of her immigration, its sympathy in blood, breeding and prejudices with the English royalist party of 1620-80, and the final impress given to the mould by the establishment of a state church, were all calculated to make Virginians fully conscious of their own importance, and ready to maintain their individual opinions. Further, the necessarily backwoods character of Virginia life, the absence of any such object of loyalty as a personally present king, and the introduction of negro slavery, tended to exaggerate in the Virginian the personal

characteristics of his English prototype, while it took away the checks which had operated upon the latter: and the English royalist was metamorphosed into the Virginia democrat. Virginia democracy was thus not based on any Calvinistic view of the universal equality of men in their infinite inferiority to their Maker; nor in any theoretical love for humanity: it was rather a general agreement by all white Virginians to recognize one another's feeling of individual importance, and to support the state government under which that feeling found the safest shelter. John Randolph's exclusive application of the expression "my country" to Virginia, only voiced the conscious or unconscious feeling of all Virginia democrats. — The political history of the state until 1881 was therefore that of the democratic party. Its electoral votes and its state government were steadily of one party, and only an occasional congressman among the opposition varied the general rule. The state's ratification of the constitution in 1788 was only accomplished by a meagre majority of ten votes (see CONSTITUTION, II.); and it is safe to say that the majority was only obtained by a sense of the insecurity of Virginia's title to western lands if a general scramble for the territories should be brought on by a failure to organize national government. (See TERRITORIES.) The inauguration of the new government marked Virginia's importance. Washington's presidency was due only to himself: the positions of Jefferson and Randolph in the cabinet, and of Madison as leader in the house, were due to Virginia's leadership among the states. There was thus developed at once the seed of what soon came to be known as the "Virginia influence," hard to define exactly, and yet very apparent in the politics of the time. Throughout the controlling tide-water counties of the state, where genealogy was a science held in the highest esteem, where immigration had almost ceased to bring new and confusing strains of blood into the established stocks, and where exhaustion of tobacco lands had not yet begun to banish the old families, nearly every leading man was related more or less distantly to most of his competitors; the different congeries of families were just far enough removed to deaden any ambitious struggles for clan supremacy; the opinions of Jefferson, Madison, Monroe, Page, Giles, Bland, Taylor, Tazewell, the Nicholases, the Randolphs, and other democratic leaders, came to subordinate leaders with the force of family as well as political sympathy; and the whole formed the shadowy but powerful "Virginia influence," which made or destroyed presidents until 1825. From the beginning of Hamilton's centralizing policy (see FEDERAL PARTY, I.), the Virginia influence stood stiffly against it, and thus became the corner-stone of the new democratic party. From Virginia proceeded most of the efforts which gradually gave the new party control of the south and a "fighting chance" in the middle states. When federalist partisanship in 1798 threatened what Hamilton considered "a tyranny," the half-uttered

counter-threat of forcible resistance came from Virginia and her daughter, Kentucky. (See KENTUCKY RESOLUTIONS.) When the federal party was finally overthrown, in 1800-1, Virginia and New York took the same places in the dominant democratic party that Virginia and Massachusetts had held in the revolutionary struggle. The former state was still able, from its pre-eminence in the country and party, to name the president, while the vice-president was generally given to the latter. The "Old Dominion" of colonial times thus became the "Mother of Presidents" under the constitution. — The Virginia influence was not altogether undisputed, even in its own state. The greatest of Virginians, Washington, was a federalist, and so were John Marshall, Charles Lee, Henry Lee, and (after parties had fairly developed) Patrick Henry. The general prevalence of the Virginia influence in national affairs after 1800 soon wiped out the last trace of federalism in Virginia, but at the same time it prepared the way for a Virginia schism. As the leaders, Jefferson and Madison, became more absorbed in national politics, more dependent on northern democrats, and more neglectful of their state, an ultra Virginian faction, "republicans of the old school," or "quids," appeared, headed by John Randolph, and including also Tazewell and John Taylor. Their public defection took place in March, 1806, and from that time they spared no effort to secure the presidency in 1809 for Monroe, a candidate of far less ability than Madison, but recommended by his long absence from national politics and his supposed devotion to his state. But the defection was a failure. In January, 1808, the Virginia legislature nominated Madison for the presidency, and the nomination was repeated, two days afterward, by the congressional caucus. (See CAUCUS, CONGRESSIONAL.) A caucus of Monroe members of the legislature nominated him, and the federalists supported him in the state; but the Monroe ticket was badly defeated in Virginia, and unheard of elsewhere. The Virginia influence was thus still triumphant: Monroe himself submitted in 1811 by entering the cabinet of Madison; and his former supporters either followed him, or kept up a filibustering opposition to the war of 1812. — But the general spread of democratic ideas, and the decrease of the state's comparative importance, had already doomed the influence of Virginia. In 1817 it was hardly able to nominate Monroe for the presidency, and its lame success in that year, as well as in 1821, was due mainly to the influence of tradition upon the new men and new states in politics. Republics are not always ungrateful, and it was not until the last Virginia leader had been duly honored that the field was felt to be fairly open for others. From that time Virginia was no longer to be the "Mother of Presidents." With one accidental exception, the sceptre was to be transferred to other states. In 1790 she was the first of the states in population: in 1830 she was third, New York and Pennsylvania having outstripped her. Changes had also been taking

place within the state. The western part of the state (now West Virginia) had more than three times as much population in 1830 as in 1790, while the eastern part of the state had increased very little; and yet the apportionment of representation remained fixed as in 1776. The crying need of a reform in this respect brought about the convention of 1829, one of the most distinguished assemblages of able men that ever met in any state. The desire of each section to be well represented sent to the convention Madison, Monroe, Marshall, John Randolph, Giles, Mercer, Tazewell, John Taylor, Garnett, Leigh, and all the ablest men of the state. The object of the delegates of the western and middle sections was to base representation on white population only for both houses; the eastern delegates wished for the "federal basis," including three-fifths of the slaves. The former plan, as in South Carolina (see that state) would have given the taxing power to the western and middle sections, while the east held the taxable property. At first the convention inclined toward compromising by giving a white basis of representation to the house, and a federal basis to the senate; but in the end the eastern delegates succeeded in establishing the artificial apportionment already detailed, which deprived their section of comparatively little political power. Slavery had been the secret of the difficulty. East and west of the Blue Ridge the white population was not far from equal; but the latter section had comparatively few negroes, while the blacks outnumbered the whites in the former, and three-fifths of them counted under the federal basis, which governed quite closely the apportionment as it was settled. The constitution had hardly been adopted when Virginia was startled by an unsuccessful negro insurrection in Southampton county, near Norfolk, in August, 1831, under the lead of one Nat Turner. When the legislature met, the western delegates at once took the insurrection as a text, and an animated debate followed for several weeks, in which every plan for abolition was proposed and advocated. At last this extraordinary discussion, the only one of its kind ever held in a southern legislature before 1865, was stifled, and never revived — Until about 1835 democratic control of the state was hardly disputed: the popular vote for Jackson in 1832 was 75 per cent. of the total vote. During Jackson's second term the whig party of the state was developed, and, though it never fully controlled the state, it was able to give its opponent battle on even terms for nearly twenty years. It contested every county of the state: in the eastern part it gained votes through the desire of many slaveholders for a system of internal improvements which should offset the exhaustion of land, and check migration; in the western and middle sections it was aided to some extent by the traditional opposition to the usually democratic tidewater counties; and the nullification element, John Tyler being its best known exponent, gave it some assistance. At first it was strong enough to elect

Tyler and B. W. Leigh to the United States senate, and to make Gilmer governor; and in 1840 its presidential electors were defeated by only 1,392 votes out of 86,394. Thereafter it remained an opposition party, with about 47 per cent. of the total vote. Its best known leaders were Tyler, Leigh, John Minor Botts, Preston, Stuart and Faulkner, those of the democrats being W. C. Rives, Dromgoole, Mason, Hunter, Boccock, Letcher and Wise. After 1849 the whig vote decreased, and after 1853 most of its former leaders became democrats. But some, not choosing to take that course, adopted the "know-nothing" organization (see AMERICAN PARTY), and contested the state with about the former whig vote. The proportionate popular vote may be seen by the results of the elections for governor: (1855) Henry A. Wise, democrat, 83,424, Thos. S. Flournoy, "American," 73,244; (1859) John Letcher, democrat, 77,112, Wm. L. Goggin, "American," 71,543. In spite of the large minority vote, the democrats continued to control the legislature and all but one or two of the congressmen. — As the sectional disputes of 1850-60 began to verge evidently toward war, Virginia strove hardest to avert that calamity. (See BORDER STATES) The struggle for the state's electoral vote in 1860 was won by the old whig element (see CONSTITUTIONAL UNION PARTY), the popular vote standing 74,681 for Bell, 74,323 for Breckinridge, 16,290 for Douglas, and 1,929 (in western Virginia) for Lincoln. The special session of the legislature in January, 1861, called a peace convention of all the states (see CONGRESS, PEACE); appointed commissioners to ask the president of the United States and the governor of South Carolina to keep the peace for sixty days; and, in calling a state convention, provided that its action should be submitted to the people for ratification or rejection. These pacific measures were due solely to the general dislike of secession by the people, who knew that in case of war their state must be the battle ground; and the real feeling of the state politicians was better shown by the passage of numerous resolutions of a covertly warlike nature—appropriating money to arm the state, and threatening forcible resistance to any attempt by the federal government to coerce any seceding state. The convention met Feb. 13, and for two months debated the various propositions offered. It was so divided that any resolution asserting the abstract right of secession was sure of a small majority in favor of it, while any resolution looking to the practical exercise of the right was equally sure of a slight majority against it. April 17, the deliberations were brought to a crisis by President Lincoln's call for troops. (See INSURRECTION.) Under the excitement of the moment, and the stimulus of still greater mob excitement in Richmond, an ordinance of secession was passed, by a vote of 88 to 55, to take effect when ratified by the people, May 23. But the new order of Virginia politicians, unsafe guides in any such crisis, had no great confidence in the popular vote, and pro-

ceeded in a course which no one has ever attempted to defend on any constitutional theory. The convention, April 25, ratified the constitution of the confederate states, and, by its commissioners and A. H. Stephens, commissioner from the confederate states, formed a "temporary convention," placing the state's whole military force under the president of the confederate states. Both measures were to be void if the popular vote in May should be against secession; but the irruption of confederate troops made the election a farce. In this lawless fashion the secession of Virginia was accomplished. It was followed by a counter-revolution, which permanently deprived the state of its western section. (See WEST VIRGINIA.) When West Virginia had been admitted as a state, its original revolutionary government was transferred to Alexandria, where it remained until the close of the war, claiming to be the government of Virginia, but receiving obedience only from the counties within the federal lines. — Throughout the war, Richmond was the capital of both the state and the confederacy, and all the political feeling of the state was concentrated upon the prosecution of the war, with very little friction between the two authorities. In May, 1865, President Johnson refused to recognize Gov. Smith, and the Pierpoint administration took its place without dispute, and held it for two years. During this time the state's idea of reconstruction was fully carried out; the constitution of 1864, with its prohibition of slavery, was accepted, but the test oath was abolished, the proposed amendment to the constitution of the United States was voted down, and stringent vagrant acts were passed for the control of the freedmen. In March, 1867, the state government came under the reconstruction laws. (See RECONSTRUCTION.) The reconstruction convention, in framing a new constitution, disfranchised all persons who had held office of even the lowest grades under the state or confederacy until 1865, and enforced the disfranchisement by providing for a stringent test oath and registry law. In a large part of the state it would thus have been impossible to find qualified officeholders, and no attempt was made to put the constitution to vote until a new act of congress allowed a separate vote on the objectionable clauses. They were rejected, and the state was readmitted, Jan. 26, 1870. — For nearly ten years the state remained democratic in all elections, the dominant party taking the name "conservative." The republican vote was at first large, but was continually in the minority, except in the election of four of the nine congressmen. In 1874 the democrats secured eight of the nine congressmen, and thereafter the republican vote was of little importance. The most troublesome problem for the successive legislatures was that of the state debt. It amounted, Jan. 1, 1871, to \$47,390,840.98, of which about \$37,200,000 was for debt contracted before April, 1861, and for lapsed interest thereon. March 30, 1871, a bill was passed to fund two-thirds of this amount (leaving one-third as the proportion of

West Virginia) into bonds whose coupons should be receivable for state taxes. The popular objections to this seem to have been mainly as follows: that the receipts from state taxation, at the rate of fifty cents on \$100, were regularly about \$2,500,000 per annum; that the expenses of government and public schools were about \$1,600,000; that the interest on the funded debt would be about \$1,800,000; and that the state was absolutely unable to increase the rate of taxation so as to make up the deficit. The whole question evidently hinges on this last assertion, whose truth can not well be proved or disproved: it is only certain that no such assertion would have been made by the ancient commonwealth. The passage of the funding bill at once went into politics, and the next legislature, March 7, 1872, repealed the "tax coupon" feature of the law. But, before the repeal, about \$17,000,000 had been funded in tax coupon bonds, and the state court of appeals decided that a repeal as to them would be a breach of contract and unconstitutional. Still, the legislature was unable or unwilling to lay taxes sufficient to pay the interest, and the constant receipt of coupons for taxes kept the treasury in a state of chronic bankruptcy. In 1873 an act was passed to pay one-third of the interest, after government expenses should have been paid—a proviso which effectually nullified the law. In 1877 a final effort was made to increase revenue by a liquor law (the Moffett act), which compelled liquor sellers to register sales by means of a mechanical register upon the counter: but this only produced about \$500,000 annually, insufficient to make up the deficit. In March, 1878, a bill was passed offering to the bondholders refunding bonds with interest at 3 per cent. for eighteen years, and 4 per cent. for thirty-two years thereafter. The probability of a settlement on some such basis crystallized the opposition into a "readjuster" party, led by William Mahone. It made some little effort in the election of 1878, though Gov. Holliday, the debt-paying candidate, was elected by 101,940 out of a total vote of 106,329. In the following February the "readjuster movement" took complete shape, as the final "McCulloch bill" was being perfected. This act, passed March 28, 1879, and accepted by the bondholders, provided for forty-year refunding bonds, with interest at 3 per cent. for ten years, 4 per cent. for twenty years, and 5 per cent. for ten years, coupons receivable for taxes. The interest would thus have been about \$900,000 annually for ten years, and there would have been little danger of a deficit. But the readjusters, in addition to the standing claim of inability to levy a higher rate of taxation than fifty cents on \$100, denounced the tax coupon feature of the act as "against public policy, and degrading to the state and people." On this issue they obtained a popular majority in the election of November, 1879; and by a coalition of their forty delegates with the seventeen republican members they obtained a majority in the lower house of the legislature. They have since controlled the

state, though the "debt-paying" electoral ticket, recognized by the national democratic committee, was successful in the presidential election of 1880. In December, 1879, Mahone was elected United States senator, and when his term began, in March, 1881, he at once ranged himself with the republicans, declaring that he had been elected as a readjuster, not as a democrat. Since that time, the fusion of the readjusters and republicans has been complete, and has controlled the state. In November, 1881, it elected Governor Cameron by a vote of 111,473 to 99,757 for the "funder" candidate, Daniel, and obtained a majority in both branches of the legislature. Riddleberger, who was the framer of the bill passed in 1873, was sent to the United States senate for the term beginning in 1883. But the defection of a few of their number during the session prevented the readjusters from carrying out their debt programme, and the future of the party is very uncertain. Its leaders are supported by the national administration, which is republican, and yet the fusion between readjusters and republicans has never been more than a mechanical mixture, and there are many signs of its breaking asunder. While it lasts it at least secures the free exercise of the right of suffrage to the negro voters of the state. — In addition to the names of Jefferson, Madison, Marshall, Monroe, John Randolph, Tyler, Wirt and Washington (see those names), the following have been among the more prominent of the state's political leaders: William S. Archer, whig congressman 1820-35, and United States senator 1841-7; Philip P. Barbour, democratic congressman 1814-25 and 1827-30, and supreme court justice 1836-41; Theodorick Bland, anti-federal delegate to congress 1780-83, and congressman 1789-90; Thomas S. Bocoek, democratic congressman 1847-61, confederate congressman and speaker of the house 1862-5; Alexander R. Boteler, whig and "American" congressman 1859-61, confederate congressman 1862-4; John Minor Botts, whig congressman 1830-43 and 1847-9, and an open opponent of secession throughout the rebellion; James Breckinridge, federalist congressman 1809-17; Matthew Clay, democratic congressman 1797-1815; George C. Dromgoole, democratic congressman 1835-41 and 1843-7; John W. Eppes, democratic congressman 1803-11 and 1813-15, and United States senator 1817-19; Charles J. Faulkner, whig and democratic congressman 1851-9, and minister to France 1859-61 (see WEST VIRGINIA); John Floyd, democratic congressman 1817-29, governor 1830-34, and a leading nullificationist; John B. Floyd (son of the preceding), governor 1849-52, secretary of war under Buchanan, and brigadier general in the confederate army; William B. Giles, democratic congressman 1790-99 and 1801-3, United States senator 1804-15, and governor 1827-30; Thomas W. Gilmer, governor 1840-41, congressman 1841-4 ("Tylerized" whig, afterward a democrat), and secretary of the navy under Tyler; Wm. L. Goggin, whig congressman 1839-43,

1844-5, and 1847-9; John Goode, confederate congressman 1862-5; democratic congressman 1875-81; Benjamin Harrison (father of Pres. Harrison), delegate to congress 1774-8, and governor 1782-4; Patrick Henry, the state's popular leader in the revolution, delegate to congress 1774-6, governor 1776-9 and 1784-6, leader of the anti-federalists in the Virginia convention of 1788 (see CONSTITUTION, II.), and afterward a federalist; Robert M. T. Hunter, democratic congressman 1837-43 and 1845-7, United States senator 1847-61, confederate senator 1862 (see CONFEDERATE STATES); Eppa Hunton, confederate brigadier general, democratic congressman 1873-9 (see ELECTORAL COMMISSION); Arthur Lee, congressional commissioner to France and Spain 1776-80, and delegate to congress 1782-5; Henry Lee, a cavalry officer in the revolution, delegate to congress in 1786, federalist governor 1792-5, and congressman 1799-1801; Richard Henry Lee, delegate to congress (see DECLARATION OF INDEPENDENCE) 1774-80 and 1784-7, and United States senator 1789-92; Benjamin Watkins Leigh, whig United States senator 1834-6, then resigning rather than obey "instructions" from the legislature; William Mahone, confederate major general, organizer of the "readjuster" party, and United States senator 1881-7; George Mason, a revolutionary and anti-federal leader (see CONSTITUTION, II.); James M. Mason, democratic congressman 1837-9, United States senator 1847-61, and confederate commissioner to Great Britain; John Y. Mason, democratic congressman 1831-7, secretary of the navy under Tyler and Polk 1844-9, and minister to Great Britain 1854-9; Charles F. Mercer, democratic congressman 1817-39; Wilson C. Nicholas, democratic United States senator 1800-4, congressman 1807-9, and governor 1814-16; Edmund Pendleton, delegate to congress 1774-5 and president of the Virginia convention of 1788; William B. Preston, whig congressman 1847-9, secretary of the navy under Taylor, confederate senator in 1862; Edmund Randolph, delegate to congress 1779-82, governor 1786-8 (see CONVENTION OF 1787; CONSTITUTION, II.), attorney general and secretary of state under Washington, who requested him to resign in 1795 for official misconduct; Peyton Randolph, delegate to congress and president of that body 1774-5; Thomas Mann Randolph, democratic congressman 1803-7, and governor 1819-22; William C. Rives, democratic congressman 1823-9, minister to France 1829-32 and 1849-53, United States senator 1833-4 and 1836-45, and confederate congressman 1861-4; James A. Seddon, democratic congressman 1845-7 and 1849-51 (see CONFEDERATE STATES); Andrew Stevenson, democratic congressman 1823-34, speaker of the house 1827-34, and minister to Great Britain 1836-41; Alexander H. H. Stuart, whig congressman 1841-3, secretary of the interior under Fillmore; John Taylor, democratic United States senator 1792-4, and 1803, and 1822-4 (see authorities under CONSTITUTION, IV. c); Littleton W. Tazewell, democratic con-

grossman 1800-1, and United States senator 1824-32; Abel P. Upshur, state judge 1826-41, and secretary of the navy and of state under Tyler; George Tucker, democratic congressman 1819-25, professor of political economy in the state university 1825-45, and a standard historian; Henry St. George Tucker, democratic congressman 1815-19, thereafter chancellor of the Winchester district, president of the court of appeals, and professor of law in the university until 1845; John Randolph Tucker, state attorney general 1857-65, and democratic congressman 1875-83; and Henry A. Wise, democratic congressman 1833-44, minister to Brazil 1844-7, governor 1856-60, and confederate brigadier general. — See 2 Poore's *Federal and State Constitutions*; 2 Hough's *American Constitutions*; Neill's *History of the Virginia Company* (1869); H. VIRGINIA RESOLUTIONS. (See KENTUCKY AND VIRGINIA RESOLUTIONS.)

W

WAGE FUND, The. The wage fund is the term used to characterize that theory of the distribution of wealth which became prevalent in England shortly after the close of the Napoleonic wars; which was generally accepted upon English authority by American economists, and remained in full virtue unchallenged for nearly half a century. It never crossed the British channel, however, and is practically unknown to the political economy of continental Europe. — This theory made the capitalist employer to be the residual claimant upon the product of industry. Rent was to be first deducted, the amount thereof to be determined, in the main, according to the Ricardian formula, with more or less of concession or remission by landlord to tenant, under the influence of personal good feeling or of a public sentiment prescribing a kindly and considerate treatment of the actual cultivators of the soil. Next, wages were to be deducted, the amount thereof to be ascertained, according to the wage-fund formula, of which we are now to speak. There were to remain: profits, composed of interest on the capital employed (including a premium for the insurance of capital against extraordinary risks), and of the remuneration of business management. Profits constituted the share of the product of industry going to the capitalist employer, who, after paying rent and wages, as indicated, retained all the rest as his own. This view of the relation of the several parties to the distribution of wealth was summed up by De Quincey in the saying: "Profits are the leavings of wages," rent not being here mentioned, inasmuch as De Quincey has in view the produc-

tion of wealth upon the lowest grades of soil, which pay no rent. — We find no trace of the wage-fund doctrine in Adam Smith's "Wealth of Nations," published in 1776. Dr. Smith, indeed, writes of "the funds for the maintenance of labor"; but while he thus recognizes the need the laborer has of a pre-existing body of wealth from which he is to be sustained during the period while his labor is bearing its fruit in harvested or marketed products, he did not intimate that the laborer's remuneration was strictly limited to the amount thus required for his immediate sustentation; he did not allege that no part of these funds might be the laborer's own, accumulated from the savings of previous years; he did not assume that these funds were so fixed and definite in amount as to be independent alike of the industrial quality of the laboring class and of any efforts they might put forth to increase their share of the product of industry. So far was Adam Smith from holding this view, that he expressly stated that "the wages of labor are the encouragement of industry, which, like every other human quality, improves in proportion to the encouragement it receives." — Even Mr. Malthus, in his work of 1820, although he gave great prominence to the laborer's need of provisional maintenance during the interval between the rendering of the service and the realizing of the product, failed to intimate any constant or any necessary relation between the funds so employed and the aggregate capital of a country. — Yet at this time the industrial condition of England had become such through the effects of the Napoleonic wars, and of the ill-devised pauper legislation of parliament.

as strongly to suggest the doctrine which was, in 1824, to be announced by Mr. James Mill, and was, for nearly fifty years, completely to dominate all theory of the distribution of wealth, so far as English and American political economy was concerned. — The wars which, with the intermission of a single year, raged from 1793 to 1815, by checking the importation of grain, drove cultivation in England down to inferior soils, thus raising the proportion of the aggregate produce going in rent to the landlords. The frequent and violent fluctuations of prices through all this period, according to the fortunes of battle by sea and by land, threw no small part of the wealth of the kingdom into the hands of the speculating as distinguished from the producing class. And while these causes were working to prejudice especially the interests of labor, the volume of wealth to be distributed was diminished by the waste of war. — But it is doubtful whether the effects of all these causes, acting in conjunction to depress the condition and degrade the character of the mass of the English people, were equal to the deleterious influence of the changes in the poor law system of the kingdom, by which the workhouse test for able-bodied paupers was abandoned; by which appropriations were made from public funds, to supplement wages; and by which a premium was put upon births, and an even higher premium upon illegitimate births. — So efficient for evil were the causes described as operating during this period, that, by the close of the Napoleonic wars, the working classes of England had been reduced to extreme and apparently hopeless misery. Accumulation by the laborer had been rendered impossible, and he was thus rendered completely dependent upon the employer, who was required to advance the whole of his subsistence, in anticipation of the crops or the goods being harvested or marketed. At the same time the average efficiency of the industrial agent had been so impaired, by both moral and physiological causes, and the market for labor had become so crowded, that the laborer's share of the ultimate product rarely exceeded in any degree the sums so advanced in provisional maintenance. — Under these conditions the subsistence fund became, in fact, precisely equivalent to wages; and it is not at all surprising that English economists, contemplating the state of things reached in their own country, should have come to regard the subsistence fund and wages as necessarily identical, and, in so doing, have evolved the notion of a wage fund. — The first distinct statement of the doctrine under consideration, is that of James Mill, in his work of 1824. The "Political Economy" of J. R. McCulloch, published in the following year, contains a positive assertion of the necessary dependence of wages upon the proportion which the whole capital of a country bears to the whole laboring population. Mr. John Stuart Mill, in his great work of 1848, makes the doctrine of a wage fund the keystone of his theory of the distribution of wealth. The following is

his statement: "If wages are higher at one time or place than at another; if the subsistence and comfort of the class of hired laborers are more ample, it is and can be for no other reason than because capital bears a greater proportion to population. * * The rate of wages, which results from competition, distributes the whole wage fund among the whole laboring population." Let us add the statement of this doctrine given by Mr. Mill, twenty-one years later, when its validity had been rudely questioned. "There is supposed to be, at any given instant, a sum of wealth which is unconditionally devoted to the payment of wages of labor. This sum is not regarded as unalterable, for it is augmented by saving, and increases with the progress of wealth; but it is reasoned upon as, at any given moment, a predetermined amount. More than that amount, it is assumed that the wage-receiving class can not possibly divide among them; that amount, and no less, they can not but obtain. So that, the sum to be divided being fixed, the wages of each depends solely upon the divisor, the number of participants." ("Fortnightly Review," May, 1869.) — The first challenge of the dominant theory of wages in England came from a barrister little known to fame, Mr. Francis D. Longe, who, in 1866, issued a pamphlet entitled "A Refutation of the Wage-Fund theory of Modern Political Economy, as enunciated by Mr. Mill, M. P., and Mr. Fawcett, M. P." This pamphlet attracted little attention; not one of the reviews noticed it; and when, three years later, Mr. W. T. Thornton attacked the wage-fund doctrine, he appeared wholly ignorant of its existence. Yet the earlier work was the abler of the two, and nearly covered the whole case against the current economic doctrine. That doctrine, as we have seen, stood upon the asserted need, on the part of the laborer, of provisional maintenance, to be afforded by the capitalist, out of funds previously accumulated. As Prof. Fawcett had stated in his "Manual of Political Economy," "laborers while engaged in any particular industry can not live upon the commodity which their labor is assisting to produce. The plowman who tills the soil, from which in the following autumn the harvest will be gathered, is fed with the wealth which his master has saved, or, in other words, the master pays his laborer's wages from the wealth he has previously saved." That is, because the master must needs pay the laborer something before the harvest, he can not possibly pay him anything after the harvest! To say that the laborer derives a provisional maintenance from the master's capital, is, in Prof. Fawcett's view, precisely equivalent to saying that the laborer derives his wages, his entire wages, from this source. Mr. McCulloch has left the same assertion of the natural and necessary equivalency of subsistence and wages. — Upon this open point in the position of the economists Mr. Longe fell with incisive force. He insisted upon the distinction between "the wealth or capital available for the maintenance of laborers," and "the amount of wealth available

for the purchase of their work." "The amount of money," reasons Mr. Longe, "which a farmer can afford to advance for the maintenance of laborers, without using the money he gets from the sale of his stock or crops, is unquestionably limited by the amount of wealth at his disposal from other sources; but the amount of money or wealth which the farmer can afford to pay, or contract to pay, as wages, is limited only by the amount of money for which his crops will sell." — Although Mr. Longe's pamphlet did not even receive the honor of a notice in the reviews, Mr. Thornton, when in 1869 he advanced nearly the same arguments against the current economic doctrine, and, as I must think, with less of clearness and force, achieved an overwhelming triumph. Through an article in the "Fortnightly Review" of May of that year, Mr. John Stuart Mill, after stating the wage-fund doctrine, in the terms already quoted, and adding, "this series of deductions is generally received as incontrovertible: they are found in every systematic treatise on political economy, my own certainly included," proceeded completely to renounce these life-long views. He declared that Mr. Thornton had deprived of all scientific foundation the doctrine so long taught by "all or most economists"; that Mr. Thornton had shown that the barrier (the wage fund) which had "closed the entrance to one of the most important provinces of economic and social inquiry," is but "a shadow which will vanish if we go boldly up to it." — Mr. Mill's recantation of the wage-fund doctrine produced a deep impression. The "London Quarterly Review" (July, 1871) characterized the wage fund as "a thing, or un-thing (to borrow a German idiom), which is henceforth shunted fairly out of the way of future discussion of all questions affecting labor and labor's wages." — Yet Mr. Mill's surrender was not wholly acquiesced in by the professional economists. Prof. John E. Cairnes, in his masterly work of 1874, undertook the rehabilitation of the economic doctrine of wages; and, with much care and pains, sought to show that something which might not improperly be called a wage fund, though widely different from the wage fund of the two Mills, of M'Culloch and of Fawcett, does exist, and does limit the amount that can be paid in wages. But the prestige of the old doctrine was destroyed, and the result of successive assaults has been its practical abandonment by the English economists. Prof. W. Stanley Jevons, in the second edition of his theory of "Political Economy," published in 1880, after referring to the general consent of his brethren to give up what was once the keystone of the orthodox theory of the distribution of wealth, writes: "In this matter of wages, the English economists have been living in a fool's paradise. The truth is with the French school." — In the foregoing sketch of the rise and fall of this economic doctrine, have been intimated the nature and direction of the arguments which have compelled the practical abandonment of it by the economists of to-day. Its great importance in the his-

tory of political economy, however, and the fact that it is still found in most of the systematic treatises on the shelves of our libraries, and even in the treatises now used as text books* in our colleges, render desirable a compact recital of the objections to this theory of the origin and the limit of wages. — In the first place, the reason for holding this theory of wages assigned by the Messrs. Mill, by Mr. M'Culloch and by Prof. Fawcett, proves to be no reason at all, in view of the distinction first presented by Mr. Longe. Between the amount advanced by the employer for the maintenance of the laborer, and the amount to be paid, first and last, for the laborer's services. It is seen at once, in the light of this distinction, that the mere fact that the employer must pay the laborer something, in advance of the harvest, constitutes no reason whatsoever why the employer should not pay the laborer something more, on the completion of the harvest. — But, again, this doctrine assumes, in all the statements of it we have quoted, that the laborer is always and necessarily dependent on the employer for the entire amount of his subsistence. Now, this state of things did, in fact, exist throughout England, during the period when the doctrines in question came to be formulated. Probably the doctrine would never have arisen but for that state of things. But this condition is not involved in the nature of the relation of the laborer to his employer; nor have there been wanting examples, on a large scale, of the ability of the working classes to accumulate vast sums out of their earnings; witness the deposits of our American savings banks! — But the wage-fund theory might be true were all the reasons adduced in support of it conclusively proven to be false. Let us, then, examine without prejudice from the mistakes of its advocates, the proposition that wages are paid out of capital, and that the possible amount of wages in any country, at any time, is determined by the amount of capital then and there existing. — Why does an employer pay wages at all? Surely not to expend a fund of which he finds himself in possession, and of which he regards himself as trustee; but to purchase labor. Why does he purchase labor? Not at all that he may keep it employed; as it might be employed in carrying burdens first up-stairs and then down-stairs again, but he purchases labor as a means to the production of wealth. Why does he produce wealth? Merely that it may be produced, as might be the case had he no personal part in its ownership, no interest in its use or enjoyment? Surely not: unless the most exceptional of mortals, he produces wealth, not for the sake of producing it, but with a view to a profit to himself, individually, therefrom. The mere fact that a person has capital at his command no more constitutes a reason why he should use it in production when he can get no profits, than

* In spite of Mr. Mill's complete recantation of the wage-fund doctrine, in 1869, his earlier statements are still found, unretreated and unqualified, in the latest edition of his "Political Economy."

the fact that the laborer has arms and legs constitutes a reason why he should work when he can get no wages. It is, we see, for the sake of future production, that laborers are employed; not at all because the employer has possession of a fund which he must disburse. Is it not, then, the value of the product, such as it is likely to prove, which determines the amount of wages the employer is both able and willing to pay? If so, it is production, and not capital, which furnishes the motive for employment and the measure of wages.—But, if production furnishes the measure of wages, the amount so to be paid can not be irrespective of the industrial quality of the wages class, since production varies necessarily, and varies within a wide range, according as that industrial quality is high or low. Therefore, the wage-fund doctrine is false, for it teaches that the rate of wages depends solely upon the proportion which the amount of capital bears to the numbers of the laboring population, altogether irrespective of their industrial quality.—But even were we to waive consideration of the industrial quality of a laboring population, would it then be true that the amount of possible wages is determined in and by the amount of capital existing; and that the wage fund so constituted forms a predetermined dividend, the divisor of which is to consist of the number of laborers? Precisely this is involved in the wage-fund doctrine, as it was taught, without qualification, down to a recent period. In 1864 Prof. Fawcett delivered a course of lectures in Cambridge university, in which he laid down the following rule: "The circulating capital of a country is its wage fund. Hence, if we desire to calculate the average money wages received by each laborer, we have simply to divide the amount of this capital by the number of the laboring population." The fallacy of this is seen the moment we realize that the purpose for which labor is employed is, not the distribution of a pre-existing fund, but the creation of values, the production of new wealth. This being so, the dividend can not be predetermined irrespective of the number of laborers, since the quantity or amount of the product of industry must itself depend upon the number of laborers. More laborers will produce more wealth—whether proportionately more or not, is aside from the question: fewer laborers will produce less wealth—whether proportionately less or not, we need not here inquire. Therefore the wage-fund doctrine is again shown to be false.—The only virtue the doctrine we have been considering ever possessed, for practical uses, was in its assertion that an economic reason must exist for any and every advance of wages. Doubtless this explains why some economists still cling to the doctrine, as fearing that if it be abandoned, there will be no barrier against foolish and mischievous claims by the laboring classes for increase of remuneration or reduction of the hours of work. But the proposition that production furnishes at once the motive to employment and the measure of wages, equally establishes a barrier to every claim on behalf of

the working classes which can not present a substantial economic reason. The one view of the origin and limit of wages, equally as the other, opposes itself to all demands, in the interest of labor, which are made merely under the impulse of compassion, or philanthropy, or the enthusiasm of humanity.—The only difference between the two theories is, that by the one the economic force which limits wages is found in the amount of capital, while by the other it is found in the value of the product of industry, to which land, capital and labor jointly contribute. Which rule would be more consonant to sentiments of natural justice is not at issue, though here the preference clearly lies on the side of the rule we propose; the question is, Which corresponds the more closely to the reason of the case and to the just import of industrial statistics? On this issue the movement of economic opinion since 1866 has been overwhelmingly against the wage-fund doctrine.

FRANCIS A. WATKER.

WAGES. The word wages, in its popular use, signifies the remuneration of hired labor. As so used, it is more or less disparaging, being commonly placed in contrast with the words salaries, fees, honorarium, etc., by which it is sought to denote the remuneration of services of a higher or more intellectual character.—To the economist, however, the word wages has no special reference to manual, as distinguished from intellectual, effort. That term in economic literature has two significations, the one much wider than the other. By the first is embraced, not only the wages of manual labor, hired by an employer; not only the avails of unhired manual labor, as of the smith working in his own shop, or of the peasant proprietor tilling his own lot of ground (due exception being made of rent and interest); not only the salaries of school teachers and public officials, the fees of lawyers and physicians, and the honorarium of the artist; but, also, all sums accruing to the employers of labor, through their own personal supervision and direction of the processes of industry. In a word, wages, in this largest sense, embraces all the material rewards of human exertions and sacrifices which are directed to the production of wealth, as distinguished only from the remuneration paid for the use of land and the remuneration paid for the use of capital.—In the second and narrower economic sense, while retaining in all other respects the significance attributed to it above, the word wages becomes exclusive of the sums accruing to the employer of labor, as such, who, under the four-fold division of industrial activity specially characteristic of the present age, leases land, so far as this may be essential to his operations, and pays therefor rent; borrows capital, and pays therefor interest; hires labor, paying therefor wages; and has remaining in his hands, out of the product of industry, an amount of wealth, greater or less according to his activity, his enterprise, his prescience, his prudence, and, also, in some measure according to his good or

evil fortune. — The difference, then, between the two senses of the word wages, is found wholly in the fact that the former includes, while the latter excludes, the remuneration received by the employer, as such. The two alike exclude rent and interest, proper. Throughout the present article the word will be used in the latter and more restricted sense, the remuneration—viz., profits—which is received by the employer of labor, as such, forming the subject of a separate investigation. — The questions relating to wages may be discussed under two titles, General Wages and Particular Wages: the former having reference to the problem of the distribution of wealth between the wages class, as a whole, and other claimants upon the product of industry; the latter, to the problem of the distribution of the aggregate amount of wealth paid, or possibly to be paid, in wages, among the several classes of wage receivers. We shall take up these two divisions of the subject in inverse order. — I. PARTICULAR WAGES. In any consideration of the comparative remuneration of individuals or classes, it is of the highest importance to preserve the distinction expressed by economists as that between real and nominal wages. Real wages are the remuneration of the laborer, as reduced to the necessaries, comforts or luxuries of life. These are what the laborer works for; these are truly his wages. The money he receives is only a means to that end. — Real may differ from nominal wages by reason of: *First*, variations in the purchase power of money. This is a consideration of prime importance, in the comparison of wages, as between one epoch and another. *Second*, varieties in the form of payment. Wages, though generally reckoned in money, are, to a very large extent, not paid in money. Especially in agriculture, the world over, full payment in money is highly exceptional. The forms, other than money, in which labor is remunerated, are various, the chief among them being rent, where cottages or tenements are provided for the laborer and his family, whether in agricultural or mechanical industry; board, mainly confined to unmarried laborers; and, lastly, a great variety of allowances, perquisites and privileges, such as definite quantities of certain kinds of food, drink or fuel, furnished by the employer; such as the hauling to the laborer's house of wood, coal or peat by the employer's teams, the keep of a cow, the right to take flour at millers' prices or at a fixed price whatever the market rate, the gleanings of fields, etc., etc. So numerous and diverse are the forms of payment of wages to hired laborers in agriculture, that anything like an exact comparison between the rates of real wages in different countries or districts often becomes practically impossible. *Third*, opportunities for extra earnings, by the head of the family, or by its other members. Thus, a weaver or spinner earning twenty shillings a week, may find places in which his wife and minor children may earn an equal sum, making the income of the family forty shillings. A car-

enter or coal-heaver, on the other hand, receiving twenty-five shillings a week, may find himself unable to add anything to the family income through the labor of wife or child. It is evident, therefore, that in any comparison of wages, the total income of the family should be taken as the unit. *Fourth*, the greater or less regularity of employment. Varying regularity of employment may be due to the nature of the individual occupation, or to the force of the seasons, or to social and industrial causes of a general nature. In agriculture, for example, the nature of the operations involved, and the difference of seasons, cause great irregularity of employment. The rate of wages during the third quarter of the year is generally more than twice that during the first quarter. In this respect, however, there is great difference between different countries. An English farmer is plowing while a New England farmer is hauling wood on the ice and snow. In some countries agricultural operations are spread over eight months; in others, they are confined to four. In the fisheries, also in the so-called building trades, and in most out-door avocations, there is great irregularity in the matter of employment during the different periods of the year. On the other hand, there is nothing in the force of the seasons, or in the nature of the operations involved, to prevent weaving, spinning, shoemaking, paper-making, etc., from proceeding uniformly through twelve consecutive months. Industrial causes, also, like strikes, lock-outs, panics, and so-called hard times, produce great differences in the real rate of wages, where the same nominal rates exist. *Fifth*, the longer or shorter duration of the power to labor. This consideration is of prime importance, both as between nations and as between the classes of persons pursuing different avocations within the same country. It is evident, that, if two persons begin to labor productively at the same period of life, and continue at work in the same occupation, at the same nominal wages, until death or final disability, the one receives the higher real remuneration who lives and works the longer, since the cost of his maintenance during the period of unproductive labor is properly to be charged upon his wages during the productive period. In the foregoing respect, there are wide differences among nations, which must enter to greatly affect the real remuneration of labor. Dr. Edward Jarvis has stated, that, for every thousand years expended in the developing period upon all who are born, including both those who die, and those who survive to the age of twenty, the consequent laboring and productive years are, in Norway, 1,881; in Sweden, 1,749; in England, 1,688; in the United States, 1,664; in France, 1,398; and in Ireland, 1,148. Moreover, as between different occupations in the same country, there are wide differences in the duration of the power to labor, which must be taken into account in adjusting nominal to real wages. The eminent actuary, Dr. Neison, states that the influence of occupation upon life is so considerable that the mortality in one avocation

exceeds that of another by not less than 230 per cent. Taking the period of life, twenty-five to sixty-five, Dr. Neison finds that the mean mortality in the clerical profession, in England, is 1.12 per cent., in the legal, 1.57; in the medical, 1.81. In domestic service, the mortality among gardeners is but .93, among grooms, 1.26; among house servants, 1.67, among coachmen, 1.84. Of the several branches of manufacture, paper shows a mean mortality of 1.45; tin, of 1.61; iron, 1.75; glass, 1.83; copper, 2.16; lead, 2.24; earthenware, 2.57; the mortality among those operatives in the last-named branch of industry, who are known as china-scourers, due to the inhaling of the fine dust floating in the air, being positively frightful. Among the different kinds of mining industry, the range of this effect is even greater, the mean mortality of iron miners being 1.80; of tin miners, 1.99; of lead miners, 2.50, due to the prevalence of asthma and chronic bronchitis; and of copper miners, 3.17, due largely to the excessive heat prevailing in this class of mines. Even these figures, striking as they are, do not exhibit the full effect of the cause under consideration, since the occurrence of permanent disability among operatives of certain classes is out of proportion to the actual occurrence of death. In some of the agricultural districts of England, owing to wretched food and still more wretched lodgings, the laborer, though often long-lived, is early crippled and doubled up by rheumatism. — The foregoing heads embrace the chief causes which are commonly adduced in reduction of nominal to real wages, *i. e.*, of money wages to wages expressed in terms of what Mr. Malthus calls "food, clothing, lodging and firing." In satisfaction, however, of still other desires of the laborer (using that term in the large sense attributed to it at the beginning of this article), and consequently forming a possible part of his real, as distinguished from his nominal, wages, enter certain other elements which may be found in a high degree in one occupation and in a low degree in another. Such is agreeableness of situation or of work; such is respectableness, or even distinction attaching to the performance of certain services. These are most influential causes in producing differences between real and nominal wages, in not a few departments of labor. One great object for which wealth is expended is to command social consideration. If, then, a certain position of itself gives authority or dignity, this may constitute, to one person, or even to many persons, a fair equivalent for a portion of the remuneration which, in a different avocation, he might expect and be able to exact. A judgeship is often accepted by eminent lawyers who have been accustomed in their professional practice to earn several times the salary of that office. "Forty pounds a year," wrote Adam Smith, in the last century, "is reckoned at present very good pay for a curate, and there are many curacies under twenty pounds a year. There are journey-men shoemakers in London who earn forty pounds a year, and there is scarcely an industrious work-

man of any kind, in that metropolis, who does not earn more than twenty." The conception of dignity which thus gives preference to one occupation over another, may be wholly false or mistaken, without losing anything of its power to influence the actions of men, which is all the economist has to consider. Thousands of young men, in every large American city, stand around the marts of trade, hoping, by some chance, or by influence or solicitation, to crowd themselves into hard-worked and ill-paid places as clerks, because they deem manual labor degrading, although a skilled mason or carpenter earns twice or thrice as much, and that in a shorter day of labor. On the other hand, there are avocations which are exceptionally unpleasant to the senses, or exceptionally dangerous to life and limb, or exceptionally discreditable, and which, on this account, would naturally, were all other conditions constant, command a higher rate of remuneration. If, in some instances, those who pursue such avocations do not only not receive higher wages, but are compelled to accept a smaller, perhaps a much smaller, remuneration, this is not because the force just adverted to does not operate, but because it is counteracted by another cause, *viz.*, that large numbers of persons are, by reason of ignorance, or misfortune, or disrepute, debarred from more favorable employment, and shut up to one or another avocation of the class described. — Assuming the proper reduction of nominal to real wages, by allowances on the several foregoing accounts, we next come to inquire what are the causes which produce the wide differences which exist in the wages of labor, as between different countries, and as between particular avocations within the same country. — As between different countries, the tendency to equality of wages within the same or closely corresponding avocations, varies with the readiness with which emigration or immigration, which we may call the flow of labor, takes place. Between no two countries, however near, and however similar in social or political conditions, is the flow of labor sufficiently easy to secure a close approximation to equality of wages. Adam Smith, in his day (1776), declared that man is, of all sorts of luggage, the most difficult to be transported. "A difference of prices," he says, "which is not always sufficient to transport a man from one parish to another, would necessarily occasion so great a transportation of the most bulky commodities, not only from one point to another, but from one end of the kingdom to another, almost from one end of the world to another, as would soon reduce their prices more nearly to a level." Mr. Ricardo, writing a generation later (1817), assumed that the flow of labor from country to country would be so tardy and difficult as practically to leave the laboring classes to enjoy or to suffer the industrial advantages or disadvantages of their respective countries, without any important influence as the result of immigration or emigration. John Stuart Mill, writing still a generation later (1848), just at the beginning of an age of won-

derful progress in the arts of transportation and the communication of news, noted "a visible tendency toward a freer migration of labor and capital, to take advantage of better opportunities of employment and investment." One generation later still, we may say, that, in 1883, the tendency pointed out by Mr. Mill acquires strength from year to year; but that the flow of labor still remains, as between country and country, so difficult and so tardy as to allow very great differences in real wages to remain, through long periods, but little affected by emigration or immigration. — As between different avocations within the same country, the earlier economists, like Smith and Ricardo, assumed a substantial equality of real wages; and in this they were followed, though with more or less qualification, by John Stuart Mill. In his great work of 1874, Prof. Cairnes, writing with especial reference, we may suppose, to English conditions, proposed his theory of "non-competing groups." "What we find," he said, "is, in effect, not a whole population competing indiscriminately for all occupations, but a series of industrial layers, superimposed on one another, within each of which the various candidates for employment possess a real and effective power of selection, while those occupying the several strata are, for all purposes of effective competition, practically isolated from each other." Prof. Cairnes held the practical isolation of these industrial groups to be not less complete than the isolation which Mill had attributed to the several commercial countries of his day; and he proceeded to apply to such groups, *mutatis mutandis*, Mr. Mill's law of international values. Whether Prof. Cairnes' view of the structure of industrial society, within any given country, say, England, will be found in all respects just, or not, it is evident that it contains enough of truth to deserve the careful attention of the student of wages. It is doubtless in this direction that the largest contribution to economic science now possible might be made by a competent investigator. — All the foregoing remarks relative to the rates of wages prevailing in different countries, and in different occupations within the same country, presuppose a practical equality in the powers and qualifications of laborers. In addition, however, to the difference in real wages produced by resistance to the flow of labor from country to country, or from one group of avocations to another group within the same country, are the effects upon the real remuneration of labor within particular avocations, produced by the differences in the powers, the faculties, and the aptitudes of individuals within the same country, and within the same great group of occupations. The rate of wages within any particular avocation will be determined exclusively by the operation of the principle of demand and supply. — Now, in economics, the words demand and supply alike have reference, 1, to a certain article, and, 2, to a certain price. Demand means the quantity of a given article which would be taken at a given price.

Supply means the quantity of that article which could be had at that price. Applying the term supply, in the sense indicated, to any given market for labor, we find that supply reaches its maximum in the number of persons who are capable of rendering the service which is required, and its minimum in the number who are both capable of rendering that service and are willing to do so at the price which the demand for the service causes to be offered. The maximum supply of labor so determined, may, in a given occupation, be so small as, given a large demand for the service to be rendered, to allow a very high rate of wages to be reached, and to be maintained and even increased from generation to generation. Thus, the demand for the services of opera singers of the highest class was, forty years ago, so great as to permit the wages of a prima donna to equal the income of a lord; yet, during the entire human generation that has intervened, this magnificent premium upon operatic art, although open freely even to the peasantry of every land, has not sufficed to reduce, in the slightest degree, the price of such services. On the contrary, that price has steadily risen, under the influence of enlarged demand, until \$2,000 is paid for an evening's singing. In a similar way, the wages of the lawyer of the first class is almost wholly uninfluenced by the presence of large numbers of persons of the same profession who would be rejoiced to earn a tenth or a twentieth part of his income. — Those who perform manual labor, again, seem, as one looks over the face of industrial society, to be organized into certain not very clearly defined "non-competing groups," to use Prof. Cairnes' phrase, within each of which the tendency to the equalizing of wages is in continual, if irregular, progress; but between any two of which, movement is so slow and difficult as to produce painfully small results, even from age to age. If we study the body of skilled artisans, in any country where caste does not exist, and the spirit of tradition is not very strong, we find that the interchange of the trades of carpenter, cabinet maker and carriage builder, for example, is freely made: that these trades, though less freely, interchange with those of blacksmith, mason and plumber, wherever strong reason exists for diminishing the supply of labor in one trade and increasing that supply in another. All the while, however, there is found below the class of skilled artisans a vastly greater class, consisting of factory operatives, of day laborers, etc., who are compelled not only to work for half the wages of the skilled artisan, but also, by what would seem, from almost unvarying recurrence, to be a moral necessity, to bring up their children, in the main, to take their own low places in the industrial order, however crowded and uncomfortable those places may be. Indeed, it may be said that the less desirable the place which the parent fills in life, the smaller his ability to provide for the advancement of his offspring. — The services performed by the laborer of this last-indicated

general class vary almost infinitely in form. So much, however, are the several recognized avocations within this group alike in the demands they make on the mental and physical powers, that a certain movement of labor exists, tardy and difficult, it is true, so tardy and difficult, indeed, as often to allow an individual who has been unfortunate in seeking employment, or has put himself at disadvantage by bad habits, to be cast down into the industrial grade which lies beneath; yet still the tendency to the equalization of wages here continues to operate appreciably, in spite of all obstructions. — Below the class described as including the ordinary factory operative, the ordinary day laborer, and others receiving an approximately equal remuneration, is found a great body of the more or less helpless, the more or less unfortunate, the very ignorant, the men and women of vicious habits, the weak, the crippled, and the "broken men" of the higher industrial grade. These constitute the lowest stratum of the industrial order. Movement, here, in the nature of change, whether of place or of occupation, is very tardy. A member of this class may with great difficulty pass from one avocation to another within his grade; it is most unlikely that he will ever, by any exertion of his powers, or any effort of self-denial, rise out of the class in which he was born or into which he has fallen. — We see, in the rude sketch here offered of modern industrial society, as existing, say, in England, how it is that the supply of labor within certain avocations, or groups of avocations, is restricted, so that, after making all needed allowances in reduction of nominal to real wages, the average remuneration of one class may be twice that of another, four times that of a third, though only a small fraction of that received by the members of a class still more fortunate; how it is that this may not only be at a given time, but that the causes which create these differences of condition may go on operating to produce inequality faster than competition can perform its leveling work; and that, thus, the range of wages, wide as it may be at any given time, shall steadily increase from year to year, and from generation to generation. — It is the effect of education, and, in a lower degree, of political franchises, by promoting the communication of news, from man to man and from place to place, by promoting self-reliance and power of initiative on the part of individuals, and by promoting self-respect and social ambition throughout the community, to promote, also, the flow of labor under economic impulse. Such causes, so far as they produce such effects, are strictly economic causes, to be recognized by the economist, and incorporated in his theory of the distribution of wealth. — The operation of the forces thus set in motion is clearly to be seen in such countries of the old world as Saxony, Switzerland and Scotland, rising to its maximum probably in the United States of America, where alike the inertia of the laborer and the external resistance to his migration in search of the best market

for his services, are so far reduced as to become almost inconsiderable. Nine and a half millions of the native inhabitants of this country at the present time reside in states other than those in which they were born.* Doubtless an even greater number of those who reside within the states of their birth, are found in alien counties. If we consider only the heads of families in the United States, I personally believe, although no adequate statistical data are available to corroborate this opinion, that not more than one-fourth are to be found within the towns or parishes in which they were born. — Such a complete subjection of the laborer to economic impulse has, of course, no power to reduce those inequalities of wages which are due to differences in physical or mental strength, activity or persistence. It has no great power to reduce those inequalities which result from early mistakes and misadventures, or from vicious habits and courses, always most influential causes in arranging men upon the industrial scale; yet it has a certain unmistakable efficiency in this direction, through affording the opportunity to blot out a bad record and to begin a new career without prejudice. But over all those inequalities of wages which result from accidents of condition or circumstance, the force indicated has irresistible sway. — And this, too, is to be taken into account, that in the degree, and in more than the degree, in which the laborer, by change, whether of place or of occupation, secures an increase of his own remuneration, does he also promote the general production of wealth. Whenever the laborer, by the exercise of courage and intelligence, breaks away from the spot or the kind of work in which he has found an inadequate remuneration, and seeks and finds a better market, he does not only that which is best for himself, but that which is best for others. He not only gets more by resorting to the new place or the new trade, but, in the very act of doing so, he gives more also. If in that market his service bears a higher price than elsewhere, this is, of itself, a proof that his service is there in greater demand, more needed, the subject of an intenser want. By all the difference which the change works in his own condition, and, doubtless, by even much more than that difference, is the general industrial system re-enforced and stimulated by that change. — Hence we say, that freedom and facility of industrial movement as seen at their maximum in the United States, do not only reduce the range of remuneration, as between the classes naturally less favored and those more favored, but it also, by enhancing the productive power of the community, raises the remuneration of the whole body of laborers. — II. GENERAL WAGES. The question, what portion of the product of industry passes, by the normal operation of economic laws, into the hands of that one of the co-operating agents of production whom we call, in economic discussion, the laborer, was,

* "The full-blooded American," said Michel Chevalier, "is encamped, not established, on the soil he treads upon."

until fifteen years ago, deemed to have been conclusively and definitively answered by the accepted political economy of England and America. That answer made the capitalist employer to be the residual claimant upon the product of industry. Rent was first to be deducted, the amount to be determined according to the Ricardian formula. Next, wages were to be deducted, the amount to be determined by the wage-fund formula. There were to remain profits, composed of interest upon capital and of the remuneration of business management. These constituted the share of the capitalist employer, who, after paying rent and wages, according to the formulae indicated, retained all the rest of the product of industry as his own. In the article next preceding, we have traced the rise and fall of the wage-fund doctrine, and have stated the arguments which have led to its general abandonment by the economists of England and America, opening the way for a philosophy of wages. So long as that doctrine was accepted, wages remained purely a question in long division, and no philosophy of wages was possible. To what view of the distribution of the product of industry economic opinion will ultimately incline, can not be predicted with confidence. In 1871, Prof. Stanley Jevons, decisively rejecting the notion of a wage fund, advanced the proposition that "the wages of a laboring man are ultimately coincident with what he produces, after the deduction of rent, taxes, and the interest of capital." Upon this statement of the law of wages, Mr. Henry Sidgwick, in an article in the "Fortnightly Review" of 1879, remarked as follows: "It is to be observed that it does not attempt to settle the distribution of produce as between employers and employed, except so far as the employer's share consists of interest. That is, it does not help us to determine what Mill calls 'the wages of superintendence.' Now, it is just this latter that, in our practical discussions, usually appears the most prominent element of the problem. What English workmen grumble at, is not the rate of interest, but the undue extra profits which they suppose the employer to be making." Accepting as correct the judgment of Prof. Sidgwick, that the one undetermined point in the theory of the distribution of wealth is that which relates to the "wages of superintendence," the writer of the present article now proceeds to offer a view of profits, in their relation to the other shares of the product of industry, which, if it shall be accepted as based upon a just generalization of the facts of modern industrial society, will indubitably yield a complete and consistent theory of distribution, according to which the laborer, and not, as by the exploded wage-fund doctrine, the capitalist employer, is made the residual claimant upon the product of industry. — The line of argument which appears to lead to this momentous conclusion is as follows: The successful conduct of business, under free and active competition, must be due either to exceptional abilities or to exceptional opportunities. Whether due more to one than to

the other of these causes, could make no difference with what is to follow; just as it makes no difference in the matter of rent, whether the advantages, for productive purposes, of any piece of land under consideration be due to superior fertility or to proximity to market. As the economist, in writing of rent, is wont, for convenience of reasoning and simplicity of illustration, to attribute the productive advantages of land solely to superior fertility, assuming all tracts in question to be equally near the market, so, in the further progress of this paper, the more or less successful conduct of business will be attributed to the possession of higher or lower abilities, all employers being assumed, for convenience of reasoning and simplicity of illustration, to occupy industrial positions equally eligible. When we shall have passed over the field, it will then appear that all our conclusions, upon the foregoing hypothesis, would hold equally true upon the assumption that all differences in the degree of business success were due to differences of industrial opportunity, and not at all to differences of business ability. — Since, however, it can not be a matter of indifference to the social philosopher whether the power to secure profits be due more to exceptional abilities or to exceptional opportunities, it may be worth while to pause one moment to point out that the former are much the more efficient cause of profits. To justify this assertion, it will be enough to refer to the notorious fact that the great majority of all business houses in the United States which have achieved marked success have been founded by men who owed little or nothing to opportunity, perhaps by those who had to contend at the outset against positive disadvantages or actual misfortunes; while, on the contrary, great houses, enjoying high prestige, wide connections and vast accumulated wealth, are frequently brought to the ground, under the successors of the original founder, for no other reason than that the management, which had been wise and brave and strong, became, in other hands, vacillating, purposeless and unintelligent, or perhaps no worse than merely commonplace and tied to routine. So overwhelming is the preponderance, in this country at least, of business houses owing much or everything to ability, and little or nothing to unearned opportunities or advantages, that no American* is likely to dispute the proposition that the former are much the more efficient cause of profits. — Attributing, then, for convenience, the successful conduct of business to ability alone, we have to note, that, were the number of men of a high order of business ability throughout any large community more than sufficient to do all the business of all kinds which there required to be

* "Many employers of labor," says Prof. Alfred Marshall, "in some parts of England more than half, have risen from the ranks of labor." Accepting this statement as correct, it is to be noted, that, in addition to business ability being the efficient cause of profits, in comparison of the employer with the non-employer, business ability becomes, in a still higher degree, the cause of profits, as between the employer on a large and the employer on a small scale.

done; were these men, however much surpassing other members of the industrial society, among themselves equal in all respects which concern the conduct of business; and were this class, thus constituted and endowed, so clearly and conspicuously marked that no one of their number should ever fail to be recognized as belonging to it, while, on the other hand, no one lacking business ability in this degree should esteem himself capable of conducting business or be so esteemed, with a view to his obtaining credit, by those who have capital to loan or goods to sell: were these several conditions to be all completely realized, we should then have a situation closely analogous to that which exists in the case of a community around which is found good land, of uniform quality, in amount more than adequate to raise all the produce required. The result would be, either that the employing class would, by forming a combination and scrupulously adhering to its terms and its spirit, create and maintain a monopoly price for their services in conducting the business requiring to be done, which is so improbable as to be altogether out of our contemplation, or else they would, by competing among themselves for the amount of business to be done by them individually, bring down the rate of profits to so low a point that the remuneration of each and every one of this class would be practically equal to what he could earn for himself in other avocations, either as an independent laborer, working in his own shop or on his own lot of land, or, as a wage laborer, hired by some one of his own intellectual class, no more qualified in any way than himself to conduct business. Under such conditions, profits, as distinguished from wages, would be destroyed. The persons actually remaining in the conduct of business would, indeed, earn their subsistence—otherwise the function could not be performed; but, economically speaking, it would make no difference to them whether they did this as employers or as employed. — In fact, however, the qualifications for the conduct of business are not equal throughout all of a sufficiently numerous class. — First, we have those rarely gifted persons who, in common phrase, seem to turn everything that they touch into gold; whose commercial dealings have the air of magic; who have such power of insight that they almost appear to have the power of foresight; who are so resolute and firm in temper that apprehensions and alarms or repeated shocks of disaster never cause them to relax their hold or change their course; who have such influence and command over men that all with whom they have to do acquire vigor from the contact, and work for them as they would not work for others. — Next below, but far below, the class described, we have that much more numerous body of men of business, who possess a high order of talent, merely; whose success is easily comprehended, even if it can not be imitated, by their less gifted competitors; men of natural mastery, sagacious, resolute and prompt in their avocations. — Then, descending further

in the scale, we have men who on the whole do well or pretty well in business; men who enjoy a harmonious union of all the qualities required for the conduct of affairs, though possessing those qualities each in but a moderate degree; or else in whom some defect, mental or moral, impairs a higher order of abilities; men who are never masters of their fortunes, are never beyond the imminence of failure, and yet, by care and pains and diligence, win no small profits from their business, and, if frugality be added to their other virtues, accumulate in time large estates. — Lower down in the industrial order are a multitude of men who are found in the control of business enterprises, for no very good reason that can be seen by those who know them; men of checkered fortunes, sometimes doing well, but more often ill; some of them, perhaps, filling a place which would not otherwise be filled, but more commonly in business because they have forced themselves into it under a mistaken idea of their own abilities, perhaps encouraged by the partiality of friends who have been willing to place in their hands the agencies of production, or entrust them with commercial or banking capital. — Now, in my view of the question of profits, we find, in the lower stratum of the industrial order, as thus sketched, a "no profits" class of employers. Notwithstanding all the magnificent premiums of business success, the men of real business power are not so many but that a great part of the posts of industry and trade are filled by persons inadequately qualified, who consequently have a very doubtful career, and realize for themselves, first and last, a very meagre compensation, so meagre that, for purposes of scientific reasoning, we may treat it as constituting no profits at all. Live they do, partly by legitimate toll upon the business that passes through their hands; partly at the cost of their creditors, with whom they make frequent compositions; partly at the expense of friends or by the sacrifice of inherited means. This bare subsistence, obtained through so much of hard work, of anxiety, and often of humiliation, we regard as that minimum which, in economics, we can treat as *nil*. From this low point upward we measure profits, just as we measure rent upward from the line of the no-rent lands, or lands whose selling price represents an annual interest of only a few cents an acre. — If the view of the employing class here presented fairly corresponds to the facts of industrial society, profits, manufacturing profits, for example, are, granted only perfect competition, not obtained by deduction from the wages of mechanical labor, any more than rent is obtained by deduction from the wages of agricultural labor; and, secondly, manufacturing profits do not constitute a part of the price of manufactured goods, any more than rent constitutes a part of the price of agricultural produce. All profits are drawn from a body of wealth which is created by the exceptional ability of the employers who receive profits, measured upward from the line of the no-profits employers, just as rents are drawn from a

body of wealth created by the exceptional fertility of the rent lands, measured from the level of the lands which bear no rent. The normal price of manufactured goods, of any particular description, is determined by the cost of production of that portion of the supply which is produced at the greatest disadvantage. If the demand for such goods is so great as to require a certain amount to be produced under the management and control of persons whose efficiency in organizing and supervising the forces of labor and capital is small, the cost of production of that portion of the stock will be large, and the price will be correspondingly high; yet it will not be high enough to yield to employers of this grade any more than that scant and difficult subsistence which we have taken as the no-profits line. — The price at which these goods are to be sold, however, will determine the price of the whole supply, since, in any market, at any given time, there can be but one price for different equal portions of the same commodity. Hence, whatever the cost of production of those portions of the supply which are produced by employers of higher industrial grades, they will command the same price as those portions which are produced at the greatest disadvantage, just as wheat produced on rich lands at a cost of three shillings a bushel is sold for the same price with wheat produced on comparatively sterile lands, at a cost of six shillings a bushel. — Profits, therefore, do not enter into the price of any commodity; for the price of each and every commodity is fixed by the cost of production of that portion of the supply which yields no profits. — Do profits come out of wages? Not at all. The employer of the lowest industrial grade, the no-profits employer, must pay wages sufficient to hire laborers to work under his direction. The employer of a higher industrial grade will pay the same wages, no less, no more; but, selling his goods, so far as they are of equal quality, at the same prices as the employer who makes no profits, he will yet be able, by careful study of the sources whence his materials are drawn; by a comprehension of the ever-varying demands of the market; by steadiness and self-control; by organizing force and administrative ability; by energy, economy and prudence, to accumulate a clear surplus, after all obligations are discharged, which surplus is called profits, just as the cultivator of the better soils has a surplus left in his hands, after paying wages for labor and interest for capital, which surplus, in this case called rent, goes to the owner of the soil, as such, be he the actual cultivator or another person. — It will have been observed, that, throughout this discussion, I closely assimilate profits with rent. I believe this to be a sound and just view of the origin of profits and of their relation to the other shares of the product of industry. If this view shall be approved as correct, the demand of Prof. Sidgwick will be met, and we shall have, for the first time since the destruction of the wage-fund doctrine, a complete and consistent theory of the

distribution of wealth. By this theory the residual claimant upon the product is not, as under the old economic doctrine, the capitalist employer, but the laborer. Subject to three several deductions of a definite nature, the wages class will, upon the assumption here made of perfect competition, supplying all the conditions of a really good market, receive all they have helped to produce. — *First.* Rent is to be deducted. On the lowest grade of soils there is no rent. On the more productive soils, rent, at its economic maximum, equals the excess of produce after the cost of cultivating the no-rent soils has been deducted; this rent, as has been said, does not affect the price of agricultural produce, nor does it come out of the remuneration of the agricultural laborer. We thus see that the first deduction to be made from the product of industry is of a perfectly definite nature. Rent must come out before the question of wages is considered. The laborer, as such, can not get this, or any part of it, by any economic means. It must go to the owner of the lands unless confiscated by the state, or ravished away by violence. — *Second.* From the product of industry must be deducted a remuneration for the use of capital. That remuneration must be high enough to induce those who have produced wealth to save it and store it up, instead of consuming it immediately for the gratification of personal appetites or tastes. This may imply, in one state of society, an annual rate of interest of eight per cent.; in another, of five; in another, of three. The only reason, industrially speaking, for interest being paid at all, is, that by the use of capital production may be enhanced; and the interest so paid is, theoretically, only a part, often, such is the force of competition among would-be lenders, a very small part of the excess of product so generated. Since the product remaining after the payment of interest is always, in theory, equal to what would have been the product had interest not been paid (that is, had the capital for the use of which interest is paid, not been employed), and since, in fact, the product so remaining is always greater in general, vastly greater—at times inconceivably greater—than the product otherwise would have been, we see that that party to distribution whose claims are residual, that is, which takes all which no other claimant carries away, is benefited by every payment of interest on account of capital used in the production of wealth. Indeed, as high interest, under free competition, shows that the contribution made to production through each successive increment of capital is very large, it may fairly be said that the residual claimant upon the product of industry derives a greater relative benefit through the employment of capital where a high rate rather than a low rate of interest is paid. — The third and last deduction to be made from the product of industry, before the laborer becomes entitled thereto, is what we have called profits, the remuneration of the employer, the entrepreneur, the man of business, the captain of industry, the merchant, manufacturer or banker,

who sets in motion the costly and complicated machinery of modern production. — If I have rightly apprehended the nature of the employer's function and the source of his profits, those profits would, under free and full competition, not form a part of the price of commodities (price being determined by the cost of production under the most disadvantageous conditions, *i. e.*, in this instance, production by the no-profits employers); while no economic means whatsoever would suffice to carry any portion of profits over to wages, even were employers forbidden by law to receive them, just as no economic means can be devised by which rent could be made to enhance wages, even though landlords were forbidden themselves to touch it. In other words, profits consist wholly of wealth created by individual employers, over and above the wealth which would have been produced, in similar industrial enterprises, by the same labor force and capital force, under the control and direction of employers of lower economic efficiency. — These three shares being cut off, the whole remaining body of wealth daily or annually produced is, according to the economic theory presented, the property of the laboring class: their wages or the remuneration for their services. So far as by their energy in work, their economy in the use of materials, or their care in dealing with the finished product, the value of that product is increased, that increase goes to them by purely economic laws, provided, only, competition be full and free. Every invention in mechanics, every discovery in the chemical art, no matter by whom made, inures directly and immediately to their benefit, except so far as a limited monopoly may be created by law for the encouragement of invention and discovery. Every improvement in their own efficiency as laborers, whether due to quickened zeal, to heightened intelligence or to greater industry, sobriety or thrift, will, by this rule, serve directly to advance their wages. Unless by their own neglect of their own interests, or through inequitable laws, or social customs having the force of law, no other party can enter to make any claim upon the product of industry; nor can any one of the three parties already indicated carry away anything in excess of its normal share, as hereinbefore defined. — It will appear, at a glance, how widely the result here attained differs from that which was reached under the old economic theory of the distribution of wealth, according to which from the entire product of the exertions and sacrifices of the industrial community is cut off, first, rent, as determined by the Ricardoan formula; secondly, wages, the laborer's share, as determined by the wage-fund formula, the amount possibly to be paid in this way being irrespective of the number and of the industrial quality of the laboring class. All that remains belongs to the capitalist employer. By such a rule of distribution, no gain in the efficiency of the individual laborer, whether taking the direction of greater energy or of greater economy; no mechanical invention, no chemical discovery, however

much the capability of production may be increased thereby, can profit the laborer anything, except as it first enhances the profits of the employing class, and thereby adds to the capital of the wage fund, to be thereafter expended in purchasing labor — In opposition to this view, I hold, that, notwithstanding the formal attitude of the laboring class in industry, as hired by the employing class and working for stipulated wages, the normal operation of the laws of exchange is to make the former, in effect, the owner of the whole product, subject to the requirement of paying the definite sums charged against the product on the three several accounts of rent, interest and profits.

FRANCIS A. WALKER.

“WALTHAM SYSTEM,” a term much used in connection with the manufacture of cotton and woolen goods during the period from 1814 to 1830. Prior to the war of 1812, the processes of carding, spinning, weaving and fulling, were carried on in separate establishments under different proprietors. But in 1813, in consequence of the inventions of Francis Cabot Lowell, the Boston manufacturing company was enabled to combine all these processes in their establishment at Waltham. Boarding houses for their operatives, and the periodical payment of wages in money, in lieu of payment in provisions and clothing from the factory store, were also introduced. This system was soon afterward introduced at Lowell, and soon became general. The advantages of the Waltham system, alike to manufacturers and workmen, are too obvious to require explanation. C. C.

WANTS. Man alone, of all animate beings, possesses the faculty of constantly adding to his wants, and to the means of providing for them. This double faculty, in course of time, very materially modifies human life, and the life of most organic beings; it completely changes the primitive distribution of the different genera of animals and vegetables, as well as their respective proportions. It is that faculty which, in the words of Buffon, “ends by impressing our ideas upon the face of the earth”; the faculty which has given our intellect the exercise that has so prodigiously developed its power, and without which the human mind would have remained but little above that of the different species of apes. To this faculty we must also attribute the multiplication of our race upon the earth, whose spontaneous productions would not furnish sufficient sustenance for a millionth part of those who now dwell upon it. — The faculty of increasing our wants should always be joined to that of increasing the means of satisfying them, for these two faculties are inseparable, they stand to each other in the relation of cause and effect, and the latter could never act but under the spur of the former; so that we can not logically deplore, with certain schools of pretended philosophers, the continual extension which is given to human wants by the onward march of humanity, without at

the same time censuring the increase of the means of subsistence, and of the goods of all kinds which the second faculty, that is, industry, has procured for us. — Of all the publicists who have maintained the doctrine of the limitation of wants, J. J. Rousseau is the most radical, and the only consistent one; for he is the only one who, looking upon the faculty of extending our wants as a direful gift, has entirely repudiated, at least in theory, all the goods whose production is due to that faculty. According to him, mankind entered upon the path of degradation, from the very day that they thought of substituting a cabin for a cave in the rocks and the foliage of trees, or determined to add the bow and arrow to their teeth or their nails. (*Discours sur l'origine de l'inégalité.*) If Rousseau had reflected, that, in order to reduce the human race to this manner of living, it would be necessary to sacrifice it almost entirely, he would probably have acknowledged that the advantage of thus elevating a few rare individuals to the condition of the orang-outang, would not be worth such a sacrifice. — The theorizers of to-day do not push the doctrine of the limitation of wants as far as Rousseau did; and, although they hold the same principle, they assign different motives for it. They consider the generalization of the desire for well-being the principal source of our ills, because it is calculated to develop cupidity, envy and other maleficent motives; and they would counteract it by inculcating austere religious tenets, a contempt for the pleasures of this world, and resignation to present suffering, in anticipation of happiness in a future life. They think of perfecting man's life on earth by contemning and despising it. They assure us that the general observance of their doctrines or precepts is the best means to secure the tranquillity and happiness of nations, and of *strengthening social order*. — Unfortunately these modern defenders of what Bentham calls the *principle of asceticism*, do not preach by example. Fully provided themselves with all that can satisfy most completely awakened wants, it ill becomes them to censure in the impoverished classes the aspiration to a position more or less nearly resembling their own, unless they first themselves renounce the advantages of their position. This, however, they do not do; they very willingly make use of the goods which they pretend to despise; we generally find them very anxious to escape privation, and none of them has yet been able to persuade himself to live in a Diogenes tub. This contradiction between their theory and their practice gives ground for the belief that their faith in the truth and efficacy of their doctrine is not very lively or sincere, and this is probably one of the causes of the fruitlessness of their preaching. — But even if they were to join example to precept, as did some of their predecessors in past ages, they would succeed no better than did these in inducing mankind to live a life contrary to their instincts. We can not change the nature of things by ignoring it; it remains what it is despite all our opinions

and all our errors. The soul of man, such as God made it, and as it manifests itself during the entire time of its union with the body—from the cradle to the grave—is an *inexhaustible source of desires* (Frederick Bastiat, *Harmonies Économiques*); and a desire is nothing but a seeking for some satisfaction, or a shrinking from some pain, that is to say, a *tendency to well-being*. — This tendency, therefore, is essential to the soul; it is as intimately connected with, and inherent in, our nature, as the mysterious force which attracts them to the centre of the earth is to heavy bodies. All that the will of man can do is to direct this tendency toward some gratifications rather than toward others; but we obey them in all our resolves, even when we constrain present wants in order to enjoy a future gratification, or impose a hardship upon ourselves to escape still greater ones, or resist the temptation to a physical gratification with a view to intellectual or moral pleasure, or even when we practice the greatest possible renunciation, and deny ourselves all of this world's goods with the hope of thus obtaining a happy existence in a better world. — Among the infinite variety of directions that may be given to our wants, some are more and some less favorable, some are more and some less opposed to the perfecting or improvement of human life. Thus, for instance, nations whose desires are too exclusively directed toward sensual gratifications, soon degenerate, because it is the nature of such gratifications to weaken the vigor and manhood of those who give themselves over to them without restraint, to degrade their affective faculties, to render them at the same time less fitted for intellectual operations, and thus to weaken the principal element of our power. But too absolute a repression of the instincts which urge us to sensual gratifications would be attended with no less pernicious results. Whether this repression be inspired by religious belief, or prompted by the idea—an idea which bears the impress rather of laziness than of philosophy—that it is better for man to stifle his wants than to have to produce the means of satisfying them, the inevitable effect will be to degrade his most precious faculties by allowing them to remain inactive. For it is to their activity alone that we must attribute the immense development which they have acquired, a development which may be estimated by comparing the most civilized portions of the population of Europe with the tribes that have remained almost in their primitive state of barbarism. — The science of morals points out to us the reefs upon which our blind tendencies would wreck us; its duty is to show us as clearly as possible the good or evil courses which wants may take, by discovering and indicating to us all the consequences of our inclinations, whether proximate or remote. Of the many courses which these inclinations may take, there is one which will surely lead to our ruin, and others which lead as surely to the progressive improvement of humanity in every respect. It is the part of morals to tell us *whither these differ*

ent courses lead, in order that, while obeying the irresistible impulse of our nature to seek after well-being, we may be less exposed to losing our way. — In the present state of science this mission of morals is scarcely even outlined, and the only real progress which we have made in this respect for over a century, is due to political economy. — But, although political economy has thrown a great deal of light upon the consequences of some of the tendencies and habits of mankind taken collectively, its object is not so much to influence us in the direction of our wants as to enlighten us on the general means of insuring their satisfaction. It is for this reason that it takes these wants as they are, and recognizes *utility* in everything which they cause us to seek, without stopping to examine whether they are rational or not. Those who find fault with it for proceeding in this manner, do not realize that it could not act otherwise without extending its field of investigation beyond measure; that it could not furnish suitable rules to guide us in the choice of our satisfactions, and in the development of our inclinations and tastes, without creating out of whole cloth a science which does not exist. The principles of political economy are in every way independent of the direction our wants take, and they will be none the less true and useful when the progress of morality shall have made the general wants of man better understood, and more strictly conformable to well-being and the perfection of life than they are at present. The natural laws of production, distribution and consumption of the objects of our wants remain the same, no matter what the nature of the satisfactions which these objects procure, and independently of the favorable or injurious results which the habit of these gratifications may have upon individuals and nations. It is with the principles of political economy as with those of mechanics: they remain the same whether applied to the creation of an implement of warfare—an instrument of death and destruction—or suggesting rules for the better employment of the forces employed in the production of means of subsistence. Thus, for instance, the principles of political economy are as well adapted to point out to the savages of North America the general means of obtaining abundantly the alcoholic wants which degrade and kill them, as they are to enlighten civilized nations upon the social conditions most favorable to the increase and diffusion of all that can contribute to the improvement of physical life and of the intellect. — It is nevertheless true that the progress of morality, without changing anything in the principles of political economy, must aid in rendering the application of those principles more profitable; and the realization of this truth has led most economists to some extent into the domain of morals, while they were seeking to measure the relative extent and merit of different classes of wants, while they were combating the errors and prejudices which favor luxurious and purely frivolous expenses, and condemning those which tend to enervate and de-

grade nations. — The wants of nations are never a fixed quantity, they are constantly varying and generally progressive; but they are endowed with such elasticity, even in what concerns food, that experience has frequently shown that great variations may occur in their yearly alimentary production without exercising any proportionate influence upon the number of the population, that the population may increase without an equivalent increase in the quantity of products, and that an increase of general production may coincide with the stationary state of the population. In this latter case the wants of each are more fully satisfied; in the former cases they are necessarily restricted, and there is, consequently, more suffering.

WAR. (See DECLARATION OF WAR, BELLIGERENTS, EXCHANGE OF PRISONERS.)

WAR, The Civil. (See REBELLION, THE, in U. S. History.)

WAR DEPARTMENT. One of the executive departments of the United States government, established by act of Aug. 7, 1789. (1 Stat. at Large, p. 49.) The head of this department, officially designated the secretary of war, has charge of all matters respecting military affairs, under the direction of the president; has custody of all records, etc., relating to the army, the superintendence of all purchases of military supplies, the direction of army transportation, the distribution of stores, etc., the signal service and meteorological records, the disbursement of all appropriations for rivers and harbors and their survey and improvement, and the superintendence and supply of arms and munitions of war. The secretary of war is a member of the cabinet (salary, \$8,000). He is required to make an annual report to congress, with statement of all appropriations and their expenditure, contracts for supplies or services, reports of surveys, and of improvements of rivers and harbors, returns of the militia in the various states, etc. — The extensive business of the war department is distributed among ten military bureaus, each under a chief who is an officer of the regular army, and receives a salary of \$5,000 while at the head of a bureau. The chief clerk of the department (salary, \$2,750) has charge of the correspondence and accounts, communicates between the secretary and department officers, and has general superintendence of 90 to 100 clerks and other employes attached to the secretary's office. The adjutant general of the United States army is at the head of a bureau of 575 clerks, etc. He issues the orders of the president and the general commanding the army, conducts the army correspondence, the recruiting and enlistment service, issues commissions, receives reports and resignations, is custodian of the voluminous army records of the United States, keeps the muster rolls, and makes an annual report of the strength and discipline of the

army. The inspector general, with assistance, inspects and reports the condition of the army at all military posts, as well as the accounts of its disbursing officers. The quartermaster general (132 clerks, etc.) has charge of army transportation, clothing, quarters, equipage, forage, wagons, horses and mules, fuel and lights, stationery, hospitals, medicines, etc. He employs and pays guides, spies, etc., defrays funeral expenses, and has charge of the national cemeteries. The commissary general (38 clerks, etc.) is charged with the subsistence department, army rations, and purchase and distribution of the same. The surgeon general (463 clerks, etc.) has control of the medical department, the selection, purchase and distribution of medicines, records of all wounded, disabled and deceased soldiers, the supervision of army surgeons and of the army medical museum at Washington. The latter contains an extensive exhibit of specimens, representing the effects upon the human body of wounds, morbid conditions, etc., with the complete hospital records of the army, and a very extensive library of nearly 60,000 volumes. The paymaster general (60 clerks, etc.) keeps the accounts and disburses the pay of the army, through a large body of paymasters. The chief of engineers (17 clerks, etc.) is commander of the corps of engineers, charged with fortifications, torpedo service, military bridges, river and harbor improvements, military and geographical surveys, etc. The chief of ordnance (36 clerks, etc.) is charged with artillery and all munitions of war, prescribing models and modifications of weapons, and their construction, preservation and distribution to the regular army and to the militia of the states. The chief signal officer superintends the signal service, and the weather bureau, with a corps of instruction in signal duties, prepares and issues maps and charts, and publishes daily meteorological reports from the numerous stations of observation, which are afterward consolidated in permanent form. The judge advocate general receives and reviews proceedings of courts-martial and other military tribunals of the army, and furnishes opinions and reports on questions of law, etc., to the secretary of war. — The war department is conducted at an annual expense for salaries of \$1,936,855 (in 1884), and contingent expenses (including printing) of \$340,000. The following is a complete list of the secretaries of war, with their terms of office :

1. Henry Knox	Sept. 12, 1789
2. Timothy Pickering	Jan. 2, 1795
3. James McHenry	Jan. 27, 1796
4. Samuel Dexter	May 13, 1800
5. Roger Griswold	Feb. 3, 1801
6. Henry Dearborn	March 5, 1801
7. William Eustis	March 7, 1809
8. John Armstrong	Jan. 13, 1813
9. James Monroe	Sept. 27, 1814
10. William H. Crawford	Aug. 1, 1815
11. George Graham	<i>ad interim.</i>
12. John C. Calhoun	Oct. 8, 1817
13. James Barbour	March 7, 1825
14. Peter B. Porter	May 26, 1828
15. John H. Eaton	March 9, 1829
16. Lewis Cass	Aug. 1, 1831

17. Joel R. Poinsett	March 7, 1837
18. John Bell	March 5, 1841
19. John C. Spencer	Oct. 12, 1841
20. James M. Porter	March 8, 1843
21. William Wilkins	Feb. 15, 1844
22. William L. Marcy	March 6, 1845
23. George W. Crawford	March 8, 1849
24. Charles M. Conrad	Aug. 15, 1850
25. Jefferson Davis	March 5, 1853
26. John B. Floyd	March 6, 1857
27. Joseph Holt	Jan. 18, 1861
28. Simon Cameron	March 5, 1861
29. Edwin M. Stanton	Jan. 15, 1862
Ulysses S. Grant, <i>ad int.</i>	Aug. 12, 1867
Lorenzo Thomas, "	Feb. 21, 1868
30. John M. Schofield	May 28, 1868
31. John A. Rawlins	March 11, 1869
William T. Sherman	Sept. 9, 1869
32. William W. Belknap	Oct. 25, 1869
33. Alphonso Taft	March 8, 1876
34. Jas. Donald Cameron	May 22, 1876
35. George W. McCrary	March 12, 1877
36. Alexander Ramsey	Dec. 10, 1879
37. Robert T. Lincoln	March 5, 1881

A. R. SPOFFORD.

WARS (IN U. S. HISTORY). I. FRENCH AND INDIAN WAR. This was the first *national* war of the United States, although no such nation as the United States had as yet a formal existence. Previous wars had been waged by but one colony or a few adjacent colonies in combination. They had been the inevitable Indian wars, such as the Pequot war in 1637, or King Philip's war in 1675, waged by Massachusetts and Connecticut, and the Tuscarora war, in 1711, waged by North and South Carolina; or conflicts with the neighboring French and Spaniards, into which the colonies had been dragged by their connection with the mother country. Such were *King William's war*, in 1689-97, in which Massachusetts, Connecticut and New York united to attack Canada by land and sea; *Queen Anne's war*, in 1702-13, in which the fighting was done separately by South Carolina in the south, and by New England, New York and New Jersey in the north; the *Spanish war*, in 1639-42, in which the brunt was borne by Oglethorpe and his new colony of Georgia; and *King George's war*, in 1744-8, in which all the northern colonies took part. In the course of these conflicts, an increasing community of interests had brought an increasing number of the colonies to act together; but none of them had been general, and still less could any of them be called *quasi-national*. The French and Indian war was essentially different from all its predecessors. It was not provoked by European diplomacy, but continued for two years in America before war was declared in Europe. It was not brought on by European interests, but was accepted by the colonies in defense of their own interests. It was waged by all the colonies in common, from New Hampshire to Georgia. In waging it, the first plain distinction appeared between Americans, or "provincials," and Englishmen. (See NATION.) And, as a part of it, the first effort was made to secure a formal union of the colonies. (See ALBANY PLAN OF UNION.)— In 1748 the Ohio land company was formed, as a Virginia and London speculation. Several of the Washington family were engaged

in it, and its object was to develop Virginia's western resources. The peculiar claims of Virginia, from the asserted northwest direction of her northern boundary line, made it doubtful whether the country around what is now Pittsburgh was in Virginia or in Pennsylvania. (See VIRGINIA; TERRITORIES, I.) The Ohio company obtained from the crown a grant of 500,000 acres in this neighborhood, and began preparations to make roads to it through the still unsettled country. The French colonial empire in America then consisted of two settled territories, in Canada and at New Orleans, the two having about one-tenth the population of the English colonies, joined by a line of some sixty forts between New Orleans and Montreal. Many of these forts, such as Detroit and Natchez, have since become the sites of flourishing cities. The country through which the line ran was an Indian territory, with a few French hunters and traders in addition to the garrisons. But the French asserted territorial claims up to the crest of the Alleghanies; and they naturally took alarm as the first feeble wave of English settlement appeared over the mountains. In 1749 they sent an expedition through the present states of Ohio and Kentucky, to bury leaden plates at important points, with the arms of France graven on them, to assert possession of the country, and to warn English traders out of it. In 1752 the rivals came closer together: the Ohio company built Redstone old fort (now Brownsville), on the Monongahela; and in 1753 the French built forts at Presque Isle, now Erie, and on the Alleghany to the south of it. Late in the same year, George Washington, then a young land surveyor, was sent to Presque Isle by Gov. Dinwiddie, of Virginia, to warn off the intruders. They declined to go, and made active preparations to extend their acquisitions. — The key of the country was the point at the junction of the Alleghany and Monongahela, now known as Pittsburgh. All parties understood its importance. Late in 1753 Dinwiddie bought from the Indians the right to build a fort there, and sent men to do the work. Early in 1754 came the conflict: the French descended from Presque Isle, drove away the English, and finished the fort themselves, calling it Fort Du Quesne; and the French and Indian war had begun. The battles, such as the defeat of Braddock in 1755, and Johnson's defeat of Dieskau, near Lake George, in the same year, were at first not very creditable to the English and provincials. Their discordant and inefficient efforts were easily foiled by the inferior forces of the abler French leaders. In 1757 Pitt became the head of the English ministry, and order, vigor, sense and success came with him into the English councils. Fort Du Quesne fell the next year, and Quebec in 1759. During the following year the various French forts were taken into possession, and the French empire in America was lost forever. In 1763, by the peace of Paris, Great Britain was formally vested with the jurisdiction of the whole of North America east of the Missis-

issippi, the Floridas being ceded by Spain, the ally of France in the war, in exchange for Havana, which an English expedition had captured two years before. Of her former possessions in North America, France ceded the portion east of the Mississippi to her victorious enemy, Great Britain, and the portion west of that river to her partner in misfortune, Spain. — The persistence of Great Britain in retaining her conquests from France in North America, and thus relieving her other colonies from the constant danger impending from Canada, was at first sight a great mistake. The French minister for foreign affairs warned the British envoy at the time that the cession of Canada would only clear the way for the independence of the original British colonies; and from 1763 until 1775 French statesmen patiently watched the fulfillment of the prophecy, and were encouraged by the unanimous reports of French agents in North America. It even became the fashion in Great Britain, after the opening of the revolution, to attribute the boldness of the colonists entirely to the cession of Canada. But, after all, the change of jurisdiction in 1763 can not thus be made the universal scape-goat: it but substituted Great Britain for France as an enemy. Burgoyne's expedition would not have been any more dangerous to the colonies under a French than under a British standard. The truth seems rather to be that the cession of Canada would have postponed the day of conflict with the mother country for half a century, if the stupidity of British statesmen had not brought it to a head in 1775. France, Great Britain and all Europe combined could not finally have balked of its prey the Anglo Saxon lust for land; but the cession of Canada to the mother country satiated it peaceably for the time, just as Napoleon's cession of Louisiana in 1803 (see ANNEXATIONS, I.) satiated it again for the time. From this point of view the action of Great Britain in retaining the western territory would seem to have been as blindly wise as her subsequent attempt to "govern" the colonies was blindly foolish. — II. See REVOLUTION. — III. See ALGERINE WAR. — IV. WAR OF 1812. The causes of the "second war for independence," as the war of 1812 is sometimes called, are elsewhere given. (See EMBARGO; DEMOCRATIC PARTY, III.) The internal political difficulties which accompanied it, and the great development of national feeling which followed it, have also been given a separate place. (See CONVENTION, HARTFORD; NATION, II.) It is designed here only to give, in some necessary detail, the course of action which closed it by the treaty of Ghent. — March 8, 1813, the Russian minister at Washington, Daschkoff, offered to the American government, by direction of the czar, his friendly mediation in the war. Madison accepted it, and nominated, May 29, Bayard, of Delaware (see that state), Gallatin, and John Quincy Adams, then minister to Russia, as negotiators. July 19, the senate confirmed them, except Gallatin, who was secretary of the treasury: the affairs of the treas-

ury were in so critical a condition that the senate refused to sanction his absence from the country. Nov. 4, 1813, while the three American negotiators were in St. Petersburg, one of them unconfirmed, Castlereagh wrote to the secretary of state, declining the Russian mediation, but offering to treat directly, and suggesting London as the place. It is supposed that Great Britain, not caring to offend Russia or to allow that country's friendship for the United States to influence the final treaty, wished to transfer the negotiations from St. Petersburg. In January, 1814, Henry Clay and Jonathan Russell were nominated and confirmed as additional negotiators; and Gallatin, who had by this time resigned the treasury, was confirmed. — In August, 1814, the place of negotiation was transferred to Ghent; and here the five commissioners met Lord Gambier, Henry Goulburn, and William Adams, on the part of Great Britain. The time was hardly propitious for peace negotiations. On the 30th of the previous March the allies had entered Paris in triumph; in April Napoleon had departed for Elba; and the British government was free to settle accounts with the upstart people whose ships had won more flags from her navy in two years than all her European rivals had done in a century. And so, while negotiations were going on, detachments of Wellington's victorious veterans were being shipped to America, there to seize New Orleans and Louisiana, and make possession of them at least nine points of the final treaty of peace. — Behind the British negotiators were the clamorous demands of the British war party and war newspapers, demands rising, in some cases, to the banishment of President Madison to some convenient Elba. "Better is it," said the "London Times," "that we should grapple with the young lion when he is first fleshed with the taste of our flocks, than wait until, in the maturity of his strength, he bears away at once both sheep and shepherd." Nevertheless, the first demands of the British negotiators must have seemed to them quite moderate. They were: 1, the creation of a permanent and independent Indian territory, between Canada and the United States; 2, that the northern boundary of the United States should run along the southern shore of the great lakes; 3, that the United States should have no forts on the northern frontier, and no war vessels on the lakes, while Great Britain should not be so restricted; 4, that enough of the eastern part of Maine should be ceded to enable the British to build a military road from Halifax to Quebec; and, 5, that the right to use the Mississippi, guaranteed by the treaty of 1783, should be renewed to British subjects, while the American right to the Newfoundland fisheries, guaranteed by the same treaty, should be considered lost by the war. In June, as a last concession, the American government had allowed its negotiators to waive the questions of right of search and impressment, on which the war had been begun; but no instructions could cover such demands as these. They aroused the war spirit in

America, when they were announced there, to a higher pitch than ever; and the American negotiators themselves lost their tempers. — After four months of wrangling, a treaty was made in which not a point of the British demands was granted. This result can not be attributed to any friendly feeling between the two sets of negotiators, for they quarreled unremittingly from the beginning to the end of the negotiation; nor to any accord among the American negotiators, for they quarreled with one another almost as constantly. Clay wished to give up the fisheries and save the Mississippi; Adams wished to give up the Mississippi and save the fisheries; and Gallatin alone was busied in keeping the peace among his colleagues and with the British negotiators. The best explanation seems to be that the treaty was due mainly to the high tone taken by Russia and Prussia, at the congress of Vienna, in defense of neutral rights, and the desire of Great Britain to eliminate the United States from possible complications. Nevertheless, it remains very singular that the British negotiators should have signed a treaty without any mention of Louisiana, while the British expedition for its conquest was still in position before New Orleans, with high hopes of success. The treaty even provided that "all territory whatsoever taken by either party from the other during the war, or which may be taken after the signing of this treaty, * * * shall be restored without delay"; so that the lives of Pakenham and his dead were absolutely thrown away, and their victory would have gained no more than their defeat. It is not easy to avoid the feeling that the inside history of the treaty of Ghent is yet to be written. — The treaty, dated Dec. 24, 1814, at Ghent, and ratified by the senate Feb. 17, 1815, was in eleven articles. The first three provided for peace and the restoration of prisoners; the fourth, fifth, sixth, seventh and eighth, for the northern boundary (see MAINE; NORTHWEST BOUNDARY); the ninth, for the cessation of Indian hostilities; the tenth, for the suppression of the slave trade; and the eleventh, for the exchange of ratifications. It will be seen that the treaty did not touch one of the points on which the United States had declared war. These had been more practically settled: one frigate battle at sea was worth more to that purpose than a host of treaties. — V. THE MEXICAN WAR. The settlement of Texas by Americans, its secession from Mexico, its annexation to the United States, and its admission to the Union as a state, have been given elsewhere. (See ANNEXATIONS, III.) Before the annexation Gen. Zachary Taylor was stationed in Louisiana, then the southwest frontier of the United States. May 28, 1845, he was ordered to cross the Sabine and take post in Texas, so as to protect it from invasion by Mexico. The apprehended invasion by Mexico did not take place; and, though diplomatic intercourse between Mexico and the United States was interrupted, war did not follow. Corpus Christi, on the western bank of the Nueces, was then the advanced Texas town; and here Taylor made his headquarters for

the rest of the year. The territory between the Nueces and the Rio Grande, a desert in the east but fertile in the west, had been claimed by Texas, but never reduced to possession. During the summer several dispatches were sent to Taylor, authorizing him to advance to the Rio Grande if he saw fit, because of hostile preparations by Mexico, and ordering him, in that case, not to wait for orders from Washington. But Taylor, Oct. 4, in a long dispatch declared that he "did not feel at liberty, under his instructions, particularly those of July 8, to make a forward movement to the Rio Grande without authority from the war department." There the matter rested until the following January. — In the meantime, Nov. 9, President Polk appointed John Slidell (see LOUISIANA) as ambassador to Mexico, in pursuance of an intimation from Mexico that she would receive a commissioner to settle the Texas dispute. In December the Mexican government declined to receive Slidell in the character of an ambassador, since such a resumption of diplomatic intercourse would imply an abandonment by Mexico of the points in dispute, which had led to the rupture; but the offer to receive him as a commissioner was renewed. This was refused by Slidell. Soon afterward a revolution in Mexico placed a new government in power. — Before any of these events could be known at Washington, but, as Mr. Buchanan, the secretary of state, admitted, "in anticipation" of them, an order, dated Jan. 13, 1846, was sent to Taylor to advance to the Rio Grande. Taylor arrived at the river March 28, established his camp opposite Matamoras, and was notified by Arista, the Mexican general, after a series of angry communications, that he considered war as already begun. April 26, a party of American dragoons was captured, with some bloodshed, by a superior force of Mexicans. As soon as Taylor's dispatch announcing this event reached Washington, the president sent a message to congress, in which he declared that Mexico had "at last invaded our territory, and shed the blood of our fellow-citizens on our own soil." Two days afterward, congress passed an act authorizing the president to call out 50,000 volunteers; but the gist of the act was in its short and simple preamble: "Whereas, by the act of the republic of Mexico, a state of war exists between that government and the United States." The whigs protested against the preamble, as a falsehood, but it was passed in the house by a vote of 123 to 67, and the whole bill by 174 to 14. In the senate the whole bill was passed by a vote of 40 to 2; five whigs protested against the preamble, and three refused to vote. War had thus begun; and, though the whigs had not been manoeuvred quite into an attitude of opposition to it, they were for some time thrown into confusion by their efforts to evade the issue so unkindly thrust upon them. (See WHIG PARTY.) — The essential facts and dates of the proceedings preliminary to war have been given above. Taken as they stand, they might be considered as a case of blundering into the lucky acquisition of Cali-

fornia and New Mexico, for President Polk has not usually been regarded as a very able man. But von Holst, as cited below, has focused upon Polk a great mass of evidence going to convict him of almost Satanic ingenuity in luring Mexico into war. It must be remembered that the Oregon dispute with Great Britain (see NORTHWEST BOUNDARY) was coincident with the series of events above given. It is certain that Mexico was not willing to fight about Texas; and it seems probable, that, in the beginning, she was no more willing to fight single-handed for even the disputed territory between the Nueces and the Rio Grande. The allegation, then, is that the long delay to order Taylor forward was diligently used in working the dispute with Great Britain apparently to a war point; that Taylor was then ordered forward; that Mexico, relying on Great Britain as an ally, incautiously accepted the gage of war; and that then every point in dispute was given up to Great Britain, peace was settled with that power, and California and New Mexico, the real objects of the war, were squeezed out of the grasp of Mexico. It has been said above that the array of circumstantial evidence is strong; and it is impossible to repress a certain feeling of admiration for the repulsive skill with which the diplomatic combinations were made, if they were really the result of design. The times and seasons were chosen with such consummate adroitness, the advantages gained by them were pressed with such resolute persistence, and the whole scheme was worked out to the end with such a complete repudiation of moral objections to it, that Machiavelli might have been proud to own it as his master-piece. Nevertheless, the conviction remains that Polk had not the ability requisite for the conception of such a plan, and that he was the creature of circumstances rather than their creator. The train of events may fairly have the two interpretations; and, while the first would have been the more natural in the case of Cardinal Richelieu, the second is certainly the more natural in the case of James K. Polk. Given the desire of the government to obtain California and New Mexico in case of war, the constant pressure behind it urging it toward war, and its natural hesitation to base the war on its excessively doubtful claim to the territory between the Nueces and the Rio Grande; and a little occasional *suppression veri* by the president will explain the whole drift of events without supposing them to be the result of a carefully elaborated plot. But, if the reader inclines to accept the first interpretation, he will find that it is necessary to take Marcy, the secretary of war, not Polk, as the presiding genius. — During the year 1846 Taylor first drove the enemy in headlong retreat over the Rio Grande, and then followed them and finished the campaign in Mexico. He captured, in Monterey, an army nearly double his own numbers, in spite of very strong natural and artificial defenses. Finally, Feb. 23, 1847, with less than 5,000 undisciplined volunteers, he met and routed more than four

times his number, under Santa Anna, at Buena Vista. In the meantime an overland expedition from Fort Leavenworth had captured New Mexico; and the Pacific squadron, aided by Fremont and some irregular land forces, had taken possession of San Francisco and California. The year 1847 ended the war. Scott, with 12,000 men, took Vera Cruz, and forced his way up to the plateau of Mexico before summer set in. In August and September, he beat nearly three times his number in a series of brilliant battles around Mexico, overturned the government, and conquered the peace of Guadalupe Hidalgo, Feb. 2, 1848. ALEXANDER JOHNSTON.

WASHINGTON CITY. (See CAPITAL, NATIONAL.)

WASHINGTON, George, president of the United States 1789-97, was born in Westmoreland county, Va., Feb. 22, 1732, and died at Mt. Vernon, Va., Dec. 14, 1799. In youth he became a land surveyor, and in the French and Indian war he was advanced to the grade of colonel and commander-in-chief of the Virginia forces, distinguishing himself in Braddock's defeat. In 1759 he married Martha, widow of John Parke Custis; and the care of her extensive property occupied him thereafter, though he was for fifteen years a silent member of the house of burgesses of his colony. He was a delegate to the continental congress in 1774-5, and the general anxiety to keep Virginia steady in resistance to the crown induced his appointment as commander-in-chief of the American forces, June 15, 1775. Whatever the motives may have been that governed his appointment, he very rapidly proved his extraordinary fitness for the place, and became the great and central figure of the revolution. The character of no other public man of the time can so suc-

cessfully submit to microscopic examination. There seems to have been nothing little in him. Great in defeat, he was greater still in success, and the crowning event of his military career was his surrender of his commission to congress at the close of the war. (For the events of the war see the biographies cited below.)—After resigning his commission, he retired to Mount Vernon, to put his private affairs in order, and to pursue the line of investments in western lands to which he had been attracted during his early military life. In politics he was most interested in the evident and dismal failure of the confederacy. (See CONFEDERATION, ARTICLES OF.) During the revolution he had been the trusted adviser of congress and the state governors, and his correspondence with former political and military associates throughout the country now becomes voluminous. Every conscious step toward the formation of a new government was submitted to his inspection and approval, and when the time was ripe he was almost forced into becoming a delegate to, and president of, the convention of 1787. In that body he said little, but in each case his suggestion was final. On the subsequent question of ratification his influence was still greater. Multitudes of voters, particularly in the northern states, who would have hesitated to accept the legal arguments of the "Federalist," and similar publications on either side, supported the new constitution blindly by reason of their confidence in Washington's sound judgment, their certainty that he would not recommend a scheme of government which he thought to be of evil tendency, and the evident fact that the office of president had been cut to his measure by the convention. Here, as in the revolution, there was no getting on without him; and it is as certain as anything can be that the existence of such a character, from 1775 until 1790, changed the whole course of the history of the western continent, and thus of the world.—In the elections of 1789 and 1792 all the electors voted for him, and he became president. (See ELECTORAL VOTES, I., II.) No succeeding president has received this national compliment of a unanimous vote, the one who came nearest to it, Monroe, being probably the one who least deserved it. The events of Washington's administrations are elsewhere detailed. (See JUDICIARY; CAPITAL, NATIONAL; BANK CONTROVERSIES, II.; EXCISE; APPOINTMENT; GENET, CITIZEN; DEMOCRATIC CLUBS; JAY'S TREATY; WHISKY INSURRECTION; FAREWELL ADDRESS; X Y Z MISSION; FEDERAL PARTY, I.; DEMOCRATIC PARTY, I., II.) He entered office with the impossible expectation that parties would be eliminated from his government; but his underlying consciousness that parties already existed is shown in his careful division of his cabinet offices between Hamilton and Knox on one side, and Jefferson and Randolph on the other. His expectation was of course disappointed; the companionship of Hamilton and Jefferson in the cabinet was, to use the latter's own comparison, like that of two

game-cocks in a pit. As Washington was by nature a sincere, though unconscious, federalist, the progress of party division drove the democratic leaders into opposition, and before the end of the second term all possibility, or even desirability, of further keeping the peace between the two parties was at an end. One party had overcome the prejudices of the people by help of Washington's name, and controlled the government by the continuance of the same help. The other party would have been more than human if it had not been impatient at finding Washington always in the way of its attacks upon its opponent. Its leaders successfully restrained themselves in prospect of his approaching retirement; but their impatience is shown by such symptoms as Jefferson's letter to Mazzei, though Jefferson always denied any intention to attack the president personally. The more violent members attacked Washington in plain terms, even accusing him of drawing more than his salary, publishing forged letters to show his desire to submit to the king during the revolution, and calling him the "step-father of his country." Their malice undoubtedly embittered the closing years of his second term, and yet it was only one of the symptoms which showed that the time was past when he was absolutely necessary, and that, having successfully and strongly built the stage, he must now leave it clear for the actors. The firmness of his hold upon the national heart is proved by the venom of the impatient and yet helpless politicians. He might have died in the office if he had wished it: even after his final decision to retire, two electors obstinately voted for him for a third term in 1796. — Washington was slow of judgment, and anxious to see all sides of a case and to get all possible opinions upon it, but when he had formed an opinion or a judgment, it was his own, and he seldom changed it. Most of the state papers which pass as Washington's were originally written by other hands, though none of them were given to the world until they had been revised, digested and reproduced by him and made thoroughly his own. His letters, however, are his own; and though their editor has pushed his province of correcting them to an extreme, no editing can conceal the essential nature of the writer as shown in them. The strong judgment, the good sense, the calmness and patience, the consciousness of strength and of the ability to control the strength, the absolute freedom from self-seeking in any form, make his letters a monument which will always justify the instinctive popular estimate of him. Other men have surpassed him in particular phases of character and ability; but, in all phases together, his letters will show that he was the greatest man the earth has yet seen. — A bibliography of Washingtoniana would be altogether too voluminous for our space. The list of books, tracts and medals relating to his death alone fills two volumes, as collected by F. B. Hough in 1865. Among the lives may be mentioned Marshall's, Irving's, Sparks', A. Bancroft's, Lossing's, Ram-

say's and Everett's; Custis' *Private Memoirs of Washington*; and Rush's *Washington in Domestic Life*. See also, Sparks' *Writings of Washington*; 1 *Statesman's Manual* (for his messages); Gibbs' *Memoirs of the Administrations of Washington and Adams*; Trescott's *Diplomatic History of the Administrations of Washington and Adams*; Thacker's *Life and Military Journal of Washington*; Griswold's *Republican Court*; 2 Pitkin's *United States*; 3-5 Hildreth's *United States*; 1 Schouler's *United States*. There is a forcible pen-portrait of Washington at pp. 77 and 114-126 of Schouler as cited above; and in fiction Thackeray has attempted the same thing in *The Virginians*.

ALEXANDER JOHNSTON.

WASHINGTON TERRITORY, a territory of the United States. Its area is a part of that doubtful portion of the Louisiana cession (see ANNEXATIONS, I.), whose jurisdiction was long a subject of dispute between the United States and Great Britain, but was finally decided to be in the former by the treaty of 1846. (See NORTHWEST BOUNDARY.) It was originally a part of Oregon territory, and, before the erection of that territory into a state, was set off as a separate territory by the act of March 2, 1853. As at first organized, it contained 193,071 square miles, but transfers to Idaho have reduced it to an area of 69,994 square miles. Its population, by the census of 1880, was 75,116, an increase of 213.57 per cent. in the decade previous. Its capital is Olympia, and its governor (1880-84) is William A. Newell. — The act of March 2, 1853, is in 10 *Stat. at Large*, 172.

ALEXANDER JOHNSTON.

WAYS AND MEANS. (See PARLIAMENTARY LAW.)

WEALTH. In the most ordinary acceptance of the term, the word wealth indicates, and always indicated, especially when it was applied almost exclusively to the precious metals, things having an *exchangeable value*; but the greater part of economists have applied it to all *useful* things, even to those which are entirely devoid of such value; but it is always inconvenient in scientific nomenclature to designate by the same word, things which differ by essential characteristics, for such designation invariably causes confusion and misunderstandings. It might easily be shown that a great part of the discussions to which some of the principles of political economy have given rise, was due only to the two-fold meaning given to the words *wealth* and *value*, which made them designate both gratuitous utility, that is to say, a utility acquired without cost or labor, and powerless to obtain anything by way of exchange, and the utility obtained by means of labor, and possessed of an exchangeable value. It will, therefore, be of interest to inquire whether the nomenclature of politico-economical science would not be rendered clearer and more precise if it were once well understood that the words *wealth* and

value designated only utilities of this last kind, and this is what we shall attempt to demonstrate. But we must first point out the difficulties which result from the two-fold scientific meaning given to these two words, or the lack of precision in the meaning given to each in the definitions of them by the principal economists. The intimate correlation of these two words, and of the ideas which they awaken, will not allow us to treat of wealth without at the same time treating of value; we will, however, as far as possible confine our observations on the latter word to what is necessary in order to elucidate the question of nomenclature which we are considering: the other questions relating to the subject are considered in the article on VALUE. — "Every man is rich or poor," says Adam Smith, "according to the degree in which he can afford to enjoy the necessaries, conveniences and amusements of human life. But after the division of labor has once thoroughly taken place, it is but a very small part of these with which a man's own labor can supply him. The far greater part of them he must derive from the labor of other people; and he must be rich or poor according to the quantity of that labor which he can command or which he can afford to purchase. The value of any commodity, therefore, to the person who possesses it, and who means not to use or consume it himself, but to exchange it for other commodities, is equal to the quantity of labor which it enables him to purchase or command." ("Wealth of Nations," book i., chap. 5.) — From this we see that Adam Smith at first seems to consider everything useful as wealth, but afterward restricts the qualification to things which have an exchangeable value. "The word value," he says elsewhere, "it is to be observed, has two different meanings; it sometimes expresses the utility of some particular object, and sometimes the power of purchasing other goods which the possession of that object conveys. The one may be called *value in use*, and the other *value in exchange*. The things which have the greatest value in use have frequently little or no value in exchange; and, on the contrary, those which have the greatest value in exchange have frequently little or no value in use. Nothing is more useful than water; but it will purchase scarce anything; scarce anything can be had in exchange for it. A diamond, on the contrary, has scarce any value in use, but a very great quantity of other goods may frequently be had in exchange for it." ("Wealth of Nations," book i., chap. 4.) Here we have the word value used to express both gratuitous utility and utility which brings a price. — "Everybody knows," says J. B. Say, "that things have sometimes a value in use very different from their value in exchange; that common water, for example, has scarcely any value, although very necessary, while a diamond has a very great value in exchange, although of very little service; but it is evident that the *value of water* is a part of our *natural wealth*, which does not belong to the domain of political economy, and that the value of the dia-

mond forms a part of our *social wealth*, which is the only wealth within the province of the science. The word *exchangeable* is always indispensable, and included in the values with which political economy is concerned; it is unnecessary to repeat it continually, *for it is always understood*." (*Cours Complet*, t. i., p. 74.) And again he says, "The value which constitutes wealth is not the arbitrary value which a person attaches to a thing he possesses, and which is purely relative to his particular wants; it is the *value given by industry and appreciated by the public*." (*Ibid.*, p. 306.) Thus J. B. Say understood by value and wealth only what possesses an exchangeable value, and it was probably only by the example of Smith that he was induced to give to gratuitous utility the name of value in use (*valueur d'utilité*), or natural wealth. — Ricardo fully admits the distinction established by Smith between value in use and value in exchange ("The Principles of Political Economy in Taxation," ch. i.); however, in a letter to J. B. Say he maintains that we ought to give the name of wealth only to the things which have an exchangeable value (*Œuvres diverses de J. B. Say*, p. 410). In turn J. B. Say writes him: "I can not admit what you and Adam Smith are pleased to call *value in use*: what is value in use, if it is not utility pure and simple? The word utility is therefore sufficient." (*Ibid.*, p. 409.) This remark is well grounded, and that of Ricardo is not less so. — M'Culloch recognizes that the double meaning given to the two words value and wealth has not always been clearly perceived, and that it often becomes a cause of confusion and error; hence, from the very beginning of his book, he makes it a rule to use the word *value* to signify only exchangeable value, and the word *wealth* only to specify products susceptible of appropriation, and which are obtained only by the use of human labor, and which consequently are not gratuitously acquired, but are possessed of an exchangeable value. — "When exchanges are introduced," says Storch, "the *useful things* or the *values* which we possess may serve us in two different ways: first, *directly*, when we employ them in our own use, and then *indirectly*, when we exchange them for other values. Thus, therefore, the utility of things is either direct or indirect, and so with their value. Notwithstanding the difference of expression, this distinction is the same as that established by Smith, for Storch includes gratuitous utility in direct value. — "What is value? what is wealth?" asks Rossi. "If common sense answers these questions easily, the books answer them in so many different ways that the critics have reason to assert they have not been answered at all. Once more, value is the expression of the *relation which exists between the wants of man and things*. Wealth is a generic term which embraces all the objects in which this relation is verified. Every object that can satisfy a human want possesses a value. The object itself is wealth. Thus value and wealth, without being synonymous, are two expressions necessarily correlative. Value is the

relation; wealth is the aggregate of all the objects in which this relation is realized. This is what common sense tells us, and science has no right to depart from common sense." — It is quite evident that Rossi confounds here, as in other parts of his course of political economy, the words value, utility, etc. It is to be regretted, that, after having pretended that the books did not at all answer the questions which he propounded, he himself answers them much more imperfectly than those who preceded him. But the confusion which prevented him from forming an exact idea of value is due to the fact that he admitted, with Smith, a *value in use*, which is nothing else than utility, and a *value in exchange*, which is the sole value. — Frederick Bastiat distinguished perfectly utility from value; utility is what may be called the *expression of the relation which exists between the wants of man and things*. Value, indeed, supposes utility, but admits of still other characteristics. Bastiat distinguishes *gratuitous utility*, that is, the utility we enjoy without labor or previous effort, such as the light of the sun, from *onerous utility*, which is acquired only after a service done. To procure this latter utility we must first overcome a difficulty which stands between the want and its satisfaction; we obtain it by means of the effort or service which by rendering utility onerous prevents it from being transmitted for nothing, and gives rise to value. Exchangeable value is the only value he recognizes; and he clearly demonstrates that the idea which this word expresses must be the result of exchange, and was introduced into the world when two men for the first time agreed to exchange their services or the results of their services. (*Harmonies Économiques*, p. 170, etc.) — But Bastiat held that the word wealth should be applied to gratuitous utility only. He distinguishes two kinds of wealth: *effective wealth*, which comprises all utilities, whether obtained gratuitously or with the assistance of human effort; and *relative wealth*, which consists exclusively of onerous utilities or utilities which have a price. The more gratuitous utilities increase by the progress of industry, the more effective wealth do nations or the whole human race possess. But the relative wealth of an individual, a family, or a limited agglomeration of individuals, depends upon the amount of values which it possesses, provided the share of the mass of existing wealth, which they can obtain by way of exchange, is proportioned to the sum of these values. — If we had to distinguish in political economy two kinds of wealth, we would rather admit the distinction made by J. B. Say, between *natural wealth* and *social wealth*, than that proposed by Bastiat, as the former seems to us much more exact; but how can Bastiat, who has so ably proved that exchangeable value is the only value, admit wealth without value? An examination of his motives seems worthy of attention, and we hope it will afford us an opportunity of elucidating one of the difficult points of political economy. — The "science of political economy," he says, "concerns

itself with the general welfare of men, with the proportion which exists between their efforts and their satisfactions, a proportion which modifies to advantage the progressive participation of gratuitous utility in the work of production. The science can not, therefore, exclude this element from the idea of wealth. We may conceive two nations, one of which has more satisfactions than the other; but it has fewer values because nature has favored it, and because it meets with fewer obstacles: which is the richer of the two? Nay more, let us take the same people at two different epochs: the obstacles which it has to overcome are the same, but to-day it surmounts them with such facility (it effects, for instance, the *transportation of its merchandise, carries on its labor and manufactures with so little effort*) that values are, in consequence, considerably reduced. It may therefore adopt either of these two courses, remain content with the same satisfactions as formerly, and turn its progress into leisure. Can its wealth in this case be said to be retrograde, because that wealth possesses less value? Or it may devote its unemployed efforts to increase its enjoyments. In this latter case can we conclude that because the sum of the values of that people has remained stationary, its wealth has remained stationary also? This is a momentous question for political economy. Should it measure wealth by the satisfactions realized or by the values created?" (*Harmonies Économiques*, p. 234.) — This is really a very specious argument, and one which, if we are not mistaken, will appear unanswerable to many economists; and yet we believe we can show that all this argumentation is based upon an incomplete notion of value, and forgetfulness of some of its essential characteristics. The question is an important one. Is it true, as Bastiat asserts, that a people who by its progress in industry is enabled to procure the same satisfactions as formerly with less labor, thereby reduce the sum of these values? Or is it true that the latter remain stationary, if this same people, continuing to work as much as formerly, obtain more products? Let us see. — How is the value of a product, of a service, or of an aggregate of products and services, measured? *By the quantity of all other objects having a price which they enable one to obtain in exchange for them.* This is an axiom of political economy which has never been contested. — Let us now suppose that a people has, without greater effort or more human labor than formerly, succeeded in doubling the quantity of the products of all kinds which minister to its wants: we are told that then the value of these products, although their quantity has been doubled, has not been increased; but what is there to base such an assertion on? How is the value of the products measured *before and after the doubling*? If we measure it as we should do, by the quantity of all objects having a price which *each class* of products enables us to obtain in exchange, we shall inevitably find that in doubling the quantity of all the products we have likewise doubled their total value, since

each class of products can be exchanged against a *double quantity* of all the others. But it is said that this double quantity will have no greater value than the single quantity had before. How is this possible? We ask again, what is there to base such an assertion on? Since the value of an object can not be better measured than by the quantity of all other objects having a price which can be obtained in exchange for it, is it not plain that a class of products, which, because it has been doubled at the same time that all others have been doubled, enables us to obtain, in exchange, the double of the latter, has doubled in value as well as in quantity? What misleads the mind, and prevents the clear apprehension of this truth, is that value is confounded with price, and it is very true, that if the quantity of money did not increase during this doubling of the other products, the price of the latter might have sunk one-half or nearly one-half; but what clearly proves that it is not their value which is sunk, is that if we suppose the quantity of money to have doubled in the same time as the quantity of all the other products, we shall see that the price of these latter, taken as a whole, must have doubled likewise. — What next hinders the conception and acceptance of the truth we have just stated, is, that many economists continue to suppose, with Adam Smith, that the value of products is measured by the quantity of human labor employed in their creation—an incorrect notion, which has led to many errors, and which prevents those who adhere to it from recognizing the fact that value may be increased without increasing the amount of labor. — But the greatest obstacle to a proper appreciation of the question we are considering is, in the first place, that it is too easily forgotten that value is a quality essentially relative, which can not vary in one object without varying at the same time, and in an *inverse sense* in all others; so that if sugar or wheat falls in value, all other products necessarily rise relatively to wheat or sugar, and that if iron or meat rise in value all other products fall in value relatively to meat or iron; and in the second place, that in considering the value of products the value of the *unit* is confounded with that of the *class*, and that when the fall in the value of the unit is observed, that fall is attributed to the entire class, and it is not remarked that the decline is compensated for, and often more than compensated for, by the increase in the quantity, as will appear from the following. It is noticed, for instance, that the use of the knitting machine enables us to produce a pair of stockings with half the labor or cost of production that was needed to produce the same pair of stockings when knit by hand; it is said that the value of the stockings has fallen one-half, and this is true so far as the unit is concerned; but is it equally true that the total value of the production of stockings has been reduced by half, since the introduction of the knitting machine? By no means, and it is very probable, on the contrary, that it has more than doubled; the same is true of the production

of books compared with that of manuscripts; of the manufacture of thread by machinery, compared with its production by the wheel or spindle; of transportation furnished by the locomotive, compared with that afforded by the peddler. In these different classes of production, the unit has considerably fallen in value, but the entire class represents a value incomparably greater than that which it possessed before the fall. The value of the unit of products has been more or less reduced in Europe since the beginning of the fifteenth century in many other branches of production, but there is probably not a single one which in the aggregate does not furnish a sum of values much greater than it was before that reduction. The value of products taken *en masse* is therefore far from being lessened by the effect of industrial progress, what men detract from the value of the unit, they far more than restore by the increase of the quantity. This evidently escaped Bastiat in the passage which we have quoted. He believed that a like quantity of labor could never produce anything but a like sum of values, and that the only result of industrial progress was to increase gratuitous utility: it is, however, very certain that industrial progress increases at the same time utility, which has a price; for nobody, surely, would hesitate to acknowledge that the most industrious peoples are also the richest in exchangeable values. Bastiat was imbued with the idea that values would go on constantly decreasing from the effect of industrial progress: this may be admitted in the case of various classes of products so far as the unit is concerned; but, so far as the class or the mass of products is concerned, the effect of this progress up to the present time has been to increase its value considerably, and there is nothing which authorizes us to think that it will be otherwise in the future. — This is not, therefore, so momentous a question as Bastiat imagined it to be; it may be boldly affirmed that wealth consists of objects possessed of exchangeable value, and that it is proportioned to the sum of those values, measured as it should be. — Although we realize how tiresome such discussions are to the mind, the desire to render them henceforth entirely superfluous by elucidating as clearly as possible the questions with which they are concerned, induces us to beg the reader's attention a few moments longer. — J. B. Say regarded, as one of the greatest difficulties of political economy, the solution of the question: *As the value of things possessed is what constitutes wealth, why is it, that, the lower prices are in a country, the richer that country is?* The question, it seems to us, is not here put in its true terms; for it would be difficult to show that the countries in which products have the lowest prices are always the richest. In certain large countries, as, for example, in Poland, or in certain provinces of Russia, in America, and Hindostan, the principal products (cereals, meat, wool, leather, etc.) are lower in price than anywhere else; and yet these countries can not by any means be reckoned among the richest. It seems

evident to us that the problem which the illustrious French economist meant to propound is this: "*Wealth being made up of the value of things possessed, how can a nation grow wealthy in proportion as it succeeds in lowering the value of its products by reducing the cost of their production?*" J. B. Say answers, that the productive stock of such a nation has then more value, since the services which it furnishes are exchanged for a *greater quantity* of objects of every kind having a price; but this solution is incomplete, for it does not explain why the wealth produced (and no longer the power of producing) is greater in the country in which the progress of industry has reduced the cost of production, and the value of the different species of products, most. — To give a complete solution to this question, we must recall, first, that value is an essentially relative quality, and then all that we have said above. It results from this that the lowering of value brought about by industrial progress, in the unit of a class of products, does not diminish the value of the entire class, because it is at the very least compensated for by the increase in the quantity produced, while it increases proportionately the value of all other products relatively to that in which it has become manifest, because it allows these to be exchanged for a larger quantity of the products whose value has fallen. — We repeat, therefore: on the one hand, there is no reduction in the value of the class of products in which the fall has occurred, the increase in the quantity at least compensating therefor; on the other hand, this fall gives a superadded value to all other classes of products. Is not the final result, therefore, an increase in the sum of values? Thus a fall in the value in the unit of one class of products, may be perfectly reconciled with the increase of sum total of values or wealth. — This shows why we were able to prove, as we did above, that the doubling of the quantity of all the products obtained without an increase of cost or effort, would necessarily double the sum of their total value, since each class of products would then obtain in exchange a double quantity of all the others. — What precedes seems to us to have provided sufficiently for the solution of the question of nomenclature which we proposed to ourselves. The quality which renders things capable of satisfying our wants, is called utility. There are utilities like the air we breathe, or the light of the stars, which apply themselves to our wants, without requiring the least preparation or previous effort on our part; moreover, they are not susceptible of private or exclusive *appropriation*, being equally at the disposal of all. We agree with Bastiat, in classing all the utilities of this sort under the denomination of *gratuitous utility*. Others can not be applied to our wants except after some service performed by us; they become the property of those who have furnished that service, and they are endowed with a quality which enables their possessor to obtain other utilities of the same class, but of varied species, when he wishes to exchange

them. This is the quality which is expressed by the word *value*. This class of utilities may be comprised under the general term of *utility having a price*. — Value exists only by labor and exchange; the value of any particular object is measured, not by the quantity of labor employed in producing it, *but by the quantity of all the other objects having a price which can be obtained in exchange for it*. — It is only the utility which has a price that constitutes *wealth*. The only politico-economical difference between the words *wealth* and *value* is, that the latter designates a quality, as Rossi has remarked, while the word *wealth* indicates the object in which that quality resides. — There is no value but exchangeable value: what many economists have called *value in use* is only utility. For an object to possess an exchangeable value, it is not indispensable, as Rossi supposes, that it be in circulation, that is to say, offered in exchange; it suffices that it be recognized to have some value if it be offered for sale; thus public monuments, or the clothes we wear, although they are not offered in exchange, still possess an exchangeable value. — There is no wealth but that which consists in objects possessing utility having a price. What J. B. Say calls *natural wealth* is only *gratuitous utility*. — When industrial progress enables us without more labor or effort to obtain greater quantities of objects that possess utility having a price, no fall in the sum of values takes place in consequence; for the reduction in value of the unit of the product in which that progress is realized, is immediately compensated for by the additional value acquired, relatively to this object, by all the other products for which it may be exchanged. On the contrary, the result is that the sum of values is increased proportionately to the surplus obtained in the quantity of products; this we think we have fully demonstrated. — Wealth, therefore, is really proportionate to the sum total of values, and this sum is itself proportionate to the quantity of products of all kinds, and, consequently, to the amount of gratifications we are able to procure. — The progress of industry, the increase of our power over natural agents, have not, therefore, as Bastiat supposes, the effect of reducing the sum of the utility which has a price. On the contrary, that progress increases it in proportion as it enables us to increase the objects which possess that utility. And this is the reason why the nations whose industry has made most progress are also the wealthiest, in the only legitimate sense of the word, the wealthiest in the utility which has a price in exchangeable wealth. — Every reduction in the cost of production, and in the value of the unit of any class of products, is none the less a benefit of that industrial progress; but it is a benefit only because it increases the units of that class, and because it gives an additional value to all the other products. — It seems to us that our propositions relating to the fixing of the meaning of the words *value* and *wealth* are sufficiently demonstrated.

A. CLÉMENT.

WEBSTER, Daniel, was born at Salisbury, N. H., Jan. 18, 1782, and died at Marshfield, Mass., Oct. 24, 1852. He was graduated at Dartmouth in 1801, was admitted to the bar in 1805, and served as a federalist congressman from New Hampshire 1813-17. Removing to Boston in 1816, he served as congressman 1823-7, as United States senator 1827-41, as secretary of state 1841-3, as United States senator 1845-50, and as secretary of state from 1850 until his death. (See **FEDERAL PARTY, II.**; **WHIG PARTY**; **FOOT'S RESOLUTION.**)— Webster's first great success was in the decision of the Dartmouth college case, in 1819, in which he established the principle that a charter granted by a state legislature was a contract, unalterable without consent of the corporation, unless the power of alteration was reserved in the charter. This success made him one of the foremost lawyers of the country; but it was not until 1830 that he became, by his speeches on Foot's resolutions, one of the recognized political leaders of the country. Northern men were exultant in the belief that their representative had overthrown Hayne, and thus indirectly Calhoun also. Southern writers have never admitted this, their reason apparently being that Webster, as well as Hayne, admitted the validity of the argument from authority, on which state sovereignty (see that title) mainly rests, and that he was unable to meet Hayne's, or (afterward) Calhoun's arguments from this source. No one, however, has ever disparaged the brilliancy and force of Webster's eloquence, and from that time he has been confessedly the foremost orator of America, or, as many have thought, of all time. His speeches have a massive directness which, backed by careful polish, extent and precision of knowledge, and power of repartee, made them almost irresistible, and made him an antagonist to be avoided rather than desired. — A leader so distinguished had a right to think of the presidency, but from 1833 until 1852 this honor was always just beyond his reach. In 1836 he was nominated for the presidency by the Massachusetts legislature, and received fourteen electoral votes. In 1840 he had no chance against the candidacy of Harrison, as in 1848 he had none against the kindred nomination of Taylor, which latter Webster publicly declared to be "one not fit to be made": the whig opposition to both these nominations had to be concentrated on Clay, and was then unsuccessful. In 1844, all Clay's other rivals being out of the way, Webster had been discredited with the whigs by his very creditable conduct in remaining in Tyler's cabinet to arrange the dangerous and disputed northeast boundary. (See **MAINE.**) As the convention of 1852 drew near, it was evident that Clay was out of the field, that southern whigs were suspicious of Seward's influence over Scott, and that Webster's chance was now or never. Under these circumstances his speech of March 7, 1850 (see **COMPROMISES, V.**) was delivered, which aroused such intense indignation in the north. It is difficult to see now why it should have done so, without taking into account the

general northern wrath against slavery, which was just coming to the boiling point; and it is difficult to compare the speech itself with the general course of political oratory which had preceded it, without reaching the conclusion that the audience had changed rather than the orator, and that the veteran no longer represented the north. If it was the speech of a candidate, it was unsuccessful. The southern whigs, loudly as they had applauded Webster's speech, took Fillmore as their choice, and Webster had but about 30 of the 293 votes of the convention. His death followed closely upon this final failure.— See Webster's *Works* (and Everett's life of Webster in volume I.); Webster's *Private Correspondence*; Tefft's *Webster and his Master Pieces*; Whipple's *Great Speeches of Webster*; Knapp's *Life of Webster* (1835); March's *Reminiscences of Congress* (1850); Lanman's *Private Life of Webster* (1856); Curtis' *Life of Webster* (1870); 1 Choate's *Writings*; 3, 4 Everett's *Orations*; 1 Whipple's *Essays and Reviews*; Parton's *Famous Americans*; Loring's *Hundred Boston Orators*; 6 *Harper's Magazine*; 31 *North American Review*, 474; 68 *ib.*, 1; 75 *ib.*, 84; 84 *ib.*, 551.

ALEXANDER JOHNSTON.

WEIGHTS AND MEASURES. It is with proposals to adopt the metric system that this subject now mainly comes up before legislative bodies; and we shall treat it chiefly in this aspect — The English standards for many years subsequent to 1760 were a certain brass weight constituting a troy pound, and a certain brass bar, the distance between two points on which, at a temperature of 62°, constituted a yard. Accurate copies of these were obtained for America in 1827, and have since constituted the standards for the United States. The English standards were destroyed by fire in 1834, but were carefully replaced; subsequently the troy pound has been done away with, and a standard pound avoirdupois substituted. The old unit of capacity was the gallon. It was supposed that a gallon, of whatever commodity, ought to weigh eight pounds; hence the variation of liquid and dry measure, while the further variation of wine and beer measure bears an almost exact proportion to the difference of the troy and avoirdupois pounds. All these standards are still in use in America, but are defined in cubic inches; in England the reforms of 1826 substituted a common "imperial" measure for all the three. Besides these there are more than seventy different units in general use, verified as being determinate multiples or fractions of some one of these standards. — Up to the end of the last century the systems in use in other parts of Europe were equally chaotic, and bore no relation to one another. Most of them had indeed their foot and their pound, representing somewhat the same length or weight; but there was too much difference in them to be available for anything like exact comparison. — In the year 1790 the French assembly undertook to lay the foundations of a system in which all the parts should

have the simplest mathematical and practical relations to one another, and which should rest ultimately upon some fixed natural standard. Neither of these ideas was new; but they had never—in modern times at least—been put in practice. It was at first proposed to adopt the length of the seconds pendulum as the unit, but finally the ten-millionth part of the earth's quadrant was selected instead, and attempts at determining this were at once instituted. After some preliminary legislation the system was established in France in its present shape in 1799. Its details are familiar; it is only for us to consider the history of its adoption in different countries, whether sudden or gradual, and the advantages and difficulties attending the change. — In France itself it was not carried through with the completeness which the legislators had expected. The opposition of the lower classes was so great that Napoleon in 1812 adopted a compromise, returning to a certain extent to the old names, but making the pound exactly half a kilogramme, and the foot exactly one-third of a metre. This compromise continued in use till 1840, when, by a decree passed three years earlier, the metric system went into effect in its original form. — The French conquests at the beginning of this century had extended the use of the system beyond the permanent frontiers of France. In the Netherlands, both Belgium and Holland, its use continued without interruption after the separation from France. Its use for government purposes continued in parts of Italy; and its effect was never lost in Baden. A large part of the states which had been led to introduce it temporarily under French domination, had adopted it permanently before the middle of the century. Neither there nor elsewhere has the change as a general rule taken place suddenly. Either the use of the metric system has been optional for a time and afterward made obligatory; or it has been first introduced in certain departments, such as coinage, postage, customs, or railway freight charges, and afterward made general; or, very commonly, as a transition measure the old standards of the country have been slightly modified so as to be commensurable with the metric system, as in the case of the metric foot and metric pound above mentioned. The dates of these changes in different countries are shown by table in following column, based largely upon the report of J. K. Upton, 45th Cong., 2d Sess., Ex. Doc. 71, which contains many additional details. — The growth of the system has been so gradual that it is hard to divide it into periods. The decisive points in its history were its partial adoption by the German zollverein in 1852; its complete adoption by Germany and Austria, 1868-76; and the establishment in 1875 of the international bureau of weights and measures at Paris, with representatives of all the leading nations, except England and the United States; even including Russia, which has otherwise done nothing in this direction. — Both in England and in the United States the metric system is used in scientific work;

and in the United States the smaller coins have metric weights; but the act making its use permissive has had no effect upon ordinary business. The subject of making its use compulsory has been agitated in both countries. The British standard commission, in 1869, while admitting the desirableness of the change, deprecated hasty legislation in that direction. In 1877 the house of representatives passed a resolution that the heads of executive departments be asked what objections there were, if any, to making the use of the metric system compulsory. The answers varied exceedingly in their tenor, but the majority were decidedly conservative. The arguments in favor of making the change as soon as possible are the practical convenience of the metric system for calculation and business, the confusion of names under the old system, and the importance of common units in international trade. Against the change is urged the fact that our present standards are well established, that the people are satisfied with them, and that the inconvenience and expense of a hurried change outweigh any practical advantages likely to be felt at present. They are the arguments of conservative feeling, in a case where that feeling is unusually strong.

ARTHUR T. HADLEY.

WEST VIRGINIA, a state of the American Union. Its organization had several peculiarities. Like Vermont, Kentucky, Maine, Texas and California, it had no previous territorial existence; and, like Kentucky and Maine, it was formed from a part of a state already in existence. But,

in the cases of Kentucky and Maine, the necessary consent of the legislature of the parent state was so regularly given that no exception could be taken to it; while the existence of West Virginia is based upon a legal fiction by which congress recognized a revolutionary loyal legislature in western Virginia as the legitimate legislature of the state so far as to accept the consent of the former body to the erection of the new state of West Virginia. — The manner in which the secession of Virginia was accomplished is elsewhere given. (See VIRGINIA.) There had long been a division of interests and feelings between that part of the state west of the Alleghenies and the rest of the state. The former fraction, comprising nearly one-half the territory of Virginia and about one-fifth of her population (355,526 whites and 18,371 slaves), was rather a northern than a southern state in sympathy; its representatives in the Virginia convention opposed secession; and their constituents supplemented parliamentary by forcible opposition. Early in May, 1861, a delegate convention at Wheeling declared the ordinance of secession null and void, and summoned a [Virginia] state convention. It met at Wheeling, June 11, and two days afterward passed an ordinance vacating the state offices arrayed against the federal government. June 20, it elected Frank Pierpont governor of Virginia. July 2, the Virginia legislature, elected under the convention's ordinance, met at Wheeling, and elected United States senators, who were admitted by the senate. Aug. 20, the convention passed an ordinance to create the state of Kanawha, and this was approved by popular vote, Oct. 24. At the same election delegates were chosen to a new convention, which framed the first constitution, now adopting the name of West Virginia. This constitution was ratified by popular vote, April 3, 1862, and in the following month the legislature, representing the forty counties of western Virginia, but claiming to represent the whole state, formally gave Virginia's consent to the erection of the new state. Dec. 31, 1862, West Virginia was admitted by act of congress, the admission to take effect on the adoption of gradual abolition by the new state (see ABOLITION, III.); and the state thus became a member of the Union, June 19, 1863. The whole process of the formation of the state is a difficult problem in American constitutional law. It was evidently revolutionary in the main; but there are many features in it which go to support Sumner's "state suicide" theory. (See RECONSTRUCTION.) After the downfall of the rebellion Virginia admitted the validity of the formation by beginning suit in the supreme court against West Virginia for the restoration of Berkeley and Jefferson counties; but the suit was decided against Virginia in 1871. — CONSTITUTIONS. The first constitution was framed by a convention at Wheeling, Nov. 26, 1861—Feb. 18, 1862. It provided that the state should "be and remain" one of the United States of America; that only white male citizens should vote; that the senate should consist of eighteen

members, chosen for two years, and the house of delegates of forty-seven members, chosen for one year; that the membership of both houses should be reapportioned by the legislature after each census; that the capital should be Wheeling until changed by the legislature; that the governor should be chosen by popular vote for two years, that the judiciary should be elective; and that no slave should be brought into the state. The last feature was changed to a gradual abolition of slavery as above specified. This constitution also made an attempt to introduce the township system of government for local affairs; but the system was repugnant to the feelings of the people, and was abolished by the next constitution. May 24, 1866, an amendment was added disfranchising all persons who had voluntarily given aid and comfort to the rebellion since June 1, 1861; and the provision of the constitution that no one could hold office unless entitled to vote made the amendment still more sweeping. The capital has since remained at Wheeling, except from April, 1870, until May, 1875, when it was located at Charleston. April 27, 1871, an amendment was ratified by popular vote, striking out the word "white" from the suffrage clause, and also the disfranchising amendment of 1866. — The present constitution was framed by a convention at Charleston, Jan. 16—April 9, 1872. Its principal changes were the increase of the senate to twenty-four members, chosen for four years, and of the house to sixty-five members, chosen for two years; a prohibition of registration laws, and of special legislation in a number of specified cases; the increase of the governor's term to four years (see also RIDERS, VETRO); and the abolition of the township system. — BOUNDARIES. The boundaries of the state are not defined in the constitution, which only specifies the counties of Virginia included within it. — GOVERNORS. Arthur J. Boreman, 1863-9; Wm. E. Stephenson, 1869-71; John J. Jacob, 1871-7; Henry M. Matthews, 1877-81; Jacob B. Jackson, 1881-5. — POLITICAL HISTORY. Until 1870 the majority of the voters of the state were republican, and its state officers even of that party. Even in 1860 the republicans had contested two of the counties, and had given Lincoln a popular vote of 1,929 in this part of the state. When war fairly began, the republicans, under the name of "unconditional Union men," took complete control of the new state. In 1864 Lincoln received nearly 70 per cent. of the total popular vote; and in 1868 Grant received nearly 60 per cent. But when the war ended, the return of disbanded confederate soldiers, particularly in the southern and eastern parts of the state, introduced a troublesome complication into politics. At first the dominant party met this by the disfranchising amendment of 1866, enforcing it by registration laws and test oaths, and suppressing resistance by force. The result was that in 1869 the number of disfranchised citizens was officially reported as 29,316, the number of actual voters being about 50,000; and as no disfranchised person could hold office, public busi-

ness was seriously interfered with in many parts of the state. The first sign of compromise was the "Flick amendment," finally adopted in 1871. It was supported by moderate republicans and democrats, as it combined amnesty with negro suffrage, and in the struggle over it the democrats, or "conservatives," carried the state and the lower house of the legislature in 1870, and the senate in the following year. In 1872 Grant carried the state by a majority of 2,264 out of a total vote of 62,366; but since that time the state has been so steadily democratic that the republicans almost ceased opposition until 1882, when they elected one of the state's four congressmen. In 1882 the legislature was composed as follows: senate, twenty democrats, three republicans, one independent; house, forty-six democrats, seventeen republicans, two independent. — Among the political leaders of the state have been the following: Arthur J. Boreman, governor (republican) 1863-9, and United States senator 1869-75; Wm. G. Brown, democratic congressman (from Virginia) 1845-9, and Unionist congressman 1861-5; J. U. Camden, democratic candidate for governor in 1868 and 1873, and United States senator 1881-7; Allen T. Caperton, whig member of the state legislature 1853-60, confederate senator 1862-5, and United States senator (democrat) 1875-8; Henry G. Davis, democratic United States senator 1871-8, Nathan Goff, secretary of the navy under Hayes, and republican congressman 1863-5; Frank Hereford, democratic congressman 1871-7 and United States senator 1877-81; John E. Kenna, democratic congressman 1877-85; and Waitman V. Willey, republican United States senator (from Virginia) 1861-3, and (from West Virginia) 1863-71. — See 2 Poore's *Federal and State Constitutions*; 2 Hough's *American Constitutions*; authorities under VIRGINIA; 3 Wilson's *Slave Power*, 142; 2 Draper's *Civil War in America*, 241; *Tribune Almanac*, 1861-82; Appleton's *Annual Cyclopædia*, 1861-82.

ALEXANDER JOHNSTON.

WHEELER, William A., vice-president of the United States 1877-81, was born at Malone, N. Y., June 30, 1819, was admitted to the bar in 1843, and served in the state legislature 1850-51 and 1858-9, and in congress (republican) 1861-77. (See LOUISIANA.) In 1876-7 he was elected vice-president. (See DISPUTED ELECTIONS, IV.; ELECTORAL COMMISSION.) See authorities under HAYES, R. B.

A. J.

WHIG PARTY (IN U. S. HISTORY). I. 1829-33. From 1801 until after the presidential election of 1828 the unity of the democratic or republican party was still nominally unbroken. Membership in it was so essential to political advancement that after 1817 all national opposition to it came to an end. In 1824 the nomination of presidential candidates by a congressional caucus was urged on the ground that all the aspirants belonged to the same party; and, even through John Quincy Adams' administration, the "Adams and Clay re-

publicans," who supported the president, and the "Jackson republicans," who opposed him, steadily acknowledged each other's claim to the party name. (See DEMOCRATIC-REPUBLICAN PARTY, III.; FEDERAL PARTY, II.; CAUCUS, CONGRESSIONAL.) — Notwithstanding this surface unity, there had long been a departure from the original democratic canons, and a break in the dominant party, which first becomes plainly visible after the war of 1812. The idea that the people were to impose their notions of public policy upon their rulers, and not altogether to receive them from their rulers, which the federalists had always detested at heart, had now been accepted by all politicians; but, working under this limitation, a strong section of the dominant party now aimed at obtaining, by Jefferson's methods, objects entirely foreign to Jefferson's programme. This was particularly the case in the northern states, where commerce, banking, and the other interests, not bounded by state lines, on which Hamilton had depended for the building up of nationality, were now supplemented by another, manufactures, non-existent in Hamilton's time. (See NATION.) All these looked to the republican party for a support and protection which the *laissez faire* of the Jeffersonian theory would have refused them. It is, then, very significant of the republican drift that banking was recognized by a national bank in 1816, commerce by a great system of public improvements in 1821, and manufactures by a slightly protective tariff in 1816, strengthened in 1824 and 1828. (See BANK CONTROVERSIES, III.; INTERNAL IMPROVEMENTS; TARIFF.) But this was the federalist policy, with the new feature of a protective tariff, which was at least rudimentary in the federalist policy; and the principal difference between the federalists and the Adams republicans was, that the former intended to be the guides, and the latter the exponents, of the people in carrying out the policy specified. The election of Adams as president in 1824, with his appointment of Clay as secretary of state, long denounced as a guilty bargain, was really the organization of a party, and the work was only hindered by Clay's angry denials of a "bargain." A frank acknowledgment of party birth, with the complete formulation of its principles which was given by President Adams in his annual messages, would have brought an intelligent support; the attempt to retain Jefferson's party name for the Adams faction only served to call attention to their complete departure from Jefferson's theory, and thus repelled every voter to whom "republicanism" was still the touchstone of politics. — It was not until toward the end of Adams' term of office that any of his followers began to take the step which should have been taken at first, and assumed the name of "national republicans." Even when it was assumed, the assumption was only tentative, and was confined to a few northern and eastern newspapers. To the mass of the Adams party the struggle still seemed to be only one between two

wings of the same party, and the result of the election of 1828 showed which of the two seemed the better "republicans" to the country at large. Adams' electoral vote was that of the old federal party, the vote of the New England states, New Jersey and Delaware, sixteen of New York's thirty-six votes, and six of Maryland's eleven votes. But the popular vote showed a wider strength than the federalists had ever had. Jackson's majority was but 508 out of 8,702 votes in Louisiana, a state whose sugar-planting interest was always to incline it toward a protective tariff; 4,201 out of 130,993 votes in Ohio, where New England immigration and ideas were strong, in North Carolina and Virginia 30 per cent. of the popular vote was for Adams; and his total popular vote, in spite of the practical unanimity of most of the southern states, was 509,097 to 647,231 for Jackson. This was at least an encouraging growth for a party which as yet aimed at a total reversal of the republican policy while retaining the republican name. — The year after Jackson's inauguration was one of sudden political quiet. The newspapers of the year were busied mainly with internal improvements, the first struggle of the railroad toward existence, and the growth of manufactures. It was not until the beginning of the year 1830 that Jackson's drift against the bank, the protective tariff, internal improvements, and the other features of the Adams policy, became so evident that his opponents were driven into renewed political activity. The name "national republican" at once became general. But the new party was at first without an official leader. In October, 1828, an indiscreet or treacherous Virginia friend of Adams had obtained from Jefferson's grandson and published a letter from Jefferson, written three years before, which named Adams as the authority for the allegation of a federalist secession scheme in 1808. (See *EMBARGO, SECESSION*.) Adams' newspaper organ, the "National Intelligencer," at once confirmed Jefferson's statement, with some corrections, and asserted that the president had known in 1808, "from unequivocal evidence, although not provable in a court of law," that the federalist leaders aimed at "a dissolution of the Union and the establishment of a separate confederation." The former federalist leaders of Massachusetts, or their sons, at once demanded his evidence, which he refused to give, and the quarrel died away in mutual recriminations. Adams' purpose seems to have been to emphasize his own original "republicanism"; but he only succeeded in alienating from himself the legitimate successor of the federal party. His inability to see that he had created a new party cost him the party leadership, which passed at once to Henry Clay. Adams was out of politics, and, when he entered the house again, in December, 1831, came as an anti-masonic representative; Clay, when he entered the senate in the same month, came as the most conspicuous advocate of the Adams policy. Dec. 12, 1831, the national republicans, in convention at Balti-

more, unanimously nominated him for the presidency, and John Sergeant for the vice-presidency. No platform was adopted, but an address to the country formulated the party principles very distinctly in its attacks on Jackson's policy. May 7 following, a "young men's national republican convention" met at Washington, renewed the nominations, and adopted ten resolutions indorsing a protective tariff, a system of internal improvements, the decision of "constitutional questions" by the supreme court, and a cessation of removals from office for political reasons. The popular vote of 1832 was proportionally very similar to that of 1828; but the electoral vote was very different. Maine, New Hampshire and New Jersey were now democratic; the "unit system" in New York gave the whole vote of that state to Jackson; Vermont gave her votes to the anti-masonic candidates; and the result gave Jackson 219, Clay 49, and others 18. (See *ELECTORAL VOTES, XII*.) Something was evidently lacking. Support of the United States bank (see *BANK CONTROVERSIES, III*.) helped the party in the middle and eastern states, but worked against it in the south and west. Support of a protective tariff helped the party in the middle and eastern states, where manufactures flourished, and growers of wool, flax and hemp desired a market in their own neighborhood, but again it exerted an unfavorable influence in the south and west. Too impatient to trust to time and argument for a natural increase of their national vote, and hardly willing to trust to a general system of purchase by "internal improvements" alone, the national republicans began, after the election of 1832, a general course of beating up for recruits, regardless of principle, which was the bane of their party throughout its whole national existence. No delegate could come amiss to their conventions: the original Adams republican, the nullifier of South Carolina, the anti-mason of New York or Pennsylvania, the state-rights delegate from Georgia, and the general mass of the dissatisfied everywhere, could find a secure refuge in conventions which never asked awkward questions, which ventured but twice (in 1844 and 1852) to adopt a platform, and which ventured but once (in 1844) to nominate for the presidency a candidate with any avowed political principles. The "national republicans" formed a party with principles and the courage to avow them; their reckless search for recruits placed their principles at the mercy of their new allies, and the bed became "shorter than that a man could stretch himself on it, and the covering narrower than that he could wrap himself in it."— II. 1833-53. However heterogeneous was the mass of dissatisfaction in 1833-4, there was community of feeling on at least one point, dislike to the president. In South Carolina, nullification (see that title) had received its death-blow from the president's declared intention to usurp, as the nullifiers believed, the unconstitutional power to make war on a sovereign state; and the bitterness of this feeling was aggravated

in the case of their leader, Calhoun, by a preliminary personal dispute with the president. The nullifiers were thus ready and willing to become the allies of the national republicans; and it is asserted by Hammond that Clay's compromise tariff of 1833, which gave the nullifiers a road of retreat, was one consideration for the alliance. The anti-masons of the northern and eastern states (see ANTI-MASONRY) had failed to make any impression in the election of 1832, and in transferring their national allegiance it was easier for them to go to the national republicans, whose leader, Clay, had publicly declared that he had not attended a masonic meeting for years, than to the Jackson party, whose leader was a warm and avowed free mason. In the south, particularly in Tennessee and Alabama, many democrats disliked Van Buren as the predestined successor of Jackson. Their leader was Hugh L. White, and, though his candidacy was at first that of a revolting democrat, his supporters soon came to feel that they were also fighting against the president and his dictation of his successor. In Georgia, the state-rights, or Troup, party, which had ousted the Indians from the state (see CHEROKEE CASE), had really been assisted by Jackson, and opposed by Adams, in accomplishing their purpose. Nevertheless, as a sort of connecting link between the nullifiers and the White party, they became the anti-Jackson party of their state, though their entrance to the general alliance was not perfected until 1835-7. All these elements, indeed, remained in nominally separate existence throughout the year 1833, though their approach was daily becoming closer. Jackson's removal of deposits from the United States bank, Oct. 1, 1833, in defiance of a previous adverse vote of the house (see DEPOSITS, REMOVAL OF), seemed to the entire opposition such a flagrant executive usurpation of power as could not escape popular condemnation, and the national republican leaders seized upon it as an opportunity for cementing their new alliances. The task seemed difficult, in view of the radically different political beliefs of the two leading elements of the alliance, and it was only made possible by the personal character of the opposition to Jackson, and by the political tact of James Watson Webb, of New York, in finding an available party name. His newspaper, the "Courier and Enquirer," had originally supported Jackson, and had been driven into the opposition by the president's course. In February, 1834, he baptized the new party with the name of "whig," with the idea that the name implied resistance to executive usurpation, to that of the crown in England and in the American revolution (see AMERICAN WHIGS), and to that of the president in the United States of 1834. In reality, the objects of the name were to oppose a verbal juggle to the verbal juggle of the opposite party, to balance the popular name of republican or democrat by the popular name of whig, and to give an apparent unity of sentiment to fundamental disagreement. In all these it was successful. The name "took." Within six months the anti-masons

and national republicans had ceased to be, and the whigs had taken their places. In the south the change was slower. It was not until after the election of 1836, in which White was unsuccessful, that the White and Troup parties fairly took the name of whigs; and in South Carolina the nullifiers in general never claimed the name, and at the most only allowed whigs elsewhere to claim them as members of the party. — In 1836 the party was entirely unprepared for a presidential contest. Harrison was nominated for the presidency, as a "people's candidate," by a great number of mass meetings of all parties, and, in December, 1835, by whig and anti-masonic state conventions at Harrisburgh, and by a whig state convention at Baltimore, the former naming Granger and the latter Tyler for the vice-presidency. Harrison's politics were of a democratic cast, but he satisfied the whig requisite of opposition to the president, while he satisfied the anti-masonic element still better by declaring that "neither myself nor any member of my family have ever been members" of the masonic order. Webster was nominated in January, 1835, by the whig members of the Massachusetts legislature, but he found little hearty support outside of his state. White had now gone so far in opposition that copies of the official "Washington Globe," containing bitter attacks upon him, were franked to the members of the Tennessee legislature by the president in person. The legislature, however, in October, 1835, unanimously re-elected White senator, and by a vote of 60 to 12 nominated him for the presidency. Soon afterward, the Alabama legislature, which had already nominated White, rescinded the nomination, having become democratic. The South Carolina element, having control of the legislature, by which electors were to be appointed, made no nominations, and finally gave the state's electoral vote to Willie P. Mangum, a North Carolina whig, and John Tyler, a nullifier. All the factions of the opposition thus had their candidates in the field, and at first sight their discordant efforts might have seemed hopeless. But all the politicians of the time expected a failure of the electors to give a majority to any candidate, and a consequent choice by the house of representatives, in which the opposition, though in a numerical minority, hoped to control a majority of states. These forecasts proved deceptive. Van Buren received a majority of the electoral votes, and became president. — Van Buren's whole term of office was taken up by the panic of 1837, the subsidiary panic of 1839, and the establishment of the sub-treasury system in 1840, to take the place of the national bank and complete a "divorce of bank and state." (See BANK CONTROVERSIES, IV.; INDEPENDENT TREASURY.) Seldom have so many alternations in political prospects filled a presidential term. In 1837 Van Buren entered office with an overwhelming electoral majority, and his opponents prostrate before him; and within two years the whigs "had the loco-focos at their mercy." So poor had the administration grown that

Calhoun and his followers ranged themselves with it again, holding that the executive was now so weak as to be harmless, and that the real danger was from the whigs. Preston, of South Carolina, and John Tyler, were almost the only leading nullifiers who nominally remained whigs. To balance this, the White and Troup party had now come into the whig ranks, the former bringing John Bell as its most prominent leader, and the latter John M. Berrien, John Forsyth, Thos. Butler King, Alexander H. Stephens, and Robert Toombs. Before 1840 returning prosperity had changed the scene. The democrats were now more than confident, they predicted the dissolution of the whig party, and declared that they would be satisfied with nothing less, with no mere victory; and, to crown the whole, they were completely defeated in the presidential election of 1840 by the "moribund" whig party. In the accomplishment of this sudden victory, the whig leaders have been reproached with an entire sacrifice of principle to availability, but it is well to remember that their party was as yet no complete vessel, but rather a raft, composed of all sorts of materials, and very loosely fastened together. — Of the opposition candidates who had been in the field in 1836 it was evident that Harrison was the only available candidate for 1840. The whig party was not homogeneous enough to take its real leader, Clay, or its perhaps still better representative, Webster; nor had it sunk so low in its own coalition as to take a real democrat like White. Harrison was the favorite of the anti-masonic element; his western life and military services gave him strength at the west; and, in a less degree, at the south; and it was possible in the north and east to keep his very doubtful attitude as to the establishment of a new national bank under cover, while laying special stress on his determination to respect the will of the people's representatives in congress, and to spare the veto. This last point decided his nomination, for the whig leaders saw that his name would bring votes, while under cover of it the real contest could be carried on for congressmen, the actual governing power under Harrison's proposed disuse of the veto. And yet it is plain now that the whig party was more homogeneous in 1840 than it thought itself, and that it had a "fighting chance" of success under Clay. Its leaders ought to have learned this, if from nothing else, from the desperate expedients to which they were driven in the effort to dragoon the convention into nominating Harrison. And never was a convention so dragooned. It met at Harrisburgh, Dec. 4, 1839, and was treated as a combustible to which Clay's name might be the possible spark. By successive manœuvres it was decided that a committee of states should be appointed; that ballots should be taken, not in convention, but in the state delegations; that in each delegation the majority of delegates should decide the whole vote of the state; that the result of each ballot should be reported to the committee of states; and that this committee should only

report to the convention when a majority of the states had agreed upon a candidate. The first ballot gave Clay 108 votes, Harrison 84, and Scott 57, and it was not until the fifth ballot that the committee of states was able to report the nomination of Harrison by 148 votes to 90 for Clay and 16 for Scott. In the same fashion Tyler was nominated for the vice-presidency on the following day. — The "campaign of 1840" was based entirely on Harrison's popularity and the general desire for a change, and under cover of these the whigs carried on a still hunt for congressmen, the real objects of the campaign. In all points they were successful. Log-cabins and hard cider, supposed to be typical of Harrison's early life, were made leading political instruments; singing was carried to an extent hitherto unknown; mass meetings were measured by the acre, and processions by the league; and in November "Tippecanoe and Tyler, too," received 234 electoral votes to 60 for their opponents, and were elected. The popular vote was nearly evenly balanced. The whigs had carried New England (except New Hampshire), New York, New Jersey, Pennsylvania, Maryland, Delaware, Ohio, Indiana, and Michigan, north of the Potomac; and south of it they had carried the "White and Troup party" states, Tennessee, Mississippi and Georgia, the whig states, Kentucky, North Carolina and Louisiana, and had made an exceedingly close contest in Virginia, Arkansas, Missouri and Alabama. Evidently, the conjunction of Harrison and Tyler had kept all the elements of the opposition well in hand. More important still, the new congress, to meet in 1841, had a whig majority in both houses, though the majority was not sufficient to override a veto. — In spite of its diversity of opinion, the party had now developed a number of able leaders, Clay and Webster at their head, who for the next half dozen years were fast giving their party a definite policy, very similar to that of its most valuable element, the former national republicans. Among these were, Evans, Kent and Fessenden, of Maine; Slade, Collamer and George P. Marsh, of Vermont; J. Q. Adams, Winthrop, Choate, Everett, John Davis, Abbot Lawrence and Briggs, of Massachusetts; Trumbull Smith, of Connecticut; Granger, Fillmore, Seward, Spencer, N. K. Hall, Tallmadge, Weed and Greeley, of New York; Dayton, of New Jersey; Forward, Meredith and Ingersoll, of Pennsylvania; Bayard, Clayton and Rodney, of Delaware; Kennedy, Cost Johnson and Reverdy Johnson, of Maryland; Archer, Botts, Leigh and W. B. Preston, of Virginia; Graham, Mangum, Rayner, Clingman and Badger, of North Carolina; Legaré, of South Carolina; Berrien, Forsyth, King, Stephens and Toombs, of Georgia; H. W. Hilliard, of Alabama; S. S. Prentiss, of Mississippi; Bell and Jarnagin, of Tennessee; Crittenden, Morehead, Garret Davis, Wickliffe, John White and Underwood, of Kentucky; McLean, Giddings, Vinton, Corwin and Ewing, of Ohio; R. W. Thompson and Caleb B. Smith, of Indiana; and

Woodbridge and Howard, of Michigan. Of the old nullifier element, Rives, Wise, Gilmer and Upshur drifted off to the opposite party under Tyler's leadership. — Harrison's sudden death, and the accession of Tyler, were severe blows to the rising party, for they placed it temporarily under the feet of the remnants of its former allies, the nullifiers, just as it had begun to learn that it had a policy of its own which nullifiers could not support. But the whigs themselves, and particularly Clay, made the blow needlessly severe. Seeing here an opportunity to secure for himself an undisputed party dictatorship in a war on Tyler, he declared war and carried it on *à l'outrance*. Its bank details are elsewhere given. (See BANK CONTROVERSIES, IV.) In 1842, by the act of Aug. 30, the whigs secured a protective tariff, closely following that of 1832, but only after sacrificing a section continuing the distribution of land to the states (see INTERNAL IMPROVEMENTS), because of which Tyler had vetoed the whole bill. In the elections of 1842 for the second congress of Tyler's term, the democrats obtained a two-thirds majority in the house, a result usually regarded as an infallible presage of the succeeding presidential election. And yet the whigs do not seem to have really been weakened. Their convention met at Baltimore, May 1, 1844, the first and last really representative convention of the party. For the presidency Clay was nominated by acclamation; and for the vice-presidency Theodore Frelinghuysen, then of New York city, was nominated on the third ballot. For the first time the party produced a platform, a model in its way, as follows: "that these [whig] principles may be summed up as comprising a well-regulated national currency; a tariff for revenue to defray the necessary expenses of the government, and discriminating with special reference to the protection of the domestic labor of the country; the distribution of the proceeds from the sales of the public lands; a single term for the presidency; a reform of executive usurpations; and generally such an administration of the affairs of the country as shall impart to every branch of the public service the greatest practicable efficiency, controlled by a well-regulated and wise economy." Even beyond the day of election the whigs were confident of success. But their original ally, Calhoun, had been for some years at work on a project which was, directly and indirectly, to dissolve the fragile bond which as yet united the northern and southern whigs, and made them a national party. It seems wrong to attribute the proposed annexation of Texas (see ANNEXATIONS, III.) entirely to a desire for extension of the slave area: it seems to have been a subsidiary object with southern democratic leaders to throw into politics a question which would cost Clay either his northern or his southern support, and the scheme was more successful even than they had hoped. The popular vote was nearly equal, and the electoral votes were 170 for Polk to 105 for Clay; but in the former were included the

thirty-five votes of New York and the six votes of Michigan. In both these states the Polk electors were only successful because the abolitionists (see ABOLITION, II.) persisted in running a candidate of their own. Had their votes gone to Clay, as they would have done but for Calhoun's "Texas question" and Clay's trimming attitude upon it, Clay would have been president by 146 electoral votes to 129, and a very slight popular majority. What added bitterness to the disappointment was, that the democrats had taken a leaf from the whig book of 1840, by being protectionist in some states, and free trade in others; that Polk's majority of 699 in Louisiana was the fruit of about 1,000 unblushingly fraudulent votes in Plaquemines parish; that fraudulent voting and naturalization were charged upon the New York city democrats; and that Texas annexation had cost Clay the vote of all the southern states except Delaware, Maryland, North Carolina, Tennessee and Kentucky. The consequent bitterness of feeling died away, except in one respect, the foreign vote and its almost solid opposition to the whigs. "Ireland has conquered the country which England lost," wrote one of Clay's correspondents after the election; and the permanence of this feeling did much to turn the whig party into the "native American," or "know-nothing" party of after years. — The question of Texas annexation had not sufficed to destroy the bond between northern and southern whigs, for, while both opposed this and subsequent annexations, the former did so for fear of slavery extension, and the latter nominally on economic grounds, but really for fear of the introduction of the slavery question into politics. But the war with Mexico gave their opponents another opportunity, which they used. The act recognizing the existence of war with Mexico declared the war to have arisen "by the act of the republic of Mexico." The object was to force the whigs to vote against the war, a vote much more dangerous to a southern than to a northern whig, or else array the two elements of the party against one another. The whigs managed to evade it, however, most of them by refusing to vote, some senators by adding formal protests to their affirmative votes; and fourteen in the house and two in the senate (Thomas Clayton and John Davis) found courage to vote against the bill. During the war the whigs voted steadily for supplies to carry it on, on the principle that an American army had been thrust into danger and must be supported; so that the democrats made very little political capital out of it. Indeed, the next congress, which met in 1847, had a slight whig majority in the house, a strong indication of a whig success in the presidential election of 1848. — But the "Wilmot proviso" (see that title) had been introduced, and it was to find at last the joint in the whig armor. As the effort to restrict slavery from admission to the new territories went on, it became more evident month by month that it would be supported by the mass of the northern whigs, and opposed by the mass of the southern

whigs, and month by month the wedge was driven deeper. Men began to talk freely of a "reorganization of parties," but that could only affect the whigs, for their opponents were already running the advocates of the proviso out of their organization. As the presidential election of 1848 drew near, the nomination of Taylor, urged at first by mass meetings of all parties, became more essential to the whigs. The democrats, after banishing the proviso men, were sufficiently homogeneous to be able to defy the slavery question; no such step could be taken by the whigs, and they needed a candidate who could conceal their want of homogeneity. In the north Taylor's antipathy to the use of the veto power was a guarantee that he would not resist the proviso, if passed by congress; in the south he had the tact which enabled him to answer an inquiring holder of 100 slaves thus briefly and yet suggestively: "I have the honor to inform you that I, too, have been all my life industrious and frugal, and that the fruits thereof are mainly invested in slaves, of whom I own *three* hundred. Yours truly. Z. Taylor." And his nomination was pressed harder upon the whigs by his declared intention to remain in the field in any event, as a "people's candidate." Nevertheless, when the whig convention met at Philadelphia, June 7, 1848, though Taylor had 111 votes, Clay had 97, Scott 43, Webster 22, and 6 were scattering. It was not until the next day, on the fourth ballot, that Taylor was nominated by 171 votes to 107 for all others. Fillmore was nominated for the vice-presidency on the second ballot, by 173 to 101 for all others. Clay had thus received his discharge from party service, for he was now over seventy years of age, and evidently this was his last appearance before a whig convention. To Webster, also, though five years younger than Clay, the blow was severe, and he publicly declared Taylor's nomination one which was eminently unfit to be made; but he and the other northern whigs finally supported the nomination. Taylor carried all the middle and eastern states (except Maine and New Hampshire), and, in the south, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, North Carolina and Tennessee, and was elected by 163 to 127 electoral votes. In both the north and the south he had also a plurality of the popular vote, the vote for Van Buren (see FREE-SOIL PARTY) preventing him from having a majority. But the election of Taylor was in itself deceptive. It was the result of democratic division in one state, New York, whose thirty-six votes would have elected Cass by an exact reversal of the electoral votes as above given. The division had really very little basis in principle, but was one of those contests between national and state party "machines" which have always been common in that state (see NEW YORK); but it sufficed to elect Taylor, and to give the whigs almost as many representatives in congress as their opponents. — The meeting of the new congress in 1849 showed the first strong sign of whig dissolution. A half

dozen southern whigs, headed by Toombs of Georgia, insisted on a formal condemnation of the proviso by the whig caucus; and when that body refused to consider the resolution, the Toombs faction refused to act further with the party. The loss was not large, but it was the opening which was very soon to be fatal. All through the session, which ended with the compromise of 1850 (see COMPROMISES, V.), the whole body of southern whigs exhibited a growing disposition to act together, even in opposition to the northern whigs, wherever the interests of slavery were brought into question. On the final votes, in August and September, 1850, it is practically impossible to distinguish southern whigs from southern democrats. Not that the northern whigs generally resorted to anything stronger than passive opposition: Thaddeus Stevens' suggestion, after the passage of the fugitive slave law, that the speaker should send a page into the lobby to inform the members there that they might return with safety, as the slavery question had been disposed of, lights up the whole line of policy of the northern whigs during 1850. They saw only that action of any kind must offend either their southern associates or their own constituents, and in either event ruin the party; and like the prudent man who foreseeth the evil and hideth himself, they took temporary refuge in refusal to act. — Such a policy could not be permanent, and yet most of the northern whig leaders at first thought that they could at least make its advantages permanent; that they could retain their southern associates by acquiescing, however unwillingly, in the final decision, and their northern constituents by their unwillingness to indorse the decision itself. Taylor's death, in 1850, and Fillmore's accession, committed the northern whigs to the official policy of regarding the compromise of 1850 as a law, to be obeyed until repealed, and of opposing any attempt to repeal it as a reopening of the slavery excitement. Webster's speech of March 7, 1850, which is far oftener reviled than read, was really only the first declaration of this policy and one of the least objectionable. But the popular clamor which it excited was largely an indication that northern whig leaders were already out of sympathy with a large fraction of their constituents. In several northern states schisms opened at once, the most prominent instances being those between the "conscience whigs" and the "cotton whigs" in Massachusetts, and the "silver gray" or administration whigs, and the dominant Seward faction in New York. But the general spread of any such schism was not possible. No new leaders had been developed as yet to take the place of the old ones, who still held their hands on the party machinery; reflection, and the absence of further agitation, made the mass of northern whigs willing to retain their southern wing, if the events of 1850 could be tacitly treated as a past episode in the party history; and the first twenty months of Fillmore's administration went by with a great deal of murmur,

but no open revolt. While there was no great disposition to excommunicate men like Seward and Giddings, who retained whig views on every subject outside of the slavery agitation, there was at least a disposition to relegate them to the limbo of "free-soilers" and disclaim responsibility for them. — In the spring of 1852 the southern whigs again intervened to finally break up the party. For twenty years they had accepted a northern alliance mainly as a point of resistance to southern democracy, and they had now consorted with their old opponents long enough to have lost their abhorrence of them. As the presidential election of 1852 approached, they prepared an ultimatum for the northern whigs which they must have known meant either the division or the defeat of the party. At the whig caucus, April 20, 1852, to arrange for the national convention, a southern motion was made to recognize the compromise of 1850 as a "finality." The motion was evaded, as not within the powers of the meeting, but its introduction was ominous. Northern whigs were willing to yield to such a recognition, tacitly: to do so expressly would have hazarded their majority in every northern whig state. But, when the whig national convention met at Baltimore, June 16, the southern ultimatum was pressed again, and more successfully. The platform was in eight resolutions: 1, defining the federal government's powers as limited to those "expressly granted by the constitution"; 2, advocating the maintenance of both state and federal governments; 3, expressing the party's sympathy with "struggling freedom everywhere"; 4, calling on the people to obey the constitution and the laws "as they would retain their self-respect"; and 7, urging "respect to the authority" of the state as well as of the federal government. Of the remaining three, the fifth and sixth are the last economic declaration of the party, as follows: "5. Government should be conducted on principles of the strictest economy; and revenue sufficient for the expenses thereof ought to be derived mainly from a duty on imports, and not from direct taxes; and in laying such duties sound policy requires a just discrimination, and, when practicable, by specific duties, whereby suitable encouragement may be afforded to American industry, equally to all classes and to all portions of the country. 6. The constitution vests in congress the power to open and repair harbors, and remove obstructions from navigable rivers, whenever such improvements are necessary for the common defense, and for the protection and facility of commerce with foreign nations or among the states—said improvements being in every instance national and general in their character." The eighth and last was the southern ultimatum, as accepted and formulated by the recognized northern leaders, the words "in principle and substance" being interlined in the draft by Webster at the suggestion of Rufus Choate. "8. That the series of acts of the 32d congress, the act known as the fugitive slave law included, are received and acquiesced in by the

whig party of the United States as a settlement in principle and substance of the dangerous and exciting questions which they embrace; and, as far as they are concerned, we will maintain them and insist upon their strict enforcement, until time and experience shall demonstrate the necessity of further legislation to guard against the evasion of the laws on the one hand and the abuse of their powers on the other—not impairing their present efficiency; and we deprecate all further agitation of the question thus settled, as dangerous to our peace, and will discountenance all efforts to continue or renew such agitation, whenever, wherever or however the attempt may be made; and we will maintain this system as essential to the nationality of the whig party and the integrity of the Union." This was the famous resolution that gave rise to the popular verdict upon the party, "died of an attempt to swallow the fugitive slave law." The other resolutions were adopted unanimously: this by a vote of 212 to 70, the latter all from northern whigs. — Three candidates were before the convention. On the first ballot Fillmore had 133 votes, Scott 131, and Webster 29. On the second ballot, the votes for Fillmore and Scott were reversed, and from this point there was little change until, on the 53d ballot, Scott was nominated by 159 votes to 112 for Fillmore and 21 for Webster. Graham was then nominated on the second ballot for the vice-presidency. Scott's availability was much like that of Taylor, less the latter's popularity: his military services were great, and very little was known of his political opinions. But the whigs were beaten long before election day. In the north the eighth resolution cut deep into the whig vote, and it gained no votes in the south. For some unintelligible reason Scott had been the candidate of the anti-slavery vote in the convention, and he was believed to be much under the influence of Seward: the consequent refusals of southern whigs to vote made the popular vote in southern states noticeably smaller than in 1848. As a result of both influences the whigs carried but four states, Massachusetts and Vermont in the north, and Kentucky and Tennessee in the south, and even these by very narrow majorities. Scott and Graham were defeated; but 71 whigs were chosen out of 234 representatives in the next congress; 22 of these were southern whigs, most of whom, like A. H. Stephens, had publicly refused to support Scott in 1852, and were soon to be openly democrats; and the great whig party was a wreck. The country had no use for it: its economic doctrines were not a subject of present interest, and on the overmastering question of the extension of slavery it could neither speak nor keep silence without sealing its own fate. — III. 1853-60. For the first few months of Pierce's term there was an unwonted quiet in politics. New men sought to build up a new party on the ruins of the whig organization by utilizing the old whig feeling against the foreign vote (see AMERICAN PARTY); and, as this promised a possible escape from the slavery

question, the remnants of the whig party in 1856 indorsed the "American" nomination of Fillmore and Donelson, "without adopting or referring to the peculiar doctrines" of the party which had at first nominated him. But, by this time, most of the former northern whig vote had gone into the new republican party (see its name) under new leaders, while a large part of the former whig leaders had gone into the democratic party. Thus the former element gave the republican party its economic doctrines, while the latter lost all distinction as it changed its habitat. Still, the whig remnants lived on in a few northern states until 1857-8, when they were finally absorbed into the republican party. In 1860 the old whig element in the border states nominated Bell and Everett (see CONSTITUTIONAL UNION PARTY), and was still strong enough to dispute the southern states with the ultra democracy; but the outbreak of the rebellion dissipated this last trace of the once-powerful whig party. — The history of the party nominally covers a quarter of a century, 1828-52, but it must be confessed that its real and distinct existence covers only about four years, 1842-6, and that its only real party action was its nomination of Clay in 1844, with the possible exception of Clay's nomination in 1831. During all the rest of its history the party was trading on borrowed capital, and its creditors held mortgages on all its conventions, which they were always prompt to foreclose. And yet it had its own office to perform, for in its members, rather than in its leaders, was preserved most of the nationalizing spirit of the United States. (See NATION, III.) In this sense, if we may not altogether accept the epitaph suggested by one of its leaders, that "the world was not worthy of it," we may at least believe that the nation was not ready for it. — There is no good history of the whig party. Ormsby's *History of the Whig Party* gives so much space to events before 1824 that only the last 200 pages treat of events thereafter, and the treatment is itself of little value. Niles' *Register*, though a periodical, is about the best record of the party, though Wilson's *Rise and Fall of the Slave Power* is more convenient. The *American Whig Review*, published monthly 1844-52, will give the party's view of its own work; and 2 A. H. Stephens' *War Between the States*, 237, will give the inside history of the party's downfall. Its platforms in full may be found in Greeley's *Political Text Book of 1860*, 11-18. See also 2 von Holst's *United States*; *North American Review*, January, 1876 (W. G. Sumner's "Politics in America"); Wise's *Seven Decades*; 8-16 Benton's *Debates of Congress*; 2 Hammond's *Political History of New York*; Sargent's *Public Men and Events*; Clay's *Works*, *Private Correspondence*, and Colton's *Life and Times of Clay*; Webster's *Works*, *Private Correspondence*, and Curtis' *Life of Webster*; Adams' *Memoir of John Quincy Adams*; Everett's *Orations and Speeches*; Seward's *Works*; Coleman's *Life of Crittenden*; Tuckerman's *Life of Kennedy*; Prentiss' *Memoir of S. ALEXANDER JOHNSTON.

WHISKY INSURRECTION (IN U. S. HISTORY), a revolt against the execution of a federal excise law, which came to a head in western Pennsylvania and was suppressed in 1794. — The series of disorders to which the above general name is given, were the outcome of a number of moving causes. 1. The western counties of Pennsylvania, Virginia and North Carolina, among or beyond the Alleghanies, were far removed from the main body of American civilization. The distance to the seaboard was three hundred miles; roads were few and bad; to secure any profit from grain it was necessary to convert it into the more portable form of whisky; and whisky was the money of the community, in the general scarcity of cash. Under these circumstances a tax levied specially upon the distillation of whisky seemed to the mountaineers an invidious selection of themselves for imposition, a singling out of a few counties for taxation in order to relieve the richer east. 2. The people of these counties had been so long exempt from the fetters of the law that they felt the first touch keenly. Lying within an area whose jurisdiction had long been disputed by Virginia and Pennsylvania (see VIRGINIA, TERRITORIES), they had generally escaped any troublesome interference from either state. In 1783 the supreme executive council of Pennsylvania had sent a special agent to remonstrate with "those deluded citizens in ye western counties who seemed disposed to separate from ye commonwealth and erect a new and independent state." Canada was not far away to the north; Spain not much farther to the southwest; and between the two lay the great and unoccupied "northwest territory," to the west of Pennsylvania. Who can tell how many abortive negotiations with agents of one or the other power, with the erection of a new and nominally independent northwestern power as an ultimate object, were never committed to paper, but died with the backwoodsmen who had conducted them? It is certain that, when Genet (see that title) reached the United States in 1793, his infallible instinct for troubled waters at once led him to send his agents to Kentucky and western Pennsylvania; and when the last scene in the present insurrection was being acted, the more reckless leaders showed their hand by urging the formation of a new state. When vague dreams of empire had been so long cherished, it was intolerable that they should be broken in upon by the

summons of a federal exciseman, and this sudden dissolving of frontier independence had very much to do with the whole difficulty. 3. In any event, an excise law had always been odious to English and Americans from the necessary power given to officers to enter houses and search. Blackstone had curtly said that "from its original to the present time its very name has been odious to the people of England"; and Noah Webster's predecessor, Dr. Johnson, had defined it as "a hateful tax, levied upon commodities, and adjudged not by the common judges of property, but by wretches hired by those to whom excise is paid." The continental congress, in a proclamation to the people of Canada, in October, 1774, had warned them that they would be "subjected to the impositions of excise, the horror of all free states"; and an English pamphleteer, long before, had said, "We know what a general excise is, and can not be ignorant that it hath an army in its belly." The constitution plainly gave congress power to lay and collect excises; but it was certain that the exercise of the power would be difficult and dangerous; and the first project of an excise was defeated in congress, June 21, 1790. In the following year, when the project was revived, the Pennsylvania senators were instructed by their legislature to oppose such a law, "established on principles subversive of peace, liberty, and the rights of the citizens." 4. Complicated with all these reasons was a political opposition to the excise, which will be more in place under the main reason for its passage. — Hamilton's reason for insisting upon the passage of an excise law must be judged from the standpoint of the statesman, not from that of the financier, though a hope of future revenues might have been considered. If we take into account the expense of suppressing the inevitable insurrection which it provoked, the excise cost as much for collection as it produced, and the sides of its account were fairly balanced. Hamilton had prescience enough to forecast this immediate result, and yet he felt that great gain would come from the passage of the law. His reason, as given in the letter to Washington cited below, was, that it was necessary to assert at once the power of the federal government to lay excises, which the people were accustomed to look upon as a state prerogative, and that "a thing of the kind could not be introduced with a greater prospect of easy success than at a period when the government enjoyed the advantage of first impressions, when state factions to resist its authority were not yet matured, and when so much aid was to be derived from the popularity and firmness of the actual chief magistrate." But this last paragraph shows that there was an ulterior design, and that Hamilton was endeavoring to find the line of least resistance in exhibiting to the states for the first time that which had never before been heard of, "the authority of the national government." Heretofore, "authority" had been in the state governments, and the functions of the national government, if there ever was any, were to rec-

ommend, to remonstrate, to soothe, and to bear rebuffs with patience and becoming humility. Somewhere the new national authority must be first brought upon the stage, and no safer or more undeniably legal opportunity could be imagined than in the suppression of an insurrection against an excise law. To assert that Hamilton willfully sought to provoke as weak a sedition as possible in order to make its suppression easy and certain, would be a hard saying if his object had been personal advantage, or if a hecatomb of innocent victims could be invoked in condemnation of his plans. But neither was true: not only was the success of his plan perfect and bloodless, but there seems to have been no trace of self-seeking in it. He was playing for high stakes (see *NATON*), and he played, as his antagonists did in 1800-1, with the rigor of the game. That he used opportunity, the disorganization of the opposition, the constitutional permission to lay excises, and the presidency of Washington, with such skill and effect, shows only what a master of the game he was. — Had Hamilton's purpose been plainly stated, to force an issue on which he could safely introduce the "authority of the national government" to popular view, the excise law would have received little support from a people or from politicians accustomed to regard the states as sovereign and independent, and the federal government as their creature. (See *STATE SOVEREIGNTY*.) But he took one step after another so skillfully that he ended, as he began, with the almost unanimous support of the people, who concurred in maintaining a national authority which they had hardly dreamed of ten years before. Nevertheless, there were some of the opposition, particularly Jefferson, who detected and vainly endeavored to counteract Hamilton's design. Their failure was one great moving cause of the rise of the new republican party (see *DEMOCRATIC PARTY*, I.), but it also helped to give the leaders of the new party the bitter dislike which they always cherished for Hamilton. That he had forced them to learn new ideas was bad enough, but it was intolerable that he should also compel them to kiss the rod to which they had unwillingly submitted. Their evident wrath has given some credence to a notion that some of them had been laying plans for a general disruption of the Union, and that Hamilton's shrewdness in provoking a premature explosion had balked them. The only documentary evidence to this effect is in a passage of an intercepted dispatch of Fanchet, Genet's successor, in 1794 (see *RANDOLPH, EDMOND*), that the insurrection was "indubitably connected with a general explosion for some time prepared in the public mind, but which this local eruption would cause to miscarry, or at least check for a long time." But the Frenchman's characteristic use of the word "indubitably," his failure to support it by any evidence from Randolph or elsewhere, and the failure of every other attempt to find any such evidence, put his passage out of court. Democratic anger came altogether from the dis-

covery that the power of the federal government must thereafter be considered as a factor in American politics, together with the independence of the states and of the citizen. They could no longer say, as was said in congress in 1794, that their constituents "love your government much, but they love their independence more"; for the federalists could retort, as Tracy, of Connecticut, did to Gallatin in 1796, that, "whatever might be the case in other parts of the Union, his constituents were not of a temper to dance round a whisky pole one day cursing the government, and sneak the next day into a swamp on hearing that a military force was marching against them." In this alteration of the fundamentals of political discussion was the head and front of Hamilton's offending. — The excise bill became a law March 3, 1791. Little open resistance was made to it in Virginia or North Carolina, but in Pennsylvania the agitation was headed not only by violent men, one Bradford being the most noted, but by abler and quieter leaders, such as William Findley, then and for many years afterward a member of congress; John Smilie, also a member of congress after 1792, and Albert Gallatin. (See his name.) The first meeting to protest against the law was held at Redstone old fort, now Brownsville, July 27. Its proceedings were moderate; but another meeting, Aug. 23, in Washington county, nearest to the Virginia line, and most disordered, resolved to consider as an enemy any person who should take office under the law. Violence could not but follow this, and it began Sept. 6, with the tarring and feathering of a revenue officer. Throughout the winter the disturbance smoldered, but it was so threatening that an act was passed, May 2, 1792 (see INSURRECTION), empowering the president to use militia in suppressing disturbances within a state. With it went another act, May 8, reducing the duties. An attempt to hire an office in Washington county for the revenue officers, in August, led to renewed disorder, and the president felt compelled to warn the rioters, by a proclamation of Sept. 15, to abandon their unlawful combinations. Occasional tarrings and featherings followed throughout the year 1793, but the law itself was not as yet very effectively exercised. Early in 1794 the organization of secret societies began, coincident with the introduction into the house of representatives of a plan to secure and collect the excise duties; and these seem to have made full preparations for resistance. One great reason for the popular dislike to this particular law was, that offenses under it were cognizable only in federal courts, and that an accused person would therefore be compelled to journey to Philadelphia, at the other end of the state, to answer the charge. To backwoodsmen this was certainly no slight grievance; and congress very justly removed it in the act of June 5, 1794, giving state courts concurrent jurisdiction of excise offenses, so that accused persons might be tried in their own vicinage. But while the law was in process

of passage, and before its mitigation could be taken advantage of, some fifty writs were issued at Philadelphia, May 31, against various persons in the western counties. These were served in July; as each was served, the person served joined the mob which followed the marshal; the cry was raised that "the federal sheriff was taking away people to Philadelphia"; and the short-lived whisky insurrection began. The marshal was captured, and sworn to serve no more processes; the inspector fled down the Ohio, and thence around through a wilderness to Philadelphia; and within two days the operation of the law was stopped. It is not known who was responsible for the issue of the writs of May 31, which were the spark for the explosion. There is no evidence whatever that Hamilton had anything to do with it. — The insurgents, two days after the outbreak, seized the mail from Pittsburgh, in order to ascertain the names of those of their fellow-citizens who were opposed to them. A mass meeting was called for Aug. 1, on Braddock's field. Some 7,000 armed men were present; a county judge presided, and Gallatin acted as secretary; none, even of those who disliked the posture into which affairs were growing, dared to remonstrate; and a reign of terror was begun, Bradford being the ruling spirit. Personal violence was offered to any person suspected of obeying the law, and the more reckless spirits began active preparation to call out the whole force of the counties for a defensive war against the United States. — The emergency had now come, and the manner in which it was met showed to the dullest understanding the difference between the present government and that which had been balked by Shay's rebellion. (See CONFEDERATION, ARTICLES OF.) The federalist members of the cabinet instantly advised the calling out of militia; and, when Gov. Mifflin of Pennsylvania declined to take the initiative, the "national authority" showed that it no longer was absolutely dependent on the state governments. A certificate of the existence of the insurrection was obtained from a federal judge; a proclamation from the president, Aug. 7, ordered the insurgents to disperse; a requisition for 15,000 militia was issued to the governors of Pennsylvania, New Jersey, Virginia and Maryland; and Sept. 1 was fixed as the date for the departure of the troops. A federal commission of three persons, and a state commission of two, preceded the troops with offers of amnesty on full submission. The mission was apparently a failure. It found Gallatin, Findley, Brackenridge and the other leaders of standing engaged in a desperate effort to induce submission, but impeded by Bradford and the reckless borderers, who terrorized every meeting they attended. Aug. 28, the controlling committee of sixty met at Redstone old fort. Bradford urged armed resistance, but Gallatin, by securing a secret ballot, obtained a resolution, 34 to 23, to accede to the proposals of the federal commissioners. These proposals were mainly that town

meetings should be held Sept. 11, that the people should vote yea or nay on the question of submission, that those who voted yea should obtain amnesty by signing a declaration of submission, and that the unanimity of the vote should govern the movements of the troops. Many, however, refused to sign the declaration, for the reason that they had taken no part in the outrages, and had no need of amnesty; and the reckless part of the insurgents supplemented the meagreness of the vote by a renewal of the outrages, and even by an attempt to seize the commissioners on their way home. — The report of the commissioners was so unfavorable that the president issued a new proclamation, Sept. 25, giving notice of the advance of the troops, mostly volunteers. Washington accompanied them to Carlisle, where he left the chief command to Gov. Lee, of Virginia. The Pennsylvania and New Jersey troops were led by Gvs. Mifflin and Howell; the Virginia troops by Gen. Morgan; and the Maryland troops by Samuel Smith, a member of congress from Baltimore. Hamilton accompanied the expedition throughout. In the meantime a new popular convention, Oct. 2, had sent Findley and another commissioner to the president with unanimous assurances of submission; but the president could see no evidence that the assurances represented any general feeling. Another meeting, Oct. 24, therefore declared that all suspected persons ought to surrender at once for trial, and that it would be perfectly safe to open inspection offices and put the excise laws in operation immediately; and four commissioners were appointed to carry these resolutions to the president. No halt took place in the movement of the troops, however. They arrived in the disturbed district early in November, and their commander, after giving the inhabitants time to obey his proclamation and take advantage of the proffered amnesty, arrested by a general sweep those accused persons who had not yet exonerated themselves. These culprits, however, were insignificant. Bradford and the more violent leaders had fled the country, and the more moderate leaders had protected themselves by taking advantage of the amnesty: as Wolcott, a warm federalist, expressed it, "all the great rogues, who began the mischief, had submitted and become partisans of the government." The result was, that two or three were tried and convicted, and these were pardoned. But there was for a long time an angry feeling that Hamilton, Knox and Judge Peters had acted as a "star chamber" in their manner of taking testimony, and in their sending a number of accused persons to Philadelphia, "to be imprisoned for ten or twelve months without even an indictment being found against them." — The first show of force had suppressed the insurrection, and the troops returned home, leaving 2,500 men, under Morgan, who encamped in the disturbed district throughout the winter. Its suppression had been almost bloodless, but two persons having been killed, and these in personal conflicts with soldiers for which

the soldiers were punished. But the effects were greater than if a "Peterloo" battle had been fought. The early political struggles of the United States are none the less important because they were peaceful; and the bloodless suppression of the whisky insurrection is as significant in its way as the bloody emergence of the English nation from the chaos of the heptarchy. For five years the people had been enjoying all the comforts of a national government without feeling any of the responsibilities which accompanied them; and the politicians had been developing the idea that individual obedience to the federal government under the constitution was to be as fundamentally voluntary as state obedience had been under the confederation, that all Americans were by nature good citizens, and that discontent with a law was *prima facie* evidence that the law was bad and ought to be repealed. The year 1794 completed what the year 1787 began; it revealed a power which, though seldom exerted, must always be finally decisive. The swiftness and thoroughness with which the resistance had been put down; the evident fact that, as Wolcott said, "the whole resources of the country would be employed, if necessary"; and the reflection that a part can never be equal to the whole: all combined to show the hopelessness of any future insurrection which individual dissatisfaction could be expected to produce. It is clearly within bounds to say, that this single lesson would have been sufficient to free the United States from future danger of insurrection but for the influence of slavery in binding together a number of states in organized insurrection. Its influence is certainly evident in a comparison of the congressional debates before and after it occurred. Before 1794 there is in many of the speakers almost an affectation of voluntary obedience to federal laws, and of monition to others not to provoke resistance. After that year, this characteristic disappears almost entirely, and the debates have no longer the background of possible club law. — A broader result is easily visible now, though few others than Jefferson and Hamilton saw it then. If a federal army, without the summons of the governor or legislature, was to march through a state to suppress resistance to federal laws within the state, state sovereignty, in its hitherto accepted sense, could hardly be found by searching. Little was said at the time, but when the federal party was finally overthrown, one of the first steps in reform was the abolition of the excise laws by the act of April 6, 1802. (See STATE SOVEREIGNTY.) — See 4 Hildreth's *United States*, 498; 1 von Holst's *United States*, 94; 1 Schouler's *United States*, 275; 2 Pitkin's *United States*, 421; 1 Tucker's *United States*, 552; Bradford's *Federal Government*, 84; 1 Gibbs' *Administrations of Washington and Adams*, 144; Wharton's *State Trials*, 102; authorities under GALLATIN, HAMILTON and JEFFERSON; 3 Jefferson's *Works* (edit. 1833), 308; 4 Hamilton's *Works*, 231 (letter to Washington); 6 *Pennsylvania Hist. ALEXANDER JOHNSTON.

WHISKY RING, the popular name for an association of revenue officers and distillers to defraud the government of the internal revenue tax on distilled spirits. The nature and natural effect of this tax are so fully described elsewhere that it is needless to do more than refer to them. (See **DISTILLED SPIRITS**.) It is only intended to enter a little more minutely into the formation and operation of the ring. — The ring had its origin in St. Louis, when the "liberal republican" movement had achieved its first success. (See **MISSOURI, LIBERAL REPUBLICAN PARTY**.) The distillers were assessed by the revenue officials for money with which to secure the support of an influential St. Louis newspaper. The ring soon widened, and in 1874 it had spread into national proportions. Distillers who refused to enter it were watched, and entrapped into technical violations of law. Then, having become liable to seizure, they had to choose between ruin and surrender to the ring. There were branches at Milwaukee, Chicago, Peoria, Cincinnati and New Orleans, and an agent, who has not been legally identified, at Washington; but the headquarters of the ring were still at St. Louis. It had acquired so large an influence in the national republican party, that, when the new secretary of the treasury, Bristow (see **ADMINISTRATIONS**), issued an order to transfer supervisors, which would have thrown the ring into confusion, the politicians obtained a direct countermand of the order from the president. The special treasury agents were corrupted, and the ring maintained its ground. — When the statistics of the St. Louis merchants' exchange for 1874 were published, a comparison of the shipments with the revenue returns showed that about \$1,200,000 of taxes had not been paid. Nevertheless, the secretary of the treasury was unable to reach the individuals at fault, for the ring had prompt information from the department itself of any step toward investigation. Early in February, 1875, the editor of the "St. Louis Democrat," Mr. George Fishback, sent a message to Mr. Bristow, offering to furnish him with a trustworthy agent, who would unearth the frauds. The secretary accepted the offer, and Mr. Fishback named Mr. Myron Colony, secretary of the cotton exchange. Mr. Bristow appointed the solicitor of the treasury, Mr. Bluford Wilson, to cooperate with him, and the work was begun. — At first the attempt was made to watch the operations of suspected distilleries, the amount of grain carried in and of liquor carried out; but the officials and distillers discovered the attempt, and suspended the frauds until they had organized gangs

of ruffians and driven away the detectives. Then Mr. Colony, under pretense of collecting statistics of the city's receipts and shipments, placed a man at each landing and freight depot, to copy bills of lading. The copyists were ignorant of the purpose of their employer, and were directed to copy the records of all staple articles, including whisky. Finally, by assorting the bills, Mr. Colony had a description of all shipments of liquors by each distillery for three months, with the serial numbers of the stamps. Comparison with the official returns of course laid the whole fraud bare; and, within a month after Mr. Colony's appointment, he had made all the leading houses of St. Louis liable to seizure. The work was then transferred to special agents of the internal revenue bureau, most of whom were kept in ignorance of the real object of their investigations; and a new commissioner of internal revenue, ex-senator Pratt, of Indiana, was appointed. Under his direction, experts compared the returns of other distilleries with the records already obtained, and thus the secretary was enabled, through his agents, to work up similar frauds at Milwaukee and Chicago, and to discover the manner in which the distillers, by connivance of the officials, accomplished the frauds, by shipping secretly barrels whose contents they had reported as "dumped" into the common cistern of the distillery for storage. Finally, May 10, 1875, the blow fell simultaneously at St. Louis, Milwaukee and Chicago, by the seizure of all the implicated distilleries, sixteen in number, and as many rectifying houses. The records seized enabled the government to make further seizures in almost every important city in the United States, for the seizure of May 10 had been entirely unexpected and unprepared for. One telegram had gone from Washington to St. Louis. "Lightning will strike on Monday. Inform our friends in the country." But it was found that the sender and receiver of the message were both opponents of the ring; and, with this exception, no intimation of the secretary's purposes seems to have passed outside of his own little circle. As a result of this secrecy of operation, the government was able to bring into court a total amount of about \$3,500,000 of property seized, with suits on gaugers' bonds, and indictments against 238 persons, including distillers, rectifiers, wholesale liquor dealers, collectors, deputy collectors, supervisors, gaugers, storekeepers, and other persons. It was shown that the government had been defrauded of about \$1,650,000 of taxes during the ten months from July 1, 1874, to May 1, 1875. — When the papers in the case were first laid before President Grant, he indorsed one of them with directions to "let no guilty man escape," and had supported Bristow heartily. But the first effort of the ring was to persuade the president that Bristow's zeal was inspired by a desire to obtain the presidency. The investigators had come to believe that the president's private secretary, Babcock, was one of the ring, and they directed his movements to be watched. The letter, which ordered the fraud to

be exposed "from bottom to top," was stolen from the office of the government counsel: and, when it reached Babcock, the letters "W. H." had been added at the end of a line after the word "top," so as to make it appear to be the intention to investigate the White House from bottom to top. A press copy of the letter exposed the interpolation, and prevented the removal of Wilson, for which the president had hastily given orders on first reading the letter. This, however, was but one of the efforts which were made from every side to break up all confidence and co-operation between the president and the secretary; others seem to have been more successful. — Indictments for conspiracy to defraud, and for destruction of public records, began in June, 1875, and continued throughout the year. The most important were those against John A. Joyce, revenue special agent, John McDonald, supervisor, Wm. O. Avery, chief clerk in the treasury department, and General O. E. Babcock. The trials began in the autumn at Jefferson City, Mo. Joyce was convicted, Oct. 23, McDonald Nov. 22, and Avery Dec. 3. One of the leading counsel for the government in these prosecutions was John B. Henderson, of Missouri. In the Avery trial he had occasion to introduce certain suspicious telegrams from Babcock, and he commented on them and on the president's general action in the case in terms which, to say the least, were indiscreet. "What right," said he, "had Babcock to go to Douglas [the former internal revenue commissioner] to induce him to withdraw his agents? What right had the president to interfere with Douglas in the proper discharge of his duties, or with the secretary of the treasury? Why did Douglas bend the supple hinges of his knee, and permit any interference by the president?" Henderson claimed that this language was meant only to justify the president in *not* interfering; but it must be evident that the president could not have been fairly expected to endure this mode of attacking the whisky ring. Henderson was removed; but his place was given to Jas. O. Broadhead, a leading democratic lawyer of St. Louis. Dec. 9 the federal grand jury indicted Babcock. Babcock had already asked for a military court of inquiry, to investigate the charges against him in the Avery trial, and the president was strongly disposed to direct the attorney general to suspend all civil proceedings in the Babcock case, and turn the matter over to the military court. This was successfully resisted by Bristow; but the court was granted, and met at Chicago, Dec. 9. The attorney general directed the district attorney to send to the military court his evidence against Babcock, and the names of his witnesses; but the district attorney (Dyer) refused to obey an order which would have made him punishable for contempt of court. The military court met, suspended its proceedings, and soon afterward dissolved. — The Babcock trial began Feb. 8, 1876. One of the most important witnesses, a gauger named Everest, who was alleged to have personal knowledge of payments to

Babcock by the ring, had been induced to go to Europe. District attorney Dyer had induced him to return by a promise of exemption from prosecution, met him in Philadelphia, and obtained an outline of his testimony. As soon as this became known, the attorney general issued an order to the district attorneys at St. Louis, Chicago and Milwaukee, dated Jan. 26, 1876, ordering them to give no promises of exemption, but to punish every guilty person, who should be convicted or should confess his guilt. It is hardly necessary to say that this letter excited a general indignation, and was looked upon as an official effort to screen Babcock. — It must be confessed, that, in spite of the fact that there was not a breath of suspicion upon the president personally, there was a very general feeling that he was to some extent on trial with his private secretary; and there was an equally general feeling of relief when the jury, Feb. 24, brought in a verdict of not guilty. Immediately afterward the president took another private secretary in Babcock's place. — Most of the remaining defendants either plead guilty or were convicted; and a few, in whose cases there were extenuating circumstances, were non-prossed. Of the leading defendants, Avery, McKee and Maguire were pardoned in about six months. — In March, 1876, a select committee was appointed by the house of representatives to ascertain whether any federal official had aided or given information to the defendants. It sat for six months, examined a great number of witnesses, and gave their testimony in House Misc. Doc., No. 186, 1st session, 44th congress, 1875-6. The whole makes up a startling revelation of the political methods of the time, and of the disgraceful and dangerous condition of the civil service. — Every effort had been made to blacken the private and public character of Secretary Bristow, but without the slightest success. In the spring of 1876 he opened an attack upon a whisky ring on the California coast. Here, at last, he was beaten. As soon as his investigations became dangerous, a California senator demanded the removal of several of the more active special agents of the treasury at San Francisco. The secretary refused, but was not supported by the president; and in June, 1876, he resigned. His retirement relieved the ring from further prosecution; but its active energies were broken and were never revived. C. & J.

WHITE, Hugh Lawson, was born in Iredell county, N. C., Oct. 30, 1773, and died at Knoxville, Tenn., April 10, 1840. He removed to Tennessee with his father in 1786, was admitted to the bar in 1795, and served as judge of the state supreme court 1801-7 and 1809-15, as state senator 1807-8 and 1817-18, and as United States senator 1825-33 and 1837-40. In 1836 he received twenty-six electoral votes, from Tennessee and Georgia, for the presidency, being the representative of that "state rights" southern faction which thereafter became the southern wing of the whig party.

WHITE LEAGUE. (See KU-KLUX KLAN.)

WILMOT PROVISIO (IN U. S. HISTORY).

Although this principle has been baptized with the name of David Wilmot, a democratic congressman from Pennsylvania, who attempted to apply it in 1846 to the territory about to be acquired from Mexico, it is in reality the outcome of that principle of congressional control over the territories which has constantly been applied in practice since the nation first owned territories. The ordinance of 1787 (see that title) prohibited slavery in the northwest territory; and in the territory southwest of the Ohio the prohibition of slavery was not imposed, because congress, in accepting the cessions of it by the states, had voluntarily bound itself not to do so. In the organization of the territories, while congress has allowed the election of the lower house of the legislature by the people, it has always retained to the national government the appointment of the judges and of the governors, with a veto on the territorial legislatures, and has even retained a power to veto, in the last resort, the action of territorial governors and legislatures together. Its power to prohibit polygamy and slavery in the territories has always rested on exactly the same foundation. (See TERRITORIES.) In the case of slavery it would probably never have been denied, but for the influence occasioned by the growth of slavery. Jefferson's prohibition of slavery in both the northwest and southwest territories came within a hair's breadth of success in 1784; and the more limited prohibition of 1787 had practically no opposition. In the case of Missouri, in 1819-20, there was hardly any denial in the south, while there was a unanimous affirmation in the north, of the power of congress to prohibit anything in the territories, even slavery. The southern argument was altogether different from any such denial. It showed that the national government had acquired the territory west of the Mississippi, when slavery was permitted therein by law; that it had taken no steps whatever to prohibit slavery therein, but had allowed it to extend north through Missouri; and that, when Missouri had thereby become a slave state through the continued policy of congress, confirmed by the admission of Louisiana as a slave state in 1812, it was not just, by a sudden reversal of policy in the case of Missouri, to destroy property rights which congress, at least by *lashes*, had allowed to grow up. Leaving out of question the morality of slavery, the southern reasoning was just, and indeed, *mutatis mutandis*, was exactly the reasoning of the free-soilers of after days. In 1820 (see COMPROMISES, IV.), congress recognized its justice: it refrained from touching slavery in that part of the annexation where it had been allowed to grow up, in the states of Louisiana and Missouri, and in the territory of

Arkansas; but it took absolute assurance for the future by prohibiting slavery forever in the rest of the annexation, that part lying north of latitude 36° 30'. The mistake lay in allowing this to go forth as a compromise, a bargain, a division of territory between the sections, instead of a plain exercise of rightful power by congress, coupled with an act of condonation for the past. There could then have been no attempt to stamp the Wilmot proviso in 1846 as a novelty in American legislation. — I. BEFORE ANNEXATION. Prohibitions of slavery were inserted in the organization of the new territories formed from the Louisiana purchase, Iowa in 1838, and Minnesota in 1849, by the following provision: "The laws of the United States are hereby extended over and declared to be in force in the said territory, so far as the same, or any provision thereof, may be applicable." The prohibition of slavery therein, passed in 1820, thus attached to them as organized territories. It was very doubtful whether Oregon was really a part of the Louisiana purchase (see NORTHWEST BOUNDARY), and for greater safety an explicit prohibition of slavery was inserted in the first house bill to organize the territory. In this form the house passed the bill, Feb. 3, 1845, by a vote of 140 to 59. Pending difficulties with Great Britain made the organization of the territory at that time a matter of doubtful prudence, and it was not considered by the senate until after the treaty of June 15, 1846. — All parties who voted for the annexation of Texas did so with a silent recognition of slavery therein, as established by local law. But the remainder of the Mexican republic was absolutely barred to slavery, at first by a decree of the dictator Guerrero in 1829, and then by the constitutions of the Mexican republic. If, then, any portion of it should be annexed to the United States, it would come in as free territory, just as all other acquisitions had been slave territory when acquired. Early in the Mexican war an arrangement seems to have been made by the administration with the banished Mexican president, Santa Anna, by which he was to be allowed to return to Mexico, reorganize his party, and conclude a peace on the basis of a payment by the United States for a cession of territory. Aug. 8, 1846, in a special message, the president asked for the appropriation of a sum of money for "the adjustment of a boundary with Mexico such as neither republic will hereafter be inclined to disturb," that is, for the purchase of Mexican territory outside of Texas. Such a bill, appropriating \$2,000,000, was at once introduced in the house, and debate was limited to two hours. Northern and southern whigs were alike opposed to any acquisition of territory, for fear of introducing with it the question of slavery: and White, of New York, and Winthrop, of Massachusetts, now expressed their party's views clearly and forcibly. Most of the northern democrats, while determined on acquisition of territory, were equally determined that it should remain free. Brinckerhoff, of Ohio, at once drafted, and Wilmot introduced, the

amendment afterward famous as the "Wilmot proviso," as follows: "provided that [as an express and fundamental condition to the acquisition of any territory from the republic of Mexico by the United States, by virtue of any treaty which may be negotiated between them, and to the use by the executive of the moneys herein appropriated] neither slavery nor involuntary servitude shall ever exist in any part of said territory, except for crime, whereof the party shall first be duly convicted." The words in brackets were not essential, except under temporary circumstances, and the remainder forms the Wilmot proviso proper, as it is usually cited. It followed the language of the ordinance of 1787. — Remarkably little opposition was made to this first appearance of the proviso, and that little came from southern democrats who alleged that the territory in question was already free; that the proviso was thus needless; and that it was also mischievous, as a piece of supererogatory and offensively anti-southern legislation, which would provoke the election of extreme southern representatives and endanger the Union. This view will be found best stated by Benton, as cited below, and he himself was one of the first victims. (See MISSOURI.) The proviso was quietly accepted; the house decided it in order by a vote of 92 to 37, and adopted it (83 to 64) and the whole bill (85 to 79) on the day of its introduction. Two days afterward, on the last day of the session, the senate voted, 19 to 10, to take up the bill for consideration. Lewis, of Alabama, moved to strike out the proviso. Davis, of Massachusetts, argued against the motion, and persisted in his argument until the time fixed for adjournment came, and he was cut off in the full flow of debate. The proviso thus fell with the bill. It was claimed at the time that it would have been passed by the votes of all the free-state senators, and those from Delaware and Maryland; but Wilson makes a very convincing showing that it would have been voted down. Nevertheless the denunciations of Davis' action in democratic newspapers and in the "Union," the official newspaper at Washington, were far more severe than in those of their opponents. Cass, in conversation, censured Davis severely. Polk, in his message of the following December, without any condemnation of the proviso, expressed his regret that the bill had not passed, and his confidence that a majority of both houses was still in favor of it. The legislatures of every northern state east of Indiana, excepting Maine, but including Delaware, formally approved the proviso, democrats and whigs uniting in the vote. Everything seemed to point to its passage, as a democratic measure, at the following session. — Before the following session the southern members had been naturally forced into an attitude of stronger opposition to the proviso. Every southern aspirant to a seat in congress was certain to represent the sitting member's active or passive support of the proviso as an act of treason to the south; and thus all the southern democrats, who desired an acquisition of territory, were arrayed

against the proviso. Southern whigs, who were against the acquisition, could safely vote against the proviso with its bill, and could carry enough northern whigs with them on that issue to preserve the national integrity of their party. How were northern democrats to keep their party intact? This pressing question was answered by the evolution of the new dogma of "popular sovereignty" (see that title) in the territories, by virtue of which the status of slavery in any territory was to be remitted to the decision of the people of the territory. Urged at first as a prudent way of settling the difficulty, it almost immediately became the touchstone of democracy, and Wilmot and democrats who supported him were driven out of the party. — Jan. 4, 1847, in the house, Preston King, of New York, asked leave to offer a bill like that of the previous session, changing \$2,000,000 to \$3,000,000, but adding the proviso. Before it could be considered, bills of like nature, but without the proviso, had been reported in both houses. In the senate the southern whigs unsuccessfully tried to add a prohibition of any purchase of territory; and the bill, without the proviso, passed March 1. In the house the proviso was moved by Wilmot as an amendment, Feb. 8, renewed by Hamlin, Feb. 15, and adopted by a vote of 115 to 106, Douglas unsuccessfully trying to restrict it to territory north of latitude 36° 30'. March 3, in the house, the proviso was added to the senate bill in committee of the whole by a vote of 90 to 80, but rejected on the report of the committee (97 to 102); and the bill, without the proviso, was finally passed (115 to 81). — In the meantime, a bill to organize Oregon territory, with a provision that the inhabitants should enjoy all the privileges, and be bound by all the prohibitions and restrictions, of the ordinance of 1787 (which prohibited slavery), was passed by the house, Jan. 16, 1847. But Oregon was now to be linked in, for a time, with the territory to be annexed; and the senate, after twice committing the bill, laid it on the table, March 3. — II. AFTER ANNEXATION AND BEFORE COMPROMISE. Before any further measures could be attempted at the next session, peace had been concluded, Feb. 2, 1848, and the great territories of California and New Mexico (see ANNEXATIONS, IV., for their extent) had been transferred to the United States. The fact of possession greatly changed political conditions. Southern democrats simply continued to oppose the proviso; northern democrats now opposed it by force of the doctrine of popular sovereignty; and southern whigs, who had opposed it together with the \$3,000,000 bill, on account of the acquisition of territory, found little difficulty in continuing the opposition after annexation. In short, the proviso had now no friends in congress, excepting a part of the northern whigs and the few remaining Wilmot democrats. Only the imminent presidential election of 1848, and the unknown possibilities of a northern free-soil uprising, prevented the organization of the territories, without the proviso, in the spring of 1848; and

the lost opportunity was not easily regained. — May 29, 1848, the president called the attention of congress to the pressing necessity of organizing Oregon territory; and the necessity was emphasized by the fact that the popular provisional government (see OREGON) had begun to make laws forbidding slavery. The necessary bill, which Douglas had reported, Jan. 10, was at once brought up; Hale offered as an amendment a section imposing the prohibitions, as well as the privileges, of the ordinance of 1787; and debate continued until July 12. A select committee of eight was then chosen, and it reported, July 18, a bill in thirty-seven sections, commonly known as the "Clayton compromise," from the chairman of the committee, organizing the territories of Oregon, California and New Mexico together. No power was given to the territorial legislatures to legislate on slavery, and questions of its legality or illegality in any particular territory were to be decided by the territorial courts, with a right to appeal to the United States supreme court. In this form the bill was passed, July 26, but the house laid it on the table by a vote of 112 to 97, and it was never revived. The majority was made up of seventy-four northern whigs, thirty northern democrats, and eight southern whigs. Aug. 2, the house passed an Oregon bill, with the section relating to the ordinance of 1787. Aug. 10, the senate passed it with an amendment declaring the Missouri compromise line to extend to the Pacific, and to be binding in all future organizations of territories; and on the following day the house non-concurred. Aug. 12, the senate receded, passed the bill as it originally came from the house, and Oregon was a free territory. The secret of the senate's action was in the Buffalo convention three days before, and the nomination of candidates pledged against extension of slavery. (See FREE-SOIL PARTY.) — The southern leaders were doubly embarrassed at the meeting of congress in December, 1848. The discovery of gold in California, Jan. 19, 1848, was increasing the population so rapidly that a state government would soon be even more necessary than a territorial government; and the mass of northern democrats in congress were so thoroughly provoked by Taylor's election through southern electoral votes as to be ready even for the proviso. Nothing could have postponed the proviso but the shortness of the session, and the still controlling influence of the south in the senate. Congress had hardly organized, when the house, Dec. 13, by a vote of 108 to 80, instructed the committee on territories to bring in territorial bills for California and New Mexico, "excluding slavery therefrom." The committee, one week later, reported the California bill, but it was not reached until Feb. 26, 1849. The next day it was passed by a vote of 126 to 87, almost exactly sectional. The New Mexico bill was reported Jan. 8, but was not reached. In the senate the California bill was referred, but never considered, and the committee was discharged, March 3. In place of it, an un-

successful attempt was made to tack a senate bill to the appropriation bill. (See RIDERS, II.) At the adjournment the territories were still left unorganized. — No one, as yet, denied the right of the people of a territory, when forming a state constitution, to prohibit slavery; and the new administration (Taylor's) at once undertook to solve the problem by procuring the formation of state governments in both California and New Mexico. In both of these the Wilmot proviso was a part of the state constitution. This forced the further proceedings into a new line, which is detailed elsewhere. (See COMPROMISES, V.) In reviewing the whole current of events, at the close of September, 1850, it will appear that the object of the proviso, the prohibition of slavery, had been successfully attained in all the territory outside of the Louisiana purchase, except the modern state of Nevada, and the territories of Utah, New Mexico and Arizona (then included in New Mexico); and that, as to the excepted portions, the Mexican laws abolishing slavery therein had never been interfered with by American laws. But the struggle over the Wilmot proviso, which was essentially only a declaration of the existing law of the territories, was a very sufficient warning that some influence was at work, which would resist any such declaration for the future. This was the doctrine of Calhoun, that the constitution's guarantee of security to property covered the territories also; and that congress was bound to enforce it in the case of slave property, as well as other property. The objection now seems insuperable that the slaves were always referred to as "persons" in the federal constitution, and as "property" only in state constitutions and laws, which could have nothing to do with the territories. But at the time Calhoun's doctrine fell in too closely with southern feeling to be resisted. It was adopted, openly by some, tacitly by others, and the comparative strength of the former class steadily increased. Calhoun's resolutions of Feb. 19, 1847, protesting against discrimination in the territories against any state, were the first, though vague, expression of the doctrine, and their effect was seen in the unanimous resolutions of the Virginia legislature, March 8, following: 1, that such a discrimination was in violation of the compromises of the constitution; 2, that it was to be "resisted at every hazard"; and 3, that, in the event of the passage of the Wilmot proviso or any law abolishing slavery or the slave trade in the District of Columbia, the governor should immediately convene the legislature "to consider of the mode and measure of redress." As the proviso discussion went on, the southern tone grew still warmer; and at the time of the final compromise most of the southern states had statutes or resolutions in existence directing the governor to call a popular convention in the event of the passage of the proviso. (See SECESSION, II.) — III. AFTER THE COMPROMISE. The general ratification of the compromise of 1850 seemed at first to have put an end to the desire for the pro-

viso. When was it to be applied? California was a free state, and the territories had been completely organized, those acquired under the Louisiana purchase having the proviso under the Missouri compromise, and those acquired under the Mexican purchase merely ignoring it. Not content to let well enough alone, the northern democratic leaders, in 1854, attempted to apply the "popular sovereignty" principle to the new territories of Kansas and Nebraska, formed from the Louisiana purchase (see KANSAS-NEBRASKA BILL), and thus to wipe out the proviso when it was already established by law. The attempt naturally revived the proviso on a far stronger ground. It was now an evidently conservative effort to reapply to the Louisiana purchase the prohibition which had been its organic law from 1820 until 1854; and it thus secured a breadth of support greater than it could have obtained in 1849-50, and became the basis of a great northern party. (See REPUBLICAN PARTY, I.) But of course the new party could not be content to limit the assertion of the proviso to the Louisiana purchase: law for one territory was law for all, for Utah and New Mexico as well as for Kansas and Nebraska; and thus the work of 1850 was to be done over again, with no chance now for compromise. In 1857 the supreme court decided that the proviso had always been unconstitutional in the case of any territory (see DRED SCOTT CASE); but this had little effect on the supporters of the proviso. They still asserted the right of congress to impose a prohibition of slavery upon the territories, disregarding the *obiter dicta* of the supreme court, and leaving the constitutional question to be decided by the court when the case should come directly before it. Against this permanent programme a bald negative was but a poor reliance: the south was compelled to choose between admitting the validity of a prospective prohibition, or taking Calhoun's extreme ground of the duty of congress to protect slavery in the territories. It chose the latter (see DEMOCRATIC PARTY, V.), its ultimatum being expressed in Jefferson Davis' senate resolutions of May 24-25, 1860. The most important of these, in this connection, were the fourth and fifth, as follows: "4, that neither congress nor a territorial legislature, whether by direct legislation or legislation of an indirect and unfriendly character, possesses power to annul or impair the constitutional right of any citizen of the United States to take his slave property into the common territories, and there hold and enjoy the same while the territorial condition remains; 5, that, if experience should at any time prove that the judicial and executive authority do not possess means to insure adequate protection to constitutional rights in a territory, and if the territorial government should fail or refuse to provide the necessary remedies for that purpose, it will be the duty of congress to supply such deficiency." At least a part of these resolutions was explained by a territorial law of New Mexico, in 1850, establishing slavery. It was dis-

approved by the house of representatives, but the senate did not act on the veto bill, so that the territorial slave law remained in force. On the contrary, the eighth resolution of the republican platform in May, 1860, declared "that the normal condition of all the territory of the United States is that of freedom; that, as our republican fathers, when they had abolished slavery in all our national territory, ordained that no person should be deprived of life, liberty or property without due process of law, it becomes our duty, by legislation, whenever such legislation is necessary, to maintain this provision of the constitution against all attempts to violate it; and we deny the authority of congress, of a territorial legislature, or of any individuals, to give legal existence to slavery in any territory of the United States." The issue was thus fairly made up on both sides: all or nothing. The republican programme was indorsed by Lincoln's election, and secession and war followed. (See SECESSION, III.; REBELLION.) — IV. FINAL ESTABLISHMENT OF THE PROVISIO. The withdrawal of southern senators and representatives left the republicans in a majority in both houses of congress before the end of the session of 1860-61; but they made no attempt to enforce the eighth section of the Chicago platform. The propositions of Crittenden (see COMPROMISES, VI.), and of the peace congress (see CONFERENCE, PEACE), both of which aimed to forbid the future application of the Wilmot proviso to territory south of latitude 36° 30', were rejected; but, on the other hand, the territories of Colorado, Dakota and Nevada were organized without the Wilmot proviso, in entire silence as to slavery, and therefore with all the benefits to the south of the Dred Scott decision. Slavery in the territories remained undisturbed until 1862, immediately after its abolition in the District of Columbia, April 16. (See ABOLITION, III.) In the house, March 24, a bill was introduced "to render freedom national, and slavery sectional," and was referred to the committee on territories. It was reported, May 1, recommitting, and again reported, May 8. It was now a bill to prohibit slavery in the territories, in federal forts, dockyards, etc., in vessels on the high seas, in national highways, and in all places where the national government had exclusive jurisdiction. It was debated until May 12, when it had been modified into a simple prohibition of slavery in the territories, and was then passed by a vote of 85 to 50. In the senate, June 9, its language was slightly changed to the following: "that, from and after the passage of this act, there shall be neither slavery nor involuntary servitude in any of the territories of the United States now existing, or which may at any time hereafter be formed or acquired by the United States, otherwise than in punishment of crime, whereof the party shall have been duly convicted"; and it was then passed (28 to 10). June 17, the house concurred (72 to 38); and the bill became law, June 19. It was never brought before the supreme court, in

order that its constitutionality might be examined in the light of the yet unreversed Dred Scott decision; but all doubts on that score were removed by the national abolition of slavery in 1865, through the ratification of the 13th amendment. (See CONSTITUTION, III.) — See 3 von Holst's *United States*, 286; 1 Greeley's *American Conflict*, 189; 2 Wilson's *Rise and Fall of the Slave Power*, 18; Harris' *Political Conflict in America*, 114; 2 A. H. Stephens' *War Between the States*, 185; Buchanan's *Administration*, 18; 1 Dix's *Speeches*, 179 (Three Million Bill). Gardiner's *The Great Issue*, 94; 16 Benton's *Debates of Congress*, 223-254 (Oregon), 399 (summary of Mexican laws abolishing slavery); Cleveland's *A. H. Stephens*, 343 (and law authorities there cited in favor of the continuance of Mexican laws after conquest); 3 *Statesman's Manual*, 1613 (Message of Aug. 8, 1846), 1710 (Message of May 29, 1848); 15 Benton's *Debates of Congress*, 645 (introduction of the proviso); 16 *ibid.*, index under *Slavery*; 4 Calhoun's *Works*, 339 (resolutions of Feb. 19, 1847); 1 A. H. Stephens' *War Between the States*, 409 (Senate resolutions of May 24-25, 1860); 12 *Stat. at Large*, 492 (act of June 19, 1862); Wilson's *Anti-Slavery Measures in Congress*, 92. The different shades of opinion as to the proviso may best be studied as follows: moderate democratic (south), 2 Benton's *Thirty Years' View*, 695 (north), 1 Dix's *Speeches*, 281; extreme southern democratic, 4 Calhoun's *Works*, 535 (Speech of Feb. 24, 1849); southern whig, Cleveland's *A. H. Stephens*, 332 (Speech of Feb. 12, 1847); northern whig, 5 Webster's *Works*, 253 (Speech of March 1, 1847); free-soil, Horace Mann's *Letters and Speeches*, 10 (Speech of June 30, 1848); abolitionist, Jay's *Review of the Mexican War*, 183, and Warden's *Life of Chase*, 314; administration, 1849-50, 3 *Statesman's Manual*, 1847 (Message of Jan. 21, 1850). The *Democratic Review* carefully avoids the subject until September, 1847 (p. 103), and the *Whig Review* until August, 1848 (p. 193), and then both pronounce against the proviso, the former as an abolition measure, the latter as a democratic measure.

ALEXANDER JOHNSTON.

WILSON, Henry, vice-president of the United States 1873-5, was born at Farmington, N. H., Feb. 16, 1812, and died in office at Washington city, Nov. 22, 1875. His name, Jeremiah Jones Colbath, was changed to Henry Wilson by an act of the legislature in 1830. He was self-educated during the time which he could save from his labors as a farm hand and shoemaker. From 1841 until 1852 he served frequently in the state legislature, as a whig with strong anti-slavery opinions. In 1848 he withdrew from the whig national convention, entered the free-soil party, and was its candidate for governor in 1853. He then went into the "know-nothing" organization (see AMERICAN PARTY), but withdrew from it in 1855. Before his withdrawal he had been elected United States senator by a coalition of know-nothings, free-soilers and opposition democrats; and he re-

tained the position as a republican until his election as vice-president. During the rebellion he served as chairman of the senate military committee, and took a leading part in the conduct of the war by congress. His leading work is the *History of the Rise and Fall of the Slave Power in America*; his minor works are the *History of the Anti-Slavery Measures in Congress, 1860-64*; *Military Measures of the United States Congress*; *History of the Reconstruction Measures in Congress, 1865-8*; *History of the Part of Congress in the War to suppress the Rebellion*. See Stowe's *Men of Our Times*; Mann's *Life of Wilson*; Nason's *Life of Wilson*.

ALEXANDER JOHNSTON.

WIRT, William, was born at Bladensburg, Md., Nov. 8, 1772, and died at Washington city, Feb. 18, 1834. He was admitted to the bar in 1794, and practiced in eastern Virginia until 1817, when he became attorney general of the United States, serving until 1829. In 1830 he removed to Baltimore. In 1832 he was the anti-masonic candidate for the presidency (see ANTI-MASONRY, I), and received the seven electoral votes of Vermont. See Kennedy's *Memoir of Wirt* (1852); 70 *North American Review*, 255; 92 *ib.*, 277.

ALEXANDER JOHNSTON.

WISCONSIN, a state of the American Union, formed from the northwest territory. (See TERRITORIES, ORDINANCE OF 1787.) Its area was included successively in the territories of Indiana, Illinois and Michigan, and was finally organized into the territory of Wisconsin, April 20, 1836. An enabling act was passed Aug. 6, 1846, and under its provisions a convention at Madison, Oct. 5-Dec. 16, 1846, framed a state constitution. An act was then passed, March 3, 1847, to admit the new state under this constitution, if it should be ratified by popular vote. It was rejected by the people, owing to its attempt to prohibit banks and banking, and Wisconsin remained a territory. May 29, 1848, the state was finally admitted under its first constitution. — BOUNDARIES. As this was the fifth state erected from the northwest territory, which, by the ordinance of 1787, was to be divided into not more than five states, it would seem fitting that Wisconsin should have comprised all the remnant of the original territory. This, however, was not done: five and a half states were really formed, that portion west and north of the western end of Lake Superior being taken from Wisconsin and given to the trans-Mississippi territory of Minnesota. The boundaries of the state, as fixed by the enabling act and accepted by the first constitution, are as follows: Beginning in the middle of Lake Michigan, in latitude 42° 30' north (the northern boundary of Illinois); thence, with the Michigan boundary, through Lake Michigan, Green Bay, and the Menomonee, Brulé and Montreal rivers to Lake Superior; thence through the middle of Lake Superior to the St. Louis river at the head of the lake, up the St.

Louis to its first rapids, due south to the St. Croix river, down the St. Croix to the Mississippi, down the Mississippi to the northwest corner of Illinois, and thence east to the beginning. — **CONSTITUTION.** The constitution under which the state was admitted, still in force, was framed by a convention at Madison, Dec. 15, 1847–Feb. 1, 1848, and ratified by popular vote March 13. It forbade slavery; gave the right of suffrage to white males over twenty-one, on one year's residence, but with power to the legislature to extend the limits of the elective franchise on ratification by popular vote; fixed the numbers of the assembly at not less than fifty-four nor more than 100, to serve one year, and of the senate at not less than one-fourth nor more than one-third of the assembly, to serve two years; gave the governor, elected by popular vote, a term of two years; made the judiciary elective for a term of years, and removable by address of two-thirds of the members elected to each house; forbade the loaning of the state's credit, or the contracting of a state debt of more than \$100,000 except in case of war or insurrection; and made Madison the capital of the state. Slight amendments were made in 1867, 1869 and 1870; in 1871 the legislature was forbidden to pass special laws in a number of specified cases; in 1874 county and municipal governments were forbidden to contract debts to an amount greater than 5 per cent. of their taxable property; and in 1882 the sessions of the legislature were made biennial. — **GOVERNORS.** Nelson Dewey, 1848–51; Leonard J. Farwell, 1851–3; Wm. A. Barstow, 1853–5; Coles Bashford, 1855–7; Alex. W. Randall, 1857–61; Louis P. Harvey, 1861–2; Edward Salomon, 1862–3; James T. Lewis, 1863–6; Lucius Fairchild, 1866–72; C. C. Washburn, 1872–4; Wm. H. Taylor, 1874–6; Harrison Ludington, 1876–8; Wm. E. Smith, 1878–82; Jeremiah M. Rusk, 1882–4. — **POLITICAL HISTORY.** In national politics the state was democratic until 1856, casting her electoral votes for Cass and Pierce in 1848 and 1852. In 1856, and at every presidential election since that year, the state has been republican, about 55 per cent. of the total popular vote being cast for the republican electors, except in 1876, when it fell to 51 per cent. In more local elections, the results have been closely similar. Until 1855 the state governments and congressmen were democratic, with the following exceptions: in 1851 Gov. Farwell was elected by a temporary coalition of whigs and free-soilers; and until 1852 the southeastern or Milwaukee district elected a free-soil congressman, the southwestern district a whig, and the northeastern district a democrat. The coalition of 1851 dissolved almost immediately, and for the next two years democratic supremacy was hardly disputed. Early in 1854 the organization of the republican party (see that title) was begun, and before July it had been completed, the whig and free-soil committees disbanding, and new committees of whigs, free-soilers and democrats, being appointed in their stead. In the fall elections the new party carried two of the congressional dis-

tricts and the lower house of the legislature, and elected twelve of the twenty-five senators: the Milwaukee district was now democratic. In the following year, though the democrats carried the lower house and elected all the state officers except the governor, the republicans secured the senate, and, after a struggle, the governorship also. For this office the first official count gave Barstow (dem.) 36,170 votes, and Bashford (rep.) 36,012. Bashford claimed a miscount, took the oath as governor in January, 1856, and brought a *quo warranto* suit in the state supreme court against Barstow, who had also taken the oath. The assembly voted to recognize Barstow as governor, and the senate voted to recognize him as governor *de facto* until the decision of the supreme court. Barstow denied the court's jurisdiction, which the court after argument affirmed, Feb. 19. Barstow then withdrew from the case under protest, and left the office to Bashford. Since that time all the governors, with the exception of Gov. Taylor, have been republican, as well as the legislatures, the United States senators and the congressmen, with some exceptions, most of which are noted below. — In 1856 the republicans again elected the governor, a majority of both houses of the legislature, and as a consequence the United States senator (Doolittle): the democrats again elected the other state officers. This was the last election for many years in which the result was close or doubtful. Since 1863 the Fond du Lac district has always chosen a democratic congressman; and to this must be added the northeastern or Green Lake district in 1859–65, the Milwaukee district in 1863–5 and 1871–85, the Winnebago district in 1875–85, and the general democratic success in 1882. In all other congressional elections the republicans have been successful, having usually five of the six congressmen from 1861 until 1871, and five of the eight congressmen from 1871 until 1881. In the election of 1882, under a new apportionment, the state was entitled to nine congressmen, and the democrats were successful in six of the districts. — In state politics the most interesting issues have been the Graham law in 1872, and the Potter law in 1874. The former was an act requiring a license for the sale of liquor, together with a bond for the payment of any damages recovered against the seller by a town for the support of an intoxicated person, or by any person injured in the means of support by the sale of liquor to husband, wife, parent or child. It was decided constitutional by the state supreme court in 1873, and, with other moving causes, led to a slight republican reverse in that year: the liberal republicans and democrats elected Taylor governor. March 11, 1874, the Potter law was passed. It was a general railroad law, fixing railroad rates for passengers and freight, and creating a board of commissioners to enforce the law. The railroads took the case to court, and in the interim refused to obey the law; but the case was decided against them by the state court and the federal circuit court, and steps were at once

taken to revoke the charters of the railroads for their violation of the law. For the time the railroads yielded, but the good understanding between the "grangers" (see that title) and the democrats gave the latter most of the state officers, and their candidate for governor, Taylor, was only defeated by the close vote of 85,155 to 84,314. But throughout these slight vicissitudes the republicans retained control of the legislature, except that in 1875 their regular candidate for United States senator, Carpenter, was defeated by Cameron, also a republican, through the votes of democrats and "bolting" republicans. The legislature in 1882-3 stands as follows: senate, twenty-four republicans, nine democrats; house, seventy-eight republicans, twenty-two democrats.—Among the political leaders of the state have been the following: Angus Cameron, republican United States senator 1875-85; Matthew H. Carpenter, republican United States senator 1869-75 and 1879-81; Lucien B. Caswell, republican congressman 1875-83; Orsamus Cole, whig congressman 1849-51, state chief justice at present (1884); P. V. Deuster, democratic congressman 1879-85; Henry Dodge, governor of Wisconsin territory 1836-41, delegate to congress 1841-5, democratic United States senator 1848-57; James R. Doolittle, state circuit judge 1853-6, republican United States senator 1857-69, democratic candidate for governor 1871; Charles Durkee, free-soil congressman 1849-53, republican United States senator 1855-61, governor of Utah territory 1865-70; Charles A. Eldredge, democratic congressman 1863-75; Richard Guenther, republican congressman 1881-5; George C. Hazelton, republican congressman, 1877-83; Timothy O. Howe, state circuit and supreme court judge 1850-55, republican United States senator 1861-79, postmaster general under President Arthur; Wm. Pitt Lynde, democratic congressman 1848-9 and 1875-9; Halbert E. Paine, republican congressman 1865-71; E. G. Ryan, chief justice of the state supreme court; Philetus Sawyer, republican congressman 1865-75, and United States senator 1881-7; Cadwallader C. Washburn, republican congressman 1855-61 and 1867-71, and governor 1872-4; and Charles G. Williams, republican congressman 1873-83.—The state was named from its principal river, the Wisconsin, "Ouisconsin," a mixed French and Indian word, said to mean "westward flowing."—See 2 Poore's *Federal and State Constitutions*; 2 Hough's *American Constitutions*; *Wisconsin Historical Society Collections*; Lapham's *Wisconsin: Its Geography and Topography* (1846); Smith's *History of Wisconsin* (1854); Love's *Wisconsin in the Rebellion* (1866); 2 Wilson's *Slave Power*, 409; *Wisconsin Reports*; *Tribune Almanac*, 1846-83; Appleton's *Annual Cyclopædia*, 1861-82; the acts of April 20, 1836, and March 3, 1847, are in 5 *Stat. at Large*, 10, and 9 *Stat. at Large*, 178.

ALEXANDER JOHNSTON.

WOMAN SUFFRAGE. (See SUFFRAGE.)

WRIGHT, Silas, was born at Amherst, Mass., May 24, 1795, and died at Canton, N. Y., Aug. 27, 1847. He was graduated at Middlebury college in 1815, was admitted to the bar in 1819, and almost immediately entered politics as a democrat. He served as surrogate of Rockland county 1821-4, as state senator 1824-7, as congressman 1827-9, as state comptroller 1829-33, as United States senator 1833-44, and governor 1844-6. About 1824 his ability had made him a leading member of the "Albany regency" (see that title), which controlled the state democratic party; and he held his place in it until his death. Van Buren's failure to receive the democratic nomination for the presidency in 1844 placed the regency in an attitude of armed neutrality toward the incoming administration of Polk; and, when this state of things had developed into open war in 1846, Wright was defeated for re-election as governor by the refusal of administration democrats to vote. His death soon afterward added to the bitterness of feeling between his followers and their opponents, and the state party in 1848 made the conflict national. ALEXANDER JOHNSTON.

WYOMING, a district in the northeastern part of Pennsylvania, the seat of a long conflict of jurisdiction between Pennsylvania and Connecticut. Attention is elsewhere called (see TERRITORIES) to some of the difficulties which were occasioned by the undefined western boundaries of Massachusetts, Connecticut, Virginia, and the three colonies south of Virginia. In the case of Connecticut the difficulty was increased by the fact that a western prolongation of its territory, passing over the Dutch settlements on the Hudson river, specially excepted under the head of possessions of "any other Christian prince or state," would have taken a strip of land about 120 miles wide from the northern part of Pennsylvania. Connecticut's assertion of her rights took the form of a private association, the "Susquehanna company," organized in 1753, and backed by the colonial government. In 1754 the company sent commissioners to meet the council of the Six Nations at Albany (see ALBANY PLAN OF UNION), in order to purchase the Indian title. Franklin and the other Pennsylvania commissioners, aided by Sir William Johnson, of New York, endeavored to prevent the purchase, but it was effected for £2,000. The eastern boundary was to be an irregular northerly line at a distance of ten miles east of the Susquehanna from latitude 41° north to latitude 42° north; thence two degrees of longitude west; thence 120 miles south; and east to the place of beginning. In 1763 the company sent

its first party of settlers, 200 in number; but the Indians attacked and dispersed them, sent a deputation to Hartford in 1763 to repudiate the sale to the company, and in 1768 resold the same territory to Pennsylvania. In 1769 the company, disregarding the Indian transactions, again began to throw immigrants into Wyoming, and a desultory civil war began between the Connecticut settlers and the Pennsylvania men to whom the district had been leased. The former were several times driven altogether out of the valley, and compelled to return to Connecticut, but their persistence was successful within two years in obtaining a permanent lodgment. This result was due in great measure to the faulty land policy of Pennsylvania, whose proprietors, the Penn family, made it their regular policy, whenever it was possible, to grant leases only. Franklin says of Penn's initiation of this policy: "The scene of action being shifted from the mother country to the colony, the deportment of the legislator was shifted too. Less of the man of God now appeared, and more of the man of the world. One point he had already carried against the inclination of his followers, namely, the reservation of quit rents, which they had remonstrated against as a burden in itself, and, added to the purchase money, without precedent in any other colony; but, he artfully insinuating that government must be supported with splendor and dignity, and that by this expedient they would be exempt from other taxes, the bait took, and the point was carried." It was unnatural to expect that mere lessees would exhibit the same spirit in conflict as men who were maintaining a claim for absolute ownership. In other words, the struggle was between two opposite land systems, that of freeholders and that of leaseholders. While this was the case, the result was not doubtful, and the success of the Connecticut settlers was not displeasing to most of the Pennsylvania people, who disliked the proprietary government and the proprietary land system.— In 1773 the Wyoming settlement had gained so much strength that it began to have ambitious views of independent existence as a separate colony, and the company, meeting at Hartford, June 2, 1773, adopted a form of government for it. But the legislature of Connecticut, having been fortified by the favorable opinion of a number of the best lawyers in Great Britain, Dunning, Jackson, Widderburn and Thurlow, asserted the colony's jurisdiction over the Susquehanna company's territory. In 1774 it was made a town under the name of Westmoreland, and was to be considered a part of Litchfield county, Connecticut. The town for several years sent delegates to the Connecticut legislature. The breaking out of the difficulties with the mother country suspended all minor disputes, and the contest was suspended throughout the revolutionary war, except that the attack on Wyoming and massacre of its defenders, in July, 1778, seem to have been influenced in a slight degree by the feeling that the settlers were interlopers.— In 1779 an act of the Pennsyl-

vania legislature transferred all the proprietary quit rents to the state, reserving the proprietors' private property to them, and granting them \$524,000 compensation for quit rents, payable in installments after the peace. The new lord of the soil, the state, at once abandoned the leasehold system in future sales, and thus renewed the contest with the Connecticut settlers on equal terms. Under the provision of the articles of confederation which made congress a court of last resort for the trial of title to territory disputed between the states, Pennsylvania brought suit against Connecticut to decide the jurisdiction of Wyoming. The case was heard by five judges at Trenton, and in November, 1782, their unanimous decision, afterward confirmed by congress, was given in favor of Pennsylvania. By this time a number of Pennsylvanians had settled in the territory, and when these proceeded to elect justices of the peace the Pennsylvania legislature, in September, 1783, directed the governor to commission the officers so elected. This began the "war of the Pennamites and the Yankees." The Connecticut settlers had submitted to the decision of congress, and given up their town organization; but they expected that their Connecticut titles to land would be respected or quieted. The conditions offered by Pennsylvania were intolerable: the Connecticut settlers were to surrender half their lands at once, to retain possession of the other half for one year, and were then to surrender the whole to claimants under Pennsylvania titles. The settlers resisted, led by John Franklin and others, and prevented state agents from laying out townships or counties; and their resistance had so much sympathy from the people of Pennsylvania that the legislature, Sept. 15, 1784, suspended proceedings. For the next two years the district was in a very anomalous condition, until in September, 1786, Pickering (see his name) procured the adoption of two complementary measures which bade fair to settle the whole difficulty. Luzerne county was established, and the district was thus brought within the jurisdiction of Pennsylvania, and the petitions of the Connecticut settlers for a confirmation of their titles were granted by a confirmatory act. By Pickering's active exertions the settlers were brought to agree to the settlement in May, 1787; but in the following year the legislature, having secured the organization of the county, repealed the confirmatory act, and this shocking piece of bad faith ("unjust and cruel," Pickering calls it) reopened the difficulty. Suits were brought by Pennsylvania claimants against the settlers; but it required more than eight years to decide the first suit, and the unfavorable issue of this one had no effect on the persistence of the other settlers. Finally, April 4, 1799, the legislature passed a compromise act, which secured possession to those who held Connecticut titles, acquired before the Trenton decision of 1782, on the payment of small sums ranging from 8½ cents to \$2 an acre. The war of the Pennamites and Yankees was thus ended.— See

Miner's History of Wyoming; Stone's History of Wyoming; Peck's History of Wyoming; 3 Franklin's Works, 123; Pickering's Concise Narrative of the Wyoming Dispute (1798), and authorities under PICKERING.

ALEXANDER JOHNSTON.

WYOMING TERRITORY, a territory of the United States, north of Colorado and Utah. Its area (97,883 square miles) was a part of the Louisiana cession (see ANNEXATIONS, I.), ex-

cept the southwestern strip, about one degree in width, about two-thirds of the length of the territory, and containing 14,320 square miles, which was a part of the Mexican cession. (See ANNEXATIONS, IV.) The territory was organized by act of July 25, 1868, and by the census of 1880 its population is 20,789. Its capital is Cheyenne. The act of July 25, 1868, is in 15 *Stat. at Large*, 178.

ALEXANDER JOHNSTON.

X

X Y Z MISSION (IN U. S. HISTORY). The relations between the French republic and the United States had been steadily becoming more tightly strained for years before the inauguration of President John Adams in 1797, more especially by reason of the manner in which France had seized American provision ships (see EMBARGO, I.), and permitted illegal captures of American vessels by her privateers. The position of France was more advantageous from the fact that she respected, and pretended to respect, no international law whatever. Her assumed place was not that of a coequal unit in the family of nations, but that of an apostle of liberty, limited in her action only by her own conceptions of expediency. Appeals to treaties violated by France met an easy answer in declamatory references to liberty; and any nation refusing to strengthen the hands of France was a self-confessed enemy to liberty and to France. In dealing with both France and Great Britain, Washington's policy was an armed neutrality, but no party supported him cordially in all its features. The republicans (democrats) tended from the beginning to an unarmed dependence upon France; and the federalists, as they grew to be more openly a commercial party, tended to an armed dependence upon Great Britain. Washington's policy was successful in checkmating Genet (see his name), and in keeping succeeding French envoys within limits for some years. But even Washington had to yield to the growing change in the federal party which dates from Jay's treaty (see both these titles) with Great Britain; and Adams, at his inauguration, found his party as much disposed to pick a quarrel with France as France was certain to furnish the opportunity, and far less disposed to submit to a counterbalancing influence from him than from his predecessor. — In return for the recall of Genet, the French republic had asked and obtained the recall of Gouverneur Morris, the American minister, who had not even affected any sympathy with the course of the French revolution. In his place was sent James Monroe, who proved much more acceptable to France. The French republic (see EMBARGO, I.) had already begun those interferences with American commerce which provoked English retaliatory interferences; and these con-

sequences, in their turn, made the French aggressions increasingly annoying. Most of the English annoyances were removed by Jay's treaty; as to France the United States still depended upon the old treaty of alliance of 1778. But France, in addition to her long-standing grievance arising from Washington's policy of neutrality, of which she could hardly complain openly, had now a plausible ground of complaint in what she chose to consider the American alliance with Great Britain. In February, 1796, one of the directory informed Monroe that the treaty of 1778 was at an end from the moment of the ratification of Jay's treaty; to which Monroe very properly replied that the treaty had already been brought to nothing by the constant French captures of American vessels. — In other points of his diplomatic intercourse Monroe had not so well satisfied either Washington or the cabinet. He had been given in advance a complete vindication of Jay's treaty for the information of the French government, but had not presented it, believing that it was intended to be held in readiness to answer formal complaints. And in general his diplomatic language was altogether ill advised and unfitting an ambassador. As a single instance, his letter of Sept. 3, 1794, to the committee of public safety, declared that, if they should be of opinion that the French infractions of the treaty were productive of "any solid benefit to the republic, the American government and my countrymen in general will not only bear the departure with patience, but with pleasure." Their tone of pitiful subservience makes it difficult to read Monroe's official communications, as collected and published by himself, with either pleasure or patience; and, after a sharp rebuke from Pickering, in June, 1796, he was recalled, and Charles Cotesworth Pinckney was sent in his place. — By this time the control of the French revolution had passed from the madness of the many to the selfishness of the few. The executive directory now enjoyed a power of which the military ability of Napoleon had been the first foundation and was still the principal buttress; and under its leadership the French republic was employing for pure self-aggrandizement the exemption from international law which it had at first asserted in the name of liberty. And Napoleon, from the begin-

ning, saw the limit which the British channel would put to the conquest of Europe, and the manner in which alone he could pass it, by giving the English fleets employment elsewhere. In 1797, after the peace of Campo Formis, he wrote: "We must set all our strength upon the sea; we must destroy England; and the continent is at our feet." But the same year had already seen the destruction of the Spanish fleet off St. Vincent, and of the Dutch fleet at Camperdown; and from this time until 1812 Napoleon never ceased the effort, by bluster, by kindness, or by fraud, to make the long and stormy coast of North America his most efficient ally against Great Britain. — A few days before Pinckney's arrival the French minister of foreign relations informed Monroe what formalities were to be observed in taking leave. Dec. 9, 1796, Monroe presented his letter of recall, and Pinckney his letter of credence. Two days after, Monroe received written notice that no American minister would be received until the French grievances should be redressed, and that the French minister to the United States would be recalled; and yet, at the end of the month, he accepted a public reception from the directory, at which the president, Barras, without remonstrance from him, publicly announced that France "would not stoop to calculate the consequences of the condescension of the American government to the wishes of its ancient tyrants." Pinckney was left in Paris, refused recognition by the directory, and even threatened with police surveillance, until the latter part of January, 1797, when he received written notice to quit France, and retired to Holland to await instructions from home. — Adams was intent upon following up the policy of neutrality, but this news left him little option. He called a special session of congress for May 16, 1797, and stated his intention of sending a new mission to France, to conciliate that country, if possible, but at the same time recommended the prompt formation of a navy and a general permission to private vessels to arm in self-defense. For the mission he named Pinckney, John Marshall, and Francis Dana, chief justice of Massachusetts, and these were confirmed by the senate. Dana declining, Elbridge Gerry was substituted, being specially acceptable to his close personal friend, the president, and, as a democrat, to France also. In October, 1797, the three met at Paris, and undertook to open negotiations with the directory. One leading complaint on the part of France evidently awaited them. The treaty of 1778 had established the principle (between France and the United States) that "free ships made free goods," that enemy's property, excepting contraband of war, was not to be captured in a friendly ship. Jay's treaty, on the contrary, allowed the capture of enemy's property in friendly ships; so that France complained that her ships could not lawfully take English property from American vessels, while British ships were not so restrained as to French property. On this head, the commissioners were empowered to grant to France the

same privilege which Jay's treaty granted to Great Britain. They were also directed to demand, but not as a *sine qua non*, compensation for past injuries to American commerce; and they were forbidden to consent to any loan, under any guise. — While the commissioners were engaged in Paris during the winter, and while little was known of their proceedings, owing to difficulty of winter communication, politics in the United States came to a complete stand-still. The federalists were thoroughly alarmed by the state of affairs in Europe, and the dubious prospects of a single-handed war with France. The French armies had the continent at their feet, and even Great Britain had become anxious for peace. A conflict with France, that is, with continental Europe, was certainly not at any time to be sought wantonly by a backwoods nation of 3,000,000 souls, inhabiting an enormous territory and politically divided among themselves; but the case was infinitely worse if the British navy was to leave the ocean open to the unopposed transport of French troops. Both political parties were afraid to take a step forward, and their uneasiness was increased by the fact, that, though the federalists controlled the senate, there was no party majority in the house of representatives. That body was controlled by a number of members of doubtful political sympathies, without whose support neither party could do anything. Thus, in spite of the president's recommendations to equip a navy, arm private vessels, and fortify the coast, nothing was done throughout the winter. March 5, 1798, the president notified congress that cipher dispatches, dated from November until January, had arrived from the commissioners; and March 19, having deciphered them, he sent another message, in which, without detailing the contents of the dispatches, he summed them up in the information that the commissioners could gain no terms that were "compatible with the safety, the honor or the essential interests of the nation." This first thunder-clap was so effective that the house promptly passed bills to equip three frigates, and to prohibit the exportation of arms; and the senate passed bills to authorize the lease of cannon foundries and the purchase of sixteen additional vessels of war. In spite of the long series of aggressions upon American commerce by both Great Britain and France, these were the first belligerent preparations made by the United States under the constitution. To check them, it was at first hoped by the democrats that an adjournment of congress might be secured; but this was impossible without the consent of the senate. As a second choice, resolutions were offered, March 27, that it was not expedient, under existing circumstances, "to resort to war" against France, or to arm merchant vessels. One of the leaders, Giles, during the debate, attacked the president for not communicating the dispatches; whereupon the federalists offered a resolution calling on the president for copies of such dispatches as were proper to be communicated. To prevent an invidious selection from the dispatches, the

democrats insisted on making the call for *all* the dispatches; and in this form the resolution was passed, April 2. The copies were sent the next day, the president being willing to gratify democratic curiosity to the fullest extent. One may imagine the absolute stupefaction of the democratic leaders as the *coup de théâtre*, which they themselves had assisted in preparing, fell upon them as the dispatches were read. — In brief, the commissioners had been kept waiting in Paris for six months without official recognition, had been approached by unofficial go-betweens with proposals for bribes to the directory and the French treasury as indispensable prerequisites to peace, and, on their refusal, had been ordered out of France. On reaching Paris, they had found that Talleyrand, lately a royalist exile, was now the minister of foreign affairs. They had applied to him at once for an interview, but had been informed that he could not grant it until he had finished a report to the directory on American affairs. This answer had hardly been given when Talleyrand's unofficial agents appeared on the scene, and opened communications with the commissioners. In the dispatches, as sent to congress, the names of the agents were honorably kept secret, letters of the alphabet being substituted for them. The principal agents were M. Hottinguer (designated as X), M. Bellamy, a Hamburg merchant (Y), and M. Hauteval, formerly resident in Boston (Z); and from these the whole transaction took its popular name of the "X Y Z mission." Their appearance had been heralded by information, through Talleyrand's secretary, that the directory were greatly exasperated by some passages in the president's message, that persons would be appointed to conduct the negotiations, and that they would report to him (the secretary). Oct. 18, X called on Pinckney with a message from Talleyrand: it would be necessary, in order to calm the exasperation of the directory, that a bribe of 1,200,000 livres (£50,000) should first be given them. Pinckney refused to discuss the matter without his colleagues, and X the next day laid written propositions before the envoys. The bribe to the directory was now supplemented by the demand of a "loan" to the French republic: if both were agreed to, the directory would restore the treaty of 1778, and submit American claims for damages to arbitration, provided also that the American government would "advance" money to pay any damages awarded against France. Within the next few days, Y and Z appeared, and the proposed form of the loan was explained. France had extorted from her "sister republic" of Holland, and still held, shares of stock amounting to 82,000,000 florins (£2,560,000), worth about half their par value. The United States envoys were to offer to buy these at par; and, as Holland was certain to pay them at par after the war, the whole transaction would really be only a loan. But Y put the whole negotiation into a nutshell thus: "I will not disguise from you that, this satisfaction being made, the essen-

tial part of the treaty remains to be adjusted: *il faut de l'argent, il faut beaucoup d'argent*—you must pay money, you must pay a great deal of money." They informed the envoys that nothing could be done in Paris without money; that one of the directory was in the pay of the privateersmen who had been plundering American commerce; that Hamburg and other European states had been compelled to buy a peace; and that the United States must do the same. The envoys nursed the negotiation very skillfully, proposing to send one of their number home for instructions, to suspend French captures in the meantime, and to do various inadmissible things, until they had accumulated a most unsavory mass of "diplomatic" matter. Oct. 27, X became impatient. "Said he: Gentlemen, you do not speak to the point; it is money. It is expected that you will offer money. We said that we had spoken to that point very explicitly: we had given an answer. No, said he: you have not; what is your answer? We replied. It is no; no; no; not a sixpence." This plain, manly and simple answer is probably the one which was distorted into the more bombastic form, much more popular in America: "Millions for defense, but not a cent for tribute." — The next day Talleyrand himself had an interview with Gerry, Z acting as interpreter. He informed Gerry that unless the envoys "assumed powers, and made a loan" within a week, the directory would issue a decree demanding an explanation of objectionable passages in Adams' message. On Gerry's report, the envoys unitedly sent word to Talleyrand that they would assume no such powers, and that he need not delay the decree on their account. On the following day X became still more urgent. He offered to allow the envoys to remain in Paris and communicate with their government as to the "loan," provided the bribe to the directory was paid; but, in default of this condition, threatened the expulsion of the envoys from France, and a declaration of war against the United States. This the envoys answered by flatly declining any further negotiations with unofficial agents, and here their mission really ended. The remainder of their six months in Paris was spent in preparing memorials to Talleyrand, writing dispatches to their own government, and repulsing the continued efforts of X, Y and Z to renew their negotiations. It was not until April 3, 1796, that Talleyrand dismissed Pinckney and Marshall, and then only by a letter to Gerry stating that he supposed they had "thought it useful and proper," by this time, to quit the territories of the republic. Marshall sailed for home April 16, but Pinckney was detained for several months by the illness of a daughter. — The powers given to the envoys had been joint and several, and Talleyrand, ever since the preceding December, had tried to persuade Gerry to use his own power and make a treaty. Now, on dismissing Pinckney and Marshall, he expressed his desire that Gerry should remain so emphatically that Gerry obeyed, fearing a declara-

tion of war if he should depart unauthorized. At the same time he informed Talleyrand that he would only confer informally and unaccredited. He remained in Paris until early in August, when he at last received a passport, and obeyed the imperative directions of his government to return at once. Before his departure news arrived of the explosion which the dispatches of the envoys had caused in America, whereupon Talleyrand indignantly denied all knowledge of the X Y Z negotiations, and called upon Gerry to give him the names of the "wretched intriguers" who had taken advantage of the envoys. This indignation blinded no one; and Y, who had taken refuge in Hamburgh, made a counter-declaration that he had never taken a step in the negotiations without Talleyrand's knowledge and direction. — The effect of the dispatches upon the democrats in congress was increased by the persistence with which both Talleyrand and his agents had returned to the assertion that their friends in America would believe and trust them rather than the federalist commissioners. They had so far mistaken the party, said Jefferson, "as to suppose their first passion to be attachment to France and hatred of the federal party, and not love of their country." At any rate, the allegation made the democrats (or republicans) for the time a highly unpopular party. A flame of warlike feeling burst out from the country at large, and war meetings, processions and addresses to the president, volunteering, and private subscriptions of money and war vessels for government use, became the order of the day. The black cockade, the revolutionary badge, was generally worn; two new patriotic songs, "Hail Columbia" and "Adams and Liberty," became highly popular; and the president, careering at the head of the storm, felt for once that he liked the people and that the people liked him. In the only doubtful portion of congress, the house of representatives, all the doubtful members, and many of the democrats, fell instantly into line with the federalists. The senate bills for increasing the navy and purchasing foundries were passed at once, and the necessary appropriations were made. The navy, hitherto under control of the secretary of war, was made a separate department (April 30). The president was authorized to enlist 10,000 regular troops, and 10,000 volunteers, if any foreign power should invade or declare war against the United States within three years (May 28). American vessels of war were authorized to capture any "armed vessels, sailing under authority or pretense of authority from the republic of France," which should commit depredations on American commerce (May 28). American merchant vessels were authorized to resist capture by French vessels (June 25); and American war vessels and privateers were finally authorized (July 9) to capture armed French vessels of every description. Commercial intercourse between the United States and France and her dependencies was suspended (June 13); and a brief act of July 9 declared the treaties with France no

longer binding upon the United States, since France had repeatedly violated them, refused reparation, and "repelled with indignity" all attempts to negotiate. Acts were also passed for the imposition of a direct tax, for a loan upon the credit of the direct tax, and for a general loan of \$5,000,000. — In strong contrast to the vulgar notion of the belligerency of democracies, the American republic has always aimed at peace. Nevertheless, its people have always been proud of its potential weight in war, and have been fond of looking forward to the day when its irresistible growth in power should reduce to an evident littleness the high-sounding international wars of the continent of their forefathers. In any such point of view the little history of the nation's first defiance to an equal member of the family of nations, of the *quasi* war of 1798 against France, and of the scattered sea battles in which the little navy acquitted itself so brilliantly, must always be an interesting point of departure. Had the dominant party stopped with the preparations above detailed, even its opponents must have acknowledged the vigor and success of its administration. But the time was one of political passion more intense than can well be conceived now. Each party had inherited many of the practices, and still more of the apprehensions, arising from previous party conflict in the mother country, where parties had not hesitated to assail one another, if not by force, at least by a forcible wrenching of the laws from their proper purposes. To the democrats, the provisional army, officered almost exclusively by federalists, seemed to be not only a means to provide salaries for their opponents, but a possible weapon of offense in party warfare. The step was defended by the federalists on the ground of the danger of an invasion of the southern states by a force of negro soldiers from the French West India islands, who would excite a slave insurrection. For the more flagrant measures, the alien and sedition laws (see that title), little defense could be offered. They were distinctly partisan. Under the operation of the sedition law, Hamilton published with impunity a pamphlet attack on the president, holding up to view his "disgusting egotism, distempered jealousy, and ungovernable indiscretion," and styling him an "arrogant pretender to superior and exclusive merit"; while democratic politicians were arrested and tried for even circulating petitions against the sedition law, or for expressing a wish that the wadding of a cannon might strike the president in the broadest part of his person. Supposing the next congress should prevent the embarrassing feature of a democratic majority in the house of representatives, was the majority to be removed by a series of arrests under the sedition law, supported by the provisional army? The counter-movement of the democratic leaders is elsewhere given. (See KENTUCKY RESOLUTIONS, NULLIFICATION.) Whatever its objects may have been, it need only be said here that the apprehensions which led to it were unfounded,

and that the federalists attempted no such use of the sedition law. — Even before Gerry's departure, Talleyrand had received news of the stir which the dispatches of the envoys had excited in the United States, and the effect was instant. The directory protested their desire for peace, and in August issued several decrees, releasing American prisoners, raising the embargo on American ships, and cautioning French vessels to do no injury to legitimate American vessels. They even drew a veil over the language of President Adams' messages, for which they had formerly demanded satisfaction, but which had now grown into an indictment of the directory's principles, practices and manners, of a warmth unheard of elsewhere at the time; and they semi-officially offered to receive a new American minister. But Adams, in his message of June 21, 1798, announcing Marshall's arrival, had declared that he "would never send another minister to France without assurances that he would be received, respected and honored as the representative of a great, free, powerful and independent nation." And in his annual message of Dec. 8, 1798, his language rose to concert pitch: he declined to send another minister to France without more determinate assurances, left it to France to take the requisite steps to accommodation, and gave that country "deliberate and solemn" warning that, "whether we negotiate with her or not, vigorous preparations for war will be alike indispensable." Meanwhile Talleyrand had been casting about for a channel through which to convey the assurances necessary; and had found it in William Vans Murray, the American minister to Holland. Nor was Adams unwilling to receive the assurances, for he had already found that war with France involved the elevation of Hamilton, whom he cordially detested. Washington had accepted the position of lieutenant general, conferred upon him at the previous session, on condition that he should be allowed to name his subordinates. As the three next in rank to himself he had named Hamilton, C. C. Pinckney and Knox, who were confirmed; but the president insisted on making Knox the senior, on the ground of his superior revolutionary rank, and only yielded before Washington's threat of a resignation of his own commission. Hamilton was thus to be practically commander-in-chief of the provisional army. He had already become commander-in-chief of the president's cabinet, which had been inherited from Washington; its members maintained a close and confidential intercourse with him, in striking contrast to the increasing contempt which their correspondence expressed for their nominal chief. To refuse Talleyrand's overtures in order to put Hamilton at the head of an army for the invasion of Florida and Louisiana, perhaps to make him a conquering hero and a popular candidate for the presidency, was more than could be expected from Adams. He could not trust his cabinet; and, without giving its members any hint of his intention, he nominated Murray as minister to

France, Feb. 18, 1799, and a week afterward added Chief Justice Ellsworth and Patrick Henry to the commission. Henry declined, and Gov. William R. Davis, of North Carolina, was named in his place. The blow confounded the president's party. Every influence was unsuccessfully brought to bear on the president and on the senate to balk the nominations. The cabinet officers lost their heads: instead of either resigning or keeping silence, they protested against the step, and thus finally lost the president's confidence. The federal party, which had begun the year in high and united confidence, was now convulsed by sudden feud, the president stigmatizing his federalist opponents as a British faction; and the latter equally dreading, distrusting and disliking the president. The new mission to France had not only dissolved the provisional army; it had thrown the whole federal policy into the air. It is in itself a condemnation of the party that its policy should have been reduced by this time to a single card—the continuance of the hostile attitude toward France; when this was gone, the fire of the party was out.— At first everything seemed to promise quick success to the new mission. Murray had been informed of his appointment, with the reservation that the other two members would not set sail until full assurances had been received as to their reception. Talleyrand hastened to give such assurances in the amplest terms. Before the instructions for the envoys had been completed, the face of affairs in Europe had been so changed as to give the federalists some fresh courage. Disasters to the French arms had been steadily growing more serious; Napoleon, the directory's genius, was blocked up in Egypt or Syria; and in June, 1799, a new revolution displaced all but one of the directory. The government which had given the assurances of a kindly reception of the envoys was no longer in power, and the federalists urged the president to stop their embarkation until new assurances should be given. It may be that the revived federalist spirit was also due to the ascertained fact that the new house of representatives (1799-1801) would be federalist as well as the senate, a southern reinforcement having established a party majority there. Oct. 16, the president again chilled his party by directing, without consulting his cabinet, the immediate embarkation of Ellsworth and Davis. This step was attributed at the time to the president's frantic jealousy of Hamilton, who had inopportunistly made his appearance in Trenton (then the temporary seat of government) at the same time with the cabinet and envoys, as if for consultation with them. It is now well settled that Adams' motive was mainly the pacific policy which has been the almost invariable rule with American presidents (see EXECUTIVE, III.); and that his action in this case differed from Washington's action on Jay's treaty only in the difference of mode due to the different characters of the two men. Nevertheless, this new reason for distrusting the president, together with the impossi-

bility of ignoring in the approaching election the representative of New England, the section from which most of the federalist electoral votes were to come, left the party leaders in a quandary. Their only apparent road of escape was in the effort to make C. C. Pinckney president and Adams vice-president, and this road led straight to the overthrow of the party in 1800-1. (See CAUCUS, CONGRESSIONAL, I.; FEDERAL PARTY, I.)—The envoys found, that, by the new revolution of Nov. 9, 1799, Napoleon, who had suddenly returned from Egypt the preceding month, had become first consul. Three commissioners were appointed to treat with them, and a convention was signed Sept. 30, 1800. It secured safety for American commerce for the future, until England and France in turn began to violate international decency in their attacks on neutral commerce (see EMBARGO); but Napoleon was ingenious enough to obtain a mutual abandonment of claims for damages, by reason of the declaration of congress in 1798, that the treaties with France were no longer in force. In this form it was finally ratified by both parties, and declared in force Dec. 21, 1801. — See 1 Tucker's *United States*, 597 foll.; 2 *ibid.* (table of contents); 5 Hildreth's *United*

States (table of contents); 1 von Holst's *United States*, 138 foll.; 1 Schouler's *United States*, 373; 2 Marshall's *Life of Washington*, 424; Monroe's *View of the Conduct of the Executive*, 34; Hamilton's *Public Conduct and Character of John Adams, Esq.*, 12; 2 Benton's *Debates of Congress*, 225 foll. ALEXANDER JOHNSTON.

Y

YAZOO FRAUDS (IN U. S. HISTORY), the name commonly given to a land act passed by the Georgia legislature in 1795, and to certain claims arising under it, which were not settled until 1814. — Georgia began her existence as a state with doubtful claims to the territory west of her present area. (See TERRITORIES.) The Indian title had been extinguished in but a part of the state, bounded east by the Savannah river up to a considerable distance above Augusta, and west by the Altamaha and Oconee. The rest of the state belonged to the Indians, principally Cherokees and Creeks, but over all of it the state claimed sovereignty and jurisdiction, and the exclusive right to pre-empt lands from the Indians. (See CHEROKEE CASE.) When, therefore, the state sold lands, the sale was really of the right of pre-emption. In this manner a bargain was made in 1789 to transfer about 15,000,000 acres to three land companies for about \$200,000; but the companies insisted on paying for the lands in depreciated Georgia paper, whereupon the legislature declared the bargain at an end. — This abortive sale furnished a precedent for the increasing land speculations which grew to be a mania during the twenty years, 1780-1800. During the first fifteen years of this mania it had almost exhausted the sale of whatever lands the states had not covered by military land warrants. Georgia's vague and doubtful territorial claims seem to have at last attracted attention as a promising field for speculation. Four land companies were formed, the

Georgia company, the Georgia Mississippi company, the Upper Mississippi company, and the Tennessee company, commonly called, in general, the Yazoo companies, from the general field of their operations, in the Yazoo district. These joined forces in an attack upon the Georgia legislature, and obtained from it the passage of the act of Jan. 7, 1795, the most extraordinary piece of state legislation in our history. It purported to transfer to the companies named, for a consideration of \$500,000, a tract of land then estimated at 20,000,000, but afterward found to contain 35,000,000, acres. The price, about one and two-thirds cents per acre, for the richest farm land in the country, was certainly suspicious, but the act itself kindly furnished to the companies the means of corrupting the legislature: one clause contained a provision allowing the companies to take up, on the same terms, 2,000,000 acres additional, for the benefit of whatever "citizens of Georgia" they should admit as their partners. And so little care was taken by the participants to cover their tracks that the United States commissioners in 1802-3 had only to compare the schedule of partners acknowledged by the companies with the legislature's yea and nay votes to show that every member of both senate and house who voted for the act of 1795 had been bribed by a share of the 2,000,000 acres, with a single exception, Robert Watkins, whose name deserves to be recorded. The bribery was effected in the manner now familiar, by assigning a number of acres to the legislator,

excusing him from payment until the market price had risen to forty or fifty times the stipulated price, and then paying him the difference. — The publication of the act aroused an instant storm of indignation throughout the state. In every county but two the grand juries presented the act as unconstitutional and void; and when the state convention met in May, 1795, it was deluged with petitions, memorials and remonstrances against the land act. These it transferred to the attention of the next winter's legislature, so that the election of that body turned on the Yazoo question. When it met, the members who had voted for the act had disappeared from state politics; Jackson, the United States senator, had resigned his seat and entered the state legislature to lead the anti-Yazoo majority; and an act was passed, Feb. 13, 1796, revoking the sale as a violation of the state constitution, illegal and void, and directing the repayment of purchase money to all purchasers who should apply for it within eight months. The act of 1795 was then publicly burned in front of the state house, the two houses attending in a body: the committee handed the act to the president of the senate, he to the speaker of the house, he to the clerk, and he to the doorkeeper, who threw it into the fire. All evidence of its passage was expunged from the records; and the constitution of 1798, while forever prohibiting sales of lands to individuals or companies before counties were fixed, ordered the land companies' purchase money to be kept in the state treasury at the companies' risk, and subject to their order of withdrawal. — One would imagine that all these proceedings were a sufficient evidence of a cloud upon the companies' title to make intending purchasers exceedingly cautious. They seem to have had no great difficulty, however, in disposing of their lands at a sufficient advance to give them a handsome profit; and, as the third parties continued to sell, an army of claimants was gradually formed, particularly in New England and the middle states. When Georgia, in 1802, ceded her western claims to the United States, clauses in the compact confirmed Georgia's previous grants, and provided that not more than 5,000,000 acres should be appropriated for the satisfaction of "other claims," if congress should act upon them within a year. The commissioners, Madison, Gallatin and Lincoln, who had negotiated the compact with Georgia, reported, Feb. 16, 1803, that the present Yazoo claimants were innocent third parties, holders without notice, and their claims ought to be compromised; that they offered to accept twenty-five cents an acre, or a lump sum of \$8,000,000; but that a sum of \$2,500,000 with interest, or \$5,000,000 without interest, payable out of the proceeds of Mississippi land sales, would be a fair compromise. The Yazoo claims now met the fiercest and most uncompromising opponent in the person of John Randolph. (See his name.) He had been in Georgia on a visit in 1795-6, and now took up the battle against the claimants with a rancorous sense of personal hos-

tility which added to his naturally angry support of Georgia's action as a sovereign state. Nevertheless an act was passed, March 8, 1803, one of whose clauses, after setting aside a part of the 5,000,000 acres for British claimants and squatters without title, appropriated the remainder to the satisfaction of such other claims, arising under "any act or pretended act of the state of Georgia," as should be filed in the office of the secretary of state before Jan. 1, 1804, and subsequently approved by congress. — Among the claimants was the New England Mississippi company, successor by purchase to the Georgia company. Randolph's opposition has usually been attributed to a general hatred of New England, but its real basis seems to have lain in an honest belief that the New England company was an organized attempt to obtain \$8,000,000 from congress by the same process of corruption and bribery which had originally been successful with the Georgia company. The company's principal agents were Granger, then postmaster general, and Perez Morton, a leading democratic politician of Massachusetts. Their chances in congress seemed to be fair, when Randolph anticipated them by offering a series of resolutions, Feb. 20, 1804, upholding the Georgia revoking act of 1796, and directing that no part of the 5,000,000 acres be appropriated to any claimants under the act of 1795. The second resolution contains the gist of Georgia's defense of her action, as follows: "That, when the governors of any people shall have betrayed the confidence reposed in them, and shall have exercised that authority, with which they have been clothed for the general welfare, to promote their own private ends under the basest motives and to the public detriment, it is the inalienable right of a people so circumstanced to revoke the authority thus abused, to resume the rights thus attempted to be bartered, and to abrogate the act thus endeavoring to betray them." His resolutions were postponed in March by a general majority of about 53 to 50; but his object had been obtained, for the claims were practically postponed with the resolutions. But Randolph always believed that his own fall from the leadership of his party in congress was directly attributable to the disappointment of members of congress interested in the claims, and backed by a strong and unscrupulous lobby. He was not alone in the belief: the evident conviction that bribery had been at work in congress makes the debates of the time quite unpleasant reading. — In January, 1805, the claims again came up for consideration, and Randolph, freed from any partial checks by his evident banishment from his party, gave loose reins to the powers of vituperation, in which he was unsurpassable. Every one who favored the claims in any way came in for a share, but most particularly the principal agent, Granger. Randolph, in a speech of Jan. 31, 1805, even accused him, without offering any direct evidence, of having prostituted his official power of making postoffice contracts to the purchase of members' votes for his

constituents, the New England company. One sentence will give some idea of Randolph's peculiar style: "You must know, sir, that the person so often alluded to maintains a jackal, fed not upon the offals of contract, but with the fairest pieces in the shambles; and at night, when honest men are in bed, does this obscene animal prow through the streets of this vast and desolate city, seeking whom he may tamper with." Granger, the next day, wrote a naturally indignant letter to the speaker, demanding an investigation, which was not accorded to him. Randolph's object had been sufficiently attained, and he followed the same tactics for the future, making it so unpleasant for any one who introduced a bill to satisfy the claimants that no act was passed. Even in 1808, when the short-lived democratic legislature of Massachusetts unanimously asked congress to act upon the claims, no attention was paid to the request. — Failing before congress, the claimants arranged a conflict of title between holders of Yazoo lands under their grant and under the United States, and thus got the matter before the supreme court in the case of *Fletcher vs. Peck*. The decision was given in 1810, and fully sustained the claimants. It held that the law of 1795 was a contract between the state and the claimants; that the states were forbidden by the constitution of the United States (art. I., section 10) to pass any law impairing the obligation of contracts; and that the revoking act of 1796 was therefore unconstitutional and void. Still the matter languished until March 31, 1814, when an act was passed appropriating \$8,000,000 in scrip, payable out of the proceeds of Mississippi lands, to satisfy the Yazoo claimants. Comparatively little of this, however, went to the claimants. Most of them had become discouraged by the long delay, and had sold their claims to speculators at a heavy discount. Some few subsequent acts were found necessary to complete minor details, but the end of the case was fairly reached in 1814. — It is certainly true that the states were forbidden by the constitution to pass any law impairing the obligation of contracts; but it is equally true and clear that the contracts then intended were mere private contracts between individuals, and not those which are public in their nature and trench on the prerogatives of the state government. It is usually considered that the change of course was first made by the supreme court in the case of *Dartmouth College vs. Woodward* in 1819, though that case was only that of a private eleemosynary corporation, and the rule in its case has since been transferred to the maintenance, as irrevocable contracts, of the charters of corporations essentially public in their nature. A more apt illustration of this subsequent line of decision may be found in this Yazoo case in 1810. The contract was one which deprived the state of its public lands, which was obtained by a wholesale corruption of legislative agents never effectually denied, and which was protested against by one of the principals, the people of the state, the instant their

voice could be heard, as not their act and deed. Surely it would seem that here there was no contract at all; or that, if there was a contract, it came with the implied condition of the state's power to revoke or alter it. Whether we take the standpoint of state sovereignty (see that title) or national sovereignty, it is clear in either case that the state legislatures in 1775 were left, either by the will of the people of the state or of the people of the nation, the same supreme power of revocation or alteration of their public charters or public contracts which has always been possessed by the British parliament. He who asserts that they have since lost that power may fairly be asked to put his finger on the place where the decree of the state or of the nation has taken it from them. It is hard to side with John Randolph against John Marshall, but it is infinitely harder to see any such sweeping decree in the contract provision of the constitution. We can only see a series of stepping stones, beginning with the Yazoo decision, and ending with a general judicial decree that the state legislatures have no power to revoke or alter charters. So that, as the law stands, any corporation has only to be unscrupulous enough to purchase our legislature, and to obtain from that body an irrevocable charter granting it any privileges, however enormous or however opposed to the self-government of the people of the state, and it obtains at once a vested right which must be sustained by the judicial power and physical force of the United States. In this aspect, the case has a far more dangerous appearance now than in 1810 or 1819, owing to the rise of a class of corporations whose powers, ambitious and perilous rivalries could hardly have then been imagined. It may be dangerous in some degree to expose our corporations to the meddlesomeness of state legislatures; but it can hardly be denied that it is still more dangerous to hang the safety of popular government by states upon the small chance of the unanimous and perpetual scrupulousness of an infinite number and variety of corporations. When the danger shall appear in practice for the first time it will be too late to avoid it, for the court in the Yazoo case very naturally decided, as it must always decide, that it could not examine or even recognize any allegation of corruption in the supreme legislative authority of a state: it must take the legislature's action as the voice of the state. Judge Jameson, in the pamphlet cited below, speaks as follows: "It may be heresy, but, if so, the heretics are a large and increasing company who maintain that the decision in *Dartmouth college vs. Woodward* has been carried much too far, and been made to sustain grants which neither law nor justice nor sound political principle can sanction. * * But in some of the very cases in which our courts have sustained that species of contracts, upon the supposed controlling authority of the *Dartmouth college* case, may be found the law which is ultimately to rescue us from the bondage that case has brought upon us. In many of these cases there are dissenting opinions, giving,

in the judgment of many, the better law in regard to the proper application of the principles of the Dartmouth college case. By going back, therefore, to the path which was abandoned when the rule in that case, that of a private eleemosynary corporation, was perverted to the maintenance of corporate institutions invested with great public functions, not only congress but the states will be left free to bring the needful legislation to bear against those monster establishments deeming themselves impregnable behind the barrier of the constitution."— See authorities under GEORGIA; 4-6 Hildreth's *United States* (index); 2 Schouler's *United States*, 74; 2 Tucker's *United States*, 186; 1

Z

ZEITGEIST. *Its Nature and Power.* The *Zeitgeist* is a German word, meaning the spirit of the times, or the spirit of the age. In the following article it will be frequently rendered literally by the English compound *Times-Spirit*.— Every one feels the power of the times-spirit, but no one explains to us on what that power depends. All speak of the times-spirit, or of the spirit of the age; most men pay homage to it; yet nobody tells us what the times-spirit which they worship and which they sometimes unwillingly obey, is. The idea of the times-spirit did not originate in our day. It was given expression to, even by the brahmans of ancient India. The old Romans were acquainted with the "spirit of the century" (the *seculum*). (Tac. *Germ.*, 19.) But our age has grown more attentive than any former one to the drift of the spirit of the times. Hence the question, What is the times-spirit? imperatively demands an answer.— I. Let us first see by what external signs men think they can recognize the times-spirit, and what qualities they ascribe to it.— 1. The times-spirit manifests itself chiefly in the definite character and the special intellectual direction by which the different ages and the different phases of the times are distinguished from one another. The contrast noticeable between the great periods of the world's history, marks also the changes or transformations of the times-spirit, in a general way. Even the spirit of the middle ages was once present in the world as the spirit of the times, as the times-spirit; and in its time it crushed out the spirit of the ancient world, just as it had itself to yield subsequently to the spirit of modern times. Again, in these great periods of the world's history the spirits of the centuries, and even of the half-centuries composing them, are surprisingly different. Only, the century must not be reckoned according to our Christian system of chronology, for the experience of history everywhere shows, that the spirit of the new century becomes observable in all its youthful impetuosity even in the last decade (according to Christian chronology) of the previous century. Christ was not born at

the beginning of a century, and hence our Christian chronology does not correspond with the chronology of the periods of the world's history (*weltperioden*, world-periods).— With the ages, new ideas, like stars, rise above, and again sink below, the horizon of humanity. In one century, an idea has a powerful attraction for men; in another, that same idea exercises no influence whatever. In one age, men wax enthusiastic over it, in the next they pass it by coldly and indifferently. In the twelfth century (including the last decade of the eleventh) all Christian Europe was stirred to its very centre by the desire to rescue the sacred sepulchre of Jesus from the infidel. To effect that end, millions of men with fiery ardor rush into the arms of unknown danger, privation and death. But this fanatical impulse loses its power over minds in the thirteenth century, and, later, dies out entirely. The second half of the fifteenth and the first of the sixteenth century, favor the renaissance of ancient ideas, and the reformation of the church, which had previously been attempted, without success, by individuals; while, from 1540 onward, the spirit of reaction and torpidity rose up and was just as victorious. In the seventeenth century, princely absolutism everywhere celebrated its triumph over the estates system; and in the eighteenth, beginning with 1740, the craving for enlightenment and the freedom of the middle class of citizens raged with the violence of revolution. The nineteenth century corresponds with the growth of representative constitutional government and the national (see NATIONALITIES, PRINCIPLE OF) current in politics. In one age, the fundamental feature of the times-spirit is liberal; in another, conservative; while in a third it is either radical or absolutist.— The same changes or transformations of the times-spirit are, besides, visible in miniature, in any one age. Here, too, there is an upward and a downward movement to be distinguished. The spokes of the great wheel of the world's history consist of smaller wheels which have a rotation of their own. The very same men grow enthusiastic, in one

phase of the times, over popular freedom, and in another call for a dictatorial power; but, in both instances, they appeal to the spirit of the age with which the direction they follow is in harmony. When Napoleon I. undertook to re-establish Cæsar's authority, he tried to discover, by means of pamphlets which he caused to be scattered widespread, whether the time for it had come, just as Noah, according to the Jewish record, once tried to find out whether the waters of the deluge had subsided; and Napoleon repeatedly postponed carrying his design into execution, because the time had not yet come for it. At last the signs of the times seemed favorable to him; he then cast aside the veil of the consulate, and founded the new empire. Such an undertaking would have been as impossible later, at the time of the restoration after 1815, as it would have been earlier, in the turbulent time of the revolution. — This changing of the times-spirit seems to protect mankind from the lasting, all-crushing despotism of a single, on-sided tendency or direction, and of one sole power. Time causes one force to set again, which it had previously called on to rise, and summons other sleeping forces into life and operation. With time the wheel of destiny turns round, and now new hopes and cares awaken, and now again old sorrows and old joys approach their end. In the change of human things the change of the times-spirit has a great share. Not our globe alone is round and must turn on its axis; the times-spirit too revolves, and, by its revolution, exercises a changing influence on the opinions and doings of men. — 2. A second noteworthy observation is the propagation of the times-spirit. Were it limited to a single country, or to a definite nation, we would suppose we discovered it in the peculiar spirit of that country or that nation. But it is evidently not confined within the boundaries of a country; it moves, in the same current and direction, over different nations. Like the currents of the wind, in the atmosphere, it now moves from the east to the west, and now from the north to the south, and *vice versa*. The religious, believing, and, in a political sense, feudal, fundamental feature of the mediæval times-spirit, spread not only over Christian Europe, but, simultaneously, over the Mohammedan east. — It is often thought that the changes in the spirit of the times can be explained by certain definite experiences of a people, or by certain measures taken by its government. The explanation is a wrong one; for the spirit of the times changes among other peoples also, with different experiences and different governments. We must not think that the change in the spirit of the times was caused for the reason that this thing or that thing happened, or for the reason that this thing or that was left undone. It may be that such happening or leaving undone of a thing may, as a secondary cause, have helped the efficiency of the change of the times-spirit, or put obstacles in its way. The change itself, however, is not dependent on such happening or leaving undone, and has another

and chief cause. The best liberal government can not prevent the return of the time of a conservative tendency. And when, even an absolutistic government makes no gross mistakes, the times-spirit does not always persist in the same direction, but from time to time ventures a leap in the way of radicalism. — But the spirit of the times does not propagate itself in entirely the same measure among different peoples. It changes, too, the principal representatives of its character for the time being. At one time one nation, and at another time another, appears as the especial organ of the times-spirit, according as the peculiar nature of such a nation harmonizes with the most prominent quality of the spirit of the times. The spirit of the times in this way lifts up the nations, and lets them fall again. — The principal seat of the times-spirit in Europe, in antiquity, was first Greece, and, later, Rome. During the middle ages the Germans, although unconscious of the fact, were the representatives of the spirit of the times. In the age of the reformation of the church the German nation was the chief organ of the times-spirit, just as the French nation was in the age of the revolution. In the former instance, the times-spirit swept from Germany over northern and western Europe; in the latter, like a storm, from Paris over the European world. The full power of the moving times-spirit, like the crest of a wave, becomes perceptible only in the land or among the nation which is its principal seat or principal representative; and its force in other lands and among other peoples decreases in intensity, until the wave reaches its trough. — 3. The great power of the times-spirit shows itself mainly in the multitude. It comes over the masses, they know not how themselves, and gives them the direction which they follow. The greater number of them surrender themselves up to its impressions, and allow themselves to be filled by it. As plants, at certain seasons of the year, shoot forth and blossom, then stand still and fade, nations are now stirred to action by the current of the times-spirit, and again are relegated by it to rest. The times-spirit wakes up and slumbers according as these qualities or those appear in it. Its course is mysterious. It forces itself in like the wind; it communicates itself from one man to another just as heat does from one body to another. At times, it spreads like an epidemic, and, in a moment almost, transforms the hopes and moods of men. — But there is a great difference between the times-spirit and the cosmic influences of the seasons and the changes of the wind. There was a time when men sought to explain the strangest effects of the times-spirit by cosmic causes. Astrologers calculated the destiny of men from the constellations of the heavens. They thought that by the position or movement of the planets especially they might discover men's plans and acts, and measure the change of the times-spirit. Fruitless and foolish endeavor! Were the cause of the change of the times-spirit to be found in the external nature of our globe,

that same cause, like the seasons of the year, like the changes of heat and cold, like the currents of the wind, would necessarily exercise an influence on men and on all other creatures, at the same time on plants and on animals. But of this there is no trace. No matter how the times-spirit changes, the growth of plants and the life of animals do not follow the change. They do not feel it. — The power of the times-spirit manifests itself only in the life of man; it is connected with human nature, and is scarcely explainable except by the facts of human nature. — As the times-spirit is confined to the world of men, its power is enhanced by the intercourse of men with one another, and in many ways weakened and checked by the isolation of men from one another. Nowhere is the times-spirit stronger than in great cities, in which men live closely packed together in constant and active intercourse with one another. It rules much less in the country, with its small villages and scattered farm-houses. The seclusion of a monastery can not withdraw itself entirely from it, but it only slightly feels the transforming power of the times-spirit. — 4. Its power over men is not an absolute one. Some, especially individuals of energetic character and determined mind, resist its influences, and sometimes endeavor, with success, to swim against its stream. Many combat the times-spirit which they hate. Many more, vexed and defiant, repel its rule. The world's history is determined only in part by the times-spirit. The individual freedom of men, as well as the times-spirit, leaves its impress on the history of the world, and in it another spirit besides that of the times reveals itself to us. The latter we recognize only where the spirit of the masses moves. Hence the times-spirit does not fill the whole of human nature, and is not identical with the mind or spirit of man in general. — 5. But neither can the changes of the times-spirit be explained by the play of caprice. That change is not like the varying pictures of a revolving kaleidoscope. Rather is there an intrinsic connection between the character of a preceding and of a succeeding section of time; we may perceive an organic succession of ages, and again an organic succession of phases of the times within the same age, which strongly reminds us of the succession of the age-stages in the life of man. The transformation of the times-spirit, too, begins with childhood, and rises to the height of youthful consciousness, to subsequently, after wise work and careful preservation, sink again into aging routine and prudent calculation, and to prepare for a new revolution. In all this there is regularity and law, not chance and caprice. — A great many modern philosophers have endeavored to discover this law. Hegel's endeavor to find it in the dialectic movement of the faculty of thought necessarily failed, because human faculties are manifold, and because the self-conscious mind of thinkers does not at all always determine the direction of the masses. The presentiments of Fourier and the speculation of Krause

which pointed to the succession of the age-stages of human life, and sought by them to explain the changes of the times-spirit, were happier. But Frederick Rohmer investigated the law of the times-spirit more deeply and more comprehensively than any other writer, and explained it by psychology. His own nature, which was very sensitive to, and had a fine feeling for, all the changes of the times-spirit, constantly spurred him on to observe its course, and follow it, like the minute-hand of a clock, with strained attention. In this way he at last found an accurate measure for the movement of the times-spirit. — This prevalence of law in its movement distinguishes the spirit of the times from the changeable fashion. The times-spirit, indeed, exercises its power on the fashion too. It manifests itself by way of preference in the art style of different ages, from which even the fashion can not free itself, and most clearly in the architectonic style, but in music and in literature also. Thus the fashion only followed the times-spirit, when, in the seventeenth, and to some extent in the eighteenth century, it gave its preference to rococo forms, and delighted in queues and hair-bags. Again, it was led by the spirit of the times when the French revolution revived antique fashions, corresponding to the republican models of Grecian and Roman antiquity, which then had great influence on the renovation of public life; and when it afterward, in the Napoleonic period, turned to the aristocratic and severer forms of Cæsarian Rome. To the extent that the fashion follows the times-spirit, it, too, is determined by law. But side by side with this law, the individual inclinations, whims and moods of persons and social centres, operate very powerfully on the fashion—persons and centres which are looked upon by the rest of society as authorities, and in whose footsteps the rest of society is accustomed to follow. The lions and lionesses of fashion in Paris and London are not always led to their resolutions and choices by the general movement of the times-spirit, but are determined in great part by their own freedom. We know, for instance, what kind of a personal cause it was that brought crinoline into fashion; and, in men's adhesion to the dress coat and silk hat, we perceive not so much the changeableness of the times-spirit as the supremacy of French style. — II. What, then, is the times-spirit, the qualities of which we have been considering? Is it really, as many suppose, the sum of individual human minds existing at a given time? When Goethe once wished to ridicule the false times-spirit, he wrote the well-known lines:

“Was ihr den Geist der Zeiten nennt,
Das ist der Herren eigener Geist.”

[What the gentlemen call the spirit of the times, is their own spirit.]—And, indeed, men frequently palm off their own spirit for the times-spirit; sometimes they deceive themselves about it, and sometimes they wish to deceive others about it. But the true times-spirit is something different from

the sum of separate spirits. If it were only the sum of separate spirits, the fact that the same individuals follow this current of the times-spirit to-day, and to-morrow perhaps an entirely opposite current, would remain entirely unexplained. Their individual inclinations and opinions remain sometimes the same, notwithstanding they allow themselves to be carried away by the new current. Under the cover of their own roof, they do not hesitate to give expression to their opposition to, and heartfelt dislike of, the course which they publicly pay homage to and obey. With these, therefore, their change of attitude is not arbitrary. It is not these gentlemen's own spirit that calls forth the spirit of the times. — Moreover, if the times-spirit were only the sum of individual spirits, it would not be possible to explain why the spirit of the times is so widely propagated, and yet seems specially powerful now in one country, and now in another. — So, too, would remain unexplained the intrinsic connection of the movements of the times-spirit with one another, and the succession of its changes in great periods of time from age to age, a connection and succession which extend far beyond the brief lives of individual men, and which, therefore, can not be measured by the standard of individual men, nor be dependent on individual men. — Lastly, if the times-spirit were nothing but the sum of individual minds or spirits, the many-sided struggle of the individual with the spirit of the times would be inconceivable; and yet that struggle is fought out frequently by individual men with themselves and within themselves, and not merely with other men. — But if the times-spirit be not the sum of individual minds or spirits; if, rather, there be unity in its nature and development, its cause must be looked for only in humanity as a whole. Only on the supposition that humanity as a unit has a psychic aggregate bent or aggregate disposition of its own, an aggregate destiny of its own, and therefore an aggregate development of its own, can the times-spirit be explained; and then it is explainable as the orderly development of the soul-life of humanity. — And so it is indeed. The world's history is the documentary proof that there is such a thing as a development of humanity, a development which progresses through great life-periods in organic sequences. The world's history and the times-spirit are nearly related and closely connected phenomena. The times-spirit accompanies the world's history in the paths of its development, and exercises its unceasing influence on the shaping of that history. The general character and spirit which, in the different periods and ages of the world's history, assumed a definite form, were once, when events were still, so to speak, in their fluid state, to a great extent, the spirit of the times. The world's history is development behind us, development in the past, succession that is past. The times-spirit is the development of the human mind in the present. But the times-spirit is certainly not the only thing that determines the world's history. If it

alone ruled as a power superordinated over individual men and binding individual men, the world's history would be like the growth of a plant; individual freedom would be oppressed by its weight; there would be no deeds, no works of men peculiar, but only joint works of the general human mind. But the times-spirit is only one of the moving forces; in the struggle with that force, the spirit of tradition and of traditional authority asserts itself; side by side with it works the special spirit of the nationality of a definite people, of dynasties and families, but above all, of remarkable individual men. From the reciprocal struggle and strife, action and interaction, of all human forces, proceed all world-historical results. — But the times-spirit is one of the most important and efficient of the forces which determine the world's history. By the psychologic law of ordered change, which is innate, as a common faculty, in the human race, the human race is spurred on to gradual development and perfection, and guided to its destiny. By the times-spirit, to which God has borne testimony, before the mind of man, God, with far-stretching rein, guides the course of the world's history, and carries humanity unceasingly forward. Once the great significance of the times-spirit is recognized, men will revere it as something sublime, as something divinely human, and look upon those who, ever turned toward the eternal and unchangeable, put a low estimate on the changes of the times-spirit, as short-sighted and unwise. The manifoldness of human life in common and the freedom of human development, are instigated and led by the changes of the times-spirit. — III. What, we may now ask, should be the attitude of the statesman toward this great intellectual power? 1. First, he is obliged carefully to notice the signs of the times, and to study the spirit of the times in which he is called to work. The question, What time is it? is always eminently important; for not at every hour you wish, can what you wish be done. Everything has its time, and the man who at the wrong time, whether too early or too late, undertakes great things, will generally succumb under difficulties, and his endeavors will remain without result. — Then, again, the present world must first answer the question, In what world-period do we live? What is the fundamental character of our age? The world of our day is not clear on this point. But this much, I think, can be confidently asserted: The so-called modern world-period, in which a new revolution of the great wheel of the world's history is going on, has still an aspiring youthful character. Humanity has not yet reached the height of its aggregate life. The immeasurable results of the modern sciences and the whole political movement of the time bear testimony to the masculine spirit of modern humanity, with its will to become conscious of itself, and to shape itself in freedom. Ours is a great creative age, more conscious and more free than any former world-period. Hence, in the spirit of this our world-period, a liberal

fundamental trait appears, one which recalls the still younger genius of the great period in the history of the world which brought forth the blossoms and splendor of Hellenic and Roman antiquity, and one which presents a surprising contrast to the stormy and oppressive, the intellectually less glad some and less clear, nature of the middle ages. Even in the new and most glorious world-period on which humanity entered in the year 1740, the first beginnings and first essays of the new spirit were still childishly naïve or boyishly boisterous. In the first age of the *aufklärung* (enlightenment), from 1740 to 1789, a cosmopolitan, philanthropic philosophy prevailed. The educated world, the first moved by the times-spirit, now not only turned away with contempt from the middle ages, but also from the great traditions of the past, and raised its eyes with enthusiasm to the new ideals which philosophy held up to it, and from which it expected a new order of things. Then it undertook in the following and second age of the new world-period, in the age of the revolution, to realize the pictures of its phantasy, and to transform the world in reality. But it was more successful in tearing down and destroying the old order of the world than in establishing the new one. The speculative school in which it was educated could not make up for its lack of experience and of practical understanding. The world indeed moved forward, but not without occasionally falling back again. At last it gave up its naïve confidence in the abstract ideas of equality and liberty; in consequence of the experiments it had made, it learned how to understand history better, and to appreciate the power of tradition. The principle which, in this our third age, since 1840, chiefly moves minds, especially in Europe, the principle of nationalities (see NATIONALITIES, PRINCIPLE OF) is, indeed, narrower than the ideas of the earlier revolutionary age of the universal rights of man, but it has more historical intrinsic value, and more formative power in it. We have not yet reached the height of genuinely liberal development. Even our grandchildren will not attain it. Our entire movement is not yet free from violent radical currents and precipitation; it occasionally turns about in the direction of the contrary extreme of absolutist reaction. But we may assert with joyful certainty that mankind has for a century past been making extraordinary progress, and is still making steady, manly progress toward the great goal: fully developed humanity. — 2. The statesman should never put a low estimate upon or undervalue the times-spirit, not even when the current of the times is unfavorable to him and to his plans, and not even when it brings to the surface, not the highest forces of human nature, but human nature's lower impulses; for the power of the times-spirit is always great, and its movements are necessary to the development of humanity. Remarkable men, indeed, go their own way, and do not, like the multitude, follow every change of the wind. But the statesman who despises the spirit

of the times would be like the fool who despises the winter because it calls forth no blossoms, and ridicules the night because it invites to repose. The monk or the hermit may shut himself up from the spirit of the times, by withdrawing himself from life in common with other men; but the statesman who cares to work and live among men, can not. As the cautious gardener carefully watches the heat and cold, dryness and moisture, and endeavors to guard his plants from the injurious effects of the extreme forces of nature; and as the sailor takes the winds and the waves into consideration, the statesman must notice the movements and qualities of the times-spirit, and work against its disfavor. But if he will resist the current of the times, he must neither rest from labor nor sleep. Every place he lays open to assault will be overflowed by the hostile current of the times-spirit; every gap that he leaves open will be filled by it. Before he is aware of it, he is closed in, betrayed, overthrown. — 3. If the times-spirit is favorable, the statesman whose direction is greatly promoted by the blowing of the times-spirit, may risk much, for he will succeed in much. The time goes forward in the same direction, and the boat, with a favorable wind, moves quickly and happily. If he meets with obstacles which he can not for the moment overcome, he can wait. Time comes to his assistance, removes the obstacles in his course, or wears them out and opens the way for him. Napoleon III., even when he was a prince, understood the great political truth, that the man who moves with the current of his time meets with success, while the statesman who swims against it, perishes. — 4. The ideas of the times and the forms of the times correspond to the spirit of the times. Ideas are never first conceived and expressed by races, but always by single individuals; yet ideas become ideas of the times only when they are taken up and propagated by the receptive masses. Sages and philosophers announce the ideas of the future, in advance. From their intellectual height they discover many ideas which operate only on future generations, earlier than do the multitude who live in the valleys below them. But the practical statesman can try to realize only the ideas which suit the times in which he lives. It is only for these ideas of the times that he will find understanding and support among men. He must guard against defending obsolete ideas of the times after the manner of the romantic school. For even if the spirit of tradition lends him some assistance, he will at most meet with only momentary success. The hostile age marches over him, and tramples his work under foot. His policy becomes ridiculous quixotism. But it is almost more dangerous, if more laudable, for the statesman to undertake to carry out the ideas of the future before the time to carry them out is ripe. He will then make shipwreck on the rocks of stern reality, and be scoffed at as an idealistic visionary. The true task of the statesman is the realization of the actual ideas of the times. On this depends, in large measure, the popularity

of statesmen. When they go with the ideas of the time, they are, for the most part, popular; when they go against the time, they become unpopular. The reason of the frightful unpopularity of the order of Jesuits for a century past, is to be found not solely in the dangerous intrigues of the order, but principally in the fact, that the whole tendency of the order is in deadly enmity with the modern spirit of the times and with the intellectual consciousness and cravings of the humanity of to-day. The great success of Napoleon, English, Italian and Prussian politics, was certainly determined to a great extent by this: that their main tendency was in harmony with the liberal and national tone of the spirit of the times in the present age. — 5. But every age has also a love for definite forms of its life. It is not sufficient for the statesman to recognize the ideas of the time, and to enter the lists for them; he will do well also to use the forms of the time. A century ago, enlightened absolutism was acceptable to the age. Great things could then be accomplished without great struggles, under that form. In our age, which demands, as its right, the representative form, and especially the assent and co-operation, of popular representation, enlightened absolutism meets with powerful opposition even when it advocates the real ideas of the time. Count Cavour for this very reason received earlier and more easily the recognition and cheerful support of his nation than did Prince Bismarck, because Cavour used the forms of the time for the ideas of the time, while Bismarck seemed at first to despise the forms of the time, and undertook to realize new ideas by the means of an earlier time. Hence the labor of Prince Bismarck was harder and slower; but in proportion as he showed himself more favorable to the forms of modern political life, he won for himself the furthering support of the many. — 6. Yet the greatest statesman can not singly, not even with the forms of the time, realize the ideas of the time. The new ideas, indeed, exercise their influence; but so do the old historical powers of authority and custom. The savant may carry out the thought of the time, in theory, with logical acumen, and a consistency regardless of consequences. Real life does not square with the straight lines and sharp angles of doctrines; it bends them and changes them in the application of them. Practical politics is an art which has a great many complicated problems to solve, an art which has to deal with many joint and personal forces. The result of political struggles necessitates treaties of peace, attempts at settlement or adjustment and compromises. The man who, out of blind zeal for the spirit of the times, scorns all compromise, may, indeed, be an honorable doctrinarian, but he must not expect the success or laurels of the statesman.

J. C. BLUNTSCHLI.

ZOLLVEREIN. The German *zollverein*, or customs-association, was the union effected among

a number of the German states, and begun by the junction of some of them with Prussia, for tariff purposes, a union by virtue of which (the Prussian tariff system being taken as a basis within the limits of the territory of the association) all tariff barriers between such states were swept away, while duties were collected at the boundary lines of the association, on their joint account, and divided among the several states, parties to the union, in proportion to their population. — This union came into existence after the dissolution of more than one tariff alliance against Prussia, Jan. 1, 1834, and was at first intended to continue for eight years. At that date the union embraced eighteen German states. In 1835, Hesse-Homburg, Baden and Nassau entered it; in 1836, Frankfurt; in 1838, Waldeck; in 1842, Braunschweig, Lippe and Luxemburg; in 1851 and 1852, Hanover and Oldenburg. From 1854 to 1865, all the German states, with the exception of Austria, the two Mecklenburgs and the Hanseatic cities, belonged to the Zollverein. The last Zollverein treaty is dated May 16, 1865, and was to run from Jan. 1, 1866, to the end of 1877, but was set aside by the events of 1866. The *zollverein*, or customs-association treaty, of July 8 1867, between the North German confederation considered as a single tariff territory, on the one hand, and Bavaria, Wurtemberg, Baden and Hesse on the other, which was to continue in force for twelve years, rested on a different basis entirely. — The Zollverein itself was brought to an end by the establishment of the German empire, inasmuch as the constitution of the empire, of April 16, 1871, art. 33, provides that Germany shall constitute one single country for tariff and commercial purposes, with Bremen and Hamburg as free ports. At present the Zollverein, therefore, has mainly an historical interest. — The economic consequences to Germany of the Zollverein were the consequences which may be expected from every customs-union. 1. It reduced the cost of the collection and administration of the customs duties as a consequence of the removal of the tariff barriers between the associated states; 2, it rapidly developed the industry of those states by the application of the principle of free trade in their commercial intercourse; 3, it increased the customs receipts by increasing consumption, the tariff being a moderate one; 4, it rendered it possible for these states, through the union, to conclude advantageous treaties with foreign countries, which are more disposed to make concessions to a state which offers them a large market than to small, unimportant countries; 5, it increased the commerce of the customs-union with foreign countries; 6, it increased the political importance of Germany, since its political union was destined, sooner or later, as it actually did, to spring from its customs-union.*

M.

* Says Henri Richelot, writing in 1862: "Since the year 1832 the Zollverein, although other influences concurred with its influence, has been the principal fact in Germany; and the progress of Germany since then has been, in great part,

the progress of the Zollverein. The first advance of the Zollverein consisted in its material enlargement; this it accomplished by successive incorporations which leave nothing in Germany outside of its boundaries save Austria, the Hanseatic cities and Mecklenburg. The increase of population of the Zollverein was a necessary consequence of the increase of its territory; but it has been more rapid; from twenty-three and one-half millions in 1834, the number of inhabitants of the Zollverein has risen to nearly thirty-four millions. — The reports of the commerce of the Zollverein, containing only quantities and no values, do not enable us to give the total annual movement of its trade with non-Zollverein states and countries, and in this matter we have only more or less uncertain approximations. But the approximations warrant us in classing the Zollverein, in international commerce, immediately after England, France and the United States, although it is very far from these countries; and in assigning to it the incontestable rank of the fourth commercial power of the world, of the third in Europe, and of the second on the European continent. The manufacturing character of the Zollverein has become more and more pronounced in international commerce. The increase of its exports is apparent, not in its natural products,

such as cereals and building lumber, but in manufactured commodities, in woolen, silk and cotton textile fabrics, in linen and hardware. In its imports we notice an increase in exotic articles of consumption, such as tea and coffee, an increase in the consumption of which is usually regarded as a sure index of general prosperity. The same may be said of the importation of articles used in manufacture. But so far as manufactured articles themselves are concerned, the salient point in the importation of the Zollverein is their decrease. In the vitality of the great German fairs which are still held, it is remarkable how German industry, little by little, thrusts aside its rivals in England, France and Switzerland. Lastly, in its expositions, the first of which took place in 1844 in Berlin, and the second in 1854 in Munich; and in the expositions of London and Paris in 1851 and 1855, that industry stood the test. If it had no originality or invention to boast of, all agreed that it possessed solid merit in the medium sphere which belonged to it. Its progress was still more noticeable in 1867 in Paris, and in 1873 in Vienna. The Zollverein thus seems to have advanced Germany much in the same way that the introduction of the policy of free trade promoted the wealth, well-being and industrial progress of England.—Ed.
